We may, then, safely begin with the statement that the language of Western Europe which has the oldest alphabet, exclusively of Latin origin, is either the Welsh or the Irish; in other words, the oldest alphabet of this class that we know is that which is due to the British Church in its most general form; *i.e.*, the church of the British Islands, the church of the insular Kelts, the church of the Britons or the Gaels—one or both. This is, in the first instance, (save certain exceptions standing over for notice) an inference from the universal connection between the introduction of Christianity and the introduction of the alphabet, but it is strengthened by the evidence of history, and by the agreement between the Keltic and the Anglo-Saxon alphabets. In continental Germany we find the letter *k* instead of *c*. In the British Isles, whether Great Britain or Ireland, we find *c* in the place of *k*. We find the same in the earlier Icelandic manuscripts; though, at present, as the result of German influences, *k* has superseded it. Whether this Anglo-Saxon alphabet was taken from the Latin direct or from one of the British forms of it is a question upon which we may profitably pause a little; for it suggests a distinction. The actual form of the letters is one thing, the principle upon which they were extended from the Latin to the Keltic is another. The first of these points is unimportant: for the independent existence of the Irish as a separate alphabet had not lasted long enough to engender any notable discrepancies between the copy and the prototype. The principles, however, of of its application to either the Irish or the British language are matters upon which much depends.

We must not, now, be surprised if the two irrepressibles again display themselves—*k* and *c:* if between two alphabets of Latin origin there may be a difference: inasmuch as one may have been formed upon a model so purely and exclusively Latin as to ignore the *k* altogether, whereas the other may have been formed under circumstances where the recognition of the *k* was possible.

Now it is submitted that it was upon a Latin model of the extreme and exclusive character that rejected the *k*, that the Anglo-Saxon alphabet was founded; while that of the Germans was founded upon one which contained it: and this means that what we may call a false start at the very beginning is one of the main causes of the bad conditions of the English orthography in the present advanced stage of its history. It was framed upon the worse of two imperfect models, the Greek and the Latin; and, in the Latin group, from the least fit of its members. This was the case whether the Anglo--Saxon alphabet was derived directly from the Latin, or indirectly, *i.e.*, through the alphabet of what we may call the Keltic Church; British or Irish as the case may be.

Now, at the present moment, both the Irish and the English have, as far as the details connected with the shape of the letters go, two

alphabets—one old, the other new. There are Anglo-Saxon works, which institutions so modern as the Society of Antiquaries and the Record office, have printed in the Anglo-Saxon characters; though the less conservative publishers write Anglo-Saxon with the exception of the two distinctive letters, Þ = *th*, and ð = *dh*; and print in the ordinary English letters; just as some of the Germans and Danes print in both the old black letter, and the more modern italic. The Swedes, however, have nothing to say to the black letter, and use the italic either exclusively or as the rule. The Irish do the same as the Germans and the Danes; and sometimes print in the older, sometimes in newer type. It is, I believe, a sign of nationality to use the former; and sometimes we may see the strange contrast in nominally English printing, of the words common to both languages in the modern, or Saxon, and the proper names, characteristic of Ireland, in the old, or native type. Whether the result be a handsome page or the contrary is another question. The fact to which attention is directed is that of the old Irish type and the Anglo-Saxon being convertible. It would not, perhaps, be difficult to say whether a work of King Alfred were printed in type meant for the meridian of Dublin, or in one for that of London. The general form, however, of the letters is so nearly identical, that Anglo-Saxon may be read in Gaelic and Gaelic in Anglo-Saxon types.

The native Irish, Erse, or Gaelic alphabet has—

1. No *h*. No Irish word begins with it; and, though we find more than enough of it, in the Anglo-Irish type as a sign of the so-called aspiration, it is only in this equivocal character that it presents itself. What the Anglo-Irish type gives as *bh*, etc., the true Irish of the manuscripts gives as *ḃ*. This, at first, looks like the Greek (῾): but this it is not. It came in by degrees; *i.e.*, some letters took it before others.
2. No *j*.
3. No approach, from first to last, to a *k*.
4. No *q*.
5. Nothing beyond *u*.

This, which reduces the Irish letters to seventeen, suggests that the framers of the alphabet took from Latin just the unequivocal and unambiguous letters; just the letters they could not do without; the letters which they could manage, without difficulty, and without either refinements or expedients. This, though a good principle to begin with, is a bad one to go on with. We have seen how the (·) over certain consonants, came to pass as a sign of aspiration, and out of this the later grammarians devised a class of mutable consonants, from which only *l*, *n*, and *r* were excluded. Then came the distinction between broad and small vowels; and then the law of assimilation: upon which we have already enlarged. Then came, what has also been enlarged on, the expedient of ecthlipsis: in all of which we see the elements of a very complicated orthography. The necessity of the alternative between phonetic spelling and

some such expedient as the one just mentioned was the misfortune rather than the fault of the Irish orthography. It was due to the nature of the language. But the worst of all was the particular form of the vocalic assimilation. The law of assimilation for the vowels of different syllables, following or preceding one another, was Small and Small, Broad and Broad. If this only meant that one vowel was to be substituted for another the case would have been neither better nor worse than that which we illustrated from the Finlandish. But instead of simple substitution the original vowel was, in many cases, retained, and an adventitious or supererogatory vowel added to it. The effect of this was to convert half the vowels in the language, so far as the eye was concerned, into diphthongs: and when, at point of contact between the two syllables we get, at the same time, an ecthlipsis, the result is startling. Thus *lam'*, or *lamh* = *hand;* while *geal* = *white;* and the Gaelic for *white-handed* is *laimheal.* The effect of this was, (so to say) to make vowels cheap: one or two more or less in a syllable being of no great consequence. No wonder, then, that in an Irish grammar (Neilson's is the one I quote from, which, for this purpose, is all the better for being an old one) we have such entries as the following.

There are thirteen diphthongs:—

Sound.	*Example.*
ae long, as *ai* in *pain*	lae, *of a day*
ai long and distinct	cáin, *a fine*
short, as *i* in *fight*, etc.	mait, *good*, etc.

Now, as the short vowels are not counted in the thirteen, the whole number amounts to twenty-one.

Then, there are five triphthongs, *aoi*, *eoi*, *iai*, *iui*, and *uai:* the great merit of which is that they are always long.

The vowel part is the worst part of the Irish alphabet. There are no rules for it. Ecthlipsis, indeed, is bad enough; but for this there *are* rules.

The cause of all this imperfection is manifest. There was no misappropriation of letters. There was no sacrifice to the etymological principle as taken in its ordinary sense. There was simply incompleteness of the alphabet. Yet, as compared with the English, the Irish is almost a well-ordered orthography, and this is mainly because the etymological principle was eschewed. It took *c* no doubt; but it excluded, and still excludes, *k*. In this it has its advantage over the English. In having no antiquated forms to retain, it has the advantage over the French.

SECTION XXXIX.

THE EARLY ALPHABETS OF THE GERMAN—THE MŒSO-GOTHIC ALPHABET.

We now turn from the early alphabets of the British Isles to those of Germany; where we shall find a noble landmark in our chronology—the Ulphiline Gospels. Ulphilas was born between A.D. 325, the year of the Council of Nice, and A.D. 348; and he died at Constantinople A.D. 388. He was a bishop of the Goths. These Germans were the Germans of the districts on each side of the Lower Danube. They had cut their way thus far eastward. They had firmly fixed themselves in parts of Moldavia and Wallachia, and had founded a kingdom, or, at least, under Hermanrik had become a formidable and independent nation. But they were pressed upon by the Huns, and in the reign of Valens, A.D. 376, were, either wholly or to a great extent, constrained to cross the Danube. Here they spread themselves over the province of Mœsia, from which they afterwards extended themselves, either as Visigoths, or as Ostrogoths, to Italy, to Gaul, and to Spain; in all three of which countries they founded kingdoms.

Of these Goths, Ulphilas was the bishop; and to some extent he was their missionary as well; thongh the details of their conversion as a nation, are obscure. They were Arians.

Of the languages of Germany the first that was reduced to writing was that of these Goths—the Goths of Mœsia as they are often called; their language being called the Mœso-gothic. And the one great Mœso-gothic writer is Ulphilas. Of a translation, by him, of the whole or a large part of the Bible, though much is lost, the Gospels, in an incomplete state, have come down to us. There are other portions of the Scripture as well; but these are mere fragments. Over and above these there are a few other fragments; chiefly referrable to the times of the Ostrogothic rule in Italy. The language and the alphabet are the same throughout: and, upon the latter, there is much to be said. The manuscripts which contain the Uphiline gospels, the pride and glory of the library of the University of Upsala, is one of the most famous in the world. It is entirely in capitals—large, bold, and standing apart from each other like those of a well-cut inscription. So marvelously regular is the writing that it has been supposed that each letter was separately *stamped;* and, although the evidence of those who are familiar with printing has set aside this doctrine, it required more than ordinary care to discover any difference between them. The manuscript itself is a tinted vellum—of a purple or mulberry colour. The letters themselves are silvered, and at the beginning of sections, gilded over with great care and regularity. Such is the famous Codex Argenteus, which contains the Ulphiline translations of the Gospels in the language of the Goths of Mœsia.

The language itself is old not only in respect to the age of the writing by which it is illustrated, but old in respect to its structure; though the statement that it stands to the modern German and Dutch in the same relation as the Latin to the Italian and Spanish is an exaggeration. It ceased, however, to be cultivated, and, possibly to be spoken, after the middle of the seventh century; and, as we know it only as the language of certain districts conquered by the Goths, we are unable to say, to a certainty, from what part of Germany it was derived. The dialects which come nearest to it are held to be those of Thuringia; but there are none which stand to it in a direct and undoubted line of descent.

Neither Mœsia, then, nor the country beyond the Danube (Moldavia and Bessarabia) was the native country of its German occupant; and as both lay within the limits of the Eastern Empire, and were governed from Constantinople rather than from Rome, the Mœso-gothic alphabet is of Greek origin. The Goths, however, who adopted it on the Danube might easily have carried it with them westwards, even to the Rhine: for we know that in Italy, Spain and Gaul, there were Gothic kingdoms. Now the recognition of the *k* in the *Frank* alphabet as opposed to its exclusion from the Anglo-Saxon, I mainly refer to the existence of the Mœso-gothic literature, (scanty as it was,) and the connection between the histories of France and the districts on the Lower Danube in which the first Gothic converts to Christianity were settled.

Not much later than the Goths of Mœsia, the Burgundians received Christianity; and, then, the Franks. The Burgundians were Arian; the Franks orthodox. Of the Burgundian alphabet we know nothing; indeed we only infer its existence from the fact of Burgundy being Christian. It is possible, then, that the Franks may have learned the art of writing from the tribe which, though Arian, had an earlier orthography than their own. But it is also possible that they may have taken it direct from the Latin; ignoring their brethren as heretics. This question, will repeat itself in Britain.

We thus see that the Christianization of Germany and that of Britain, must have run nearly parallel in time: and this, with the alphabet which is assumed to be concurrent with it, would give us an incipient British literature, as early as the fifth century.

The *names* of the Mœso-gothic letters are unknown. Their order is that of the Greek; and, as dependent upon this, their value as numerals. The Greek Digamma was represented by a letter of which the sound was that of *q*; the Greek Eta by H—a Latinism. Theta, Θ, was written Ψ, and Psi, or the letter that stood in its place, as Θ; a pair of forms which suggest a transposition. In the place of *xi*,—60 as a number,—stood a letter with the shape of the cursive capital *G*; and the sound of either that letter or of *y*. Omicron, with a change of form, had the power of *u*—so that we now see that between this letter and H for Eta, the Greek distinction between the long and short vowels has disappeared. For *q*

stood a letter, like the Russian *Y*, of uncertain import. We know, however, its position by its numerical power—90. Sigma was written *S* as in Latin. Hypsilon, with its pointed base, was more like a *V* than a *U*, and, is considered to have been so sounded; or, if not as *v*, as *w*. *S* has the form of the *Latin* letter.

Now Ulphilas, to whom these Goths owed their alphabet, died during the fourth century; and within the first ten years of the fifth, the Visigoths had founded their kingdoms in the south of Gaul and in Spain. The conquerors of Italy about fifty years later were the Ostrogoths, and it is universally admitted that the language of this division was that of the Ulphiline Gospels. The evidence that the language of the Visigoths, in Gaul and Spain was the same is less conclusive. There is no reason, however, to doubt the fact of its having been so. The conversion of the Anglo-Saxon population of Britain is referred to the last year of the fifth century, and to the influence of Frank teachers. But before this there was, in Britain considered as a country, the Christianity of the British Church. Now in connecting this old British alphabet—Welsh and Irish—with the Anglo-Saxon, I do not do so as against the Latin. The Anglo-Saxon might, doubtless, have been founded exclusively on the Latin. It might, also, have been founded on the British; but subjected to modifications from the Latin. This implies a second influence; and, in respect to this, I merely urge that this second influence, if it existed, was not Frank, but British. I hold that the early alphabets of Germany, of which the Frank must have been the most important, had Greek elements which the British and Anglo-Saxon had not.

SECTION XL.

THE ANGLO-SAXON ALPHABET.

There are two ways by which an alphabet may make its way into a country. It may, like the Mœso-gothic or Armenian, be introduced as a systematic whole; or it may grow up imperceptibly, without any definite system, and with no particular constructor. In our own time this latter mode of development is scarcely possible, because it is the practice of missionaries to address their hearers, as much as possible, in the language of the country to which they belong. Neither do they press upon them their books in English, so much as tracts and translations in their own vernacular. The missionary system of Rome was different. Such reading as was taught was in Latin; and the reading of anything other than Latin was exceptional. This practice was unfavorable to the composition of purely native works. There was a way, however, by which Latin composition could be partially popularized: and this was by something partaking of the nature of a translation, but yet falling short of one;—a system of interlining, in which there was every degree of closeness or

laxity. Sometimes there was a full translation of a sentence : sometimes the mere interspersion of an occasional Gloss. A very little system would suffice for an alphabet of this kind. The form and power of a certain number of letters might be picked out of the Latin text : and used just as the occasion presented them. The commonest would be most in use ; and rarer ones wholly unrecognized. In this way a systematic alphabet would be a long time in growing ; and, so doing, exist in its rudiments long before it came to be recognized in its integrity.

Between A.D. 400, when the Mœso-gothic alphabet may have been known in Gaul, and A.D. 600, when the Frank missionaries preached to the Anglo-Saxons, there was room for the gradual formation of more alphabets than one ; though of none is the exact origin known : the Mœso-gothic of which alone this can be predicated being of Greek origin. The earliest specimens of both the Irish and the British vernaculars are in the form of Glosses ; and very nearly the same may be said of those of the German and Anglo-Saxon.

The following table enables us to compare the four alphabets :—

	English.	*Latin.*	*Anglo-Saxon.*	*Irish.*
1.	A a	a	a	a
2.	B b	b	b	b
3.	C c	c	c	c
4.	D d	d	d	d
5.	E e	e	e	e
6.	F f	f	f	f
7.	G g	g	g	g
8.	H h	h	h	h
9.	I i	i	i	i
10.	J j	j	—	—
11.	K k	k (rare)	—	—
12.	L l	l	l	l
13.	M m	m	m	m
14.	N n	n	n	n
15.	O o	o	o	o
16.	P p	p	p	p
17.	Q q	q	—	—
18.	R r	r	r	r
19.	S s	s	s	s
20.	T t	t	t	t
21.	U u	u	u	u
22.	V v	v	—	—
23.	W w	w	w	—
24.	X x	x	x	—
25.	Y y	y	y	—
26.	Z z	z	—	—
27.	—	—	þ	—
28.	—	—	ð	—
29.	—	—	æ	—

The sufficiency, or insufficiency, of the Anglo-Saxon alphabet must be measured by the number and nature of the sounds which it had to represent. This is scarcely to be done without a certain amount of hypothesis and speculation. The opinion of the present writer who, unwillingly, differs from many of his predecessors, is that the proportion of letters to the sounds is not below that of the average alphabets; certainly above that of Irish; and, perhaps, comparable with that of the Mœso-gothic. But this view implies that about the seventh century the sounds which we now represent by *j* and *z*, were, then, either non-existent or rare: in other words that they have been developed in the interval. With the sound of *tsh* the same is held to have been the case; and, unless several of the preceding sections have been written in vain, the process by which a word spelt *Ceaster* has now become *Chester* has been foreshadowed. But this is not even now spelt with a single letter. *J* and *z* at the beginning of words, are now confined to those of foreign origin: and *z*, which is only a common sound as the sign of number in the plurals like *stagz*, and the existence of which is ignored in the present spelling, has been accounted for. *Y*, probably, existed in the oldest forms of our language; but the difference between such a combination as *ee-o* and *yo* is of the slightest. Besides this, *y* grows out of *g*. So much for the sibilants, both simple and compound.

The guttural sounds of *kh* and *gh*, have, probably, been lost: at least, in the literary English.

Y as a semi-vowel seems to have been unknown. As a vowel it appears interchangeable in spelling with *i* and *e*, as in *gyt* = *yet*, *gehyrsam* and *gehirsam* (in German *gehorsam*) = *obedient*. Whether it had the sound of the French *u*, German *ü*, and Scandinavian *y* is doubtful. The analogy of the allied languages is more in favor of this than the orthographical conditions under which it occurs. So far as it is a semi-vowel it seems to have been represented by *e*—*eow* = *you*, *eorl* = *earl* = Danish *jarl*, where the *j* = *y*. This is a point upon which I unwillingly differ from Mr Ellis. He argues against the semi-vowel power of *e* from its interchangeability with *ea*. But this assumes that it had only one power. He also argues against it from the small number of words beginning with *e*, followed by a vowel, where the sound is now that of *y*. This is true. But it is not from *e* as an initial that the point is to be determined. It is rather from the combination of *e* with *s*, *c*, and *sc* preceding it—as in *seo* = *she*; *sceat* = shot, (as in *pay your shot*; in *scot and lot*, the *k* sound is preserved,) and *Ceaster* = *Chester*. It is on this that the present writer mainly insists. Mr Ellis, however, is so far consistent that he thinks that the change to *sh* and *tsh* can be accounted for differently; by what he calls palatisation. This is the point upon which we are at issue. *Q* was expressed by *cw*; and *k*, in the original alphabet, was nowhere. The difference between *f* and *v* was not represented. Though *q* was ejected as super-

fluous, *x* was not. It had its present power of *ks—ricsian*, being sometimes written *rixian*.

The unsteadiness of the two sounds by which we denote the *th* in *thin* and the *th* in *thine* is a serious charge. So far as the signs were separate from one another, and both single, all was well. There were two sounds, and each of them was a simple one. There were, also, two letters; and each of them was simple also. But there was no steadiness in their import: inasmuch as either sign might be used for the expression of either sound; so that, of the two continuants of *t* and *d*, each had two signs. This is the very last inconsistency that we expect; for the origin of ð is, evidently, the letter *d*. Yet so it is. Of the two sounds the sonant is, in the present stage of language, the rarer: being, at the beginning of words, nearly limited to the words *that*, *these*, *those*, *thy*, *they*, *theirs*, *them*, *then*, *there*, and the article *the*. Yet in the Anglo-Saxon and Icelandic the spelling is with þ, as *þú* = thou, *þær* = there. Are we to suppose, then, that the sound has changed? Rask answers in the affirmative; for he remarks that though *þat*, = that, when written at length, is spelt both ways (i.e., *þæt* and *ðæt*) the abbreviated form is always þ. Upon this he lays more stress than, in my mind, it will bear. That þ is always found at the beginning of words, and that both in Anglo-Saxon and Icelandic, is more important: but even this fails to carry us over the whole difficulties of the question. "Some," writes Rask, "have considered one of these letters as superfluous, and Lye, who, however, bows to the opinion of Spelman and Somner, that ð was the hard (surd), and þ the soft (sonant) *th*, nevertheless considers them as the same letter." Later, indeed within the last two years, Mr Ellis admits the difficulty of the question. "What," he writes, "were the precise meanings of þ, ð, or rather how the meanings (*th*, *dh*) were distributed over them, it does not seem possible to elicit from the confused state of existing manuscripts."

If these views be true the demerits of the Anglo-Saxon alphabet are, so far as the consonants go, not above the average. In the vowels there seem to be some very serious deficiencies, both of omission and commission; and one, probably, as serious as all put together in the matter of mistribution; by which I mean classing two widely different sounds under the same head; or as the (so-called) long and short sounds of one another. This applies to the vowel *i*. I said *probably*; because as the case stands it is, by no means, certain. If we only knew how the contemporaries of Alfred sounded such words as *tíd* and *wín*, all would be clear: but he would be a bold man who would answer the question in either one way or another. Individually, I think that the words were sounded as we now sound them; or as *tide* and *wine*. So they are sounded in Germany—*zeit* and *wein*. But in Scandinavia the pronunciation is *teed*, and *veen*; or *tid* and *vin*, *tīd* and *vīn*. In the Scandinavian languages the diphthong (*ei* in German, *i* phoneti-

cally) is rare *as an independent sound:* though it is common enough as an educt from *-eg:* but this is only a secondary diphthong. We know that it has originated in a combination of a vowel and a consonant; and we know what the consonant is. We have no knowledge of the origin of the *i* in *tíd* and *wíf*: and there are numerous words besides of which we may say the same. Whether, however, the mistribution be Anglo-Saxon or not, it is certain that we have it in the present English—and a very grave one it is.

Then there was a minor sort of confusion between *i* and *y*, already noticed; and another, also already noticed, between *i* and *e*.

With all three of the broad vowels there was also confusion. Whether the language, or whether the ear of the framers, or upholders of the alphabet was at fault is uncertain: but between either the actual sound of the vowels or the representation of them, there was great indistinctness somewhere. It, probably lay with the language. In respect to *a*, the Scotch say *bane* and *stane*, the English *bone* and *stone*. In the Anglo-Saxon the spelling was *bán* and *stán*. When the vowel was short, there was the same indistinctness, and *hand* was, and has long continued to be, written *hand* and *hond*. In one of the latest contributions on the pronunciation of the Runes, the late Professor Munch of Christiana has shown that, even in the oldest, there was the same ambiguity. In both the present Danish and the present Swedish the sound of what is meant to be the genuine *o* is spelt with *a*—in Danish *staae*, in Swedish *stå*, *båt*. Meanwhile the ordinary *o* is intermediate to the English *o* and *oo*.

A notice of the Latin alphabet as the foundation of either the Anglo-Saxon or the German of the continent would be incomplete without a recognition of certain letters to which influential authorities have assigned a higher antiquity, and a more independent origin, than is here allowed; though, here and elsewhere, considerable importance is attached to them—the German and Scandinavian, or Norse, Runes. The Runes (and it is in Scandinavia where they are best studied) fall into two classes; those which are anterior to the introduction of Christianity, and those which are subsequent to it. The former are sixteen in number. The latter are the same as the older ones so far as they go; but with certain additions to make up the number of the letters of the Latin alphabet which they are coined to represent. They are formed out of the earlier ones by diacritical marks, generally dots; so that the older alphabet consists of the unpointed, the newer of the pointed and unpointed, Runes. As *Run* means a *secret*, or something whispered in the ear, it is probable that the art of reading them, was, at first, known to but few. The earliest are assigned to the ninth century A.D. The original Runes consist solely of straight lines; as if they were meant for inscriptions and for nothing else.

Of the Runes the most important is the third: Þ = *th*; by name *Thurs;* and also *Thorn;* for out of this grew the Anglo-Saxon

letter þ = the Greek θ, the English *th*; as we have already seen. The sign for *w* is also believed to have a similar origin.

The Ogham characters, which in some degree bear the same relation to the Irish as the Runic does to the Anglo-Saxon alphabet, inasmuch as both are invested with a certain halo of mystery and antiquity, are of a very artificial construction; and are more truly of the nature of cyphers in the way of cryptography, or secret writing, than their German analogues. The Ogham characters, moreover, remind us of musical notation rather than of ordinary alphabetic writing. There is a long straight horizontal line, like those we see in copybooks; and upon, under, or across (*i.e.*, both under and over) this are certain short ones, equally straight, which according to their grouping by ones, or twos, or threes, etc., and by their relation to the base line, take their import as letters. Of those that lie both above and below the line some lie across it at right angles, others obliquely. The two alphabets which have commanded the most attention are (1) the *Beith-Luis* and (2) the *Bobel-Loth;* named after the letters with which they, respectively, begin. These letters are *twenty-four* in number, like the Latin; indeed, in this respect more so than the genuine practical vernacular one. So far, then, as this goes, the old Irish had *two* alphabets. The names of the letters are extremely fanciful. *Beith* = birch, and *Luis* = mountain-ash; and as these, so are the rest of the letters—named after trees. The *Bobel-Loth*, on the other hand, takes its names from the Bible; and *Bobel, Loth, Foronn, Davith, Talemon, Qualep*, etc. = *Babel, Lot, Pharaoh, David, Solomon, Caleb*, etc., figure as the names of letters.

Add to these the numerous inscriptions, both in Latin and Greek characters, sometimes found on stone monuments, but oftener on coins, (where we also get a date,) and we have a fair view of the condition of the alphabets of Western Europe between the middle of the fourth and the middle of the seventh century.

The little that need be added concerning that part of the Anglo-Saxon orthography which relates to accents I give in the words of Dr Bosworth, than whom no one has paid more attention to the subject. The evil influence of the French system of spelling, introduced by the Norman Conquest is here indicated; and certainly it is not exaggerated.

As the simplicity of the Anglo-Saxon accentuation has frequently been overlooked, or involved in a complicated system, it will tend to remove false impressions and to make the matter clear, by recollecting that the Anglo-Saxons only used one accent, which always indicated the long sound of the vowel over which it is placed. Our complicated system of English vowels arose from the Norman scribes, who first confused the Anglo-Saxon accents, and then attempted to supply their place by a multiplicity of vowels, which we have adopted, as will be seen by the following examples:—Cwén, *a cween;* fét, *feet;* gés, *geese*, etc:—Díc, *a dike;* líc, *like;* lím, *lime;* wín, *wine;* etc:—Bóc, *book;* fór, *fore, before;* gód, *good;* gós, *a goose;* etc:—Dú, *thou*, hú, *how*, hús, *house;* mús, *mouse*; etc:—Brýd, *a bride;* fýr, *fire;* mýs *mice*. In all the instances the Anglo-Saxon is quite

plain and consistent, expressing the same sound by the same accented vowel, while the English employs different vowels for the same purposes as in c*ee*n, g*ee*se;—g*oo*d, g*oo*se, f*o*re; th*ou*, h*ow*,, h*ou*se and m*ou*se. The greatest complication of vowels is seen in our expression of the long open sound of *o*, heard in n*o* and b*o*ne. We use *oe*, *oa*, and *o* with a silent final *e*, while the Anglo-Saxons, in all cases, merely accented the *o* as—Dá, *a doe;* fó, *a foe;* tá, a toe.—Bát, a b*oa*t, ác, an *oa*k, fám, f*oa*m, etc.—Bán, a b*o*ne, stán, a st*o*ne, etc. The super-abundant employment of English vowels is troublesome to natives and most perplexing to foreigners. On the contrary, the Anglo-Saxon system of accenting the long vowels is plain and definite.

SECTION XLI.

HISTORY OF THE ANGLO-SAXON ALPHABET.

In Dr Bosworth's remark upon the ignorance of the Norman scribes, we shall find nearly the whole of the remainder of the history of the Anglo-Saxon alphabet and orthography. We have indicated the faults in the original construction of it; we have seen how old a system it is; and we have hinted at the inordinate amount of wear and tear to which it has been exposed. This constitutes its history, as what we call a working alphabet; and, in tracing it, the single event of the Norman Conquest is all in all. It plays much the same part in the history of English spelling as the well-abused letter *c* does in the construction of the alphabet. I am not so much in love with two great landmarks, and the simplicity with which they invest our examination, as to distribute the whole mass of the orthographical mischief entailed upon the present generation under these two heads exclusively. There are certain faults common to all systems of spelling, and such when they occur in English, cannot, of course, be imputed to either of these causes. But so long as our spelling has nothing worse than these, it is no worse than that of other countries. It is by the inordinate amount of faultiness peculiar to itself, that it especially afflicts our language; and of this, I think that nine-tenths, at least, are due to these two causes. We must understand this. There are other countries in which they use *c* instead of *k;* but there are none in which the antagonism of the two letters exists as it exists in England; and the antagonism, be it remembered, is that of two systems, the Latin, and the German. There are other countries too, which have been conquered by an army of foreigners, and have, therefore, had their languages inundated by words of foreign origin; but such a history as that of the British Islands during the two centuries which followed the battle of Hastings, we find nowhere except in England.

There is not much to be said about the influence of the Danes. In the charters of Canute and Edward the Confessor, the use of the *k* becomes conspicuous. For this there are two reasons. (1) the original Frank influence dating from the beginning of the seventh century, or the introduction of the Christianity of the Frank missionaries as opposed to that of the Irish, or British church; and (2)

that of Northern Germany upon Denmark, and through Denmark upon Scandinavia in general. Between these two we explain the difference between the orthography of the charters immediately preceding the death of Edward the Confessor and those of Alfred, Athelstan, and Edgar. We are not always sure of the date of the Anglo-Saxon Charts. We may learn, however, by mere inspection, that the derivations from the original spelling are numerous in proportion as they approach the time of the Norman Conquest. We must be careful, however, not to overvalue the Danish influence. There is adequate evidence of this in the Codex Ævi Saxonici. But it must be read with the caution that, though Kemble, as a general rule, marks the chartas of doubtful antiquity with an asterisk, he, so far as he is other than wholly unexceptionable, favors antiquity.

Then comes the Norman Conquest—our great epoch—and, after that, comes a break. For neatly two centuries there is but little written in either English or French. Latin prevails. The exceptions are well known. There is the continuation of the Anglo-Saxon Chronicle. This comes down to the death of Stephen. This is certainly Anglo-Saxon, as opposed to English in its orthography. But it must be remembered that it is the continuation of an Anglo-Saxon work; wherein the spelling of the earlier parts may have served as a model for that of the later ones. Under Henry I., however, the English was depressed; while the French was rather in a state of formation than formed. The court, however, the nobles, the priests, and the lawyers were French. We must see how, in the reign of Henry II., the English emerges after its period of disgrace and abeyance. It still passes, however, for Anglo-Saxon rather than English; and, though it is doubtful whether the language of the few compositions we have of the twelfth century be that of the common people, it is certain that their spelling is that of the bookmen, who looked backwards, rather than that of the speakers, whose natural tendencies were to take the language as they heard it.

But we may now consider the history of the Anglo-Saxon alphabet from a different point of view. We may ask what it would have been if left to itself. I believe this view to be one that has either not hitherto been taken; or, if taken, not considered historically. The conversion of the Anglo-Saxon orthography into an orthography so unlike its former self as the present English, is not the only continuation of its history. It was what we call a mother alphabet; one out of which others were formed; or, to say the least, one by which others were largely influenced. For the first of these we must look to Westphalia, This is because, in Westphalia, we are in the old Saxon country; in what is called Lower *Saxony*. The Franks *before* the time of Charlemagne were Christians. The Saxons, *after* his time, were Pagans. England, meanwhile, had been Christianised. It was the business of these Christianised Englishmen to send missionaries into the old country—Westphalia, Friesland, and Northern Germany in general. And here their ef-

forts were successful. In England the Northern Germans were called the *Old* Saxons; *Eald*-Seaxan, *Antiqui-Saxones;* their instructors being the *Anglo*-Saxons. These last took with them their own proper alphabet; and out of this grew a comparatively creditable body of compositions. Some of them hardly deserve the name of literature; for they are mere muniments, or rolls of certain convents, *i.e.*, of Essen and Frekkenhorst. But the *Heliand, Healer,* or *Savior,* a metrical harmony of the four Gospels, giving us the history of Christ during his ministry on earth, is a work of no small importance. Being written without any metrical divison of the lines, it was, at first, mistaken for a narration in prose, and for one composed in the Danish parts of England; by which supposition its divergence from the ordinary Anglo-Saxon was accounted for. It is now known to be a poem. As for its language it is amply explained by the doctrine that it was the *Old* Saxon of the original mother country in Germany. Add to this the fact that it is that of the rolls and muniments of the Westphalian convents already mentioned, and the evidence is complete.

Here, then, we have the Anglo-Saxon alphabet in Germany, where it may re-act on that of the Franks, just as that of the Franks acted upon the English. It is essentially Anglo-Saxon with differences. The Anglo-Saxon *w* is *uu*. The *c* is strictly adopted. The only word I remember as spelt with *k* is the proper name *Isaak*. The same claim, of having supplied either an alphabet as an actual model, or a standard to which writers might refer, may be made upon Scandinavia. In the present Icelandic, Swedish, and Danish we know that the *k* is paramount. *C* appears oftenest in the Swedish; but it is only when it precedes a *k*, for the sake of indicating the shortness of the vowel which it follows, as *dricka,* in Danish *drikke.* Here the function of *c* is just what it is in *thick*. But in the older Icelandic manuscripts, though *c* is non-existent in the print, *k* is exceptional; or rather it is found subject to the rule we can so easily anticipate; the one connected with the broadness or smallness of the vowel by which it is followed. Thus while the print of the Völuspa runs:—

Hljóðs bið *ec* allar
Helgar *k*inder,
Meiri o*k* minni,
Mögue Heimdallar,
Vildu at e*k* Valfödrs
Vél framtelja,
Fornspjöll fira,
Þau er e*k* fremst um man

The manuscript on which it is founded runs:—

Hlioðs bið *ec* allar *k*inder meiri miNi mango heimdalar vildo at *ec* ualfaþ uel ƿýr telia ƿorn spioli ƿira þæ e' ƿremst ū man.

But, even here, when *two* vowels follow, the spelling is with *c* as—

Sol *sk*ein sunnan
A′ salar steina,
þá var grund gróin
Grœnum lau*k*i.

in the manuscript—

Sol scein suNa a salar steina þa var grvnd groin grSunō lauki.(5)

The earlier Anglo-Saxon prototype and the latter modifications of it are here manifest. In the Codex Regius, assigned to the beginning of the fourteenth century, *k* appears before *n* as *kna*. Upon this, however, Munch remarks that "*c* is used oftener than *k*." In the Arne Magnusson Codex the *k* is exclusively used.

From the Icelandic, or Old Norse, the present alphabets of Denmark, Norway, and Sweden are derived. They are of average merit; and such we may suppose the English would have been had there been nothing to interfere with it.

SECTION XLII.

HISTORICAL SKETCH OF ENGLISH SPELLING SUBSEQUENT TO THE NORMAN CONQUEST.—THE MUTE *E*.

Though the mute *e* is mainly of French origin we must not suppose that it is wholly and absolutely foreign to our language. It appears, for the first time, after the Norman Conquest; and, at present, it is in words introduced from France that it chiefly occurs. So far, then, as it is conspicuous and prominent it is French; but it is probable that, even if no such an event as the Battle of Hastings had occurred, we might have mute *e*'s to some extent at least, of native origin and independent growth. In all words where the penultinate vowel is long, and the last is the letter *e*, (which in this case is sounded,) there is always a chance of the *e* becoming, sooner or later, obsolete; in which case it drops out of the pronunciation. If then, as generally happens, the spelling fail to keep pace with the pronunciation, and if the vowel be preserved in writing after it has been dropped in speaking, a mute *e* is the natural result; and as the syllable which precedes it is already long, the connection between the two vowels in the way of orthography, is invested with a character to which it has no claim. The two vowels look as if they belonged to a system, or a method, or had some connection with a principle, or a function, namely, that of indicating longness. The combination, however, has, as we have seen, a different origin; and is in fact, so far as the expression of quantity is concerned, merely accidental.

Now the extent to which a final *e* became thus obsolete in the earlier stages of our language was inordinately great; greater, perhaps, than in French, as may be seen by the merest inspection of an

5. Den Ældre Edda—P. A. Munch. Christiania. 1847.

Anglo-Saxon grammar. In our language anterior to the Norman Conquest, there was a whole declension of substantives, in which the nominative case ended in *-n*, and the oblique cases in *-e*;—an *e* which was as clearly sounded as it is in the present German, or Danish. This was the case with *heortan*, *tungan*, *eage*, *hearts*, *tongues*, *eyes*, etc. Here the first step in the change was the ejection of the sound of the final consonant; then came that of *e;* which was long preserved in writing.

Besides this, there was a double inflection of the adjective. When it followed the definite article, *-n* or *-e* was the ending. Hence, there came a Definite, as opposed to an Indefinite, Declension; and this, also, at the present moment occurs in German. So important is this real and organic *-e* with its subsequent disappearance in speech, that it gives us one of the rules for the pronunciation of the adjective in Chaucer; where (whatever may be the case in other words) we are safe in treating it, for the purposes of metre, as sounded where it is Definite, or preceded by *the*. In this, then, to go no farther, we get a measure of the degree to which the Anglo-Saxon orthography had, within itself, the germ of what we may call the mute *e* system; for it is the doctrine of the present writer that the final vowel was written, at least, as long as it was pronounced, and the hypothesis (we may almost say the certain fact) that it was retained in the writing after it had been dropped in the pronunciation are equally legitimate deductions from the history of our orthography. Hence, when, from two different causes—the one derived from our own language, and the other from the French, the two modes of spelling became confluent or united, the predominance of what looks like a very artificial way of expressing the length of a vowel, is explained by the very natural process of a change in language preceding the appropriate change in spelling; or the retention of a letter in writing after its proper function had become, both literally and figuratively, a *dead* letter. Then, when *e* final was made mute, the necessity of expressing it when sounded, led to orthographical expedients; and this, (as was shown in our remarks on the words *quantity*, *quality*, etc., which are spelt in French with an accented *é*, whereas with us, the accent was not recognised,) to say the least, favored the practice of writing *y* at the end of words; a thoroughly non-natural termination.

As for the mute *e* itself with a consonant between it and the vowel with which it was supposed to be associated, the orthographic process in which it plays its part is so exceptional, that the English and the French are the only two languages in which it is found. Its origin (as has been shown) was, to some extent, natural. It soon, however, became artificial; consciously, and designedly artificial. One of the worst instances of this is the word *whose*. The Anglo-Saxon was *hwæs*. Here, the *e* presented itself in the diphthong. Then came *hwaes*; then the transposition; in which there is nothing natural; nothing even French. It is purely and simply artificial;

and when considered with reference to its natural import, a combination of which the true signification is as different as can be from its conventional; in other words, it is an artifice of the worst kind. *Pence* is much such another word as *whose, i.e.*, an example of the mute *e* in its most objectionable state.

SECTION XLIII.

HISTORICAL SKETCH, ETC. *(continued)*. THE APOSTROPHE (') AS A SIGN OF THE GENITIVE CASE.

The *e* mute, which presented itself at the *end* of words was dropped; or fell off. The *e* which preceded the *s* in words like *scipes* = *ships*, and served as part of the sign of the genitive case, was *elided; i.e.*, it lay in the middle of two other letters and slipped out from between them. Hence, it became obsolete as a *sound:* and so long as it was used in spelling was, as a *letter*, mute. In the plural number where there was the same termination in *-s*, the original vowel which preceded it was *a;* as *wulfas* = *wolves*. Both vowels, however, suffered elision: the result being the use of the so-called apostrophe; as in *the man's hat, the children's father, the ships' sails*,—three different forms, each of which is a bad one, and each bad in a manner peculiar to itself. They deserve, however, notice; because of all the orthographical expedients with which the English language is overloaded, this use of the apostrophe has the least foundation in anything like a philological fact; while it presents on the other hand, the most decided signs of a conscious adaptation, invention, or construction. It is not, however, a mere sign of elision in general; for, if it were so, we should find it in the nominative and accusative plural as well as in the genitive singular. But in the plural it is conspicuous from its absence; and is meant to be so: for it is a sign not only of elision but of differentiation or distinction between two elided sounds. It is not, then, so much the sign of a vowel in the genitive case which has dropped out, as that of a difference in case and number between the word *lions* in such clauses as the following (1) *the lion's den* and (2) *the lions are let loose*. Now in respect to this expedient we may fairly say that, supposing an expedient of any kind to be needed, it is, as we here see it before us, one of more than average merit. All expedients, in the eyes of the Phonetic speller, are bad. But this is among the least bad. As a construction it is simple and natural; and as a sign adequate to the work it has to do; so that the only objection to it is its superfluousness.

Here, however, we must stop. Its extension to the genitive *plural* is utterly indefensible. Except in the few words like *men, women, children, oxen*, where we actually say *the men's memories, the women's children, the children's parents, the oxen's horns*, the *s* has no real

existence: and as there is no genitive in *'s* there is no elision; and that for the simple reason that there is nothing to be elided. Hence the *s'* represents nothing. No one supposes that there were ever such words as *ships-es*, *fox-es-es* and the like; or that such a sentence as "the genitive plural is formed from the nominative by the addition of *-es*" ever existed as a real rule. The Anglo-Saxon genitive plural ended in *-a*, and when this became narrowed into *-e*, and the *-e* became mute, there was no sign of any case in the plural number except the nominative. This, however, is by no means, an intolerable condition for a language to be reduced to. The French has no sign for a genitive case in either number; and, by means of the preposition *de*, does very fairly without one. By a similar application of *of* we might have done the same: indeed, it is the opinion of the present writer, that in nine cases out of ten this is what we do. Still we have such constructions as the *children's bread* and the *ships' sails;* and the explanation of them is easy. Taken by itself, the notion that the genitive plural may stand to the nominative of that number in the same relation that genitive and nominative cases singular stand to each other, is one which when a language is (so to say) in difficulties and reduced to an alternative, naturally presents itself. The actual formation, however, of the new cases is, by no means, so simple. Thus—the English nominative plural has already a sign; *stone*, *stones*, just like the Latin *lapis*, *lapides;* and before we can *substitute* another for it (for the the process is one of substitution rather than of addition) this sign has to be got rid of; for, it is clear, that we can no more say *stones-es*, than the Latin can say *lapides-um;* though something like it is done with the word *its;* where *t* is the sign of the neuter gender, and *s*, the sign of the genitive case, is tacked on to it. Let this difficulty, however, be got over, a second remains. The signs of the cases, the nominative plural and the genitive singular, are alike; both ending in *s*. Yet we do not say *ships'es*, and still less *fox-es-es*. What then does this *'s* represent? The best that can be said of it is that it represents a confluence, fusion, amalgamation, or unification of two *ss*'es, with different powers, and belonging to different numbers, and though this, being a purely historical fact, is not capable of being represented in speech, it is the high prerogative of orthography, in cases like these, to make good the want of a real distinction by an artificial one; and that, in the case before us, the apostrophe of the genitive singular with its change of position in respect to the *s*, does this. With the few words in *n (men's, oxen's)* the addition is real; and, so far as there is a genitive plural at all, these are the words in which it occurs, Here, however, no (') is wanted. There has been no elision; and there is nothing with which the forms can be confounded: the singular genitives being *man's*, *woman's*, *child's*, *ox's*.

The apostrophe, then, in the genitive plural is much less defensible than that of the genitive singular. Neither is laudable; though the latter is less blameworthy than the former. It is the misfor-

tune, however, of this unlucky sign to have been woefully misinterpreted. We all know what it was for a long time supposed to represent; viz.: the pronoun *his*. We know, too, the chief texts, ("Christ *his* sake" and others,) upon which this belief rested. The rectification of this error took place by degrees. The objection that lay closest at hand was, of course, the fact that it was only for the masculine gender of the singular number that this explanation was available. We do not, it was urged, say "The Queen, *her* Majesty" nor yet "the children, *their* bread." This, however, was soon condemned as insufficient: inasmuch as, though nothing like so common as *his*, both *their* and *her* are used in the corresponding constructions. A better objection, however, was found in the word *hi-s* itself; because, here, the *s* could not possibly be made (so to say) out of itself. The most conclusive argument, however, was, at the same time, the shortest, and this was the fact of the *s* in "father*s*" being simply the *s* in the Latin "patri*s*," the Greek πατερ*ὸς*, the *s*, indeed, of all the Indo-European languages.

This is as much as need be said about the two most prominent conventionalities which followed the Norman Conquest. The rest may be considered more briefly: indeed they need only be indicated.

(*a*) The doubling of the vowel, as in *feet*, to show that its sound is long, is one which is so natural that we only wonder at its not having become practical and prominent at an earlier period; *i.e.*, in the Latin stage of the alphabet. It is foreshadowed by the Greek Omega Ω, ω, which is, really, a modified, lengthened, and enlarged Omicron, Ο, ο. The whole doctrine of the Greek Isochronism, or Equality of Time, pointed in the same direction. The statement that two short *syllables*, equalled one long one, and *vice versâ*, had only to be extended to the vowel, and the doubling of the vowel as a sign of longness followed. The Anglo-Saxon, though imperfect and inconsistent, promoted this result.

(*b*) The combination of *different* vowels in the same syllable is due to other, and less simple causes. The Anglo-Saxon combinations *ea* and *eo* (though here the smaller vowel preceded the broader one, and was often semi-vocalic) had the effect, to say the least, of accustoming the eye to the presence of two vowels in the same syllable: and be it remarked that, in English, the sequence is that of the Anglo-Saxon stage; *i.e.*, *e* comes before *a*. *I*, however, is rarely found in the same place: and this is because it was, when followed by a vowel, diphthongal; or, in the eyes of those who failed to recognise its diphthongal character, long; and, as such, less likely to suggest coalescence. In Dutch the *e* follows the broader vowel; and here is, so far as mute letters are tolerable, the mute *e* in its right place; or would be if it had a place at all.

(*c*) Combinations like *oa* as in *coal* are probably due to another cause, and have no connection with the expression of longness. They seem to be the result of the original indistinctness (already noticed) between the sounds of *a* and *o*.

(*d*) The same applies to *oo* = *ū*, an indistinctness which has also already been indicated.

(*e*) *I* after *a*, (as in *snail*,) in words of English origin, almost always indicates an original *g (snægel)*, which is first changed into *y*, and then, being eliminated, brings the two vowels in juxta-position.

There is enough in these examples to show that in the actual contact of two vowels in the same syllable, much as it may offend against one of the primary laws of Phonetícism, there is little non--natural or arbitrary. But is this all? No. We have written as if these anomalous forms of spelllng were only detrimental so far as they were anomalies. But this is not the fact. They are inconsistent as well; for the *oo* in *foot* is short: and that either the second vowel as the sign of longness, or the second consonant (as in *spotted*) as a sign of shortness is superfluous, has already been stated. Hence we have, in addition to an inordinate amount of anomalies, a notable amount of inconsistencies and redundancies as well.

SECTION XLIV.

DIALECTS OF THE ANGLO-SAXON AND OLD ENGLISH.

These redundancies and inconsistencies might have been prevented by a certain amount of rigidity or uniformity in the practice of our spelling. But no such conditions existed. It is still a matter of uncertaintyas to the particular dialect which the orthoepy and orthography of the present literary English represent. It was *not* that of the literary Anglo-Saxon; not that of the dialect which prevailed anterior to the Norman Conquest. Nor is it unnatural that such should be the case. The present High German is not that of the parts which most especially constituted the Germania of Tacitus. The Castilian of Spain is not that of the great mass of the Spanish peninsula. The Italian is that of Florence rather than of Rome; the French that of Northern France; anything, indeed, but that of the district wherein the first language of Gaul was both spoken and written; indeed, so far as the place of its first successful cultivation is concerned, the French originated in England rather than in France. Just, then, as it would be a mistake to suppose that the present Italian was a continuation of some Sicilian or South Italian form of speech; the Castilian one of the Catalonian or Valencian; the German one of that of Westphalia or the parts about Cologne, and the French that of Provence; so it would be an error to suppose that, between the language of Alfred and the language of Dryden, there was any literary continuity. In short, in England, as elsewhere, the points which coincided with the cultivation of the earlier and the later English literatures shifted.

Now the cultivated dialect of the Anglo-Saxon period was the West Saxon, or the Saxon of Wessex; the English of the counties

of Dorset, Wilts, Berks, and Hants. The nearest approach to a concurrent literary language was in Northumberland. We may call this form of speech, if we choose, Angle rather than Saxon, though the term is anything but unexceptionable. Both, however, were *English*. Then there was the great intervening tract formed by the Midland and Eastern counties, which we may call Mercia and East Anglia. Of the Mercian, however, and the East Anglian dialects the cultivation was, practically, *nil*. The little we know about them tells us that they differed from one another less than the West Saxon and Northumbrian, and that they differed in small and negative, rather than in great and positive, characters.

Now as an origin of the present literary English, the claim on the part of Northumberland is no better than that of Wessex. Nor is there one for East Anglia as opposed to Mercia. Individually I hold, with the generality of investigators, that the *Mercian* is the dialect which the present written language most especially represents: and to Mercia I assign London. I prefer this to fixing upon any particular county as the district from which we are specially called to deduce it. Mercia gives us the counties wherein we find the smallest amount of provincialism, and, also, those to which the two Universities belong.

Be this as it may, the history of our literature gives the West Saxon dialects a predominance until the middle of the fourteenth century. Over and above the writers of the proper Anglo-Saxon period we have for Wessex, Layamon, and the author of the Ancren Riwle, Nicholas of Guildford, the author of the Ayenbite of Inwit (a native of Kent, but a writer whose language is nearly as Devonian as that of Devonshire itself,) Robert of Gloucester, William of Shoreham, Langland, the author of Piers Plowman's Vision, Trevisa, (both these somewhat later than their predecessors) and others, either anonymous or of less importance. Against these there is little to be set, except the conclusion of the Anglo-Saxon Chronicle, which is assigned to the parts about Peterboro'; the Ormulum, and Havelok the Dane, which are assigned to the Danish parts of England; Robert Manning, or Robert of Bourne, a Lincolnshire man; and Rolle, or the Hermit of Hampole, the author of The Prick of Conscience, a Yorkshire man.

Chaucer and Gower and Mandeville, in the latter part of Edward III.'s reign were Londoners. Wycliffe's language was probably that of the university of Oxford, rather than of his birthplace, Yorkshire. By the beginning of the fifteenth century there is a fair proportion of writers from the more central districts—London being included herein. Great changes now take place. The most Northern dialects of Northumberland, which, philologically, extended to the Forth, are now the dialects of a literature of no ordinary merit; for just while the English is in a degenerate and chaotic state, the Scotch is advancing. But we must not call it Scotch, not even Lowland Scotch. We must call it what the speakers themselves called

it, English. They were constrained, perhaps unwillingly, to do this; but they had no choice in the matter. It had to be distinguished from the Gaelic of the Highlands; even at the cost of some national distaste to the name. The English, however, of Northern England is not the English of our classical writers.

In other respects, too, the first three quarters of the fifteenth century form a notable epoch. The antagonism between the English and the Norman French has ended in the predominance of the former. The age, too, is an age of manuscripts. Printing is about to begin; but just in proportion as the vocation of the copyist approaches its end, the mass of materials has accumulated; for the manuscript stage of our literature and orthography is now in its ninth century; and there is more than ever there was before to be transcribed. Neither are authorship and transcription limited to any particular districts. We have now manuscripts from the borders of Wales. We have now, in Capgrave and Lydgate, writers from East Anglia; and both these, Shropshire and Norfolk, are quarters to which, hitherto, but little has been assigned. There is, indeed, a diffusion of the practice of both composing and copying to an extent hitherto unknown: of uniformity, or any directing authority, very little. It was no part of the business, then, of the transcriber of a work in a dialect different from his own to adhere to the very words and letters of his author. *Translation* from one local form to another is too strong a word. But, though the transcriber did not translate, he *accommodated* the minor details of spelling and grammar from one part of England to that of another—the one to which he himself belonged. That this was done largely we know from ample evidence. How much confusion it created we can more easily imagine than calculate.

SECTION XLV.

EXTENSION OF THE PHONETIC PRINCIPLE AND SUBJECTS ALLIED TO PHONETIC SPELLING, AS SPECIALLY APPLIED TO THE ENGLISH LANGUAGE.

The Phonetic Spelling, so far as it has hitherto been discussed, is that of the English language. The term, however, has a wide import; and, there are certain varieties in the application of the phonetic principle which are sufficiently akin to the subject of the present treatise to call for a slight notice.

The first of these is Metagraphy,[6] or Transliteration. This

6. This is a derivative from *μετα*, in its sense suggestive of action and reaction, or interchangeableness, and *γράφω* = *I write*. I can safely recommend the word, inasmuch it is not one of my own construction; but one suggested nearly forty years ago by one of the best scholars in Cambridge. It is not held that, except so far it is somewhat shorter, Metagraphy is a better word than Transliteration: and it is admitted that Transliterate is a much better word than Metagraphize. On the other hand, however, Metagraphic is a better word than Transliterational. There is room for, and need of, both.

means the substitution, sign for sign, of some letter in an alphabet comparatively known (say the English, or any one of Western Europe) for one in an alphabet comparatively strange; as for instance the Sanskrit, or the Hebrew; indeed, any Oriental alphabet whatever. If the latter be, itself, phonetic, the two principles coincide. This, however, is merely a happy accident. If the English alphabet were transliterated into the Greek it would be no more phonetic than it is at present. The Greek reader would get a series of letters somewhat less unfamiliar to him than the English are at present. The faulty spelling, however, would still remain. As between a Greek and an Englishman this would be but a small boon. Where the orthography, however, is of a moderate badness, and where the difference of the letters is considerable, the boon is a great one: and, in all cases, there is some advantage.

We have now only to ask whether a letter which will stand for a sound in one language, can stand for the same sound in another; and, if the answer be given in the affirmative, the question of a Universal Alphabet dawns upon us. What the answer is, and what it may lead to, is another question. The three questions have been suggested for the sake of showing how they are connected, and how they differ; and further than this we are not called to go.

Out of a mixture of Metagraphy and Phonetic Spelling we get the most difficult of the problems connected with our subject; namely, the transliteration of dead languages so far as their pronunciation is known, combined with the attempt to represent the true sounds of the letters and combinations of which the import is doubtful. In the Latin, where the letters are the same as our own, this is merely phonetic spelling. In the Greek it is phonetic spelling with metagraphy superadded. Important as these questions are, they need not, in a treatise like the present, detain us beyond the mere indication of their place in a full view of the general system of Orthographical Reform.

For a different reason I say nothing about the extension of Longhand Phonography to Shorthand. I know so little of it that I am constrained to take its merits upon trust. Nor is this the place to publish the unanimous verdict that I have heard in favor of the extension. It is part, however, of the system, and those who know it best put the highest value upon it.

Lastly comes the notice of what, when it was done for the first time, was the greatest benefit ever conferred on mankind; namely, that analysis of sentences into words, and of words into their articulate elements, without which the sign that speaks to the eye is impossible. Here there is nothing but Progress to report. Not a year goes by without our hearing of some language, barbarous as it may be, being reduced to writing, generally by the missionary, but sometimes, from the mere love of his subject, by the philologue. To bring the results of all this into harmony, is the duty and pleasure of the systematic student. The English and the Russian languages

show the greatest amount of admirable work in this field; the English and American missionaries from every quarter of the world, the Russian *savans* from the Babels of Caucasus and Siberia. I am unwilling to travel beyond the wide domain of the Anglo-Saxon tongue; but, with accumulations of new material, in all cases requiring a phonetic representation, it is impossible to abstain from the expression of a hope that it is not too late to put the whole system of Phonēsis on as broad a basis as possible. For the leading languages of the world a universal alphabet is but the dream of an enthusiast. For the languages recently reclaimed from barbarism, and, still more, for those where the reduction of an alphabet is either in progress or prospect, some approach to harmony and unity may be effected.

SECTION XLVI.

REVIEW OF THE QUESTION.

Such is the exposition of that part of the subject which the writer has thought himself best justified in laying before the reader; and it is plain that it forms but one division of the question. Upon the general character of the defects of the most insufficient system of writing in the world, there are works both old and new; not, indeed, in excess of the demands of the subject, nor yet proportionate to them; but still numerous enough to form a small literature; —one, however, of which it is certain that the dimensions must increase. Few who have written on the matter will feel themselves disparaged by a special reference to the work which, in conjunction with the earliest Journal printed in phonetic types, first succeeded in fixing public attention on the reform of which the writer was the advocate,—Mr Ellis's "Plea for Phonetic Spelling." This was, mainly, a classification of the actual, and an anticipation of many possible, objections to it. Between these and its successors (for the greater part, contributions to our periodical literature) little is now left to be done, either in the exposure of the thousand-and-one faults of the present system, or the exposition of the advantages of a phonetic one. It is probable, that, as so many matters of simple fact, they are admitted by even the foremost defenders of things as they are. If so, the time for the enumeration of them is going by. At any rate, I have considered myself justified in taking them for granted. Neither have I cared to go out of my way to denounce them: for it is possible that, flagrant as the demerits of our spelling may be, they have been stripped and whipped according to their deserts. I have, then, taken them, as aforesaid, for granted. Considered as obstacles in the way to knowledge no one thinks worse of them than I do; yet I am sensible that, at the first view, the present treatise, may be mistaken for a palliation, perhaps, for a defence, of them. It tries to account for them; and to account for them is to show

that they are neither less nor greater than we should expect to find them; or, in other words, that, given the conditions under which they arose, they are only what they ought to be. This, however, in the most decided way that an admission can be made, admits their existence, so that if further proof of it were required, it would be found in the criticism that explains it. And this method carries us farther than it seems to do. The great theoretical objection is the Etymological; and this, the *historical* view of the origin of the present system, most especially enables us to meet; for what is the etymology of a word but its history? what its history but its etymology?

Important, however, as this branch of the question may be, it is not the one which touches us the nearest. The mere theoretical objections to a change are a trifle. The "lion in the way" is the existing system, and those who should assail it are those whom it most affects—the million, the masses, or whatever else they may be called; the thousands of the present, the tens of thousands of the rising generation, those to whom time and money are of importance, and that to such an extent that even a boon like primary education may be purchased too dearly. It is these who are, or ought to be, most in earnest in favor of a change; and there is far more danger in their apathy than in the opposition of the learned. There are several facts by which Phoneticism may be recommended; just as there were several upon which objections could be founded. But, just as there was one objection, the etymological, which outweighed all the rest as a point for theoretical discussion, so is there, also, one recommendation which—for the class now addressed—is all-in-all; and that is, its value in primary education, or, to put it in humbler language, the teaching of reading. Symmetry and consistency, and the rational representation of articulate sounds, and other matters of the same kind, may gratify the scholar and the etymologist. Etymologists, however, or comparative philologists, as they best like to be called, unless they have either to teach the alphabet to their own children, or have grown-up sons who may be plucked for dictation, care much more for Metagraphy than for Phonetic Spelling *per se*. Anything like enthusiasm must be got from them in their character as educationists; and the two attachments by no means, of necessity, go together. The enthusiasm of Mr Ellis and the still unabated perseverance of Mr Pitman, are not likely to be again combined.

Not but what everyone of these subordinate applications, and these amateur tastes, has its value in the promotion of the greater end. They are the smaller springs, the ornamental rivulets, which help to swell the impetus of a grand stream which must owe both its main waters and its definite direction to a more unfailing source, and to a stronger power. It is the business and the interest of others to make it both broad and deep, and to direct it towards the machinery for which it is most specially demanded. The

Glossic system of Mr Ellis is, in this respect, a good help, though a bad substitute. Of the Shorthand Phonography of Mr Pitman I know less; but I can easily see that, when Mr Ellis tells us that those who have learned shorthand phonetically, will not learn long-hand on the present system of spelling, he simply tells us the truth. Metagraphy, and the aspirations for a universal alphabet help us in the same direction; but the paramount power is the one which, founded as it is in the value of Phoneticism for the purposes of primary education, must be derived from the union and the sagacity of the vast masses which it interests.

SECTION XLVII.

THE WORKING ALPHABET.

It has been no part of the present writer's aim to exhaust the subject; still less has it been either within his aim, or his authority, to write in the character of a director or an adviser. What he has done is to exhibit the faults of the present system from a point of view which is, to some extent, a new one. He has assumed that they exist; and that, to an extent which those who have most earnestly impeached the current orthography have not over-rated. He has assumed their existence, and, to a certain extent, excused it. But the excuse has been a condemnation. How these inordinate faults, both of omission and commission are to be rectified, is a matter for the consideration of those whom it affects most. These are not the learned Few who have got over difficulties which they have forgotten, but the unlearned Many who have yet to learn: and to say this is to say that it is, solely and wholly, as a matter of Primary Education—in other words the arts of reading and writing—that the question has been treated. The treatise itself is, probably, that of an etymologist. The object, however, is that of the educationist—that of one who looks to the value of the phonetic system in *primary* education only.

The working-out of the special details of such a change as those involved in Phonetic Reform is as different from the theoretical part of it as Administration is different from Legislature; the aptitudes for one, being, by no means, synonymous with the aptitudes for the other. Hence, I have never presumed to give advice—advice, at least, of a positive kind. "Do this" or "do that" are forms of the imperative mood which have not found a place in the treatise; nor will they. At the same time there are certain things which may be recommended *not* to be done. The first, and foremost of these is—

(a) Don't do nothing.—It is implied in what has preceded that, bad as is our present orthography, it is no worse than the present generation has a right to expect. If, however, with its full knowledge of all these deficiencies, the present generation bequeath it to the next; if those who are most concerned in amending it, either

leave the work to be done by others, or to do itself, no such extenuation can be pleaded. If we not only take it as we find it, but are satisfied to keep it as we take it, it is pretty clear that, bad as it is, it is as good a one as we deserve.

(*b*) *Don't keep out of the water till you have learnt to swim:* this meaning, *Don't wait until you have got a Phonetic Alphabet which pleases everybody.* An Alphabet is, of all things in the world, the most equivocal. It partly belongs to Science; partly to Art. It is, to a large extent, dependent upon the powers of analysis and comparison, on the part of the constructor; to an extent equally large on his taste for the harmonious and the symmetrical. How often, or rather how rarely, these two qualities in the highest degree are combined in one and the same individual, the history of human thought tells us very plainly. Of the two great divisions, however, the latter presents the more important difficulties. The decomposition of the several words into their articulational elements is a point upon which, in all the cultivated languages of Europe, the work is already done. What remains is the choice, or the invention, of the particular signs by which these are expressed. Now, in its most general terms, an Alphabet of this kind is one of which a cynical sciolist might say that it is an achievement which anyone above six years of age can accomplish. "He could," he might say, "dash down three dozen different combinations of straight lines, curves, and dots, and the thing would be done." He might, perhaps, if he meant to be very contemptuous, say that "the aid of color could be invoked, and that, with only twelve original signs, he might draw them in red, blue, or brown, by making one color denote one dozen of articulations, and another another, and do the whole thing out of twelve combinations. He might, too, by bringing in all the colors of the rainbow, reduce the number of really invented (or applied) signs to a *minimum*, and so bring printing to the condition of painting."

We know that this is neither more nor less than puerile trifling, but there is excuse for introducing it; inasmuch as it shows how easy the construction of an alphabet is from *one* point of view. Alphabets, under such a freedom from limitations, may, possibly, be constructed at the rate of a letter per minute.

Let us, however, take the opposite view. Then, the difficulty becomes as conspicuous as the ease has hitherto been. Paradoxical as it may sound at first, the statement that, so far as the question of new signs (letters) is concerned, construction is easier than improvement, is both true and important: important because, without seeing its full bearing on the present question, we cannot duly appreciate the difficulties with which the modern reformer must contend. With (say) between thirty and forty letters, all coined out of his own brain, he can ensure a due amount of symmetry or harmony among them; so that he has, consequently, nothing to fear from the perception of incongruity on the part of the reader. With a frame-

work, however, of (say) twenty characters as parts of a well-known alphabet already in use, he has the unsatisfactory task of adapting the new to the old; to avoid what Mr Ellis has called the Strange--appearance objection; an objection which of all the ones that have ever been made against Phonetic Spelling is the hardest to refute. Where a character is too complex or too cumbrous for writing; where it is too indistinct in its outline to be a good indicator of difference; where, from being either so unlike the letter to which it is allied in sound, or so like others with which it has no such affinity, as to suggest an incorrect view of the Phonēsis of the language to which it applies, (not to mention other shortcomings of less importance,) there is something definite and tangible upon which an objection may be made, or a defence founded. But the Strange-appearance objection is mainly a matter of taste; and when, of two disputants, one says that such or such a combination of lines displeases, and the other that it pleases, his eye, there is little more to be said on the subject. There is something, indeed, that a dispassionate looker-on might suggest; for he might urge that familiarity or unfamiliarity with the combination might have more to do with its congruity or incongruity than the actual details of its outline. This, no doubt, is true; but the proportion which the two elements bear to one another is not a matter that we can either weigh or measure. Neither is the system itself with which a new letter has to be brought into conformity a simple one: inasmuch as it gives us a great deal more than the mere twenty-five or thirty letters of any particular alphabet. The number of these, whatever it may be, has to be multiplied by four—*i.e.*, for capitals and for small letters, for printing and for manuscript. Respect, too, must be had to the alphabets of other languages; though this is not one of the more important complications: for, upon the whole, our motto in England should be, "English principles for English spelling." Still, where the original orthography is so peculiar as to be exceptional and eccentric when compared with that of other countries, a derivation from the national principle in its strictest form is not only pardonable but imperative. In no part of their work have the constructors of the Phonetic Alphabet shown a sounder judgement than in their treatment of the English vowels. Of *a*, *i*, and *u*, as letters, our pronunciation is pre-eminently exceptional. There is no better proof of this than the abnormal way in which we pronounce what we may call English-Latin, or Latin as it is taught and read in England. General, however, as this eccentric pronunciation may be within the Four Seas, it has been ignored; and the ordinary power given to the exceptional vowels on the Continent has been recognised. There is, in this, not only an anticipation of the charge of imperfect scholarship, but sound sense and legitimate conservatism. When the English is spelt properly, English-Latin will be pronounced, so far as the vowels go, in the only way in which, *out of England*, it is pronounced at all.

Be this, however, as it may, the preceding instance tells us that there are cases where "England for the English" is not an absolute rule. It leads, however, into further complications: for it enlarges the sphere of the system to which every new letter may have to adapt itself. In an alternative, for instance, between two signs, the constructor who holds that, if one letter has a certain currency in certain important languages, while another has not, the latter should go to the wall, there is much to be said on both sides. For what are the languages which are of sufficient importance to demand this abatement of the original rule? Is the practice of the French, the Italian, the Spanish, the Portugese, and, above all, the Latin on one side, sufficient to outweigh that of the German, the Dutch, the Danish, the Swedish, the Icelandic, and the Greek on the other—supposing that *c* or *k* be the letter in question? We know that on this point doctors have disagreed; and, individually, I have a strong opinion that the decision in favor of *k* is the right one. But the question is a complex one. Now the more comprehensive and more ambitious a reformer's view may be, the greater the amount of the complications that embarrass him. No one doubts as to the advantages of a Universal Alphabet—*optandum magis quam sperandum*. Other things, then, being equal, the spelling that favors it should prevail. For the present purpose, I am neither comprehensive nor ambitious; but, if I were so, I should certainly be perplexed in more cases than one, as to my choice of a sign or letter.

Then there is another complication. It seems to be a matter of almost instinctive unanimity that vowels within the same degrees of longness and shortness (so called) should be represented by signs of some appreciable similarity. No one would propose a letter like the Greek *xi* (Ξ ξ) for a vowel. How far is this principle to extend?—for it *is* a principle, though no definite reason for its existence or its limitations has been given with any adequate exposition. What are we to do with sounds like the *th* in *thin* and in *thine?* Are they to be *t* and *d* with a difference?—for such is the phonetic relation: or are they to be as unlike as *f* and *p*, *v* and *b?* I can only say, that though it is not upon any *a priori* principle at all that this or that sign will be constructed, the very suggestion of a principle of any kind suggests a corresponding choice of alternatives.

Again—and as I am only writing for the sake of illustration, and that for the third and last time,—what are we to do with our superfluous letters, such as *c*, *x*, and *q*, which even the ordinary grammarians admit to be redundant? Are we to eliminate them altogether, or are we to use them up—utilise them as the word is—as old signs with a new import?

"Utilise them, by all means," says A, "because it will save the excogitation of a new letter."

"Fling them away off-hand, and have done with them," says B, "because the new power will give us the trouble of unlearning the old one."

Who will decide on the comparative value of these two recommendations and the two reasons by which they are accompanied?

Surely, then, if from one point of view the construction of an alphabet is a light matter, it is, from another, a very grave one. But all this may, possibly, be got over; for every one of the preceding questions can be reasoned on. So can certain points connected with the forms of the several letters. A printer may decide that one of a pair is better for the press; a copyist that it is better for the pen; a reader may say whether it is or is not sufficiently distinct. But what are we to say to the Strange-appearance objection? We have already said that next to nothing can be said about it by any third party. The common sense of the body of readers must decide upon it; and the decision cannot be delivered *extempore*.

An alphabet must have had a certain amount of existence, must have lived so long, must have been submitted to so much trial, must have undergone so much wear and tear before a single vote can be given either in confirmation or condemnation of it. The inference from this is self-evident. We must take the best working alphabet as we find it. To wait for one which will, on mere inspection, satisfy all the world is to wait, like the clown at the river, till the water becomes, of its own accord, and for his special accommodation, dry land.

This is, naturally, the introduction to what follows, viz., the prelude to the only working alphabet, that, lying ready for us, precludes us from any excuse for waiting till some other alphabet which shall please everybody is constructed. To wait for this is to fold our hands and live in expectancy *sine die*. It was not extemporised. On the contrary, it is the result of much consideration and practice extending over a quarter of a century. It does not pretend to be a construction which, by mere inspection, satisfies every inspector upon every point. And this the constructors tell us implicitly; for they say with truth that the test is to be found in the attempt to make a better one. It is needless to say that the primary details of the analysis of sounds is complete, and that there is no room whatever for improvement in this matter. Of the rest the reader must judge for himself. It is perfectly impossible for one reader to say how such or such a character may strike the eye of another. He has only to urge three cautions in the criticism of the general character of the alphabet as it is about to be presented to him; or, rather, he has to repeat (and the caution will bear repetition)—(1) the difficulty of improvement; (2) the fact of the alphabet being not only ready-made to his hands, but in actual use; and (3) the simple fact of novelty and unfamiliarity; which has nearly as much to do with what is called the Strangeness of Appearance, as the individual forms of the several new letters themselves.

THE PHONETIC ALPHABET.

The phonetic letters in the first column are pronounced like the italic letters in the words that follow. The last column contains the names *of the letters.*

PREFACE.

BETWEEN the end of the third and the middle of the sixth century a language different from both the original British and the Latin of the Roman period was introduced into England. It was the mother tongue of the present English. We know the direction in which it spread; because in Wales and Scotland the original Celtic still keeps its ground. And we know that about A.D. 600 it was firmly established in the Eastern half of South Britain as the *English*. Two names of two divisions of the German family, *Angle* and *Saxon*, are also known to us. But the date of its first introduction, the rate at which it encroached upon the earlier forms of speech, along with the exact way in which it has extended itself, are points about which we know very little.

This is, doubtless, a matter of regret. On the other hand, however, if we look upon the study of the English Language purely and simply as grammarians, we can dispense with the study of its external history; or, at least, the two branches of investigation can be kept separate. As to the essentially foreign and German character of the English, the language speaks for itself. We know it familiarly as it is spoken at the present moment. We have specimens of it as old as the eighth century, and we have a rich intermediate literature. Moreover we have the present German,

and allied languages of Holland, of Denmark, of Norway, of Sweden, and of Iceland, with which we can compare it. Hence, even when loaded with additions from the Latin, the French, the Greek, and other languages, its genuine German character is undoubted.

I am not prepared to say that with this we may not be satisfied. In this case we may begin at once with the details of our language and its affinities to the German dialects of the Continent. The presumptions deduced from the little that we know of its external history may coincide with its known structure; or they may differ from it. They may lead us to suppose that our language should be as free from British or Latin elements as it actually is. Or they may lead us to expect more remains of the languages which it displaced than we find. But upon these questions we may abstain from speculation. In other words we may take our language with its German character as we find it, and pronounce it to be what it is, either with the presumptions in favour of its being so, or in spite of them.

Much may be said in favour of this mode of treatment. It is usual, however, to say something about its introduction; about the parts of Germany from which it came; about the import of the terms Angle and Saxon; about the relations of the dialects of Germany Proper and Scandinavia; and, above all, about the extent to which the blood and the language of the English nation coincide.

All this—as has just been stated—may be avoided by limiting our consideration to the language itself. Nevertheless, one thing is certain: viz., that if the question of its introduction is to be gone into, it must be gone into thoroughly. If we write about it at all, we must write fully.

In a work like the present this is impossible. But the present is only the forerunner to a larger one; in which the subject is treated more comprehensively. Still there are special pieces of evidence with which the reader cannot make himself familiar too soon, and on this principle the chief notices in the way of evidence are laid before him. Even when taken altogether they are neither numerous nor long. The selected texts in the present small volume may be counted on our fingers. They fall, however, into two classes—the first containing the incidental allusions of the *cotemporary* Latin and Greek writers; the second the account of the Venerable Beda in the eighth century. Each class has its merits, and each its weak points. But if we give one, we must give the other also: for it is certain that they do not coincide. Of this the reader should be aware; though it is not necessary that on the very threshold of his studies he should either fix upon the class he prefers, or trouble himself to reconcile the two. But—as said before—he should know from the very first the nature of the scanty materials he has to deal with.

The Saxons came from Southern, the Angles from Northern, Germany; the former introducing the dialect in which the chief works of the times anterior to the Norman Conquest are composed. The latter brought with them the dialects of the parts between the Humber and the Forth; and these culminated in the literary languages of Scotland under the first five Stuarts. The former is represented by the present dialects of Dorsetshire, Devonshire, and the West of England, and is called Westsaxon; the latter by the Lowland Scotch and the English between the Tweed and the Humber. This is called Northumbrian. Out of the intermediate dialects arose the present literary English. These, though all three *dialects* of the German

of England, have as fair a claim to be called different *languages* as the Danish and Swedish, or the Spanish and Portuguese; and each has its several stages.

But besides this there are stages of the English language in general; and it is necessary to separate the two histories.

In Part II., which treats of *Orthoëpy* and *Orthography*, there is little which is not found in the earlier editions.

And the same may be said of Part V., which treats of *Prosody*.

In the Third and Fourth Parts, which give us *Etymology* and *Syntax*, the general principle which distinguishes them from one another is clear and precise. Where we have words like *father* and *fathers*—*write* and *wrote*—*call* and *called*—we have, in each pair, *one* word and no more. This is Etymology. The second word is a slightly altered form of the first. Still it is a *single* word.

In combinations like—*of a father*—*I have written*—*I am calling*, and the like, we have *more words than one*. This is Syntax; *i. e.* two, three, or (it may be more) words in combination. Sometimes one of these governs the other. Sometimes they are in concord or agreement. But, in all cases, they are two words in combination. Hence the name Syntax.

On the first view nothing is clearer, or more distinctive, than this. There are, doubtless, cases where the place of a word is equivocal; *e. g.* in compounds. Terms like *oak-tree*, *Thursday*, and hundreds of others are of this class; and it cannot be denied that they may belong to *either* Syntax or Etymology. They belong to Syntax so far as they are *two* words. But they are combined together and treated as one: and, so far, may be referred to Etymology. Still the class of compounds is not the one that need

detain us longer. It raises a slight objection to the principle here laid down; but not one of much practical importance. When we say *all blǎck bírds are not blǎckbirds*, it is easy to see that in the first pair, we have two *separate* words; in the second, two words compounded into one.

The class which has a tendency to perplex us is represented by such combinations as *the hand of a man* when compared with *a man's hand*, *the skin of the lion*, &c. &c. Here the words *man's* and *lion's* are, according to every test, Genitive Cases, and, as such, single words belonging to Etymology; whereas *hat of a man* and *skin of the lion* are combinations of words, and, as such, belong to Syntax. In sense, however, they are so nearly identical that we are tempted to treat them as such. At any rate, we say that *of* is the sign of Genitive case. Yet *lion* is not a Genitive case at all. The true fact is somewhat different; and the accurate expression is—not that *lion* is a Genitive Case of which *of* is sign—but that there is a combination of a wholly different character with a meaning equivalent to a Genitive Case.

In the Verb the tendency to confusion is greater, and the influence of the Latin Grammar has much to do with it—that of the Greek a little. But the Latin is sufficient for our illustration. Where the Latin gives us *scribam* = *I shall write*; *scribebam* = *I was writing*; *scripsi* = *I have written*, and the like, it gives us a true Future, a true Imperfect, and a true Past Tense; and, as such, a form in Etymology. The English equivalents in sense, which are all combinations of different words, in every sense, belong to Syntax.

In the Passives we get a still more decisive influence. *Amor* = *I am loved*, *amabar* = *I was loved*, *amabor* = *I shall be loved*; all of which are Etymological Tenses. But

in the same table *amatus sum = I am loved*, is treated exactly in the same way. It is called the Perfect Passive Tense: whereas it is really a combination of the Substantive Verb with the Past Passive Participle. The difference in the way of form and expression is clear; but the meaning is that of a true Tense.

It is not, then, strange that combinations so accurately coinciding in sense as *I shall write* and *scribam* should be placed in the same class, and treated as *Tenses*.

This, perhaps, is enough to illustrate the difference between true Inflections like *fathers*, *wrote*, *patris*, *scripsi*, and the like, and combinations like *of* (*a*) *father*, *have written*, *shall write*, *was writing*, &c. There is a true Case or Tense in one series; a combination of different words as its substitute in the other.

It is only necessary to add that I have carefully kept these two classes distinct; referring the first to Etymology, the second to Syntax; I have done this not merely here and there, but generally and thoroughly; and I believe that no competent critic will deny the propriety of my doing so, as a matter of pure and simple Grammar; or that he will condemn the distinction as wrong in itself. Some, perhaps most, of them recognise it partially; and, perhaps, I may suggest that they would go further in the same direction, if the practice to the contrary were less prevalent than it is. Sooner or later, however, the thoroughgoing character of the distinction must prevail, and, in my mind, the period of transition and compromise is coming to a close.

This difference between true Inflections like the signs of Case and Tense in words like *patris*, *fathers*, *scribam*, *scripsi*, &c., as opposed to combinations like *of* (*a*) *father*, *will write*, &c., concerning which thus much has already been said, has another bearing upon our grammar. We have

seen that for the former the latter may be substituted. But are we sure that this is an accurate way of speaking? It is certainly accurate when we translate from Latin into English; for then we render an original single word like *scripsi* by the combination *have written*. But what if we translate *I have written* into *scripsi?* In such a case the combination is the original form, and the Inflection the substitute. This, however, is a point upon which we need not dwell. What we must most especially understand is that, so far as meaning goes, certain inflections have certain combinations by which they may be represented, and *vice versâ*.

For these two modes of representation there are two names. Forms like *scripsi*, *scribam*, *scribebam*, *scripturus*, &c., where we have but one word, are called *Synthetic*. Their substitutes, such as *I have written* or *I wrote*, *I shall write*, *I was writing*, *I am about to write*, &c. are called Analytic. Languages in which the single word prevails are called *Synthetic*; those in which the combination of more words than one prevails are called *Analytic*. But this is not all. The same language which is Synthetic in one stage may become Analytic in another; the Latin for instance is Synthetic, its daughter (the Italian) Analytic. More still—the change is, as a rule, in one direction. The Synthetic stage is always the older of the two; *i. e.* Synthetic languages become Analytic as they become modern. The converse never takes place. In the Synthetic languages the signs of Case, Tense, Mood, Person, Voice, and the like are numerous, and well marked; so that if we see a word with its signs of Case and Gender, we know that it is a Noun, even if it stands alone. And if we see it with the marks of Person, or Tense, we infer that it is a Verb. When this is the case it is easy to say what it is as a Part

of Speech. But when all these outward and visible signs are gone, we have no such criterion.

Now the English is the most Analytic Language in the world. It has so few inflections of any kind that there are few words in it which we can distinguish from one another as Parts of Speech, except by observing what place they take in the construction of a sentence; and we can only do this by applying the rules of Syntax. Hence, it is in the Syntax rather than in the Etymology that the differences between the several Parts of Speech—Noun, Pronoun, Verb, &c.—are explained.

Nearly all this, however, is already exhibited in my earlier Editions, and, to some extent, recognised. In other matters the alterations are limited to particular details.

AN

ELEMENTARY ENGLISH GRAMMAR

FOR THE USE OF SCHOOLS.

PART I.

HISTORICAL INTRODUCTION.

CHAPTER I.

§ 1. THE English Language was originally foreign to the British Islands; and *Germany* was the country from which it was introduced.

§ 2. It spread gradually; indeed, at the present moment, there are remains of the original languages in Wales, in Scotland, in the Isle of Man, and in Ireland. There was a similar fragment in Cornwall during the last century.

The English language, then, extended itself over the British Islands more than thirteen hundred years ago, just as it extended itself over North America in the Seventeenth, and over Australia, Tasmania, New Zealand, and the Cape in the present, century.

§ 3. *The names under which it extended itself.*—The two most conspicuous names in the German invasions were those of the *Angles* and the *Saxons*. From the former we get the words *England* and *English*, from the latter the syllable *-sex* in *Essex*, *Middlesex*, *Sussex*, and *Wessex*=*East*, *Middle*, *South*, and *West Saxons*.

The notices of these two names fall into two classes. The first contains those authors that speak about them simply and exclusively, as applying to certain parts of Germany; and without any reference to Britain. The second contains those that connect them with the soil of Britain.

§ 4. *Early notices of the Angles.*—Of these there are two, and two only.

Tacitus.

After mentioning the Langobardi, or Lombards, Tacitus writes thus:—

Then come the Reudigni, the Aviones, the *Angli*, the Varini, the Eudoses, the Suardones, and the Niuthones, protected by either rivers or forests. There is nothing remarkable in detail, for these nations; though, in common, they worship Herth, *i.e.* Earth the Mother.

Reudigni deinde, et Aviones, et *Angli*, et Varini, et Eudoses, et Suardones, et Niuthones, fluminibus aut sylvis muniuntur; nec quidquam notabile in singulis, nisi in commune Herthum, id est Terram Matrem colunt, &c.—*Germania*, § XL.

Ptolemy.

Of the nations of the interior, the greatest are those of the Suevi *Angli* (who be east of the Langobardi, stretching northwards to the middle course of the river Elbe), and of the Suevi Semnones, who reach from the aforesaid part of the Elbe, eastward to the river Suebus, and that of the Buguntæ in continuation as far as the Vistula.—*Lib.* II. *c.* XL.

§ 5. *Early notices of the Saxons.*—Of these there is only one, that of Ptolemy; for Tacitus says nothing whatever about them.

The Frisians occupy the sea-coast beyond the Busacteri as far as the river Ems. After these the Lesser Chauci, as far as the river Weser; then the Greater Chauci, as far as the Elbe; then in order on the Neck of the Cimbric Chersonese, the *Saxons*; then the Sabalingii, &c.; and after the Saxons, from the river Chalasus to the Suebus, the Pharodini. —*Lib.* II. *c.* XL.

In another part of the work there is a notice of '*Three Islands of the Saxons*,' but without comment or explanation.

§ 6. *Both* Tacitus and Ptolemy wrote *after* the reduc-

tion of Britain as a Roman Province; but *before* the time when the Germans became formidable to Rome, and attracted notice as enemies on the coasts both of Gaul and Britain. The interval between the Saxons of Ptolemy and the Saxons of the next writer who will mention them is nearly two hundred years; and with the Angles it is still longer. For this reason, I pause at the two earlier notices. The division is natural; for the populations of Tacitus and Ptolemy had nothing to do with Britain; and there is a considerable interval between the two classes of authorities. For the greater part of the second and third centuries the history of both the Angles and the Saxons is a blank; and when they re-appear, they are more connected with Gaul and Britain than with Germany.

§ 7. *Languages with which the English came into contact.* The original language of *South* Britain was the *British*; now represented by the Welsh of Wales, and, in the last century, by the Cornish of Cornwall.

The original language of *North* Britain was the *Erse* or *Gaelic*; now represented by the *Erse* or *Gaelic* of the *Highlands* of Scotland, of Ireland, and of the Isle of Man.

Both belonged to the *Keltic* family.

But, besides these two, there was a third: the Latin. This was because, when the Germans invaded it, Britain was a Roman Province.

§ 8. The extent to which the Latin was a spoken vernacular language now comes under consideration; for we must know not only that the German was an intrusive language, but the languages upon which it intruded.

Upon this point Beda is our authority; for, although he did not write till near the middle of the eighth century, he gives us the philology of his own time.

The first of the following extracts makes the number of languages *Five*. The second implies that the *Latin* was the language of the Church, rather than the people at large; and, so doing, reduces the true vernaculars to Four.

Thus much, for the present, according to the number of the books in which the Divine Law is written, explores and confesses the one and same knowledge of supreme truth in the language of five nations: viz., the *Angles*, the *Britons*, the *Scots*, the *Picts*, and the *Latins*, which from the perusal of the Scriptures is made common to all the others.

In the next he tells us what was the import of the word *Latin*:—

He received in surrender all the nations and provinces of Britain, which are divided into the four languages—that is, of the Britons, the Picts, the Scots, and the Angles.

§ 9. *Rate and date of the introduction and diffusion of the English Language.*—The *rate* at which the English spread itself over Britain is uncertain; indeed, it is closely connected with a question which is more uncertain still, that of the *time of its first introduction.*

§ 10. The evidence upon this point falls under seven heads.

a. The coinage of Carausius, and the notice of Mamertinus.

b. The first notice of the Saxons in *Gaul.*

c. The first notice of them in, or connected with, *Britain.*

d. The notice of Eutropius as to the *Littus Saxonicum.*

e. The subjection of the *Britains* under the Saxons.

f. The *Angles* of Procopius.

g. The Mission of St. Augustin.

§ 11. *a. The Franks of Mamertinus.*—In the reign of Diocletian the coast of Gaul was entrusted to a Menapian named Carausius. The enemies who seem to have been most especially formidable were *Franks*. Carausius, however, betrayed his trust, and succeeded in making himself independent of the government in Rome. As far as the Emperors Diocletian and Maximian were concerned, he kept his position; and medals are still extant on one side of which are stamped the joint Emperors with the inscription: '*Carausius and his brothers*,' and on the other Imperial Peace, Peace of the Empire, or Peace between the Emperors. This recognition, however, was not achieved without a contest.

To this we have an allusion in the following extract from Mamertinus in a Panegyric delivered before Maximian, the colleague of Diocletian in the Empire:—

By so thorough a consent of the immortal Gods, O unconquered Cæsar, has the extermination of all the enemies whom you attacked, and of the *Franks* more especially, been decreed, that even those of your soldiers who, having missed their way on a foggy sea, reached the town of London, destroyed promiscuously and throughout the city the whole remnant of that mercenary multitude of barbarians which, after escaping the battle, sacking the town and attempting flight, was still left—a deed whereby your provincials were not only saved, but delighted by the sight of the slaughter.

This extract gives a Frank army in the parts about London A.D. 290; and its value upon this point is unimpeachable. The evidence is that of a panegyrist, and, as such, cotemporary with the events alluded to; moreover, it is addressed to hearers who had taken part in them. Whether the victory was as glorious as the orator makes it, or whether the arch-pirate Carausius, on whose side the Franks were manifestly engaged, was much injured by it, are matters of minor importance.

But the Franks, though Germans, are neither Angles nor Saxons; neither is their history in Britain from this time at all continuous. Still they are named by Mamertinus; and, what is more to the purpose, the *Saxons* are *not* named by him; either in the extract under notice or elsewhere. Neither are they mentioned by any cotemporary of Mamertinus, or by any historian under the long reign of Diocletian's successor, Constantine the Great.

§ 12. *b. The first notice of the Saxons in Gaul.*—The first notice of the Saxons *in Gaul* is the *second* notice of them *anywhere*. The only writer who has mentioned them before is Ptolemy. They are, *then*, in *three islands*, and on the *Neck of the Cimbric Chersonese* (*Holstein*), as we have seen.

The authority now is the Emperor Julian, who not only writes from personal experience, but states that he does so:—

The Franks and *Saxons* of the nations on the Rhine and the Western Sea are the most warlike of nations . . . . this I know, not from hearsay alone, which is unsafe, but I have thoroughly learned it by the proof itself (*αὐτῇ πείρᾳ τοῦτο ἐκμαθὼν οἶδα*).—*Opp., ed. Spanheim*, pp. 34, 56.

§ 13. *c. The Saxons in connection with Britain.—The Limes Saxonicus.—The Notitia Utriusque Imperii* is referred, from certain points of internal evidence, to the interval between A.D. 369 and A.D. 408. It tells us that there was a tract in Britain called *Limes Saxonicus*; that it was under the administration of a *Comes Limitis Saxonici*, and that it consisted of the sea-board from the Wash to the Southampton Water:—

Sub dispositione viri spectabilis Comitis Limitis Saxonici per Britanniam—

Præpositus numeri Fortensium Othonæ.
Præpositus militum Tungricanorum Dubris.
Præpositus numeri Turnacensium Lemanis.
Præpositus equitum Dalmatarum Branodunensis Branoduno.
Præpositus equitum Stablesianorum Garionnensis Garionno.
Tribunus Cohortis Primæ Vetasiorum Regulbio.
Præpositus Legionis II. Aug. Rutupis.
Præpositus numeri Abulcorum Anderidæ.
Præpositus numeri Exploratorum Portu Adurni.—Cap. lxxi.

There was a similar and corresponding *Littus* in Gaul, in which we find the German word *March* (= *Limes*).

Sub dispositione viri spectabilis Ducis Belgicæ Secundæ
Equites Dalmatæ Marcis in Littore Saxonico.—C. xxxvii. 1.

§ 14. *d. The notice of Carausius by Eutropius, &c.*—The preceding extracts have given us *cotemporary* evidence. The present will *not* do so. There are special reasons, however, for submitting it to the reader:—

Carausius apud Bononiam per tractum Belgicæ et Armoricæ pacandum mare accepit, quod Franci et *Saxones* infestabant.—*Eutropius*, ix. 15.

It is well known that a very important use has been made of this passage. With few, if any, exceptions, the histories of England, when they treat of the German Conquest, give very little prominence to the *Littus Saxoni-*

cum; and, when they notice it at all, they generally add that *Saxonicum* need not be supposed to mean '*inhabited by Saxons*,' but simply '*harassed, or threatened, by the Saxons*,' or '*exposed to the ravages of the Saxons*.' That this meaning is, to some degree, a forced one, few deny; but it is probably admitted, on all sides, that, from one point of view, it is not unnecessary. The authority of Beda, supported by that of the Anglo-Saxon Chronicle, makes the history of the German Conquest begin with Hengist and Horsa, Vortigern and Vortimer, and their cotemporaries; and it is clear that if this be the case, the *Littus Saxonicum* must be explained away. This, to say the least, excuses a construction which, under other circumstances, might be condemned as non-natural.

This passage of Eutropius does more. It makes it almost natural. It suggests that the *Littus Saxonicum* may date from the time of Carausius, and that it was because the Franks and Saxons had to be *kept away from it*, rather than because *they occupied it*, that it took its name. Whether this would have any definite bearing on the main question is doubtful; because we have seen that, however much, *in the first instance*, Carausius was opposed to the Franks, he afterwards took them into his service.

But it is the value of Eutropius as an authority for the word *Saxon*, rather than the application of his evidence, that is now under notice; and it is the opinion of the present writer that he took the word *Saxones* as connected with the name of Carausius, not as it was in the time of Carausius himself, but according to the meaning it bore in his own time.

§ 15. There are three periods in the early history of this perplexing word *Saxon*:—

1. That of the Saxons as occupants of the Cimbric Chersonese, in which they are simply items in the geography of Germany, and in no connection whatever with the rest of Europe. This is given in the single notice of Ptolemy.

2. That of the Saxons as formidable seamen during the decline of the Roman Empire, especially along the coasts of Gaul and Britain.

3. That of the Saxons in Germany subsequent to the establishment of the Frank Kingdom.

§ 16. The second period is the one under notice; and I submit that it had *not* begun in the time of Carausius. That there may have been Saxons among the pirates against whom Carausius was employed is likely. It is also likely that the Saxons, single-handed, may have been as formidable as the Franks themselves. But it is certain that, in the Panegyric of Mamertinus, no such name as *Saxon* is to be found. The difference between the Saxon element in a piratical population and the other elements had yet to be made. As far as our evidence goes, Julian is the first who does this. He is the future Emperor of the *East*; and it is in the writers of the Eastern, rather than the Western Empire, that it is found. By the time of Eutropius their ravages had become frequent and persistent, and, when he wrote, the name of Saxon had become familiar in Constantinople. Under this influence, then, it is submitted that Eutropius wrote; identifying the Saxons of his own time with the marauders of the time of Carausius. This is Gibbon's opinion, who writes that Eutropius 'used the language of his own times.'

This is why, when every other piece of evidence in the present work has been (upon principle) given only when it is cotemporary with the event, this notice of Eutropius has been recognized. It is *not* the evidence of a cotemporary. If it were, it would be evidence of extraordinary value; for it would put the state of both Gaul and Britain in the time of Carausius in a much clearer light than that under which we find it; and, what is more, it would tell us not only that the term *Saxon* was then in use, but what were the relations of the men who bore it to the British and Gallic coasts. It is *not*, however, evidence of this *kind, but of a much* inferior character.

§ 17. *c. The Subjection of the Britains under the Saxons.*—The settlement of a German population in Britain is one thing; the evacuation of the island by the Romans is another. Yet they are closely connected. Germans on the soil of Britain we have already found; but Germans as the dominant population, Germans unchecked by either the legions or the navy of Rome, we have yet to find.

Who the Saxons of the *Saxon Shore* actually were is uncertain. The ordinary meaning of the term is, undoubtedly, a coast *occupied by a Saxon population*; but, in the present case, it is (as we have seen) held to mean a coast *threatened or harassed by the Saxons, and*, as such, *defended against them.*

It is nowhere suggested that this is the natural import of the term; it is only maintained that it is, if needed, a legitimate one. And, provided we take the accounts of Beda and the Anglo-Saxon Chronicle as genuine history, it *is* needed. It is needed if the accounts of the Hengists, Ellas, Cerdics, and other Anglo-Saxon heroes are to be taken not only as permanent settlements, but as the *first of the kind*; and that so exclusively as to make it necessary to put upon the words *Littus Saxonicum* a construction which would never suggest itself spontaneously, and of which no second instance has ever been adduced.

Whether these two statements be accurate or the contrary is a matter upon which the reader must judge for himself. He need only understand, as a preliminary, that it is in no respect a point of scholarship. Whether *Coast* or *Shore* be the better translation of the word *Littus* is a matter of indifference. '*Saxonicum*' there is but one way of translating. Hence, in respect to the import of the four words, there is no difference. We can do nothing with the words *Littus Saxonicum* in Latin, that we cannot do with *Saxon Shore* (or *Coast*) in English. If '*harassed*' or '*threatened*' or '*frequented* by the Saxons' be a forced interpretation of '*Saxon Shore*' as an English term, it is

equally forced in the Latin *Littus Saxonicum*. Those who have noticed the way in which several influential writers usher in this secondary sense of '*Saxonicum*' will not condemn the present remark as superfluous. Either consciously or unconsciously, a great many of them suggest that in the Latin phrase there is more latitude and pliability than in the English.

§ 18. *e. The Evacuation of Britain by the Romans.*—The following extract from Prosper Tiro is one that, in the mind of the present writer, has had scant justice done to it.

The date is A.D. 441.

The Britains, up to this time torn by various massacres and events, are reduced to the dominion of the *Saxons*.

Britanniæ, usque ad hoc tempus variis cladibus eventibusque laceratæ in ditionem *Saxonum* rediguntur.

I submit that these *Saxons* of Prosper Tiro are the Saxons of the *Littus Saxonicum*.

The date is earlier than that assigned to Hengist and Horsa, but it is later than that of the withdrawal of the legions by Honorius, A.D. 409. That Honorius withdrew the exclusively military legions, or rather that they were withdrawn by Constantine and the British pretenders who fought their battles in Gaul, is likely enough. The question is whether he withdrew the dockyards, the arsenals, and those sailors who chose to remain where they were; and on this point there is not a particle of evidence. Failing this, we must look to the *Littus* of Gaul; and here it seems to have been left as it was. At any rate we hear of the Saxons of Bayeux—the *Saxones Bajocassini* of Gregory of Tours, and of others—long after the Imperial character of the Littus has disappeared, and long after the Merovingian Franks had become strong enough to keep off intruders. Still, it must be from either fresh intruders from the North, or from the remainder of the *Littus*, that the Saxons of Gaul, of the Fifth, Sixth, and Seventh centuries, are to be deduced.

The word Britannia during the Fifth century means not only Britain, but Brittany, or Armorica. Hence, it is probable that these two countries are the *Britanniæ* of the extract. Still, there is in Britain a Britannia Prima, and a Britannia Secunda; while even in Gaul there is, besides the Armorican Brittany, a notice of certain *Britanni* on the Loire. It will be seen in the sequel that there are other ambiguous words connected with this period.

The gist of these remarks is to put the evidence of Prosper Tiro, *at least*, on a level with that of Beda and the Saxon Chronicle; and if the present work were one upon the general history of England during the fourth and fifth centuries, instead of a mere introduction to the details of the structure of the language, more would be said on the subject. Objections would be anticipated, and the result of the difference between the two authorities indicated. As it is, however, the solitary date of Prosper Tiro is simply preferred to the details of Beda and the writers who follow him.

§ 19. The well-known letter to the Roman general Ætius, in his third consulship, sometimes quoted as 'The Groans of the Britons,' in most works (and in none more than my own) finds its place, A.D. 449. It is now excluded from the text, and that purposely. This is to show that the omission is not accidental. It runs thus:—

To Ætius, thrice Consul, the groans of the Britons. The barbarians drive us to the sea. The sea drives us back to the barbarians. Between these arise two sorts of deaths. We are either slaughtered or drowned.

Ætio ter consuli gemitus Britannorum. Repellunt nos barbari ad mare; repellit nos mare ad barbaros. Inter hæc oriuntur duo genera funerum. Aut jugulamur, aut mergimur.

It is doubtful whether the Britons of this epistle, instead of being Britons of Britannia, are not the Bretons of Armorica (Brittany). When Ætius was in Gaul, St. Germanus was in Britain. On his return he passed through Armorica. The Armoricans at that time had offended Ætius, and he sent his ally, the barbarous king of the Alani, to chastise them. The barbarians, then, are the Alani.

Read from this point of view, the letter has a significance which it

wants if we read it as an application from Britain. The Britons are pent up between the enemy on the land on one side and the sea on the other. This might, or might not, have been the case with the Saxons. The Alans, however, *must* have pressed on the Bretons from the *land* side, and the more they pressed westwards, the more the latter retreated, the more stringent the alternative of the surrounded population would become.

§ 20. *f.* The following extract gives us a new name—that of the *Frisians*. It is a name that has long been recognized, and one that we may undoubtedly add to those of the Angles, the Saxons, and the Jutes. It is not to be found in Beda. In the following notice where it *is* found there is no such word as *Saxon*. The inference from this, that some Saxons were Frisians under another name (and *vice versâ*), suggests itself at once; and, if we knew no more about the Frisians than what we learn from our present authority, it might pass without comment. Indeed, it is probable that, to some extent, such is the case. There is much, however, connected with the Frisians which points to the Angles and the Danes rather than to the Saxons.

From Procopius.

Three nations extremely populous occupy the island of Britain. One king is at the head of each. The names for these nations are *Angli*, Phrissones, and (of the same name as the island) Britons. Such is the manifest populousness of these nations, that every year, in great numbers, they migrate from thence, and with their wives and children go over to the Franks.

Βριττίαν δὲ τὴν νῆσον ἔθνη τρία πολυανθρωπότατα ἔχουσι. Βασιλεὺς δὲ εἷς αὐτῶν ἑκάστῳ ἐφέστηκεν. Ὀνόματα δὲ κεῖται τοῖς ἔθνεσι τούτοις Ἀγγίλοι καὶ Φρισσόνες καὶ οἱ τῇ νήσῳ ὁμώνυμοι Βρίττωνες· τοσαύτη δὲ ἡ τῶνδε τῶν ἐθνῶν πολυανθρωπία φαίνεται οὖσα ὥστε ἀνὰ πᾶν ἔτος κατὰ πολλοὺς ἐνθένδε μετανιστάμενοι ξὺν γυναιξὶ καὶ παισὶν ἐς Φράγγους χωροῦσιν.

Bellum Gothicum, iv. 20.

§ 21. *g. The Mission of St. Augustin.*—This is loosely identified with the introduction of Christianity in England—in *England*, as opposed to *Britain*; for into Britain, as a Roman province, Christianity had found its way before. The time is the last three years of the seventh century, say

A.D. 600. Ethelbert is king of Kent; his queen is a Frank princess. Gregory I., then Pope, enjoins a Frank mission to promulgate the Christianity of the Franks. The Frank King sends interpreters, and St. Augustin is at the head of the mission. The evidence of this is the Papal letters. They did not reach England till later, when Nothelm brought them over. Now Nothelm was an early cotemporary of Beda's, and as such belongs to the latter half of the seventh century; and, so doing, brings us to the time of Beda himself.

Hence, A.D. 697 there is no doubt as to the fact of the mother-tongue of the present English having become thoroughly established in Britain; in the southern parts at least. It was a language, too, intelligible to the Franks; at least to the Franks of the western division of the Frank kingdom.

§ 22. If full justice is to be done both to Beda and the earlier authorities with whom he is at variance, his account may be divided into three parts.

1. *The Century in which he wrote.*—Here he writes of what was to be found in England during the time of his own life; and, doing this, writes with an authority which it would be vain to impugn.

2. *The Seventh Century.*—This gives us, within a few years, the introduction of Christianity and several of its immediate results, one of which would be the use of the Latin language as that of the Church, and (unless it existed before) the use of the alphabet. Under these conditions we get the elements of a truly historical record; and, although *we* have no remains of it, it is probable that Beda may have had the opportunity of availing himself of it. More than this, for the latter half of the century, there were the early cotemporaries of Beda, to whom he may have applied. This we know to have been the case. We know, too, that there was a fair amount of literary activity during the period. One of the Christian duties of the recent converts to Christianity in England was that of

preaching the Gospel to their near kinsmen on the Continent, who, in the parts north of the Rhine and Ems, were still pagans. This they performed honourably. They called the Germans of these districts *Old* Saxons; an important name, because it shows that the descent of the English from them was recognized. It is also a convenient name, because it means the Saxons of the Continent as opposed to the Saxons of England. These latter, even in Beda's time, are called *Anglo*-Saxons.

Between Beda and his cotemporaries we get trustworthy evidence for at least the latter half of the seventh century, especially as the cotemporaries whom we appeal to are not imaginary or merely possible ones. Beda himself tells us, not only that there were some of them to whom he applies, but he tells us who they were and upon what points they instructed him. Thus he mentions by name Albinus and Nothelm for Kent; Bishop Daniel for Sussex and the Isle of Wight; the monks of Lestingham for Mercia and part of Essex; with Cyneberct and others for Lincoln. For the province of Northumberland Beda was his own authority.

For the *first* half, however, of the century the value of Beda's statements decreases, though not to any great degree. There is still, without doubt, some learning in the country, and some records. Hence, when Beda writes that Eadwin, king of Northumberland, defeats Ethelfrith, and soon after invades the little kingdom of Elmet (in the West Riding of Yorkshire), and that Elmet is, then, not only independent, but British, we should not only not demur to his evidence, but adopt it as one of the best statements we have for calculating the *rate* at which our language extended itself.

This, then, is a *third* point in the history of our language upon which Beda speaks with authority. The other two we have are (1) the four (or five) languages of Britain, and (2) the existence of the Jutes in Kent and the Isle of *Wight (for which see* § 25).

The *fourth* point, however, is the most important of all. It is in Beda that we first meet the word *Angle* in connection with England and the English.

§ 23. *Beda's Evidence for the Sixth and Fifth Centuries.*—For what Beda tells us here, especially for the *fifth* century, we must look less to the account he delivers than to the question as to how he got his information. The middle part of the period is one of almost total darkness. The time for the influences of the early English Christianity with its concomitant civilization has not yet come; and the time for information from the Latin writers of the last days of Roman greatness has gone by. That Beda took more than ordinary pains to obtain his information from his older cotemporaries we have seen; but we know nothing of the sources on which *they* relied. The century and a half under notice is nearly destitute, not only of historical records, but of statements capable of either contradiction or confirmation. To say that nothing whatever can be found for the period would be an overstatement.

§ 24. Farther than this in the way of cotemporary evidence we cannot go. But Beda must also be considered as a geographer; for it is manifest that, in the following extract, there are two questions involved—viz. that of the particular Germans who came over to Britain, and that of the particular districts of Germany from which they came:—

Advenerant autem de tribus Germaniæ populis fortioribus, id est de Saxonibus, Anglis, Jutis. De Jutarum origine sunt Cantuarii et Vectuarii, hoc est ea gens quæ Vectam tenet insulam, et ea quæ usque hodie, in provincia Occidentalium Saxonum, Jutarum natio nominatur, posita contra ipsam insulam Vectam. De Saxonibus, id est ea regione quæ nunc Antiquorum Saxonum cognominatur, venere Orientales Saxones, Meridiani Saxones, Occidentales Saxones. Porro de Anglis, hoc est de illa patria quæ Angulus dicitur, et ab eo tempore usque hodie manere desertas inter provincias Jutarum et Saxonum perhibetur, Orientales Angli, Mediterranei Angli, Mercii, tota Northumbrorum progenies.

The extent to which these notices by Beda were recognized, not merely as sufficient but as standard authorities,

may be seen by their reappearance, in the same form, in Alfred and elsewhere; even out of England. Nor were there, until the tenth and eleventh centuries, the data for criticizing them, even in the parts which were most open to objection; these being the parts connected with the geography of the Angle and Jute districts.

§ 25. That there may have been *Angles* in the *Angulus* is not unlikely. But the *Angulus* of Beda is the present district of Anglen, a nook of land, no larger than the county of Rutland, lying on the *eastern* side of the duchy of Sleswick between the Slie and Flensburg. *Some* Angles may have come from this district, but it would be wrong to treat it as the true Angle part of Germany, when both Tacitus and Ptolemy, our only authorities, place it on the middle Elbe.

The Jutes of Beda, in the opinion of the present writer, were not Jutlanders from Denmark, but *Goths* from the opposite coast of Gaul, then a powerful *Gothic* kingdom.

The chief point, however, in the comparison of the evidence of Beda and that of the earlier writers, is the extent to which one *excludes* the other. If the Saxons of the times of the Hengists and Ellas are to be not only so many Saxons on English ground, but so exclusively the first of their nation as to justify us in putting constrained constructions upon cotemporary texts, the criticism is sure to become unduly one-sided; and that this one-sided character characterizes the early history of England throughout few deny.

§ 26. *The Danes, or Northmen, in Britain.*—The importance of the Danish influence in England may be measured by the trouble it created in the reigns of Alfred and his successors, and the culmination of the Danish power in that of Canute.

Who were the Danes? What was the date of their first settlements? In what way have they affected our language? These are the questions that are more especially *connected* with them.

In respect to the first, we may say that they were the Danes of Jutland and the Danish Isles. But they were this and a great deal more. They were the Danes of Denmark proper, and they were the Norwegians of Norway as well.

The date of their first recorded inroads is to be found in the Anglo-Saxon Chronicle, A.D. 787.

How far they have affected our language is the third question, and it is full of difficulties. It would be no difficult task to make lists of one, two, three, four, five, or even more, hundreds of words which are either Norwegian or Danish. But, unless it can be shown that they are not German, such lists would be worthless; and the proof upon this point is the proverbially difficult task of proving a negative proposition.

This, however, applies to *common* names only; with *proper* names it is different. The termination *-by*, in words like Grims*by*, &c., is a *Danish* word. *Caster*, in the place of *Chester*, is a Danish form. *Skip-*, *Carl*, *Orm-*, and *Kirk*, imply Danish occupancy. Hence, where the English parts of Britain give us Charl*ton*, Dor*chester*, *Ship*ton, and *Worms*head, the Danish forms are *Carlby*, An*caster*, *Skipton*, *Orms*head, and *Ormskirk*. Any ordinary map supplies the list of these. They are the most numerous in Yorkshire, especially in the East and North Ridings; but Yorkshire is an inordinately large county. For its size, Lincolnshire gives us the most. Then, at a great distance, Leicester, Nottingham, Derby, and Northampton. We lose the word *by* in the south at Rug*by*, and on the north in Durham—Ra*by*. It is to be found, in patches, in Norfolk and Suffolk. Elsewhere, on the eastern side of England, they are either undiscovered or undiscoverable. From Yorkshire, however, they follow the western feeders of the Ouse to its watershed, which they cross, and then reappear in Cumberland, Westmoreland, Lancashire, Cheshire, the Isle of Man, and North Wales; at least in such names as *Orm's* Head.

In Ireland, we have a new instrument of criticism. In Carling*ford*, Strang*ford*, and Wex*ford*, the final syllable has not its ordinary import. It means an arm of the sea; in short, it is the Norwegian *Fjord*. And so it is in the *Firth* of *Forth* in Scotland. In this country the distribution of the *bys* is remarkable. We have it at Duncans*by* Head in the extreme north, and we have it in Eskdale and Annandale in the south-west. Otherwise the *bys* are exceptional. As *proper* names, these give us a long list. But they are not *common* names. They are all proper names, the names of geographical localities.

It may be expected that where we find these, we shall find *common* names also. But such is not the case. If true Danish common names exist in one part of Great Britain more than another, it is in Scotland; but that is just where the local names give us the fewest signs of Danish occupancy. This anomaly, however, has been explained. Mr. Worsaae, in his 'Danes and Northmen,' has shown that it is only the Danes of Denmark proper that exhibit this inordinate partiality for villages ending in *-by*, and that in Norway they are rare. In Iceland, pre-eminently a Norwegian colony, they are not to be found. The admitted inference is that it was Norwegians who assailed and circumnavigated *Scot*land, but Danes who assailed *Eng*land; and, from the parts about Kirk*by* Lonsdale, &c., crossed the watershed, and gave us the numerous *-bys* of Cumberland and Selkirkshire.

This, at least, is the inference from the distribution of the termination. It is far more Danish than Norwegian, as may be seen from comparing a map of Iceland and Norway with one of Jutland or Denmark.

With this division in geography between the proper Danish and the Norwegian settlements, we no longer expect that, as a matter of course, they will agree in time. Lincolnshire is preeminently Danish.

In parts of Caithness, and the Orkneys, the language was Norwegian. In Shetland a Norse dialect was spoken *in the last century.*

§ 27. The earliest specimens of the English language, so far as they are dated at all, belong to the first half of the eighth century. They are known as the *Fragment of Ceadmon* and the *Death-bed Verses of Beda.*

Ceadmon was born at Whitby. The long and important poem which has come down to us in his name is in the *West*-Saxon dialect; and this has engendered the notion that the original has been lost and re-cast. The following lines, however, which have been preserved by Beda, are admitted to be genuine; for of Beda Ceadmon was an early cotemporary.

Older Text.	*Later Text.*
Nu scylun hergan . . .	Nu we sceolon herigean
Hefaen ricaes uard . . .	Heofon-rices weard
Metudæs mæcte . . .	Metodes mihte
End his modgithanc . .	And his modgethanc
Uerc uuldur fader . . .	Werc wuldor fæder
Sue he uundra gihuaes . .	Sva he wuldres gehwæs
Eci drihten	Ecé drihtin
Ord stelidæ	Ord onstealde
He ærist scopa . . .	He ærest scóp
Elda barnum	Eorðan bearnan
Heben til hrofe . . .	Heofon tó rofe
Halig sceper	Hálig scyppend
Tha middun-geard . . .	Da middangeard

Eci drihten	Ece drihten
Æfter tiade	Æfter teóde
Firum foldu	Firum foldan
Frea allmectig . . .	Freá ælmihtig.

The Death-bed Verses of Beda.

Fore the neidfaerae . .	Before the necessary journey
Naenig uuirthit . . .	No one becomes
Thoc snottura . . .	Wiser of thought
Than him tharf sie . .	Than him need be
To ymbhycganne. . .	To think about
Aer his hionongae . .	Before his hence-going
Huaet his gastae. . .	What for his spirit
Godaes æththa yflaes . .	Of good or evil
Æfter deothdaege . .	After death-day
Dœmed uuieorthae . .	Doomed shall be.

These, however, partly from their shortness, and partly from their containing few of the inflections which give us the best characteristics of the Northern dialect, are of more importance in the history of Anglo-Saxon Literature in general than as specimens of any particular dialect: though the dialect of both Beda and Ceadmon was the *Northern* or *Northumbrian*.

§ 28. That this Northumbrian dialect was the first cultivated is probable. By the end, however, of the Ninth Century, it is, as compared with the West-Saxon, obsolete as a vehicle of literature. Nearly all that we know of it is from *Glosses*. Of these:

1. The Glosses of the *Rushworth Gospels* are referred to the end of the Ninth or the beginning of the Tenth Century.

2. The Glosses of the *Durham or Lindisfarn Gospels*.

3. The Glosses of the *Durham Ritual*.

4. Inscriptions in Runic characters near Ruthwell in Dumfriesshire, and Bewcastle in Cumberland.

5. Glosses on the *Psalms*—known as the '*Psalter*,' but not universally admitted to be *Northumbrian*.

§ 29. For nearly the whole of the eleventh, twelfth, and thirteenth centuries no specimens of any dialect north of the Humber are known: yet the Northern boundary of Northumberland is, not the Tyne, but the Forth. After, however, an interval of 300 years it will, again, appear in the County of Durham. The Northern Version of the '*Cursor Mundi*' is a valuable specimen of a literature which is common in the Old English period, viz., an adaptation of the dialect of one part of England to that of another part. We can scarcely call works of this kind translations, yet they are more than mere transcriptions. The work under notice is one of these; and that without doubt, since the author expressly tells us as much.

> In a writte this ilke I fand
> Himself it wroght, I understand,
> In suthron Englys was it drawn,

And I have turned it till urr awn
Language of the Northern lede,
That can non other Englis rede.—*Cursor Mundi.*

This, for its date and place, is easy to read: in other words it is very modern. But it is also very Scotch. Indeed, the classical time of the true national literature of Scotland is now about to begin. During the Thirteenth Century, however, the Northumbrian dialect of the middle period will still continue to be represented by compositions from the district between the Tyne and Humber, rather than between the Tweed and Forth. I write between the 'Tweed and Forth,' rather than between the 'Tyne and Forth,' because, in the way of records, Northumberland, as the *County* so called, contributes little or nothing. Yorkshire belongs to the old Northumberland; and of this Durham is the representative County. This means, of course, that what is here treated as Northumbrian English is, to a great extent, Lowland Scotch. To distinguish this from the present Gaelic of the Highlands, the Scotch themselves called their language *English*; and that during the Fifteenth Century; when, as far as politics and nationality went, the difference between the Scotch and the English was a matter of life and death. At the time of the Reformation the word *Scotch* took its present meaning—not much before.

A little later than the Cursor Mundi in its Northern form comes Hampole's Pricke of Conscience, along with other works by the same writer. These represent the Northumbrian of Yorkshire, for the parts about Doncaster, and they are quite as Modern, and English, and quite as North British, or Scotch, as the Cursor Mundi.

§ 30. With the Fourteenth Century begins the classical time of North British literature; English by name, Scotch in reality. This is introduced by James I., the cotemporary of Henry IV. in England. Dunbar, who divides with Burns the honour of being the great poet of Scotland, continues it; and it is further continued till the times of

the Reformation, by Gawain Douglass and Sir Thomas Lyndesay; but it begins to be called *English*. After this it is Scotch, more or less Anglicised. Wyntoun, Blind Harry, and Barbour, are early cotemporaries of James the First. No known Scotch *manuscript* is older than 1397.

The Northumbrian dialect has been considered at length, because it has certain perplexing peculiarities of its own. It begins early, but it breaks off early. It then presents us with a long blank. It then comes to its climax of cultivation in the fifteenth century; after which it begins (in Scotland) to be Anglicised. Moreover, though it is in politics, nationality, and geography Scotch, it is called, and is, *English*.*

§ 31. *The West-Saxon Dialect.*—This, as the dominant and classical language of the times before the Norman Conquest, began with the latter half of the ninth century. The few examples of our earliest English that go further back have been noticed already, and they were Northumbrian rather than West-Saxon, though not in a very decided form. Rich as the West-Saxon is in detail, the greater part of its literature is dateless and anonymous. But two great names represent it, those of Alfred and Ælfric.

Its ascendancy begins with the reign of Alfred. It ends in wholly displacing the Northumbrian. It is continued with diminished lustre till the thirteenth century, when we first meet with undoubted *Midland*, or Mercian, compositions. It is continued through the thirteenth and fourteenth centuries, concurrently, however, with the Northumbrian and Midland. It passes into the condition of a provincial form of speech about A.D. 1550, or, to speak more generally, at the time when the two new influences of the Printing Press and the Reformation came into action.

* All the complications connected with the thorough *English* character of the *Northumbrian English* of the *South of Scotland* are admirably unravelled in Dr. Murray's *Dialect of the Southern Counties of Scotland*, 1873.

The West-Saxon chief works of the thirteenth and the earlier part of the fourteenth centuries are :—

Layamon's Brut; from Worcestershire, or the Worcestershire and the Gloucestershire border.

The Ancren Riwle; from Wiltshire.

Robert of Gloucester; from Gloucestershire.

Trevisa, a cotemporary of Chaucer's, is also West-Saxon in its original form. But when Caxton reprints his work, he has to adapt it to the current form of speech; though not to any very great extent.

Chaucer is West-Saxon (we may now say Western); at least as opposed to Northumbrian.

There are other West-Saxon writers of this period of less importance. But one work is of special importance. It was written in Canterbury A.D. 1340. It shows that, though Kent is the most eastern county south of the Thames, its dialect was *Western*. The *Ayenbit of Inwit*, or *Remorse of Conscience*, is its title. It is, doubtless, to some extent, a provincial, rather than a classical, composition. The spelling, however, makes it look more provincial than it really is; for it is that of the present provincial spelling for Devonshire: *i.e.* with *z* and *v* for *s* and *f*.

§ 32. *The Midland, or Mercian, Dialect.*—The *Ormulum* is the work of a writer named Orm; and this points to the Danish parts of England.

Havelok the Dane does the same. Neither are either strictly West-Saxon or strictly Northumbrian. But the Mercian, or Midland, characteristics are of a negative rather than a positive character.

Robert of Bourne was a native of Lincolnshire. He is a cotemporary of Robert of Gloucester and of Hampole, so that the three together represent the three dialects, now written concurrently. They all belong to the reigns of Henry III. and Edward I., *i.e.* the beginning of the fifteenth century.

What the Midland, or Mercian, literature more espe-

cially resembles (for we have already remarked that its characters are negative, and may now add that its geographical position is intermediate between the two extremes) is the literary, classical, or standard English of the present time; though as a standard literary language it does not take its place until later.

This is only another way of saying that the present literary English is not the lineal descendant of the classical West-Saxon. And we may go further. We may add that it is less like the West-Saxon than it is like the Northumbrian, but it is not Northumbrian. It is Midland or Mercian.

§ 33. These three leading dialects have each their own history. With the dialects of Shropshire, Cheshire, Lancashire, Westmoreland, Cumberland, and the West Riding of Yorkshire this is not the case. None of them have ever become classical. Neither is their relation to the other three groups manifest. Nor should we expect it to be so. It varies with the frontier. They have been called *West Midland*. The name, however, is merely provisional. It is only certain that they have mixed and heterogeneous characteristics.

§ 34. It is customary to cast the English language into chronological divisions, or, as they are called, *Stages*. At first the process began with the broad distinction between the times of Alfred and his immediate successors, and those of the modern writer. This made to some extent the Anglo-Saxon one language, and the ordinary English another. The difference, however, was that the former was what is called a Dead, the other a Living language. But where the history of a language, and indeed the language itself, is continuous, the distinction between the two vanishes. No one who bestows any thought upon the subject can imagine that because one language is called Dead and the other Living, or because one is called Anglo-Saxon and the other English, they are different languages in the way that Latin differs from the German, or the German from the French. The English of the present time is simply the Anglo-Saxon in a later,

the Anglo-Saxon the English in an earlier form or stage. Nevertheless, the fact that the one is understood at once, while the other has to be learned, is a fact that conveys (along with a considerable amount of likeness) a difference of some kind or other. It is not, however, the difference between two parallel and distinct languages.

As languages begin to be studied in their intermediate stages, this difference ceases to be felt; and when any notable changes take place, divisions and sub-divisions suggest themselves, and *stages* of a language are the result.

When this takes place there will always be two questions. Where is the division to be made? and what is the name to be applied to it? It is too much to expect that any line of demarcation, or any series of names, can be wholly satisfactory, or wholly permanent. The characteristics by which one stage is determined may change their value; or new principles of division may be established. There is, beyond all doubt, a tendency to change either the actual divisions, or the names which indicate them (one or both) at the present time.

§ 35. The divisions and names, however, which were adopted by the scholars of the last generation should be known; and, whether they are to be upheld or rejected, the principles upon which they were given should be understood. These were—

1. The *Anglo-Saxon* stage, from the earliest known compositions, of English origin, to the Norman Conquest and a little beyond it.

2. The *Semi-Saxon*.—Middle of the 11th to the middle of the 12th century (there or thereabouts).

3. *The Old English*.—This means the English of the latter part of the reign of Henry III., and the reign of the first two Edwards (there or thereabouts).

4. *The Middle English*.—From Chaucer to the time of Henry VIII. (there or thereabouts).

5. *The New, or Recent, or Modern English*.—From Henry

VIII. (say Sir Thomas More) to the time at which the divisions were suggested.

Of these terms, *Semi-Saxon* is the newest.

§ 36. We may approve of these or we may not; but, as they are still current, we must understand them. Otherwise there will not be a work on English philology of ten years' standing that we shall be able to read with ease.

We must know, too, how certain works, especially for the three middle periods, are to be distributed.

§ 37. The first important composition which is called transitional or Semi-Saxon is *the concluding part of the Anglo-Saxon Chronicle*—especially the reign of Stephen, the last of the kings it contains. This is reasonably referred to the earlier part of the reign of his successor Henry II. But it is a difficult work to fix. In the first, it may be somewhat more Anglo-Saxon than it would be were it not the continuation of a genuine Anglo-Saxon composition. In the second, it is considered to be, to some extent, Mercian rather than pure West-Saxon.

Layamon's Brut.—*West*-Saxon (as we have seen) in dialect, *Semi*-Saxon in date.

The Ancren Riwle.—West-Saxon (as aforesaid) in dialect, *Semi*-Saxon in date.

The Ormulum.—Mercian in dialect, generally considered *Semi*-Saxon in date. It has been thought by some that its language is too modern for the antiquity assigned to it. The modern character, however, may be due less to date than to the dialect.

§ 38. *Of Old English*, as opposed to *Semi-Saxon*, the *Proclamation of Henry III. to the People of Huntingdonshire* passes for the earliest specimen. The date is 1258.

The following are the titles of the more important ones. They are selected from a Glossary* especially dedi-

* *A Glossarial Index to the Printed English Language of the Thirteenth Century.* Published by the Philological Society. Edited by H. Coleridge. 1859.

cated to English of the *thirteenth* century; which shows how decidedly the term *Old English* excludes the *Semi-Saxon* on one side, and English of Chaucer's time on the other.

Havelok the Dane	The Owl and Nightingale
The Early English Psalter	Robert of Gloucester, &c.

Havelok the Dane is Mercian; the Early English Psalter is Northumbrian. The rest are chiefly Western.

§ 39. This division is very artificial; and it is not likely that it will be permanent. Neither will the term *Old English* as applied to it: inasmuch as those who disapprove of the word *Anglo-Saxon* propose the word *Old English* as its substitute. However, the Proclamation to the Men of Huntingdonshire gave a convenient date; while the scantiness of our literature in the reign of Edward II. made the conclusion of the division pretty definite. This is about all that can be said in favour of it.

§ 40. *Middle English.*—This division, so far as it gives us such writers as Chaucer and Mandeville in contrast to Robert of Gloucester and Layamon, is natural; and it is probable that, as Chaucer is read by the English of the present period, the division is a convenient one. But when Chaucer dies, England, as compared with Scotland, is, at least, on the decline. The time of the three Henrys is one when the West-Saxon has ceased to represent the Anglo-Saxon period, and when the Midland has yet to become the literary English of the present time. For the time of the four Henrys (or that of the five Jameses), the best middle English is the English of Scotland. This is doubtless compatible with the use of the term; but it was not the meaning that was given to it by the scholars who originally applied it.

§ 41. It is probable that this arrangement will not satisfy many of my readers—least of all those who have gone through the preceding remarks on the Dialects of our language. Indeed, more than thirty years ago it was

complained of by the earlier investigators of them; and now, when each of our three leading dialects is acknowledged to have a corresponding literary language, the impropriety of massing them together as one, and treating them as uniform in their continuity, is manifest.

§ 42. What we know of the English *in general* is that it is the mother-tongue of three well-marked forms of speech out of which three literary languages have grown. One of these is the West-Saxon, one the Scotch, and one the present literary English. There is also a fourth class of indefinite limits, but which has never culminated in a literary language; viz., that of the north-western counties of South Britain. Each of those has its peculiar and proper history, which may or may not be susceptible of divisions in the way of growth or development.* But the stages of the *three* cannot be dealt with as if they were *one*.

§ 43. Still we know something akin to the stages of our language in general. We know that there are certain epochs at which the language in mass of the whole island was, or might be, affected.

Such a one is the time from the reign of Diocletian, at the end of the third century, to the middle of the fifth, when we know that some Germans of some sort or other had set foot in our island.

Such a one is the time from the middle of the fifth century to the beginning of the seventh, when the history of our language was a blank. But we know that it was to a great extent German.

Such a one was the time from A.D. 600 to the death of Beda; for which we have a few lines in English, and these we know belong to the *northern* rather than to the *southern* form of speech.

Such a one is the time from the death of Beda to that

* For the characteristics of the Middle English Dialect, see Dr. Morris's *Specimens of Early English*, and Prefaces to his Editions in the 'Early English Text Society.'

of Alfred, where we know that the northern literature is declining. Under Alfred and his successors the classical *West-Saxon* literature was formed. But a fresh influence was introduced by the Norman Conquest.

§ 44. From the Norman Conquest to the death of Richard II. there is a period out of which many subordinate stages may be made. There are the reigns of the two Williams, Stephen, Henry II., Richard, and John, in which the West-Saxon still is the predominating dialect; but there is very little of it. Then, under Henry III., there are compositions other than West-Saxon. Those that are Northumbrian are representatives of an old, though diminished literature in a new shape after a long arrest. Hence we have the Northumbrian form of speech re-appearing, but with no continuity in its history.

There are, also, Midland dialects, which are represented in this century, but they have no anterior history.

Meanwhile the West-Saxon declines.

For this period there is no continuity for any one of the forms of speech of which the English language consists; nor can we expect one of the language in general.

§ 45. In the Fifteenth Century—under the three Henrys—the English Language is no longer represented by the West-Saxon, but by the Northumbrian of Scotland; which is itself destined to be displaced by the Mercian of the middle district of England.

Upon both of these the Invention of Printing acts as an influence of inordinate power, and brings us to something like the present English. But this is the history of a third form of speech, in the history of which the Northumbrian and West-Saxon forms of speech are left out of sight.

§ 46. '*Anglo-Saxon*' *as opposed to* '*Old English.*'—'*Anglo-Saxon*' has till within the last half century been used generally, and perhaps universally, as the name for that stage of the English Language which preceded the Norman Conquest.

It has meant the English of England in its oldest known form, and it has meant nothing more. That it has denoted a different language from the most modern form of the present language has never been imagined. But, of late, there has arisen the opinion that it has a tendency to engender the notion that the Anglo-Saxon is one language, and the English another; or, at least, that it is a term which disguises the identity and the continuity of the two. It is difficult for a mere looker-on to say how far this error is real, or how far imaginary; whether it is held by the many or the few; and finally whether it is held by those whose obliquity of understanding need be humoured. It is certain, however, that no small amount of attention has been paid to the question; and that the claims of the term 'Old English' have been advocated with some learning, and with much zeal.

As early as 1852 a writer in the Gentleman's Magazine (April and May) proposed the following change: that—

1.	From A.D.	550 to 1150	the Language	should be called	*Old* English.
2.	,,	1150 to 1350	,,	,,	*Early* English.
3.	,,	1350 to 1550	,,	,,	*Middle* English.
4.	,,	1550 to 1852	,,	,,	*New* English.

That the use of the term *Anglo-Saxon* in its *original* sense has any chance of being abandoned, is, in the opinion of the present writer, improbable. Its original sense was the 'Saxon of *England*' as opposed to the 'Saxon of *Germany*;' and this last is called *Old* Saxon, or the language *Antiquorum* Saxonum, by Beda himself. Paulus Diaconus uses *Anglo-Saxon* for the *Saxon of England*.

As the name of the English of Alfred and Ælfric—the classical or standard English of the times before the Norman Conquest—it can be more easily dispensed with; and so it can for the few extant remains of the *Northern* dialect. For these the terms *West-Saxon* and *Northumbrian* may be used with advantage; and Kemble, for one influen-

tial writer, has already used them. For the *Midland* dialects the word has never been used; inasmuch as there are no early Midland compositions.

§ 47. But, besides this, there is the new term *Semi-Saxon*. The class itself being divided between two different dialects (for the Ormulum is Mercian, while the other two are West-Saxon), is so little likely to be permanent that the merits of the name scarcely claim investigation.

That the term *Anglo-Saxon* will always be opposed to *Old* Saxon is probable; and it is also probable that, where the more special terms West-Saxon or Northumbrian are unsuitable, it will hold its ground as the most convenient term in numerous general and indefinite questions. What these are is best known to those who have to investigate them.

When the matter is thus put in the simple form of a question of convenience, there should not be much to say about the comparative merits of the two terms in the abstract. That the existing name for the language is *English* is beyond doubt; but whether it is applicable to every stage and form of the language represented by the occupants of South Britain is a matter on which the Scotch and Americans, not to mention the philologists, have something to say.

That the Lowland Scotch was called English in the fifteenth century to distinguish it from the Gaelic of the Highlands we know; but we also know that it is not called *English* now.

Semi-Saxon is, in my mind, a useful word. It certainly favours the notion that *Anglo*-Saxon is more of a different language from the current English than it really is; but, on the other hand, it indicates the connection between the two. It also gives us the first undoubted instance of a Non-West-Saxon composition (the Ormulum) interfering with the predominance of the *West*-Saxon. The period itself, too, is a convenient one. It is separated from the *concluding*

part of the Anglo-Saxon Chronicle by the whole reign of Henry II.; and it contains, at least, three works of bulk and importance with well-marked transitional characters.

There is another period, also, which is certainly more natural than either the *Old* or the *Middle* English: the reign of the three Henrys; or the interval between the brilliant reign of Edward III. and the Invention of Printing. It coincides with a marked decline of English, and a rapid culmination of the Scotch. It begins with the deaths of Chaucer and Gower; the latter of whom is the last writer who composed a work of any magnitude in French. It coincides with a decided preponderance of Northumbrian and Mercian compositions over West-Saxon.

§ 48. The English as a member of a family of languages is only one of a large group.

Of the allied forms of speech on the Continent, the *Old* Saxon of Westphalia is the nearest. Only, however, so far as it is known; and this is but imperfectly. The Old Saxon should be compared with the English in its West-Saxon form.

Next to this comes the *Frisian*. This we know in three stages—the Old, the Middle, and the New. It is only the Old Frisian and the Old English that need be compared. Any one who can read the English of the times before the Norman Conquest can read the Old Frisian. It is more like the *Northumbrian* English than the West-Saxon. Where it differs from the West-Saxon, it, in many points, agrees with the Norse or Scandinavian. This is what we expect from its geographical position.

The *Norse* or *Scandinavian* includes the literary languages of Denmark and Sweden, with their several dialects. It is best represented in its oldest form by the Icelandic. The Feroic of the Farö Isles belongs to this class. The affinities between the Norse and the Frisian, and of both with the Northumbrian of Great Britain, have introduced many complicated questions in the history of the English in general; especially in reference to the Northern dialects.

§ 49. The Old Saxon area is bounded by the Frisian and Danish on the North and West, and by the *High* German on the South and East.

This means that the Old Saxon is *Low* German. It lies nearest to the *Dutch* of the Netherlands, and to the *Platt-Deutsch* dialects of Northern Germany.

The present literary language of Germany, or the High German, is less closely allied to the English than the *Platt-Deutsch* forms of speech.

All these forms of speech are divided into stages; and it is in their oldest stages that they are most advantageously compared with the English in *its* oldest stage—Northumbrian or *West-Saxon*, as the case may be.

§ 50. The Norse differs from the languages of Germany Proper and England by having a Passive Voice, and what is called a *Post*-positive Article. Thus:—*a*. *En* Sol is *a* sun. Sol-*en*—*the* sun. *Et* Bord is *a* table. Bord-*et*—*the* table.

This is not a mere *transposition* of the same Article. The *In*definite *en* is the Numeral; *et* is its Neuter form. The Definite Danish *en* is the English *he*; *et* is the English *it* (*hit*), *i.e.* the Masculine and Neuter forms of the Demonstrative Pronoun.

b. Jeg kal*le*=*I call*. Jeg kalle-*s*=*I am called*;—as voco and voc*or* in Latin. The final *s* is the Reflective Pronoun *sik*, abbreviated and incorporated.

§ 51. *The Mœsogothic*.—There is another branch of the German family which, notwithstanding the opinion that it is to be classed as *Low* German, I prefer to place in a class by itself. Of its importance there can be no doubt.

It is the oldest of all the German forms of speech: for it was written as early as the last quarter of the 4th century. This applies to the mere date of the earliest specimens of it.

It is equally the oldest if we look to its structure.

But it is known in one stage only. It begins with the

Fourth Century, and by the end of the Seventh every vestige of it has disappeared. There is no dialect throughout the whole of Germany of which we can say, 'This is a modern, or middle form of the Gothic;' for so the language under notice is named—Gothic or Mœsogothic.

Moreover it has never been definitely and unanimously traced to the soil of Germany. It is German, but in what part of Germany it originated no one knows. At least there is no unanimity of opinion.

Nevertheless, it is the representative of the German Language in its oldest form, and there is no language in the German family which can be explained in some of its important details in the way of Inflection without a reference to it.

Such is a sketch of its general character, and such the reasons for giving it what at first may appear an undue prominence.

What we know of its external history is as follows:—

At the beginning of the Third century a German population was known on the northern side of the Lower Danube, in what was then called the Province of Dacia; now the Danubian Principalities, or Wallachia, Moldavia, and Bessarabia. The Goths became formidable to the Romans. They crossed the Danube, and invaded the north-eastern provinces of the Empire. They defeated the Emperor Decius in a great battle. They ravaged the coasts of Greece and Asia Minor. They continued formidable; and the Province of Dacia, to the North of the Danube, was surrendered by the Emperor Aurelian to the so-called Barbarians. Here the Goths establish a Kingdom; and we know, in respect to its geography, that the valley of the river Dniester belonged to it:—that it was probably the central part of it. They break up into two divisions—each with three names. They were called Ostrogoths or Visigoths from their geographical positions; Amalungs or Baltungs from the name of the *royal dynasty*; and Grutungs or Thervings from the names

by which they seem to have designated themselves. However, collectively, they are called, by the Romans, Goths.

In the last quarter of the fourth century they cross the Danube; nominally by permission of the Romans, but actually as a nation of warriors going forth to conquer. By A.D. 412 they have sacked Rome under Alaric; and initiated one Kingdom in France, and another in Spain. This division is that of the *Visi*goths.

In the latter half of the century the Ostrogoths, under *Theodoric*, make themselves masters of Italy.

But, though conquerors in three countries, they lose their language in all. It is smothered (so to say) by the Latin of the three conquered countries.

They are never heard of, from first to last, in Germany.

By the end of the Fourth Century these Goths were converted to Christianity—the Christianity of the Greek Church and of the Arian heresy.

This conversion was accompanied by a translation of the Scriptures: the Alphabet being founded on the *Greek*.

Of the translation, dating from the last quarter of the Fourth Century, we have remains, viz., the greater part of the Four Gospels.

The particular division of these Goths who seem by their conversion to have been transformed from warriors into peaceful villagers, settled in a district near Philippopolis in the Roman Province of *Mœsia*. The translation of their Scriptures is attributed to their Bishop, Ulphilas.

Hence, *Mœsogothic*, or the language of their *Ulphiline Gospels*, is the ordinary name for the chief fragment (the most important, though not the only one) of the language of these great Gothic conquerors.

§ 52. Its exact place in the classification of the German forms of speech is of less importance than the structure of their language.

1. It has a sign for the Nominative case; like the Greek and Latin. The Old High German and the Ice-

landic have the same. But it is wanting elsewhere. However, in both the High German and the Icelandic the sign is *-r*. In Mœsogothic it is the older form *-s*.

2. It has a reduplicate Perfect Tense also, like the Latin and Greek.

3. It has a Passive Voice. So have the Scandinavian languages. But this (as aforesaid) is really a Middle, which was originally a Reflective.

§ 53. The German Class, although so large and comprehensive, is itself but a single member of a large Class, Group, Family, or Order: the oldest name for which was Indo-Germanic; the next in order Indo-European; the newest Aryan.

Of this group there are, at least, five divisions besides the German which are referred to, as a matter of course, in all works upon any German language; and, *vice versa*, works upon the Slavonic, Lithuanic, Latin, Greek, or Sanskrit refer to the German. These members of the Indo-European Class not only mutually illustrate each other, but are so frequently used in illustration that even in so special a work as the present they must be noticed. About the exact dimensions, however, of the class nothing will be said. There are certain points connected with it upon which there is no absolute unanimity of opinion. Upon the place of the six groups under notice there is no doubt whatever.

§ 54. *The Slavonic.*—The Slavonic division is represented by the Russian and the Polish, as the languages of which the general reader hears most. But the *native* language of Bohemia, the *Czekh* (pronounced *Tsẖekh*), as it is called in opposition to the Germans, is one that has, of late years, greatly risen in both political and literary importance. Then comes the *Servian*, from which, notwithstanding the close geographical contact, we must separate the *Bulgarian*, which is a very well marked form of speech. Like the Russian and the Servian, it is written in an alphabet of Greek origin. To the languages of this division belongs the *Old* Slavonic,

or the language in which the first translation of the Scriptures was made. The Servian language is one that is not so definitely divided from the Russian on one side, and the Slavonic dialects of the Austrian Empire, as the other languages of the family are from each other; and when we trace the Servian of the Eastern Church westwards, we find that the division is political rather than philological. The alphabet, however, of the Austrian Slavonic is of Roman, as opposed to Greek, origin. The Austrian provinces here under notice are Istria, Dalmatia, Carniola, and Carinthia. In the two latter the people call themselves Slovenzi (or *Slovenians*), and this word may be used for the whole group, though from its resemblance to *Slavonic* it is not a convenient one. These Slovenians to the south of the Baltic must not be confounded with the *Slovaks* and *Ruthenians* of Upper Hungary and Gallicia. The *Slovak* is a form of the Tshekh (Bohemian) of Moravia; the *Ruthenian* is Russian.

Besides these languages there are two others which, like the Cornish of Cornwall in the last century, are mere fragments of an older language; which in the ninth century was spoken over the whole of the districts to which they belong. The first is the *Sorb*, or *Sorabian*, of Lusatia and part of Brandenburg, falling into two dialects. The second is the *Kassubic*, spoken in a few villages of the eastern part of Pomerania. This is wholly separated from the great area of the rest of the family.

Lastly, there was spoken in the last century, in the parts about Kostrow, Lüchow, and Danneberg, a fragment of the old Slavonic of the Duchy of Lunenburg.

§ 55. *The Lithuanic Language.*—This class falls into divisions: (1) the Lithuanic, and (2) the Let.

(1.) In the fifteenth century the Lithuanic language extended as far westwards as the Vistula, so that *East* Prussia, at least, was Lithuanic. Of the Lithuanic of East Prussia, or the *old* Prussian, we have only a Catechism, the Lord's Prayer, and Creed, dating from the time of the

Reformation. The great centre of the Lithuanic language at present is Samogitia, or the Russian Government of Kovno. The next great Lithuanic occupancy is the north-eastern part of East Prussia, the parts about Insterburg, Gumbinnen, and Tilsit. There are also fragments of the language in the governments of Vilna, Vitepsk, Polotsk, and Grodno.

(2.) Courland, Livonia, and parts of Estonia are the Let districts.

§ 56. *The Latin Family.*—Important as is the Latin in itself, it is still more so in its descendants; for the Latin is the mother-tongue of the following forms of speech.

The *Italian*; of which some of the dialects are *philologically* languages, e.g., the Sardinian, and more than one of the Piedmontese dialects.

Of the *Languages of the Spanish Peninsula* the chief are the Spanish and the Portuguese; but between these as *languages*, the difference is political rather than philological. Meanwhile the form of speech in Catalonia and Valencia is provincial rather than either Spanish Proper, or Castilian, or Portuguese.

The French.—Politically this includes all the so-called dialects of France; but the Provençal of the south is, philologically, a different language from the true French of the north.

The *Rumanyo.*—This is the language of the Danubian provinces (Wallachia and Moldavia), Bessarabia, and parts of Transylvania and Buckovinia, *i.e.*, the old Roman province of Dacia.

The *Romance*, Rumonsch, of the Grison districts in Switzerland.

§ 57. *The Greek.*—Upon this it is not necessary to enlarge. In its modern form it is called the *Romaic*.

§ 58. *The Sanskrit.*—This is the literary and religious language of *Brahminical* India: the literary and religious *language of the Buddhists* of Ceylon, Burma, Siam, Pegu,

Cambojia, and Tibet being the *Pali*, a closely allied form of speech. The *Zend*, or language of the Zendavesta, the great canonical book of the old Persian creed, is another member of this group. From the antiquity of its structure, and from the richness of its literature, a very high value is put upon the Sanskrit. Its form, or stage, is that of a language of great antiquity, and so is that of the Pali and Zend. Upon the extent to which this class illustrates the change from an older stage to a newer, there has of late risen a difference of opinion; and it is clear that the matter is an important one. Is the Sanskrit a language like the Latin, the Greek, or the English, which we can trace through a long series of periods and point to certain recent forms of speech as its lineal descendants, or is it a language, like the Mœsogothic, that ends in the same condition as it begins, with no lineal descendants, or no languages that stand to it in the same relation as the English to the Anglo-Saxon, or the Italian to the Latin? Are the existing languages of Northern India derivatives of the Sanskrit, like the French from the Latin, or are they languages of a different origin into which an inordinate amount of Sanskrit elements has been introduced? The older opinion, and the opinion at present of a decided majority, is in favour of the former of these views; that of a recent and comparatively small minority is in favour of the second. In the present work it is sufficient to speak of this very important class as constituted by the '*Sanskrit and its derived languages, whatever they may be.*'

§ 59. Something has been said about the original languages of Britain as opposed to the alien language introduced from Germany; and more would have been said if the work were a larger one. Something, too, has been said about the language of the Roman conquerors who held the island for upwards of four hundred years. With both these the Germans, or English, came in contact. What came of this contact? What was the action and re-action between the languages thus brought side by side? Was it

much or little? Was it attended with intermixture of blood? If so, to what extent? It is well known that on this point there are extreme opinions, and that some of them run far beyond the domain of philology. Are we a mixed race? Were we conquered wholly, or only half denationalized? Does our language help us in the investigation? If it do, what does it tell us? This is a question with which the present work has, fortunately, little to do. Upon the character, however, of the language which resulted, either through or in spite of the contact, there is but one opinion. The English is not an equivocal or ambiguous language; it is not Keltic and German mixed in such proportions as to make its character indefinite. It is, in this respect, scarcely a mixed language at all. Nothing short of the minutest philology can trace any Keltic element in it. It contains much that is not German. But this is not Keltic; and neither the other extraneous elements nor the Keltic besides can make the speech of England other than English—and English means German.

PART II.

ORTHOËPY AND ORTHOGRAPHY.

§ 60. In *speaking*, we represent our ideas and thoughts by means of *words*; which words are composed of certain elementary *sounds*. In the word *go* there are two such; in the word *got*, three; and so on. As long as we limit ourselves to speaking, these elementary sounds are all that require notice. They address themselves to the *ear*.

They are capable, however, of being represented by certain signs called *letters*; by which we are enabled not only to speak, but to *write*. Letters address themselves to the *eye*. In the word *go* the letter *g* is the sign of its first, the letter *o* the sign of its second, sound.

Orthoëpy signifies the right *utterance* of words. It deals with language as it is *spoken*, and determines how a word is to be *pronounced*. *Orthography* signifies the right use of *letters*. It deals with language as it is *written*, and determines how words should be *spelt*.

All languages were spoken long before they were written; and, at the present moment, there are numerous forms of speech which have never been reduced to writing at all. Hence, letters come later than the sounds they express, and orthography is subordinate to orthoëpy.

But as a picture never exactly represents the object from which it is taken, so the orthography of a language never exactly represents the orthoëpy; in other words, there is always some difference between language as it is spoken and language as it is written. Sometimes there are more

sounds than letters. Sometimes words change their pronunciation as they pass from one people or from one generation to another; whilst no corresponding change is made in the manner of writing them. Sometimes fresh sounds from other languages are introduced; and, as no fresh letters are brought to represent them, they must be represented, as they best may, by the letters already in use.

§ 61. The elementary sounds in the English language as at present spoken are as follows:—

Vowels.—*A.*—1. The sound of the letter *a* in *ah*, *father*, &c.

2. The sound of the letter *a* in *fate*, *bate*, *ale*, *pale*, *bait*, *ail*, *snake*, *snail*, &c.

3. The sound of the letter *a* in *fat*, *pat*, *bat*, *that*, *hat*, *patting*, &c.

E.—4. The sound of the *e* in *bed*, *beck*, *less*, *net*, *netting*, &c.—This is a short quick sound. It is expressed by the letter *e*.

I.—5. The sound of the *e* in *feet*, *need*, *seed*, *seek*, *leak*, *seat*, *beat*, &c.—This sound is often considered as allied to the preceding one and as a long variety of it. It is, however, the long form of the vowel sound next about to be mentioned; namely,

6. The sound of the *i* in *tin*, *pity*, *pitted*, *stick*, *kick*, &c.—This sound is often considered as allied to the sound of *i* in *pine*, *shine*, &c., and as a shortened variety of it. It is, however, a shortened form of the sound of *e* in *feet*.

U.—7. The sound of the *oo* in *cool*, and of the *o* in *move*, *prove*.

8. The sound of the *u* in *bull*, *full*, *pull*, &c.—Although these two last-mentioned sounds are expressed in spelling by different letters, they are evidently allied in utterance. They are both varieties of one and the same sound, pronounced rapidly in the one case, and slowly in the other. The two sounds bear the same relation to each other as the *a* in *fate* bears to the *a* in *fat*, and the *ee* in *feet* to the *i* in *fit*.

O.—9. The sound of the *aw* in *bawl*, of the *au* in *haul*, and of the *a* in *hall*, *all*, *talk*, &c.—This sound is generally expressed by the letter *a*, either alone, as in *all* and *ball*, or combined with some other letter, as in *haul* and *bawl*. The expression, however, is faulty, and conceals the true nature of the sound. Its real relation is to the two sounds that will next be mentioned, to which it stands in the same relation that the *a* in *father* does to the *a* in *fate* and the *a* in *fat*.

10. The sound of the *o* in *note*, *boat*, *float*, *no*, *so*, &c.

11. The sound of the *o* in *not*, *knot*, *knotty*, &c.

12. The sound of the *u* in *but*, *nut*, &c.

Semi-Vowels.—13. The sound of the letter *w* in *wo*, *will*.—This sound is evidently allied to the sound of the *oo* in *cool*. Some writers consider it identical, and assert that the words *will* and *oo-il* are sounded alike. It is, however, convenient to consider the *w* in *will* as a separate independent sound.

14. The sound of the letter *y* in *ye*, *yes*, *yet*.—This sound is evidently allied to the sound of the *ee* in feet. Some writers consider it identical, and assert that the words *yet* and *ee-et* are sounded alike. It is, however, convenient to consider the *y* in *yet* as a separate independent sound. The sounds expressed by *w* and *y* are called *semi*-vowel (*i.e. half*-vowel) sounds, or *semi-vowels*.

Mutes.—*P*, *B*, *F*, *V*.—15. The sound of the letter *p* in *pin*, *pit*, &c.

16. The sound of the letter *b* in *bin*, *bit*, &c.

17. The sound of the letter *f* in *fin*, *fit*, &c.

18. The sound of the letter *v* in *van*, *vane*, &c.

T, *D*, *TH*, *DH*.—19. The sound of the letter *t* in *tin*, *tip*, *teal*, *neat*, &c.

20. The sound of the letter *d* in *din*, *dip*, *deal*, *need*, &c.

21. The sound of the letters *th* in *thin*, *thick*, *through*, *cloth*, *moth*, &c.—It is here necessary to mark the difference that exists between the speaking and the spelling. The

sound of the *th* in *thin* is a simple single elementary sound, and, as such, should be expressed by a simple single elementary letter. Instead of this, it is expressed by two letters, or by a combination; so that, although a simple sound to the ear, it has the appearance of being a compound one to the eye.

22. The sound of the letters *th* in *thine*, *them*, *than*, *clothe*.—Respecting this sound the reader's attention is called to two points:

1st. That like the sound last mentioned, it is a simple single elementary sound, expressed, not by a simple single elementary sign, or letter, but by two letters, or a combination.

2nd. That, although different from the sound last mentioned, it is spelt precisely in the same way.

The *th* in *thin* is allied to the sound of *t*, as in *tin*.

The *th* in *thine* is allied to the sound of *d*, as in *din*.

K, *G*.—23. The sound of the letter *k*, as in *kill*, *keep*, *oak*, &c.

24. The sound of the letter *g*, as in *go*, *gun*, *log*, *egg*, &c.

25. The sound of the letter *s*, as in *sin*, *seal*, *yes*, &c.

26. The sound of the letter *z*, as in *zeal*, *buzz*, *blaze*, &c.

27. The sound of the letters *sh*, as in *shy*, *shine*, *short*, *ash*, *bush*, &c.

28. The sounds of the letter *z* in *azure*, *z* in *glazier*, and the *s* in *pleasure* are identical.

NG.—29. The sound of the letters *ng*, as in *king*, *sing*, *ring*, &c.

H.—30. The sound of the letter *h*, as in *hot*, *hear*, *hop*, &c., consists of a simple breathing.

Liquids.—31. The sound of the letter *l* in *leg*, *kill*, &c.

32. The sound of the letter *m* in *mat*, *cram*, &c.

33. The sound of the letter *n* in *net*, *none*, &c.

34. The sound of the letter *r* in *row*, *bear*, &c.

Here ends the list of the *simple* single elementary sounds in the English language.

Compound Sounds.—Of these, there are six; four are compounded by means of a vowel, and two by means of a consonant.

The compound sounds formed by vowels fall into two divisions.

Compounds formed by means of a vowel and the semi-vowel *w*.—These are two in number:

1. The sound of the letters *ou* in *house*, *mouse*, &c.—The nature of this compound is disguised by the spelling. It consists of the sound of the *a* in *father*, followed by that of the *w* in *will*, rapidly pronounced.

2. The sound of the letters *ew* in *new*. The nature of this compound is disguised by the spelling. It consists of the sound of the *i* in *pit*, followed by that of the *w* in *will*, rapidly pronounced.

Compounds formed by means of a vowel and the semi-vowel *y*.—These, also, are two in number:

1. The sound of the letter *i* in *pine*, *fine*, *find*, *mind*.—The nature of this compound is disguised by the spelling; since it is represented by means of the single letter *i*. The real elements of the sound in question are generally considered to be the sound of the *a* in *fat*, followed by that of the *y* in *yet*, rapidly pronounced.

2. The sound of the letters *oi* in *voice*, *noise*.—The nature of this compound is sufficiently, although not exactly, represented by the spelling. Its real elements are the *aw* in *bawl*, and the *y* in *yet*.

The compound sounds formed by the union of a *vowel and a semi-vowel* are called diphthongs.

The compound sounds formed by the union of two *consonants* are two in number:

1. The sound of the letters *ch* in *chest*.—This is really the sound of *tsh* rapidly pronounced.

2. The sound of the letter *j* in *jest*.—This is really the sound of *dzh* rapidly pronounced. The letter *g*, as in *gibbet*, also represents this sound.

§ 62. When the passage of the air is either free, or only partially closed, the stream of air passes without interruption, and so forms the sound which we call the *vowels*. The vowels can all be pronounced with the mouth partially open and with the breath in an uninterrupted stream.

The elementary sounds called *consonants* have the following peculiarity. They are unable to form even the shortest word or syllable without the aid of a vowel. Thus, the vowels *a* or *o* are capable of being used as syllables, and so are the combinations *ba* or *lo*. But the single sounds of *b'*, or *l'*, if taken by themselves, cannot form a word, or even a syllable.

In order to understand this difference, it is necessary to take some mute consonants and to pronounce them as independently of any vowel as it is possible to do. We must try to give a sound to such single consonants as *p'*, *t'*, &c. In attempting this, we shall succeed in making an imperfect sound.

Now, if the mute consonant so taken and uttered be one of the following, *p*, *f*, *t*, *th* (as in *thin*), *k*, *s*, or *sh*, the sound will be that of a *whisper*. The sound of *p*,' *t*' is that of a man speaking *under* the natural pitch of his voice.

But if the mute consonant so taken and uttered be *b*, *v*, *d*, *th* (as in *thine*), *g*, *z*, or *zh*, the sound will be that of a man speaking at the *natural pitch of his voice*.

§ 63. Those that are sounded like *p*' and *f*', &c., are called the *Surd* mutes.

Those that are sounded like *b*' and *v*', &c., are called the *Sonant* mutes.

Surd.								Sonant.							
p	.	.	f		k	.	.	—	b	.	.	v	g[2]	.	.	—
t	.	.	th[1]		s	.	.	sh	d	.	.	th[3]	z	.	.	z[4]

Rule.—When two mutes of different degrees of sonancy come together in the same syllable, they form a sound that is incapable of being pronounced.

[1] As in *thin*. [2] As in *gun*. [3] As in *thine*. [4] As in *azure*.

This rule may be verified by practising a few combinations according to the arrangement of the preceding table; wherein it may be observed that the surd mutes are arranged on the left, the sonant mutes on the right hand. Having clearly recognized the distinction between the two, let us proceed.

Surd.						Sonant.					
p	. .	f	k	. .	—	b	. .	v	g[2]	. .	—
t	. .	th[1]	s	. .	sh	d	. .	th[3]	z	. .	z[4]

Taking whatever letter we may from the one side of the double line, and joining it immediately, in the same syllable, with any letter whatever from the other side of the double line, we find the combination unpronounceable.

aba,	*avt,*	*abth,*	*avth.*
agt,	*agp,*	*agf,*	*ags.*
apd,	*afb,*	*apv,*	*afd.*
atb,	*akd,*	*akz,*	*akb.*
asd,	*ashd,*	*asg,*	*ashg,* &c.

Of course, combinations of this sort can be *written*, and they can be *spelt;* they cannot, however, be pronounced, each sound remaining unchanged.

In order to become *pronounced*, a change must occur; one of the sounds must change its character, and so accommodate itself to the other. This change takes place in one of two ways; either the first of the two sounds takes the degree of the second, or else the second takes the degree of the first. Thus, *abt* becomes pronounceable either by *b* becoming *p*, or by *t* passing into *d;* in other words, it changes either into *apt* or into *abd.* So on with the rest.

av	becomes either	*aft,*	or	*avd.*	*apd*	becomes either	*apt,*	or	*abd.*
abth	„	„	*apth,*	„	*abdh.*	*asd*	„	„	*ast,*	„	*azd.*
agt	„	„	*akt,*	„	*agd.*	*ashd*	„	„	*asht,*	„	*azhd.*
ags	„	„	*aks,*	„	*agz.*	*asg*	„	„	*ask,*	„	*azg.*

This change is necessary and universal. It holds good not for the English alone, but for all languages. The only

[1] As in *thin.* [2] As in *gun.* [3] As in *thine.* [4] As in azure.

difference is, that different languages change different letters; that is, one language accommodates the first letter to the second, and so turns *agt* into *akt;* whilst another accommodates the second letter to the first, changing *agt* into *agd.*

§ 64. There is no fact that requires to be more familiarly known than this; since there are, at least, three formations in the English language where its influence is most important. These are the Possessive forms in *-s*, the Plurals in *-s*, the Preterites in *-d* and *-t.*

The *s* in the word *stags* is surd; the *g* in the word *stags* is sonant. Notwithstanding this, the combination *ags* exists. It exists, however, in the *spelling* only. In *speaking*, the *s* is sounded as *z*, and the word *stags* is pronounced *stagz.* Again, in words like *tossed*, *plucked*, *looked*, the *e* is omitted in pronunciation. Hence the words become *tossd*, *pluckd*, *lookd*, &c. But this combination exists in the *spelling* only; since the preterites of *pluck*, *look*, *and toss*, are, in *speech*, pronounced *pluckt*, *lookt*, *tosst.*

§ 65. Next to knowing that two mutes of different degrees of sonancy cannot come together in the same syllable, it is important to know that two identical sounds cannot come together in the same syllable.

In illustration of this, we may take a word ending in *p*, *t*, or *s*, such as *tap*, *bat*, or *mis*. To add a second *p*, a second *t*, or a second *s*, is impracticable. At the first glance this statement seems untrue. Nothing, apparently, is commoner than words like *tapp*, *batt*, *miss.* However, like the combinations indicated above, these are, in reality, combinations in *spelling* only; they have no existence in pronunciation. We have only to attempt to pronounce *bat't*, *sap'p*, &c. to prove this.

§ 66. To express these twenty-eight sounds in writing, there are, in English, the following twenty-six letters: *a e i o u w y p b f v t d k g s z h l m n r j c q x.* It is, therefore, easy to see that there are in English more sounds to be expressed in writing than there are letters to express them by.

From these twenty-six letters, however, we must subtract the following—

1. The letter *j*, as in *jest*; since it is not one of the twenty-eight *simple* elementary sounds that this letter is the sign of. The subtraction of the letter *j* reduces the number of letters expressive of the *simple* sounds to twenty-five:

2. The letter *c*; since it expresses only what is as well expressed by either *s* or *k*. The words *city* and *can* are pronounced *sity* and *kan* respectively. The subtraction of the letter *c*, reduces the number of letters expressive of the simple sounds to twenty-four:

3, 4. The letters *q*, and *x*; since *q* is only *kw*, and *x* is only *ks*. The words *queen* and *box* are pronounced *kween*, and *boks*, respectively. The subtraction of the letters *q* and *x* reduces the number of letters to twenty-two.

We have now seen that for * twenty-eight simple elementary sounds there are only twenty-two simple elementary letters; consequently, six of the simple elementary sounds have no sign or letter corresponding to them. These are,

1. The *u* in *but*.
2, 3. The *th* in (*a*) *thin*; in (*b*) *thine*.
4. The sound of the *sh* in *shine*.
5. The sound of the *z* in *azure*.
6. The sound of the *ng* in *king*.

§ 67. The English Alphabet is,

1. *Redundant*. It contains three superfluous letters, *viz*. *c*, *q*, and *x*.

2. *Deficient*. It wants signs for the six sounds mentioned in § 66.

3. *Inconsistent*. It expresses the double sound of the first letter in *jest* (*dzh*) by a single sign, and the single

* See § 68. Here the list gives *forty* sounds: eleven of the vowels, however, are reducible to modifications of *a*, *e*, *i*, *o*, and *u*; whilst the last six sounds are *Diphthongs*.

sounds of the first letters in *thin*, *thine*, and *shine*, by two signs (*th* and *sh*).

There are other faults in the English Alphabet and the English method of spelling, which it is not necessary here to enlarge upon. For many of these a sufficient, though not satisfactory, reason can be exhibited.

§ 68. Recapitulation.

Vowels.	1.	The sound	of the	letter	*a*	in	*father.*
,,	2.	,,	,,	,,	*a*	,,	*fate.*
,,	3.	,,	,,	,,	*a*	,,	*fat.*
,,	4.	,,	,,	,,	*e*	,,	*bed.*
,,	5.	,,	,,	,,	*e*	,,	*glebe.*
,,	6.	,,	,,	,,	*i*	,,	*pin.*
,,	7.	,,	,,	,,	*o*	,,	*prove.*

,,	24.	,,	,,	,,	*g*	,,	*guns.*
Sibilants.	25.	,,	,,	,,	*s*	,,	*seal.*
,,	26.	,,	,,	,,	*z*	,,	*zeal.*
,,	27.	,,	,,	letters	*sh*	,,	*shine.*
,,	28.	,,	,,	letter	*z*	,,	*azure.*
Nasal.	29.	,,	,,	letters	*ng*	,,	*king.*
Breathing.	30.	,,	,,	letter	*h*	,,	*hot.*
Liquids.	31.	,,	,,	,,	*l*	,,	*low.*
,,	32.	,,	,,	,,	*m*	,,	*mow.*
,,	33.	,,	,,	,,	*n*	,,	*no.*
,,	34.	,,	,,	,,	*r*	,,	*row.*

Diphthongs.	35.	The sound of	the	letters	*ou*	in	*house.*
„	36.	„	„	„	*ew*	„	*new.*
„	37.	„	„	letter	*i*	„	*pine.*
„	38.	„	„	letters	*oi*	„	*voice.*
Sibilants.	39.	„	„	„	*ch*	„	*chest.*
„	40.	„	„	letter	*j*	„	*jest.*

The last two sounds of this list are *Compound Sibilants*; inasmuch as they are made up out of those of *tsh* and *dzh* respectively. They are, in fact, *Consonantal* Diphthongs, though the term Diphthong is generally limited to *Vowel* combinations.

§ 69. *Accent.*—The following words are accented on the first syllable—*ánchor*, *árgue*, *hásten*, *fáther*, *fóxes*, *smíting*, *húsband*, *márket*, *vápour*, *bárefoot*, &c.

In *brigáde*, *preténce*, *harpoón*, *reliéve*, *detér*, *assúme*, *besoúght*, *beréft*, *befóre*, *abroád*, *abóde*, *abstrúse*, &c., the accent is on the last.

I. Words where the unaccented syllables are to the accented syllables as one to one:

a. Accent on the first syllable,—*ánchor*, *árgue*, &c.

b. Accent on the second syllable,—*harpoón*, *brigáde*, &c.

II. Words where the unaccented syllables are to the accented syllables as two to one:

a. Accent on the first syllable,—*fórtify*, *mérrily*, *cheérily*, *pítiful*, *déstitute.*

b. Accent on the second syllable,—*disáble*, *endeávour*, *repúlsive*, *replénish.*

c. Accent on the third syllable,—*cavaliér*, *disembógue.*

d. Words with their accent on the *fourth syllable from the end* are rare; because, quadrisyllables have generally two accents, as *Eúropéan*; or one on the third syllable from the end, as *inquísitive.* Still, there are a few words, like *orthodoxy*, &c., where the accentuation is *órthodoxy*, and not *órthodóxy*. *Three*, however, as a general rule, is the greatest number of syllables for which a single accent is sufficient.

§ 70. Words like *harpóon* and *cavaliér*, where the accent

is on the last syllable, are comparatively rare in English. This is because the ordinary place of the accent is on the most fundamental syllable of the word to which it belongs; secondary additions, whether affixes, like the *-ly* in *mánly*, the *-ness* in *neárness*, &c., or prefixes, like the *be-* in *bespéak*, the *with-* in *withóut*, &c., being unaccented.

As *af*fixes, or additions to the end of a word, are commoner in English than *pre*fixes, or additions at the beginning of one, the tendency of our grammar is to throw the accent *back*, *i.e.* towards the beginning of words of more than one syllable, rather than towards their end.

§ 71. The same was the case in Latin; where, as most words ended in an inflectional, or some similar superadded syllable, the accent was thrown back. In the Latin, however, before it became French, many of these unaccented syllables dropped off; and words like *civíl-is*, *natión-is*, and many others, became *civíle*, *natión*, and the like. The French, then, abounds in words whereof the last syllable is accented; and, hence, it will be found that most of the words like *cavaliér*, *brigáde*, and the like—words with their accent on the last syllable—are of French origin.

The derivatives of the word *týrant* well illustrate the conflict between the claims of the most fundamental part of the word to keep the accent, and the difficulty of throwing it as far back as the fourth syllable from the end: (1) *týrant*; (2) *týranny*, not *tyránny*; (3) *tyránnical*; (4) *tyránnically*. Nevertheless, we say *tyránnic*, not *týrannic*; probably on the precedent of *tyránnical*. Here we have as many as *three* manifestly superadded syllables.

§ 72. Certain words, in other respects identical, are Nouns when the accent is on the *first*, Verbs when it is on the last, syllable—*e.g.*, *an ábsent man* as opposed to *I absént myself*; *aúgment*, *augmént*; *cómpound*, *compoúnd*; *súrvey*, *survéy*; *tórment*, *tormént*; &c., &c.

PART III.

ETYMOLOGY.

§ 73. *Etymology of two kinds.*—There are two kinds of Etymology.

(1.) One treats of such connections as that between words like *pater* and *father*; *patres* and *fathers*. These belong to different languages, and are not derived from one another. The *-s* in both is the sign of the same case; and the radical parts of the two are the same. But their history is that of two *concurrent* forms; and the common origin must be sought in some older form of speech. This is Comparative Etymology.

(2.) The other treats of such connections as *patres* and *pater*; *fathers* and *father*. Here one of the two words is derived from the other, and both forms belong to the same language. This is Grammatical Etymology; with which the present treatise will have the most to do.

Etymology deals with *single* words and the various forms they may take. It is, in doing this, opposed to *Syntax*, which treats of two or more words in combination.

§ 74. But, as two words are often combined into one, we have a department of grammar intermediate to the two divisions. This is called Composition. It is sometimes difficult to say where the combination of two separate words ends, and the fusion of the two into one begins. Composition, however, is generally and properly considered to belong to Etymology.

Composition takes place when two separate words are joined together so as to form a single word, as

day-light	dog-star	English-man
nut-brown	father-like	pea-cock.

§ 75. *Derivation* takes place when a word is either changed by the addition of some new elementary sound, or by the alteration of one previously existing.

hunt-*er*	drunk-*ard*	*be*-spoke
wood-*en*	spin-*ster*	chick-*en*.

Composition implies the addition of *whole words*; Derivation, the addition of *parts of whole words*, either real or possible.

§ 76. Certain Derivatives are called *Inflections*. These present themselves in nouns and verbs only. They are the forms by which we determine gender, number, case, voice, mood, tense, and person, and will be considered in detail in the sequel.

The Inflection of a noun is called its *Declension*. Nouns are *declined*.

The Inflection of a verb is called its *Conjugation*. Verbs are *conjugated*.

§ 77. *Transitional forms.*—All these divisions run into one another; though not to an extent which should embarrass us if a few preliminary notices are borne in mind.

Grammatical combinations may be made in such a manner that it is difficult to determine whether two separate words are in contact with one another, and combined by the rules of Syntax, or in a state of Composition. Thus in *all blúck bírds are* not *blúckbirds*, what is *blackbird?* Is it a pair of separate words or two words combined into one? Again in *Thursday*, is the combination one like *man's hat* in which the *-s* is the sign of a genitive case, and the case is one of Syntax; or is *s* a mere connected link by which the two elements of a compound are united? It may be either. In questions of this kind it is the *accent* helps us. In the

ordinary syntactic combination each word keeps its own accent, as *blác̀k bír̀d*. In composition one gives way to the other—*blác̀kbird*, *Thúrsday*.

Composition often simulates derivation when, after the union of two distinctly separate words, one of them either changes its form or becomes obsolete. Thus *manly* looks more like a derivative than a compound. But it is only a shortened form of *manlike*. Again, the *ric* in *bishop-ric* is no longer current as an ordinary term in English. Yet, when it was first attached to the word *bishop*, it was as truly a separate word as *kingdom*, *domain*, or *jurisdiction*, or any other substantive.

With instances like those just given the process of reducing derivation to composition is an easy matter. All that is required is a certain amount of knowledge of the language in its earlier stages. This is wanted for *bishopric*. But in the word *manly* less than this will be enough. We have only to *consider* a little, and its connection with *manlike* strikes us at once. The words *gentlemanly* and *gentlemanlike* are still more to the purpose. With a little knowledge, then, and a little consideration, we can do much—so long as the word is a *dis*syllable—for we can separate its component parts, even if we do no more. But *mono*syllables may also be, in respect to their origin, compounds. Here the analysis is more perplexing. Words like *not*, *such*, and *which* are not easily picked to pieces. Yet, common words as they are, and monosyllables as they are, they are *compounds*. *Not* is a compound of the negative element *n'*, and *whit* (as in *not a whit*). It is *n' aught*, which is again compounded of a prefix *â-*. *Which* is, in Scotch, *whilk*; in German, *welch*; and *such* is in Scotch *swilk*, and in German *solch*, where the *lk* (*lch*) is the word *like*. Here, we get derivation, as opposed to composition in its most characteristic form.

In Frisian the form is simpler still; the elements *so* and *like* being reduced to *sok*. From *thilk*=*the like*, found

both in Scotch and our provincial dialects, the *l* is similarly ejected, and *thec* in the local dialects of the South-western counties represents the compound.

Composition.

§ 78. Substantives preceded by Substantives.—*Day-star, land-slip, light-house, fir-tree, goose-grass, sea-man, collar-bone, earth-nut, fire-wood, moon-light.*

Substantives preceded by Adjectives.—*Blind-worm, free-man, half-penny, grey-beard, quick-silver, holy-day.*

Substantives preceded by Verbs.—*Turn-spit, dare-devil, turn-coat.*

Substantives preceded by the form in *-ing*.—*Turning-lathe, sawing-mill.*

Adjectives preceded by Substantives.—*Sin-ful, thank-ful, blood-red, eye-bright, coal-black, snow-white, nut-brown, heart-whole, ice-cold, foot-sore,* &c.

Adjectives preceded by Adjectives.—*All-mighty, two-fold, many-fold,* &c.

Adjectives preceded by Verbs.—*Stand-still, live-long.*

Verbs preceded by Verbs.—*Hear-say.* Rare.

Present Participles* preceded by Adjectives (with an adverbial power).—*All-seeing, all-ruling, soft-flowing, fast-sailing, merry-making.*

Past Participles preceded by Adjectives.—*New-born, free-spoken, fresh-made, new-made, new-laid.*

Present Participles preceded by Substantives.—*Fruit-bearing, music-making.*

Past Participles preceded by Substantives.—*Heaven-born, bed-ridden, blood-stained.*

Verbal Substantives preceded by Substantives.—*Man-eater, woman-eater, kid-napper, horn-blower.*

Verbal Adjectives preceded by Substantives.—*Mop-headed, chicken-hearted.*

* See §§ 140–144. These will explain a difficulty which is only indicated here, viz., the ambiguous import of the termination *-ing*.

Verbal Adjectives preceded by Adjectives.—*Cold-hearted, flaxen-haired, hot-headed, curly-pated.*

§ 79. **Adverbs entering into composition are of two sorts:**

1st. Those that can be separated from the word with which they combine, and, nevertheless, appear as independent words; as *over*, *under*, *well*, **in** *over-do*, *under-go*, *well-beloved*, **&c.**

2nd. Those that, when they are separated from the verb with which they combine, have no independent existence as separate words; *e.g.* **the syllables** *be-*, *un-*, *a-*, **in** *be-hove*, *be-fit*, *be-seem*, *be-lieve*, *be-lie*, *be-smatter*, *be-smear*, *be-get*, *be-labour*, *be-do*, *be-gin*, *be-gird*, *be-hold*, *be-mourn*, *be-reave*, *be-deck*, *be-think*, *be-mire*, *be-rhyme*, *un-bind*, *un-do*, *un-loose*, *un-lock*, *un-wind*, *a-light*, *a-rouse*, *a-rise*, *a-wake*, *a-wak-en*, *a-bet*, *a-bide*.

Derivation.

§ 80. **Addition of a Vowel.**—*Ba-by* **from** *babe*—*Dogg-ie*, *lass-ie*, *mous-ie*, *wif-ie*.

Addition of L.—*Gird-le*—*mick-le*—*spark-le*.

Addition of R.—(1) *Laugh-t-er*, *slaugh-t-er*; (2) *gan-d-er*; (3) *lay-er*, *fodd-er*; (4) *hunt-er*, *sinn-er*.

Verbs—*Hind-er*, *low-er*.

Addition of N.—**Substantives.**—*Maid-en*, *mai-n* (**as in** *might* **and** *main*). **That the** *-n* **is no part of the original word in** *mai-n*, **we see from the word** *may*. **The idea in both** *may* **and** *mai-n* **is that of** *power*.

Adjectives.—**Words of this sort express the circumstance of the object to which they are applied, being** *made of the material of which* **the radical part of the derivative is the name: thus,** *gold-en* **is a derivative from** *gold*, **the material of which** *golden guineas* **are made. So, also,** *oak-en*, *ash-en*, *beech-en*, *braz-en*, *flax-en*, *gold-en*, *lead-en*, *silk-en*, *wood-en*, *wooll-en*, *hemp-en*, *wheat-en*, *oat-en*, *wax-en*.

Addition of the sound of O, originating in *-ow* **or** *-ov*, **and spelt in the present English** *-ow*.—**By comparison with**

shade and *mead*, the forms *shad-ow* and *mead-ow* are shown to be derivative.

Addition of T.—1. Substantives.—*a.* Words which in A. S. ended in *-t*, *gif-t*, *shrif-t*, *thef-t*, *wef-t* (*weave*), *rif-t*, *drif-t*, *thrif-t*, *fros-t* (*freeze*), *gris-t* (*grind*), *fligh-t*, *sigh-t*, *draugh-t* (*draw*), *weigh-t*.

b. Words which in A. S. ended in *-ta*. The compounds of the word *wright* (from the root *work*, in the old past tense *wrought*); such as *cart-wrigh-t*, *wheel-wrigh-t*, *mill-wrigh-t*, &c.

2. Adjectives.—*Tigh-t* (*tie*).

Addition of D.—Substantives.—*Bran-d* (*burn*, *brenn*, obsolete), *floo-d* (*flow*), *mai-d* (*may* in Lowland Scotch), *see-d* (*sow*), *bur-d-en* (*bear*).

2. Adjectives.—*Col-d* (*cool*).

Addition of TH (A. S. þ as sounded in *thin*).—Substantives.—*Dea-th*, *bir-th* (*bear*), *heal-th*, *leng-th*, *bread-th*, *heigh-t*, *dep-th*, *mir-th*, *tru-th*, *weal-th*, *fil-th*, *til-th* (*tillage*, or *tilled ground*), *ki-th* (as in the phrase *kith and kin*).

2. Adjectives.—The syllable *-cou-th* in the compound word *uncou-th*. This word originally means *unknown*, originating in the word *ken*=to *know*.

Addition of TH (A. S. ð) as sounded in *thine*. *Bur-th-en*, derived from *bear*.

Addition of the sound of the Z in *zeal* and the S in *flags* (*flagz*).—Verbs.—*Cleanse* (*clenz*), from *clean*. In A. S. *clæn-s-ian*.

Addition of the sound of K.—*Hill-ock*.

Addition of the sound of the vowel E (as in *feet*), originating in *-ig*, and spelt in the present English *-y*.—All the derivative adjectives that now end in *-y*, ended in A. S. in *-ig*; as *blood-y*, *craft-y*, *drear-y*, *might-y*, *mist-y*, *mood-y*, *merr-y*, *worth-y*, of which the A. S. forms were *blôd-ig*, *cræft-ig*, *dreór-ig*, *might-ig*, *mist-ig*, *môd-ig*, *myr-ig*, *worth-ig*.

Addition of *-en*, or *-in*.—*Vix-en* = *female fox*.

Addition of the syllable *-ing*.—*Farth-ing* (¼), *rid-ing* *

* As the *Three Ridings of Yorkshire*.

($\frac{1}{3}$, a corruption from *thrith-ing*). Also, *cleans-ing*, *dawn-ing*, *morn-ing*. In these words the *-ing* was originally *-ung*; as *clæn-s-ung*, *dag-ung*, A. S.

Addition of the syllable *l-ing*.—*Gos-l-ing* (*little goose*), *duck-l-ing* (*little duck*), *dar-l-ing* (*little dear*), *hire-l-ing*, *found-l-ing*, *fond-l-ing*, *nest-l-ing*, &c. The words of this class are generally diminutives, or words expressive of smallness.

Addition of the syllable *-kin*.—*Lamb-kin* (*little lamb*), *man-i-kin* (*little man*). Words ending in *-kin* are chiefly diminutives.

Addition of the syllable *-rel*.—*Cock-erel* (*little cock*), *pick-erel* (*little pike*).

Addition of the syllable *-ard*.—*Drunk-ard*, *stink-ard*.

Addition of the syllable *old*.—*Thresh-old*.

Addition of the syllable *-ern*.—*East-ern*, *west-ern*, *north-ern*, *south-ern*.

Addition of the syllable *-ish*.—*Child-ish*, *Eng-lish*, *self-ish*, *whit-ish*. The original form was *-isk*; *cild-isc* (*child-ish*), *Engl-isc* (*Engl-ish*), A. S.

Addition of the syllable *-ness*.—*Good-ness*, *bad-ness*, *wicked-ness*, *bright-ness*, *dark-ness*, *weari-ness*, *dreari-ness*, &c.

Change of the sound of a *consonant*.—*Price*, *prize*; *cloth*, *clothe* (pronounced *clodhe*); *use*, *use* (pronounced *uze*); *grass*, *graze*; *grease* (pronounced *greace*), *grease* (pronounced *greaze*). In each of the pairs of words given above, the former is a substantive, and the latter a verb.

Change of the sound of a *vowel*.—*Rise*, *raise*: *lie*, *lay*: *fall*, *fell*: *sit*, *set*. The generality of these words are verbs. There are, however, a few nouns; as *top*, *tip*; *cat*, *kit*.

Here the sense is generally that of a Diminutive.

§ 81. The termination *-ry* in words like *rookery*, *fishery*, &c., presents some difficulty. It is clear that the *-r* forms no part of the original word; for, though there is such a word as *fisher*, *fisherman*, there is no such word as *rooker*. Neither does *fishery* mean a collection of *fishermen*, but one of *fishes*. *Yeomanry* and *Jewry* are words of similar

origin and meaning. They carry with them the idea of a collection, or assemblage. The words *Englishry*, *Danishry*, and *Welshery* are to be found in old authors. They are, however, at present obsolete. *Eyrie* is generally said to mean the nest of an eagle. It rather means a *collection of eggs*, or *eggery*; for such is the old form of the word.

What, however, is the *-r?* In the old Dutch and other allied dialects, we find a kind of plural in *-r*. Thus *cealfru=calves*; *lambru=lambs*; *eggru=eggs*. Indeed, in one word it occurs in provincial and archaic English, viz. *childer=children*. Out of this *-r*, with the addition of the sound of *-y*, has the termination *-ry* in the words above given originated.

In other words, however, this origin is inadmissible; and the idea of collection or assemblage is either obscure or non-existent. Such are *foolery*, *prudery*, *bravery*, *slavery*, *witchery*, *stitchery* (*needlework*), &c. In all these the *-ry* has originated out of a false analogy.

§ 82. Derivation by means of the addition of the syllable *-ster.*—*Song-ster*, *pun-ster*. Originally words in *-str-* were limited to the names of females, and were opposed to the substantives in *-er*, the names of *male* agents. Thus, in A. S.,

sangere, a male singer	were opposed to	sangestre, a female singer.
bæcere, a male baker		bæcestre, a female baker.
fidelere, a male fiddler		fidelestre, a female fiddler.
webbere, a male weaver		webbestre, a female weaver.
rædere, a male reader		rædestre, a female reader.
seamere, a male seamer		seamestre, a female seamer (or *seamstress*).

The single word *spin-ster* still retains its feminine force.

Inflection.

§ 83. Inflection is a special part of Derivation. It consists of (1) the Declension of Nouns, and (2) the Conjugation of Verbs. We begin with Nouns.

The declension of a noun gives its signs of (1) Gender, (2) Number, (3) Case.

The words *boy* and *girl*, *father* and *mother*, *horse* and *mare* are the names of living beings of different sexes—*boy*, *father*, and *horse*, the names of males; *girl*, *mother*, and *mare* of females.

In grammar, however, instead of saying that the word *boy* is a *male* word, and the word *girl* a *female* word, we use the terms *masculine* and *feminine*; and we say that *boy* is a word of the masculine gender, and *girl* a word of the feminine gender. But besides such objects as *boys* and *girls*, which are either male or female, there are in the world a vast number of objects, such as *swords*, *bows*, *shoes*, *iron*, &c., that are neither male nor female. These objects have names, and these names are very often neither masculine nor feminine, though they are sometimes supposed to be endowed with sex, and made either males or females. Words of this sort, that are neither masculine nor feminine, are said to be of the neuter gender. We may say then that there are three genders; the masculine, the feminine, and the neuter. The masculine denotes males; the feminine, females; and the neuter *things*, or objects that are neither male nor female. We can now apply this to the words mentioned above. In the English substantives and adjectives there is no true Inflection indicative of Gender; words like *man*, *woman*, *he-goat*, *she-goat*, &c., being approximations only. In Anglo-Saxon, however, this Inflection existed, and even in the language as it is spoken at the present time, exists among the Pronouns. Thus—

The two words *him* and *her* are of the same number, in the same case, and from the same nominative. Yet they are different words, and they differ in meaning; the first being applied to *males*, the second to *females* only.

Have you seen your brother?—Yes, I have seen him.

Have you seen your sister?—Yes, I have seen her.

Now this difference of form gives a true inflection of

gender, and it is one of the peculiarities of pronouns to be changed, not only in the way of case and number, but in the way of gender also.

§ 84. *Number.*—In the following phrases we speak of a single object; that is, of one object and of no more than one; *a father, my father, this father, one father; a son, my son, this son, one son; a horse, this horse, that horse, my horse, one horse.* Here the words *father, son,* and *horse,* appear in a simple form, without the addition of any letter or syllable whatsoever. But this is not the case with words like *these father-s, these son-s, these hors-es,* &c. Here we speak of more objects than one; that is, of *two* (or more) *fathers,* of *two* (or more) *sons,* and of *two* (or more) *horses*; and hence the letter *s* is added to the words *father, son,* and *horse* respectively. Now in the Latin language the word *singularis* means *single;* so that the forms without *s,* such as *father, son,* and *horse,* denoting respectively *one father, one son, one horse,* and no more, are called *singular* forms, and are said to be in the *singular* number. On the other hand, in the Latin language the words *plus* and *pluralis* mean *more* or *many;* so that the forms with *s,* like *father-s, son-s,* and *hors-es,* denoting respectively *two* (or more) *fathers, two* (or more) *sons, two* (or more) *horses,* are called *plural* forms, or are said to be in the *plural* number. In the English language we may therefore say that there are two numbers, the singular and the plural. The singular speaks of one (*a father*), and the plural speaks of more than one (*fathers, books*).

§ 85. *Case.*—We may arrive at a knowledge of the nature of cases by examining the structure of the following propositions.

He is striking him;—these words form a proposition, of which *he* is the subject, *is* the copula, and *striking him* the predicate. Now *he* and *him,* although the same parts of speech, of the same gender, and of the same number, appear *in* different forms. In one there is the presence, in the

other the absence, of the letter *n* (*he*, *hi-m*). The reason of this is because the two words are in different cases. The same takes place with *they are striking them*. We cannot say *him is striking he*, nor yet *them is striking they*. We cannot even say, *him is striking*, *them are striking*. If we examine farther, we shall find that *he* and *they* can, by themselves, form terms; since we can say not only *he is striking*, but *this is he*, and *these are they*. On the other hand, *him* and *them* can only form *parts* of terms: as *he is striking them*, *they are striking him*. Such is the difference in meaning between the words *he* and *him*.

When the words differ from each other in meaning in the way that *he* and *him*, *they* and *them* differ, it is the habit, more or less, of languages to express this difference of meaning by a difference of form. This is done with the words just quoted; where *he* and *they* take one form, and *him* and *them* another. Differences of this sort, expressed by difference of form, are said to constitute cases. The word *he* is in one case (the nominative), the word *him* in another (the accusative or objective). So it is also with *they* and *them*.

A noun is said to be in the nominative case when it can by itself constitute a term. The words *he* and *father* are nominative cases; since we can say, *he is speaking*, *father is coming*, *this is he*, *this is father*.

They fought with a sword.—Here there is the substantive *sword* accompanied by the word *with*. In many languages, however, the word *with* would be omitted, and the word *sword* change its form. The Anglo-Saxon for *they fought with the sword*, was *feohton sweord-e*, where no such word as *with* appeared in the sentence, but where the additional syllable *-e* served instead. This constituted in Anglo-Saxon a particular case.

This is a picture of John.—Here there is the substantive *John* accompanied by the word *of*. In many languages, however, the word *of* (or its equivalent) would be omitted, and the word *John* would change its form. This would

constitute a fresh case. The meaning of the sentence *this is a picture of John* is, *this is a picture of which John is the subject* (or *original*).

§ 86. These three inflections, viz. Gender, Number, and Case, belong to the declension of nouns. They are true Inflections, which the following are *not*.

Difference of sex expressed by composition.—

Male.	Female.
he-goat	*she*-goat
cock-sparrow	*hen*-sparrow
man-servant	*maid*-servant.

Here objects of different sexes are expressed by *partially* different words, and the result is a compound.

Difference of sex expressed by derivation.—The words in the first column are the names of males, those in the second of females.

Male.	Female.	Male.	Female.
actor	actr-*ess*	duke	duch-*ess*.
lion	lion-*ess*	peer	peer-*ess*.

Here the names of females are formed from those of males by the addition of the syllable *ess*. The result is an ordinary derivative; of *French* origin.

When we come to the *conjugation* of *verbs* we shall meet with other Inflections, viz., those of Person, Tense, and Mood. Of these the first two are the most truly Inflectional, in the present English. The Infinitive Mood has lost its original termination *-en*; and so has the Conjunctive. Of this mood the signs for all the Persons except the Third Singular are the same as those of the Indicative. The difference between *he speaks* and *if he speak* is neglected; and, even adhered to, it gives us only a *negative* sign of Mood, i.e., the omission of the *s* of the Indicative.

Inflection, etc., of Pronouns.

§ 87. *The Pronouns—why considered first.*—The pronouns come first under notice on account of the fulness of their declension. They are not, however, in this respect all alike.

Words like *some*, *same*, *each*, &c., have no more signs of gender, numbers, or case than the adjective; and this means that they have none at all. *Self*, *one*, and *other* are declined like substantives.

But the (1) demonstrative, (2) interrogative, and (3) relative pronouns, which are all declined on the same principle, have a true distinction of gender, and, at least, three oblique cases.

The demonstrative, interrogative, and relative pronouns have all a neuter in *t*, a possessive in *s*, objectives in *m*, *n*, or *r*, according to the gender; *it*, *what*, *his*, *whose*, *him*, *whom*, *when*, *her*, *where*. *I-t*, *tha-t*, and *wha-t* are true neuter signs; *t* being the original sign of the neuter gender. In the present Danish, Swedish, Norwegian, and Icelandic, and in the old Norse and Mœso-Gothic, *all* neuter *adjectives* as well end in *-t*.

§ 88. Demonstratives.—The demonstrative pronouns derive their name from the Latin word *demonstro*=*I show*, or *point out*.

Of demonstrative pronouns there are three varieties, viz.:

1. True demonstratives.—*This*, *that*, *yon*.

2. Demonstratives which partake of the nature of the personal pronouns—*he*, *she*.

3. The definite article, *the*.

True demonstratives.—*This* applies to comparatively near; *that* to comparatively distant; *yon* to remote objects.

Yon is undeclined. *This* and *that* are declined in respect to number only.

The old and proper plural of the demonstrative and definite article *þe*, *þio*, *þæt*, was *þá*, *þæ*, *tha*, *thea* or *tho*, without any sound akin to that of the semivowel *y*, as in *they*. This was when *he* had a plural number (*hi*, *heora*, *heom*) of its own; now superseded by *they*, *their*, *them*. When this plural of *he* became obsolete, a double change affected the plural of *þe*: (1) the vowel *á* became *-eɜ*, *-ɛ̀i*, or *-ey*—

þeȝȝ, *thei*; (2) þá, þo took the affix *-s*, the forms *they* and *those* being the result.

He is found in the singular number only.

	Masculine.	Feminine.	Neuter.
Nominative:	*he*	—	*it.*
Possessive:	*his*	*her.*	*it-s.*
Objective:	*him.*	*her.*	*it.*

She is now undeclined.

The nature of the demonstrative pronouns is only understood through their history. In the older stages of our language, the words *this* and *that* were fully declined and had both possessives and objectives. More than this, they had two other cases; the dative and the instrumental. To say that this inflection is wholly lost, would be inaccurate. It still exists, though in an altered form and as a different part of speech.

Certain words, which at the present time are adverbs, were originally demonstrative pronouns. Thus:

There was a dative case, of the singular number and feminine gender, meaning *in that direction;* the word *direction* being understood.

Then was in the objective case, masculine gender, and singular number. It meant *at that time; time* being understood.

The word *the* in such expressions as *all the more, all the better, the more the merrier,* is more remarkable still. It means *by so much;* and was, originally, an instrumental case. The Anglo-Saxon form was þy (*thy*); corresponding in power to the Latin *eo* (*eo majus*). Its present identity of form with the definite article is accidental; the origin of the two words being different.

In like manner, *here* was the dative feminine of *he;* and meant *in this direction* or *place.*

It, in its present form, has no evident connection with *he;* of which, however, it is the true neuter. The older form is *hit.*

Its is a strange word and a new word. The original neuter possessive was *his* for the masculine and neuter genders. From a comparison by Mr. Watts of the different versions of the Bible it appears that 'so lately as 1611—the date of the issue of the authorized version—the word did not exist, or, at all events, was not considered to belong to that elevated portion of the language regarded as suitable for the translation of the sacred writings.'

And thei shulen take the iacyntyn mantle with the which thei shulen cover the candelstik with the lanterns and *her* (*their*) toonges & snyters.—*Wicliffe.*

Thei schulen also take a meatie of iacynt, with which thei shulen hile (cover) the candelstike with these lanternes and tongis and snytels. —*Purvey.*

And they shall take a cloth of jacyncte and cover the candelstick of light and *her* lamps and *her* snoffers and fyre pans and all *hir* oyle vessels which they occupy about *it*, and shall put upon *her* and all *her* instrumentes a couerynge of taxus skin and put it upon staues.—*Tyndale*, 1530.

And they shal take a yalowe clothe and cover the candelsticke of light therwith, & *her* lamps with *her* snoffers, and outquenchers.—*Coverdale*, 1535.

And they shall take a cloth of iacincte and cover the candelstycke of lyght and *her* lampes and *her* snoffers and fyre panes and all her oyle vessels which they occupy aboute it, &c.—*Mathews*, 1537.

And they shall take a cloth of blue and cover the candlestick of the light and *his* lamps & *his* tongs, and *his* snuffdishes, and all the oil vessels thereof wherewith they minister unto it.—*Authorized Version.*

The feminine of *he* was *heó*. This has been lost. In Anglo-Saxon, however, the inflection was—

Masculine.	Feminine.	Neuter.
He	*heó*	*hit.*

Beside which there was an accusative form *hine*. *Him* was originally dative.

In the plural the changes have been greater still. Instead of *they*, *their*, and *them*, the Anglo-Saxons said *hi*, *hira*, *hem*; all of which forms were true inflections of *he*, and all of which are now lost. To make up for them, the existing plurals have been borrowed from another quarter.

She was originally the feminine of *se*, and served as the definite article; as *se hlaford=the lord; seo hlafdige=the lady*. At the present time the masculine *se* no longer exists, whilst, in the feminine, *she* stands in the place of the Anglo-Saxon *heo*.

These changes being understood, it is easy to see how inaccurate it is to talk of *she* being the feminine, and *they* being the plural, of *he*. The different words belong to different systems, and are no more the masculines and feminines of one another, than (to use a well-known illustration) *puss* is the vocative case of *cat*.

§ 89. Of the two powers of the pronoun *who*, the *Interrogative* is the older; its use as a *Relative* being secondary.

The neuter form is *what;* the possessive, *whose;* and the objective, *whom*

The adverbs *where* and *when* were originally dative and accusative cases from *who;* in other words, the remarks that applied to *here*, *there*, and *then*, apply to *where* and *when*.

Again,—*why* was originally the instrumental form *hwi;* meaning, *for what reason;* in Latin, *quâ causâ?*

Which is no true neuter, no true inflection. It is a compound of the radical of the relative and the adjective *like*.

The Scotch form still possesses the *l*; as *whilk*. So does the German *welch-e*. *Such* is a similar compound from *so-like*, in Scotch *swilk*, in German *solch*.

Whose.—This is the way of writing *whoes* or *who's*. It disguises to a slight extent the nature of the word, which is, in respect to its sound, as regular a possessive case as *father's* or *man's*.

The relatives, as already stated, differ from the interrogative only in their syntax.

§ 90. *The true personal pronouns*.—*I*, *me*, and *we* denote the *speaker*. *Thou* and *ye* the person *spoken to*.

I is found in the nominative case and singular number only.

Me has no nominative case. Its possessive is *my*, its *objective me*.

Forms of the *first* personal pronoun, *singular*—*I*—*me*, *my*.

Forms of the *first* personal pronoun, *plural*—*we*, *ours*, *us*.

Forms of the *second* personal pronoun, *singular*—*thou*, *thee*, *thy*.

Forms of the *second* personal pronoun, *plural*—*ye*, *you*, *your*.

The true possessive pronouns.—*This is my book; this is a book of mine.* In each of these propositions we make an assertion as to the nature of a *book*. We state what the book is in regard to ownership or *possession*. We assert that it is *my book*, that it is a book belonging to *me*, that it is a book of *mine*, and not any other person's.

Between, however, the words *my*, *thy*, *our*, *your*, *her*, and *their* on one side, and *mine*, *thine*, *ours*, *yours*, *hers*, *theirs* on the other side, there is the following difference. *My*, *thy*, *our*, *your*, *her*, and *their* signify possession, because they are possessive *cases*. *Mine*, *thine*, *ours*, *yours*, *hers*, *theirs* signify possession for a different reason. They partake of the nature of adjectives, and in all the allied languages are declined as such.

In opposition to the words *my*, *thy*, *our*, *your*, *her*, *their*, they may be called the true possessive pronouns. Respecting the difference between these two classes of words, more may be seen in the Syntax. Those who are familiar with the classical languages may at once comprehend the distinction. *My* and *thy* are the equivalents of *mei* and *tui*; *mine* and *thine*, of *meus* (*mea*, *meum*) and *tuus* (*tua*, *tuum*); and, like *meus* (*mea*, *meum*) and *tuus* (*tua*, *tuum*), *mine* and *thine* were once declined.

In *hers*, *theirs*, *ours*, *yours*; or *her-s*, *their-s*, *our-s*, *your-s*; the analysis is *he-r-s*, *thei-r-s*, *ou-r-s*, *you-r-s*. Although adjectival in meaning, these *forms originated as cases*; and that since the Anglo-Saxon period. The *-s* is the *s* of the genitive case; so that, in these words, we have a case formed from a case.

§ 91. *One* and *man*.—These are what are called the indeterminate pronouns. The latter has been entirely superseded by the former. Yet they both have the meaning. The one, however, is a word of French, the other of German origin.

a. *One* is the French *on*, as in *on* dit = one (*i.e.* the world at large, or Man in general) says. The older form is *homme*, which is the Latin *homo* = man.

b. Before the Norman Conquest, or during the true Anglo-Saxon period, the word was *man*, just as it is at the present time in German, where *man sagt* = *dit* = *one says* = they say. It presents itself as *mc;* the vowel being changed and the *n* dropped; the dropping of the *n* being conspicuous in the Frisian as a rule, and of the West-Saxon in this particular word; where it is *me*.

The *reflective* pronoun *self* is chiefly connected with syntax. In respect to their etymology, *self*, *other*, and *one* are declined as *substantives*.

	Singular.		
Nominative	self	other	one
Possessive	self's	other's	one's
	Plural.		
Nominative	selves	others	ones
Possessive	selves'	others'	ones'.

That some of these forms are rare is certain. Such expressions, however, as *one is unwilling to put one's friend to trouble*, or *my wife and little ones are well*, or *these are my two little ones' playthings*, are common.

§ 92. The *-s* in *this*, *these*, and *those*.—These three words are *compounds* of the roots *the* and *se*; both Demonstrative. In the word *those* (§ 88) the *-se* is a late addition. In *this* and *these*, however, it is found in the oldest specimens of our language.

Numerals.

§ 93. *Cardinal Numbers*.—It rarely happens that the *whole of the* Cardinal Numbers are, in any language, de-

clined throughout. *One* is naturally singular; so that it has no need to take any particular form in order to distinguish it from a plural. In like manner the rest of the numbers are naturally plural, so that words like *five* and *six* have no need of taking any particular form to distinguish them from singulars. These facts do away with the necessity of any forms expressive of number. The expression of case and gender is not so naturally superfluous; and, hence, in many languages the earlier numerals are declined. In the present English all the cardinals are undeclined. One antiquated word, however, preserves a trace of an earlier Anglo-Saxon declension. The word *twain* was originally the Accusative masculine of *twá* (*twá-n*, A. S. *twegen*).

§ 94. As a *Number*, the word *first* is the ordinal of *one*. As *words* they have no connection. There is no such word as *on-th*; while *fir-st* is a derivative from *fore*. This difference between the Cardinals and the Ordinals of 1, *as words*, is common throughout the class to which the German class of languages belongs. German *ein*, *erste* (derived from *ere*=before); Latin *unus primus*, Greek ἑῖς πρῶτος.

As a *Number*, the word *second* is the ordinal of *two*. As *words* they have no connection. *Second* is the French *second*, from the Latin *secundus*; which is, itself, a form of *sequundus*, from *sequor*=I follow. In English there is no such word as *two-th*. There *is*, however, in German *zwei*, *zweite*. Hence the difference: the Cardinal and Ordinal which we have noticed as very general in the *first* numeral, is less so in the second.

In the word *third* and those that follow, no such differences will occur. The Ordinal will be formed from the Cardinal by the addition of *d* or *th*, subject to slight variations.

§ 95. *Numerals from* 13 *to* 19 *inclusive.*—Here the affix *-teen* is another form of *ten*. It denotes *Addition: i.e. thirteen*=3+10.

§ 96. *Numerals from* 20 *to* 90 *inclusive.*—Here the affix *-ty* is, also, connected with the word *ten*, though not so closely. The fuller form of *ty* is *tig-*; and the *g* in *tig* is the κ in the Greek δεκ-α, and the *c* in the Latin *dec*-em.

Tig means a Collection of Ten, or a Decad, and, so doing, denotes multiplication; *i.e. twen*-ty=2 × 10, or two tens.

Nom. Fjórir tigir manna=4 decads of men.
Acc. Fjóra tiga manna =4 „ „
Dat. Fjorum tigum manna=to „ „
Gen. Fjögurra tiga manna=of „ „

§ 97. *Possessive and Objective as names of English cases.*—*Possessive* is the English name for the *Genitive* case in Latin, Greek, and other languages; and, in English, the two terms are sometimes used indiscriminately. But the alteration is an improvement. In the vast majority of cases the English form in *-s* denotes Possession; thus the *man's hat* means the hat of which the man is in *Possession*. The case is sometimes, perhaps often, used in other senses; but to this of Possession it is *mainly* restricted. It ends in *-s*, *i.e.* takes *'s* as its sign; and, if this were all, there would be nothing more to say about it. But this is not the case. Practically the *man's hat* means the *hat of the man*, and *vice versâ*. Confusion comes out of this. The word *of* passes for the *sign* of the Possessive Case; and there are few who have not considered it as such. But the true sign of the Possessive Case is *'s*; and, in the combination *hat of the man*, the word *man*, whatever else it may be, is *not* a Possessive Case.

The fact is that in *the hat of the man* we have no case at all, but a combination of words instead of one—which is a very different thing. This, alone, is an instance of confusion. But it may be said that *of* governs a Possessive Case, and that, for this reason, the Combination is as truly Possessive as the Inflection. It may or not be this. If it were, however, we should expect, instead of the form *man*, *the Possessive* form *man's*—which we do not find.

This will be further considered in the sequel. At present it is enough to say that *of* is not the sign of a Possessive or Genitive Case, in the way that *'s* is.

§ 98. *The Objective Case.*—Objective, like *Possessive*, is a new name. The innovators, however, who introduced it showed good judgment. They preferred it to the old word Accusative. This was because, though the Objective Case *in the main* coincided with the Accusative, it was, to a considerable degree, made-up out of other Cases as well. The Objective, then, is an Accusative and something more.

§ 99. *Virtual Inflections.*—There was, then, a time when the single case which is now called *Objective* consisted of two, three, or perhaps more cases, each with a name of its own. One of these was, certainly, an Accusative; and another Dative. Indeed, at the present moment, a third case still survives, though only found in Pronouns—*he, his, him.* This last word is called an Accusative. In Anglo-Saxon, however, it was no Accusative, but a Dative; and of the Dative rather than the Accusative *m* was the sign. The sign of the Accusative was *n.* Hence, the form that corresponded with the Latin *eum* was *hene*, whereas *him* =*ei.* Again, in a few old words a genuine Instrumental Case is to be found. All these are now massed together under the general name Objective. Still, there are times when it is necessary to ask to what particular division of the Objective such or such a word should be referred. Few would deny that in such phrases as *give it him, it is like him*, the original Dative character of the form still maintains itself. Such cases may be called Virtual.

Substantives.

§ 100. A Substantive is an *invariable* name, capable of forming, by itself, either the subject or the predicate of a proposition. The Pronoun, as we have seen, can do the same; but the Pronoun differs from the Substantive in being a variable name. See §§ 192–200.

The Declensions of the Substantive are those of (1) Number, and (2) Case.

The Numbers are two—the Singular and the Plural.

The only *Case*, with a distinct sign, is the Possessive; and even this does not distinguish it from the Plural Number—not, at least, in the language as it is *spoken*. This is because both the Nominative Plural and the Possessive singular end in *-s*; so that, when a word like *fathers* or the like stands alone, we have no means of knowing of what the sound *s* is a sign. When it stands in a sentence, and in the relation with other words, its import is more easily seen —for the context helps us. Still there is always the possibility of ambiguity of some kind. In *writing* we remedy this by the insertion of the so-called Apostrophe, *i.e.* an inverted comma. Hence, whilst the *fathers of the families* gives us a Plural Number, the *father's children* means the *children of one father*, and is a Possessive Case. This, however, is not so much a process of Language as an artificial contrivance in the way of a substitute. In unwritten languages it can have no existence.

But the ambiguity in the spoken language did not always exist. The Anglo-Saxon sign of the Possessive was *-es*, *e.g. cyning=king—cyning-es, king's;* while that of the Plural was *-as*, *e.g. cyning-as, kings.*

§ 101. *The Possessive Plural.*—This, like the Apostrophe in the Possessive Singular, is, to a great extent, artificial. In the Anglo-Saxon there was, certainly, a sign of the Possessive Plural; but it was *-a*—not *-s*, as *cyninga=kings'= of kings=reg-um*. Here the present English again addresses itself to the eye, and by altering the place of the Apostrophe we get such forms as the *fathers' children=the children of different fathers.* But between this Plural *s'* and the Singular *'s* there is this notable difference. The Singular *s* is a real one. The *s'* of the Plural has no existence at all; for the *s* in words like *fathers'* is simply the *'s in the s of* the Nominative. If there were a true sign of a

Possessive Case, the full forms would be the *father-s-es children*; the *master-s-es men*, &c. It is probable that if such combinations existed, we should soon drop them, on account of the accumulation of *esses*. But it is also probable that they never existed. In the few words where the Plural does *not* end in the sound of *s*, we have a true Possessive sign—*e.g.* *men's*, *children's*, *oxen's*; and, so far, they are real, rather than artificial.

§ 102. The result of these uses of *s* is that, with few exceptions, it stands for two cases and two numbers. Indeed, as a sign of Inflection, it is the only one which the Declension of the Substantive supplies. Even here, it speaks more to the eye than the ear. We spell it as if it were *s*; but, in the great majority of cases, we sound it as *z*.

In some cases we are obliged to do so—

1. Thus: *slabs*, *slaves*, *lads*, *blades*, *dogs*, &c., are words which we can spell, but which we cannot pronounce. We pronounce them *slabz*, *slāvz*, *ladz*, *blādz*, *dogz*, &c.

2. Words like *hills*, *drums*, *hens*, *bars*, *days*, *fleas*, *bows*, &c. we *can* pronounce as they are spelt; but we do not. The *s*, in all these words, and in all words like them (*i.e.* all words ending a liquid or a vowel), is sounded as a *z*.

3. If the last sound of the singular be that of *s*, *z*, the *sh* in *shine*, or the *z* in *azure*, the addition is that of the sound of the syllable *-ez* (spelt *-es*); as *loss-ez*, *kiss-ez*, *blaz-ez*, *haz-ez*, *blush-ez*, *lash-ez*, spelt *loss-es*, *kiss-es*, *blaz-es*, *haz-es*, *blush-es*, *lash-es*.

The true rule, then, for the Inflections of the Substantive is that it consists of the addition of the *sound of s modified according to the termination of the root.*

§ 103. *Plural of certain words in* f.—The following words end in the sharp mute *f*—*loaf*, *half*, *wife*, *life*, *calf*, *leaf*. Now, according to § 102, their plurals should be formed by the addition of the sound of *s* in *seal*, and so be *loafs*, *halfs*, *wifes*, *lifes*, *calfs*, *leafs* (pronounced *loafce*, *halfce*, *wifce*, *lifce*,

calfce, *leafce*). This, however, is not the case. Their plurals are formed by the addition of the sound of *z* in *zeal*, and are *leaves*, *halves*, *wives*, *lives*, *calves*, *leaves* (pronounced *loavz*, *halvz*, *wivz*, *livz*, *calvz*, *leavz*); the sound of the *f* being changed into that of *v*. Respecting these words we must observe:

1. That the vowel before *f* is *long*. Words like *muff*, where the vowel is short, form their plurals by means of the sounds of the *s* in *seal;* as *muff*, *muff-s* (pronounced *muffce*).

2. That they are all of Anglo-Saxon origin. In the words *mischief*, *chief*, *handkerchief*, *grief*, *relief*, the plural is formed as in *muff*; that is, by the addition of the sound of *s*; *mischiefs*, *chiefs*, &c.

Putting these two facts together, we can use more general language, and say that

When a word ends in the sound of *f*, preceded by a long vowel, and is of Anglo-Saxon origin, the plural is formed by the addition of the sound of the *z* in *zeal*.

To this rule there are two exceptions.

1. *Dwarf;* a word of Anglo-Saxon origin, but which forms its plural by means of the sound of *s*—*dwarfs* (pronounced *dwarfce*).

2. *Beef*; a word *not* of Anglo-Saxon origin, but which forms its plural by means of the sound of *z*—*beeves* (pronounced *beevz*).

If we ask the reason of this peculiarity in the formation of the plurals of these words in *-f*, we shall find that it lies with the singular rather than the plural forms. In Anglo-Saxon, *f* at the end of a word was sounded as *v*; and it is highly probable that the original *singulars* were sounded *loav*, *halv*, *wive*, *calv*, *leav*.

§ 104. *Plural forms in* -ce.—1. The word *penny* should form its plural by means of the sound of *z* in *zeal*. It does so, and consequently, there is the plural form *pennies* (*penniz*). But, besides this, there is the form *pence*.

Now there are two plurals to the word *penny*, because there are two meanings. *Six pennies* means *six separate penny-pieces*. *Six pence*, or *sixpence*, means a *single coin equivalent to six penny-pieces*. This last sense is Collective rather than Plural.

The plural *pence* has a further peculiarity. According to § 102, it ought to end in the sound of *z* in *zeal*, which it does not: it ends in the sound of *s* in *seal*. This serves to distinguish it from the plural of *pen*, which is *penz* (spelt *pens*).

2. *Dice*.—This word ends in the sound of *s* in *seal*, instead of that of *z* in *zeal*. This serves to distinguish *dice* for play from *dies* (*diez*) for coining.

§ 105. *Equivocal forms from Singulars* in s.—The number of the following words has always been a matter of discussion amongst Grammarians.

1. *Alms*.—The -s is no sign of the plural number, but part of the original singular, like the *s* in *goose* or *loss*. The Anglo-Saxon form was *ælmesse*. Notwithstanding this, we cannot say *alms-es* in the same way that we can say *loss-es*. Hence the word *alms* is, in respect to its original form, singular: in respect to its meaning, either singular or plural.

2. *Riches*.—The *-s* is no sign of the plural number, since there is no such *substantive* as *rich*; on the contrary, it is part of the original singular, like the *s* in *distress*. The form in the original French, from which language it was derived, is *richesse*. Notwithstanding this, we cannot say *riches-es* in the same way that we *can* say *distresses*. Hence the word *riches* is, in respect to its original form, singular; in respect to its meaning, either singular or plural: most frequently the latter.

3. *News*.—The *-s* here is *no* part of the original singular, but the sign of the plural, like the *s* in *trees*. Notwithstanding this, we cannot subtract the *s*, and say *new*, in the same way that we *can* form *tree* from *trees*. Hence the

word *news* is, in respect to its original form, plural; in respect to its meaning, either singular or plural: most frequently the former.

4. *Means.*—The *-s* is no part of the original singular, but the sign of the plural, like the *s* in *trees*. The form in the original French, from which language the word is derived, is *moyen*, singular; *moyens*, plural. If we subtract from the word *means* the letter *s*, we say *mean*. Now, as a singular form of the word *means*, with the sense it has in the phrase *ways and means*, there is, in the current English, no such word as *mean*, any more than there is such a word as *new* from *news*. But, in a different sense, there *is* the singular form *mean*; as in the phrase *the golden mean*, meaning *middle course*. Hence the word *means* is, in respect to its form, plural; in respect to its meaning, either singular or plural.

5. *Pains.*—The form in the original French, from which language the word is derived, is *peine*. The reasoning that has been applied to the word *means* is closely applicable to the word *pains*.

6. The same also applies to the word *amends*. The form in French is *amende*, without the *s*.

7. *Mathematics*, *Physics*, *Metaphysics*, *Optics*, *Politics*, *Ethics*, *Pneumatics*, *Hydraulics*, *Hydrostatics*, *Mechanics*, *Dynamics*, *Statics.*—All these words are plural in form; in sense they are either singular or plural.

The words just noticed may be called equivocal forms. In words like *alms* and *riches* the original *s* of the singular is confounded with the *s*, the sign of the plural. In the remainder the *s*, the sign of the plural, is taken for a part of the original singular. This confusion prevents the words in point from having either true singulars, like *new*, *mean*, *pain*; or true plurals, like *riches-es*, *alms-es*.

If the reason of this confusion be inquired into, it will be found,

1. That all the words in question are of foreign origin.

2. That in sense they are partly singular and partly plural. *Alms* means either *a number of separate donations taken severally*, or *a number of separate donations dealt with as a single act of charity*. In the first case the plural, in the second the singular, sense predominates.

§ 106. *Signs of Number not ending in* -s.—Besides the usual plural forms in *s*, there are four other methods in English of expressing a *number* of objects.

§ 107. *Change of vowel.*—This class consists in the present English of the following words:

1. *Man*, singular; *men*, plural. The vowel *a* changed to the vowel *e*.

2. *Foot*, sing.; *feet*, pl. The vowel *oo* (sounded as the *ou* in *could*) changed to the vowel *ee*.

3, 4. *Tooth*, sing.; *teeth*, pl.: *goose*, sing.; *geese*, pl. The vowel *oo* (as in *food*) changed to *ee* as in *feet*.

5, 6. *Mouse*, *louse*, sing.; *mice*, *lice*, pl. The diphthong *ou* changed to the vowel *i* (as in *night*). The combination *ce* used instead of *se*, for the same reason as in *pence* and in *dice*, *i. e.* lest, if written *mise*, *lise*, the words should be pronounced *mize*, *lize*.

§ 108. *Addition of* -en *or* -n.—In the present English the word *oxen* is the only specimen of this form in current use. In the older stages of our language the number of words in *-en* was much greater than at present.

hos-en	=	*hose or stockings*	*scher-en*	=	*shire-s*
shoo-n	=	*shoe-s*	*doghtr-en*	=	*daughter-s*
ey-ne	=	*eye-s*	*sustr-en*	=	*sister-s*
bischop-en	=	*bishop-s*	*uncl-en*	=	*uncle-s*
eldr-en	=	*elder-s*	*tre-en*	=	*tree-s*
arw-en	=	*arrows*	*souldr-en*	=	*soldier-s.*

§ 109. *Childer.*—Here the analysis is child-*er*-*en*, the *en* being the *en* in ox-*en*, and the *er* or -*r*, that of child-*er*, which is the ordinary Northumbrian form. In A. S. the *r* was followed by an -*u*, the sign of the nominative case in the

declension to which the word belonged. *Æg=egg*, *lam=lamb*, *cealf*=calf were thus declined, the plurals being *ægru*, *lambru*, *ceafru*; *eggs*, *lambs*, *calfs*. From the first we get the word *eyry* or *eggery*, applied to the nest of the eagle. To the second we owe the *b* in lam*b*, which is no part of the original word: for when *lam-*, after becoming *lam-er-u*, undergoes contraction, the euphonic insertion of *b* between the *m* and the *r* takes place, and then, because the letter *b* presents itself in the plural, it passes for a part of the simpler singular form.

§ 110. *Combination of two of the preceding methods.*—Three words occur in this class.

1. *Kyne=cows*; a plural formed from a plural by the addition of *-n*; as *cow*, *kye*, *ky-ne*. *Kye* is found in provincial English, and *cý* in Anglo-Saxon.

2. *Children*; a plural formed from a plural by the addition of *en*; as *child*, *child-er*, *child-er-en=children*.

3. *Brethren*; a plural formed from a plural by the addition of *-en*; as *brother*, *brether* (?) or *brethre*, *brether-en=brethren*.

§ 111. When the singular ends in *o*, the plural ends in *oes*; as *cargo*, *cargoes*.

When the singular ends in *y*, preceded by a consonant, the plural ends in *-ies*; as *lady*, *ladies*; *quantity*, *quantities*.

In *youth*, *oath*, *truth*, and *path*, the *th*, though sounded in the singular as in *thin*, is generally sounded in the plural as in *thine*. You*th*, pronounced you*dhz*, not you*thce*. Tru*th*; pronounced tru*dhz*, not tru*thce*. Path, pronounced pa*dhz*, not pa*thce*.

In *house*, the *s*, though sounded in the singular as in *sin*, is sounded in the plural as *z*. *Houses* is pronounced *houzez*.

The plural of *woman* is pronounced *wimmen*.

§ 112. *Current and obsolete processes.*

By adding the sound of the *s* in *seal* to the word *father*, we change it into *father-s*. Hence the addition of the sound in question is the process by which the word *father* is

changed into *fathers*. The process by which *ox* is changed into *ox-en* is the addition of the sound of the syllable *-en*.

Let us suppose that from the Latin, Greek, French, or some other language, a new word is introduced; that it is a substantive; and that it has to be used in the plural number. The formation will be in *-s*, and not in *-en*—the habit of forming plurals in *-s* being *current* or usual, the habit of forming them in *-en* being *obsolete*.

In all languages there are two sorts of processes, those that are in operation at a certain period, and those that have ceased to operate.

§ 113. *The Possessive Case.*—In the language as it is *spoken*, the possessive case singular is the same as the ordinary nominative plural—both ending in *-s*.

Such is the rule, to which there is only one class of exceptions. Words in *f* form their possessive case in the sound of *s* in *seal*; as *loaf's*, *wife's*, *calf's*, and *leaf's*, &c.; sounded *loafve*, *wifve*, *calfve*, *leafve*, and not *loavz*, *wivz*, *calvz*, *leavz*. We say *the wives are good-tempered*, but *the wife's temper is good; the loaves are well-baked*, but *the loaf's baking is good; the calves are well-fed*, but *the calf's feeding is good; the leaves are changing colour*, but *the leaf's colour is changing*.

§ 114. The possessive case singular is distinguished, in the language as it is *written*, from the nominative (or objective) case plural by the insertion of an ' between the last letter of the original word and the letter *-s*; as *father*, *father's*, *fathers*; *the father's son*; *the fathers are speaking*. This, however, is merely a point of spelling. It does not affect the spoken language.

Athough at the present time identical, the possessive case singular and the nominative case plural were originally distinct. The first ended in *-es*, as *endes=end's*; the second in *-as*, as *end-as=ends*. The ejection of the vowels (*a* and *e*) reduces the two words to the same form.

The possessive case plural, when it is formed at all,

is formed, in the *spoken* language, from the nominative case of the same number, in the same way as the possessive case singular is formed; that is, by the *addition* of the sound of *-s*; as *children, children's; oxen, oxen's: the children's bread; the oxen's horns.*

It is rare, however, that in the *spoken* language the possessive case plural differs at all from the nominative case. As the nominative plural generally ends in *-s*, and as the possessive is also formed in *-s*, there would be too many sounds of *s* accumulated in a single word; *e.g.* the possessive plural of *trees* would be *treeses*, and the possessive plural of *fox* would be *fox-es-es;* as the *foxeses tails*. Hence, in the *spoken* language, the nominative and possessive cases plural are alike whenever the former ends in the sound of *-s*.

In the *written* language the difference between the nominative (or objective) case plural, and the possessive case plural, is expressed by the addition of an ' *after* the letter *-s; the trees are in leaf*, but *the trees' leaves are coming out; the ships are in full sail*, but *the ships' sails are spread.*

Adjectives.

§ 115. A word capable, by itself, of forming the predicate, but not capable of forming the subject of a proposition, is called an adjective.

An adjective is not exactly the name of anything, though something akin thereto. In such an expression as *snow is white*, it cannot be said that *white* is a name. That it is a word is certain. It is also certain that it denotes a quality, or attribute. Yet it is not the name of that quality. The name of that quality is *whiteness*. Neither can it be said that *white* is quite equivalent to *white thing*.

White, then, and adjectives like it, are not names. They are, rather, words that suggest names. The true name is the Abstract, *white-ness*.

§ 116. An adjective shows that the substantive with *which* it is united possesses a certain quality. To say that

glass is smooth, clear, brittle, and *bright,* is to say that it possesses the qualities of *smoothness, clearness, brittleness,* and *brightness.*

Qualities may be possessed in different degrees. One piece of glass may be *brighter* than another, another may be *brighter* still, and a third the *brightest* of all. English adjectives, therefore, have degrees of comparison, viz. :—

1. The *positive;* which gives the word in its simple form: as *bright:*

2. The *comparative;* formed from the positive by the addition of *-er;* as *bright-er:*

3. The *superlative;* formed from the positive by the addition of *-est;* as *bright-est.*

§ 117. The sign of the comparative degree is equivalent in meaning to the word *more.* In the word *bright-er,* the syllable *-er* is the sign of the comparative degree; and the word *bright-er* is equivalent in meaning to *more bright.*

The sign of the superlative degree is equivalent in meaning to the word *most.* In the word *bright-est,* the syllable *-est* is the sign of the superlative degree, and *bright-est* is equivalent in meaning to the words *most bright.*

§ 118. The comparative degree is formed from the positive by the addition of the syllable *-er:* as *cold, cold-er; rich, rich-er; dry, dry-er; low, low-er.* We have, also, just seen that *brightest* is the superlative of *bright,* or, we might say, of *bright-er.*

The following positives have no comparative, and also no superlative forms:—*good, bad, evil, ill.* There are in the current English no such words as *good-er, badd-er, evill-er, ill-er;* or *good-est, badd-est, evill-est, ill-est.*

The following comparatives (and superlatives) have no positive forms: *worse, worst; better, best.* There are in the current English no such words as *wor* and *bett.*

The comparative form elder.—The positive form *old* has two comparatives; *a*) *old-er; b*) *eld-er.* A knowledge of the following facts will account for the latter form. In

Anglo-Saxon there were several words, which, besides adding the syllable *-re*, changed the vowel.

A.S. Positive.	A.S. Comparative.	A.S. Superlative.	English.
Lang	Leng-re	Leng-est	*Long*
Strang	Streng-re	Streng-est	*Strong*
Geong	Gyng-re	Gyng-est	*Young*
Sceort	Scyrt-re	Scyrt-est	*Short*
Heah	Hy-rre	Hyh-est	*High*
Eald	*Yld-re*	*Yld-est*	*Old.*

The Anglo-Saxon form *yld-re*, then, explains the English form *elder*. The word *elder* is often used as a substantive. We say *the elders of the people.*

§ 119. *Latter.*—The word *late* has two forms for the comparative degree: (1) *later*, (2) *latter.* In the first the vowel is the *a* in *fate;* in the second, the *a* in *fat.*

More.—As late as the reign of Queen Elizabeth we find the positive form *moe.* From this *more* (*mo-er*) is regularly derived.

Nether.—The positive form *nith* is obsolete. From this, the comparative form *neth-er* (in A.S. *niðere*) is regularly derived. In phrases like *the Netherlands, the nether regions*, the word *nether* means *low*, or *lower.*

Less, lesser.—This form is not satisfactorily accounted for.

Near.—This word, although, in meaning, an adjective of the positive degree, is, in respect to its form, a comparative. The *-r* is no part of the original word. The Anglo-Saxon form is *neah* for the positive; *nea-rre*, *nea-r*, and *ny-r* for the comparative. Speakers who would be shocked at calling an *idea* an *idear*, say *near* for *neah* without misgiving. Hence,

Nearer is, in respect to its form, a double comparative, *nea-r-er.*

Further.—This means *more in front*, or *more forward.* It is derived from the word *fore*, as found in *foremost.* Besides the change of the vowel from *o* to *u* (*fore, fur-th-er*), there is the addition of the sound of *th.* This sound was inserted

in an early stage of language. It occurs in the Old High German forms *vor-d-aro*, *for-d-oro*, *vor-d-ero*, *for-d-ar*, *fur-d-ir*, and in the A.S. *forð*, and English *forth*.

Farther.—This means *more far*, or *more distant*. It is derived from the word *far*, which appears in the following different forms: *fairra*, Mœso-Gothic; *vërro*, *vër*, *fër*, Old High German; *feor*, Anglo-Saxon; *fiarri*, Old Norse. The proper comparative is formed without the *th*; as *vërr-ôr*, *vërr-ôro*, Old High German. In the English word *far-th-er* the *th* is inserted, either because *far-er* is inharmonious, or from the word being confounded with *fur-th-er*.

Former.—A comparative from the original word *fore*. For the insertion of the *m* (*for-m-er*) see § 124.

§ 120. It is necessary to know that in the Mœso-Gothic the comparative degree was formed differently from the comparative degree in Anglo-Saxon, English, and the other allied languages. Instead of being formed by the addition of the sound of *-r*, it was formed by the addition of the sound of *-s* or *-z*.

Positive.	Comparative.	English.
ald	ald-iza	old, old-er
sut	sut-iza	sweet, sweeter
blind	blind-oza	blind, blind-er.

In the latter stages of languages this *s* became *r*.

In the word *worse* we may suppose that there is a remnant of the old comparative in *-s* or *-z*. The Mœso-Gothic form is *váirsiza*, the Anglo-Saxon *vyrsa*.

§ 121. The Superlative degree may be formed from the positive by the addition of the syllable *-est*; as *cold*, *cold-est*; *rich*, *rich-est*; *dry*, *dry-est*; *low*, *low-est*. This is the manner in which the greatest part of the English superlatives are formed.

§ 122. *Best*, *last*.—By comparing these with the words *bett-er* and *lat-er* (or *lait-er*), we discover that the sound of *t* has been lost. The full forms would be *bett-est* and *lat-est*.

Least.—The nature of this form has not been satisfactorily determined.

First.—A superlative from the original word *fore.*

Worst.—By referring to § 120, we shall see that the comparatives in Mœso-Gothic were formed in *-s* or *-z*. We have also seen that the Mœso-Gothic is supposed to exhibit the oldest forms of the languages allied to the English. Hence it is considered that the oldest process for forming the comparative degree consisted in the addition of *-s* or *-z*; and that it was during some later period that the sound of *-s* or *-z* became changed into that of *-r*.

By referring to § 121 it will be seen that the superlative is formed from the positive by adding *-st*, or *s* followed by *t*. Such is the view that in the present English, and in most of the allied languages, it is necessary to take. It is clear, however, that, if the comparative were formed by adding to the positive *s* instead of *r*, a different view might be taken. If the comparative degrees of words like *sweet* and *blind* were *sweet-es* (or *sweet-ez*) and *blind-es* (or *blind-ez*), just as they really were in Mœso-Gothic, we might then say that the superlative was formed from the *comparative* by adding *t*, instead of saying that it was formed from the *positive* by adding *-st*. Now this is the view really taken by J. Grimm, who, on all these points, is a high authority; in which case the word *worst* is a superlative regularly formed from the old comparative form *worse.*

§ 123. *Most.*—See § 119.

Nearest.—See § 119.

Next.—The superlative of *nigh*, contracted from *nighest.* The Anglo-Saxon forms were *neah*, *nyh-st*, *neh-st*, *nyh-ste.* In A. S. the letter *h* was pronounced strongly, and sounded like *g* or *k*. This fact is still shown in the spelling; as *nigh*. In the word *next* this sound is preserved, slightly changed into that of *k*; *next=nek-st.*

Furthest.—See § 119.

Farthest.—See § 119.

Eldest.—See § 118.

§ 124. *Upmost*, &c.—Words like *upmost* look as if they were compounds formed by the addition of *most*.

The Anglo-Saxon language presents us with the following forms; which show that the *m* has nothing to do with the word *most*.

Anglo-Saxon.	English.
innema (inn-ema)	inmost
ûtema (ût-ema)	outmost
siðema (sið-ema)	latest
lætema (læt-ema)	latest
niðema (nið-ma)	nethermost
forma (for-ma)	foremost
æftema (aft-ema)	aftermost
yfema (uf-ema)	upmost
hindema (hind-ema)	hindmost
medema (mid-ema)	midmost.

From the words in question there was formed in Anglo-Saxon, a regular superlative form in the usual manner; *viz.* by the addition of *-st*; as *æfte-m-est*, *fyr-m-est*, *læte-m-est*, *sið-m-est*, *yfe-m-est*, *ute-m-est*, *inne-m-est*.

Hence the *m* is the *m* in the words *innema*, &c.; whilst the *-st* is the sign of the superlative. Hence, we should write

mid-m-ost	*not*	mid-most	fore-m-ost	*not*	fore-most
ut-m-ost	,,	ut-most	in-m-ost	,,	in-most
up-m-ost	,,	up-most	hind-m-ost	,,	hind-most

In *neth-er-most*, &c., there is a superlative super-added to a comparative.

VERBALS AND VERBS.

§ 125. The Verbals are names of actions and of agents.

Hunt-*ing* is the act performed by a hunt-*er*, or the agent.

The Verbal in *-ing* is identical in form with the Present Participle. But it is this only when we compare the later forms of the two words. The Verbal Abstract

in Anglo-Saxon ended in *-ung*, as clæns-*ung*=cleans-*ing*. The Participle ended in *ande*, *ende*, or *-inde*: as clæns-*iande*.

For the present this is nearly all that need be said. We are passing from one of the chief parts of speech to another, from the Pronoun, the Substantive, and the Adjective, to the Verb and Participle. Which class is the most important is difficult to say. The Verb, by many grammarians, is looked upon as the primary part of speech, and from this view it derives its name. The Latin *verbum* means *word*, and the Verb has been held to be pre-eminently *the word* in language. Whether this doctrine be right or wrong need not now be asked. The object of the present remarks is to show that the difference between the two great classes is by no means very great; and, in order to do this, an apparent deviation from the right line of investigation has been resorted to. The Verbal is evidently derived from the Verb; and the Verb is the basis of the Verbal. Yet the Verbal, though a secondary and derived form, has been taken first. However, by thus taking it, we show more clearly the connection between the Verb and the Substantive.

§ 126. A Verb can form, by itself, *both* the Predicate and the Copula of a Proposition; as *I call*; *he speaks*.

Verbs can be resolved into their elements, and that part which coincides with the Predicate can be separated from that which coincides with the Copula. *I call*=*I am calling*; *he speaks*=*he is speaking*.

That part of the Verb which gives the Predicate is called a Participle. *Calling*, *speaking*, *called*, and *spoken* are Participles.

The words which give the Copula are *am*, *art*, *is*, *are*, *was*, and *were*.

In such propositions as *I am speaking*, *thou art writing*, *he is singing*, the words *am*, *art*, *is*, *are*, *was*, and *were* connect the subjects *I*, *thou*, *he*, *she*, *it*, *we*, *ye*, &c., with the predicates *speaking*, *writing*, *singing*, &c.

§ 127. Verbs express actions. Actions are either Intransitive or Transitive.

Intransitive actions imply an agent and an act; as *I sleep*, *I walk*, and *I live*.

Transitive actions imply an agent, an act, and an object acted on; as *I strike the ball*; *he loves his parents*; *Brutus killed Cæsar*.

Certain Transitives have Intransitives with which they correspond, and from which they are formed by changing the vowel. Thus *rise*, *lie*, *sit*, *fall*, *drink*, are Intransitive; *raise*, *lay*, *set*, *fell*, *drench*, Transitive. To *rise* is to *raise oneself*. To *fell* is to *make to fall*.

§ 128. In respect to their inflection Verbs are (1) related to the Substantive, (2) related to the Adjective, and (3) characterized by peculiarities of their own.

So far as the Verb is related to either the Substantive or the Adjective it is Declined. So far as it is characterized by peculiarities of its own it is Conjugated.

The Declension of the Verb in Anglo-Saxon was fuller than it is in the present English.

In Anglo-Saxon there was a true Infinitive Mood which ended in *-an*, as *bærnan = burn*, *lufian = love*. When this was preceded by *to*, *-an* became -enne; as *to lufienne = to love*, *to bærnenne = to burn*.

This will perplex no one who has gone through the elements of the Latin grammar, and knows what is meant by an Infinitive Mood or a Gerund. Such a reader will at once compare *lufian = love* with *amare*; and *bærnan = burn* with *urere*; whilst *to lufienne = to love* he will compare with *ad amandum*; and *to bærnenne = to burn* with *ad urendum*.

Verbs, when Conjugated, have Number, Person, Mood, and Tense.

§ 129. *Number.*—When we say *he read-s*, we speak of an action performed by one person. In this case the Verb is Singular. But when we say *they read*, we speak of an action performed by more than one person. In this case

the Verb is plural. When there is a positive distinction of form between verbs singular and verbs plural, there is a positive sign of Number. In Latin, *voco=I call*; whilst *vocamus=we call.*

§ 130. *Person.*—In the words *thou speakest*, the pronoun *thou* is of the Second Person, and the verb *speak*, when taken along with it, has attached to it the syllable *-est.* The syllable *-est* is an ending or termination. It shows that the word is taken with a pronoun of the second person. It is a positive sign of the Second Person. The sign of the Third Person is *-s*; as *he speaks.*

§ 131. *Tense.*—The forms *call* and *call-ed* are different. The presence of the *-d* is one sign, its absence another—the former being positive, the latter negative. A word with the sign of past, present, or future, time, is said to be in a certain *Tense.* The word *call* is in the Present, the word *call-ed* in the Past Tense.

§ 132. *Mood.*—When we say *John walks*, we state something as a fact. We say positively that the action of walking is going on.

When we say *John! walk!* we give orders for something to take place; *viz.* the action of walking. We do not say that the action of walking is positively taking place, or going to take place. We only express a wish, or give a command, that it should do so.

When we say *if John walk fast he will fatigue himself*, we use the word *walk* in a third sense. We do not say that the action of walking is taking place, or has taken place, or will take place. Neither do we deliver an order that it may take place. We say, however, that *if* it do take place, something else will take place also; *viz.* that the person who causes it to take place will fatigue himself. Now in this case there is the idea of conditions and contingencies. John's fatigue is contingent upon his walking fast.

In *John begins to walk*, the word *walk* is in a different

sense from any of the preceding; for it depends neither upon John, nor upon any conditional conjunctions. It depends upon *begins*. Hence—

In *John walks*, the verb is in the *Indicative Mood*.

In *John! walk!* it is in the *Imperative Mood*.

In *if John walk fast, he will fatigue himself*, the word *walk* is in the *Conjunctive Mood*; in which case the words *he will fatigue himself* form one proposition; *John walks fast*, another. The word *if* connects or conjoins the two, and this connection changes the mood.

In *John begins to walk*, the verb *walk* merely states what the action is that *John begins to perform*. And this is an action without any *direct* agent. That *to walk* is *indirectly* connected with *John* is true. It is also true that the person who *begins to walk* is a *walker*, whilst in such expressions as *John refuses to walk*, or *John ceases to walk*, there is no *walking* at all. All that John does is *to refuse*, or *to cease* to do something; and it is upon the verbs *refuse* or *cease*, *not* upon the substantive *John*, that the *Infinitive to walk* depends.

How slight, however, is the difference between *refusing to walk* and *refusing the action of walking!* Equally slight is the difference between a verb in the Infinitive Mood and a Noun. Slighter still is the difference between *he begins to move, he begins a movement, he begins motion.*

This makes the Declension of the Infinitive Mood, which was prevalent in Anglo-Saxon, and which is still to be found in a fragmentary form in the present English, intelligible. At the present moment the Infinitives like *to err*, though preceded by a Preposition, and originating in an Oblique Case, are, for all practical purposes, Nominatives. When we say—

To err is human; *to forgive*, divine:

we really use—

To err = error; to forgive = forgiveness.

Signs of Number.—§ 133. In the words *a-m*, *speak-est*, *speak-s*, the sounds of *-m*, *-est*, and *-s* denote a difference of person. They also denote a difference of number, since they are found only in the singular. But this they do in a secondary way. They are truly the signs of *persons*. Hence, the only real sign expressive of a difference of number occurs in the past tense of the indicative mood of the verb substantive.

Singular.	Plural.
I was.	We *were*.
Thou wast.	Ye *were*.
He was.	They *were*.

In Anglo-Saxon there were other Verbs that thus changed their vowel in the Plural.

Ic arn, *I ran*.	We urnon, *we run*.
Ic ongan, *I began*.	We ongunnon, *we begun*.
Ic span, *I span*.	We spunnon, *we spun*.
Ic sang, *I sang*.	We sungon, *we sung*.
Ic swang, *I swang*.	We swungon, *we swung*.
Ic dranc, *I drank*.	We druncon, *we drunk*, &c.

Hence, there were no such forms as *ic*, *swumm*, or as *we swammon*. This distinction of number is not adhered to in the present English. It is the author's opinion that the writers and speakers who say *I sang*, say also *we sang*; whilst those who say *we swum*, say also *I swum*.

Signs of Mood.—§ 134. The only instance in English of a verb in one mood being distinguished from a verb in another by any *positive* sign, occurs in the conjugation of the word *was*.

Indicative.		Subjunctive.	
Singular.	Plural.	Singular.	Plural.
I *was*.	We were.	If I *were*.	If we were.
Thou *wast*.	Ye were.	If thou *wert*.	If ye were.
He *was*.	They were.	If he *were*.	If they were.

Note.—Although in *John walks*, as compared with *if John walk, he will be fatigued*, there is a difference between the two verbs; the difference is only a *negative*, and conse-

quently scarcely constitutes a true distinction in form between the two moods.

Signs of Person.—§ 135. *Sign of the First Person Singular.*—In the word *am* (*a-m*) the *m* is no part of the original word. It is the sign of the first Person Singular Present Indicative. Beyond this, no word in English has, in any mood, tense, or number, any form of termination for the First Person.

§ 136. *Sign of the Second Person Singular.*—The usual sign of the Second Person singular is *-st* (originally *-s*), as *thou call-est.* It occurs both in the present and past tenses; *thou called'st, thou spakest.* Like the pronoun *thou*, it is rarely used except in formal discourse.

§ 137. *Sign of the Third Person Singular.*—The usual sign of the Third Person Singular is the sound of the syllable *-eth*, or of the letters *s*, *z* (or *es*); as *he call-eth*, or he *call-s.* The first of these two forms is only used in formal discourse. The Third Person is only found in the indicative mood, and in the present tense. We cannot say *if he speaketh*, or *if he speaks*; neither can we say *he called-th*, or *he called-s*, *he spak-eth*, or *he spake-s.*

Whether the addition be the sound of *s* in *seal* (as *hit-s*), of *z* in *zeal* (as *call-z*), or of the syllable *ez* (as *hiss-ez*), depends upon the same circumstances as the use of the same sounds in the possessive cases, and the nominatives plural.

Throughout the whole of the plural there are no signs of the persons; *i. e.* no changes of form:—*we call, ye call, they call*; *we called, ye called, they called.*

§ 138. In respect to Person the following peculiarities deserve notice.

Forms sungest and *sangest.*—In Anglo-Saxon, the word *sing*, and a great number of words like it, took in the past tense a different vowel for the second person from the one found in the first and third; *e. g. Ic sang=I sang, he sang =he sang*, were the forms for the first and third person

singular. But the *second* person singular was *þu sunge*= *thou sungest.* In this way were conjugated, amongst others, the following verbs:—*þu swumme, þu on-gunne, þu sunge, þu sprunge, þu runge, þu sunce, þu drunne, þu runne*=*thou swummest, thou begunnest, thou sungest*, &c., &c.; and on the other hand, *Ic* (or *he*) *swam, Ic* (or *he*) *ongann, Ic* (or *he*) *sang, Ic* (or *he*) *sprang, Ic* (or *he*) *rang, Ic* (or *he*) *sank, Ic* (or *he*) *drank, Ic* (or *he*) *rann*=*I* (or *he*) *swam, I* (or *he*) *began*, &c., &c. There were no such forms in Anglo-Saxon as *Ic* (or *he*) *swumm*, or as *þu swamme.* Now this distinction of person is not adhered to in the present English, since it is the author's opinion that the writers and speakers who say *I* (or *he*) *sang*, say also *thou sangest*; whilst those who say *thou sungest*, say also *I* (or *he*) *sung.*

§ 139. *Second Persons not ending in -st.*—In five words the sign of the second person singular is not *-est*, but *-t*; *viz. ar-t, was-t, wer-t, shal-t, wil-t.* There are no such words as *ar-est, was-est, wer-est, shall-est*; and the word *will-est*, when used at all, is different in sense from *wil-t.*

§ 140. Verbs have now been considered in respect to their mood, their number, and their person, especially with respect to the last two. This is because it is by its number and person that the verb in its most characteristic form is distinguished. Where there are no persons and no numbers the verb begins to be something else. It becomes participial, and participles are, at least, as closely connected with the adjective as with the true personal verb. On the other when the verb is in the infinitive mood, a mood in which there are no persons, it is very like a substantive.

To err is human; *to forgive*, divine.

§ 141. As for the forms in-*ing*, they are so thoroughly substantival, that we shall soon see that the whole class of the so-called Present Participles is endangered: indeed, it is for the sake of preparing for this doctrine that I am in the present remarks drawing attention to the connection. A

Verb is, beyond doubt, a name; and so far as it is this, it is as good a Noun as a substantive or a pronoun, and a better noun than an adjective. Still it is not a substantive, for it is not the name of anything that has a substance, actual or conceivable. It is not a word like *fire*, *water*, *stone*, &c., that applies to an object with certain visible or conceivable attributes by which its substantive character is determined. The verb is a word which denotes a *state* or *act* of some such agent. A *horse* may run or a *man* may run. The horse may be in the act of *running* to-day, or the man may have performed the act of *running* yesterday. Or the horse or man may be *about to run* at some future time. But if I wish to have the notion of *running* as an act independent of the person who runs, I get a result of a very abstract character. I treat, however, the word *running* as a name, as the name of an act or state, as so far as it is this it is a noun. Such a noun is '*to err*' (or '*to forgive*)' in the line just quoted. Such nouns preceded by their article, but ending like a verb, are the Greek combinations—*τὸ φθονεῖν*=*envy* in the nominative case; *τοῦ φθονεῖν*=of *envy*, or *envy's* in the genitive, and *ἐν τῷ φθονεῖν*=in *envy* dative. All this we get when we consider any state or act in the abstract or independent of either its object or its agent.

§ 142. And for such states or acts there are names. In English they end in *-ing*, and can be formed, as occasion requires, from the verb: as *hunt*, *hunt-ing*, &c. These are called Verbals. They are, however, unquestionably substantives.

For the agents in such actions there are also names, which, like the preceding, are derived from the verb. In English these end in *-er;* as *hunt-er*=the person who *performs the act of hunting* or *hunts*.

But what if the name of the agent *coalesce* with that of the action, so that the two together form but a single word? This, at the first sight, looks like a very clumsy and improbable piece of machinery; and if we suppose that it

means that *every* Nominative Case coalesces with its Verb is absurd. But, it is clear that, countless as are the number of known and conceivable actions, each one with its agents, the whole incalculable host of the latter can be reduced to *three* classes. Everything that has or will be done, or is capable of being imagined as a deed, is done by one out of three doers. It is done by either (1) the speaker, (2) the person spoken to, or (3) some one of the innumerable objects spoken about; and if each of these classes has a short and adaptable name, a coalition with the verb is a very natural result.

§ 143. Be this as it may—when such a coalition *has* taken place, the whole character of the verb is changed. It loses to a great extent its abstract and indefinite character. It becomes 'invested with circumstances;' for it is no longer the name of a bare action, but the name of an action *plus* that of the actor.

When verbs arrive at this condition, there is a great tendency to separate them from the noun; and, indeed, when they thus become *personal*, the difference is a great one.

As the infinitive and the gerunds are thus *impersonal*, they retain their abstract character; and may be, as they sometimes are, called *impersonal*. But the commoner names are *infinitive* and *finite*.

§ 144. A *finite* verb, then, when it gives us persons, gives us not only the action, but the agent. Doing this, it does all that is done by the impersonal verb, and much more beside. It is a combination of the impersonal verb and something else, and what this second element is likely to be has been suggested. That, in some form or other, it was a personal pronoun has long been the current opinion—an opinion right in the main, but deficient in preciseness and speciality. That there was a personal pronoun the world at large admitted. Whether it was the nominative or any *one of* the oblique cases was a question not gone into.

It is chiefly with the name of the late Mr. Garnett, among whose numerous contributions to the higher departments of philology the present doctrine stands, perhaps, the first in value, that it is most especially connected. Mr. Garnett, however, with his usual justice towards his predecessors, has indicated a suggestion of the famous Keltic scholar Edward Lhuyd.

The verb, according to Mr. Garnett (who henceforth will speak for himself), is not so much a finite verb as a verbal, i.e. a word like *teaching* or *moving*, rather than one like *teach* or *move;* the pronoun which invests it with personality being not in the nominative case, or in concord with the verb, but in the possessive case, while the verb itself is in a state of regimen or government.

'Grammarians have not been able to divest themselves of the idea that the subject of the verb must necessarily be a *nominative*; and when it was ascertained that the distinctive terminations of the verb are in fact personal pronouns, they persisted in regarding those pronouns as *nominatives*, abbreviated indeed from the fuller forms, but still performing the same functions.'

'The personal terminations in Welsh are pronouns; but it is an important fact that they are evidently *in statu regiminis*, not in apposition or concord; in other words, they are not nominatives, but oblique cases, precisely such as are affixed to various prepositions. For example, the second person plural does not end with the nominative *chwi*, but with *ech*, *wch*, *och*, *ych*, which last three forms are also found coalescing with various prepositions, *iwch*, "to you," *ynoch*, "in you," *wrthych*, "through you."

'Now the roots of Welsh verbs are confessedly nouns, generally of abstract signification; as, for example, *dysg* is both *doctrina*, and the second person imperative *doce*. *Dysg-och*, or *-wch*, is not, therefore, *docetis* or *docebitis vos*; but *doctrina vestrum*, "teaching *of* or *by* you." This leads to the important conclusion that a verb is nothing but a *noun* combined with an oblique case of a personal pronoun, virtually including in it a connecting preposition. This is what constitutes the real *copula* between the subject and the attribute. *Doctrina ego* is a logical absurdity; but *doctrina mei*, "teaching of me," necessarily includes in it the proposition *ego doceo*, enunciated in a strictly logical and unequivocal form.'

The Syntax of the Prepositions greatly strengthens the

argument; and hence the following table improves the evidence on this point.

Prepositional Forms.		Verbal Forms.	
er-ov . .	'for me.'	*car-ov* . .	'I will love.'
er-ot . .	'for thee.'	*car-ot* . .	'thou wilt love.'
er-o . .	'for him.'	*car-o* . .	'he will love.'
er-om . .	'for us.'	*car-om* .	'we will love.'
er-och . .	'for you.'	*car-och* .	'you will love.'
er-ynt . .	'for them.'	*car-ont* or *car-wynt* .	'they will love.'

'No one capable of divesting his mind of preconceived systems, who compares the Welsh prepositional forms with the verbal forms, will deny the absolute formal identity of the respective sets of endings, or refuse to admit that the exhibition of parallel phenomena of languages of all classes, and in all parts of the world, furnishes a strong *primâ facie* ground for the belief of a general principle of analogy running through all.'—*Philological Essays*, pp. 289–342.

Such is Garnett's doctrine; and it is given in his own words.

§ 145. *Tense.*—The question of Tense now presents itself; and of this I must say explicitly what, I hope, shows itself in almost every page of my chapters on Etymology and Syntax, viz., that by Tense I mean an Inflection.

Collections of *different* words, like *I am speaking*, are *not* true Tenses.

Collections, like *I shall go*, are *not* true Tenses.

Collections, like *I have slept*, are *not* true Tenses.

They are combinations of certain words which serve in the place of true Tenses; just as combinations like *of a man*, *to a man*, *from a man*, &c., are combinations that take the place of true cases.

They are not Tenses like γέγραφα=*I have written*, in Greek; nor Tenses like *monui*, *I advised* (or *have advised*), in Latin. They are rather like such combinations as *amatus sum*=*I have been loved*, in Latin; or γράψας ἔχω=*I have written*, in Greek.

They are *combinations* of more words than one; and not one single, separate word in a changed, modified, or determinate state; so that they belong to Syntax rather than to Etymology.

What, then, is the number of the Tenses in English, and what are they? There is, certainly, a Present Tense; and there is, certainly, *not* a Future Tense. Whether there be one or two Tenses of *Past* Time depends upon what we mean by the term.

If Tense mean the Time, and the Time only, to which the action or state conveyed by the verb is assigned, the Past Tense in English is one and indivisible; and words as different as *moved*, and *spoke*, inasmuch as they denote the same period of Time, are both in the same Tense.

On the other hand, however, if fundamental differences of Form are considered to make different Tenses, the Past Tenses in English amount to two.

§ 146. Upon this point the *History* of the forms may guide us; for it may tell us that the antagonism between the difference of form, and the identity of meaning, is not irreconcileable. It may tell us that the identity of meaning is due to the modern, recent, or advanced stage of the language in which it occurs, rather than to the language in its older form. And this certainly tells us something.

In words like *moved* from *move*, the Tense is indicated by the addition of the sound of *d*, *ed*, or *t*. In words like *spoke*, there is no addition of anything; but there is a change of the vowel. The great majority of existing Tenses belongs to the first class, a majority so overwhelming that, for the practical purposes of teaching, it may be excusable to call the exceptions *Irregular*. Still it is well to know wherein the irregularity lies. It manifestly lies not in words like *spoke*, *swam*, *drank*, &c., being irregular forms of a single Tense, of which words like *moved*, &c. are the regular ones; but in the fact of two different Tenses having merged their two distinctive imports into one.

One element in this distinction we can see with great clearness. We can see how there are two sorts of Past Time. We can see, within the limits of our own language, the difference between *I wrote a letter* and *I have written a letter*. The former makes the writing simply a past action. The latter connects it with the time at which the sentence is uttered. It means *I have written the letter you are asking about*; or the *letter which I promised to write*; or the *letter which I am now ready to forward you*. These and other similar illustrations show that the letter is by no means done-with at the time of speaking; but that something is still connected with it. This is called *Past Time continued up to the Present*. Sometimes, when the combination is treated as a Tense, it is called the *Perfect* Past, or the Preterit; *Perfect*, or, simply, the *Perfect*.

§ 147. The Greek language helps us to the next step. It gives us for the Perfect *Time*, a definite, separate, and truly inflectional Tense; and, as it has, also, an equally true one for the more indefinite Past Time, it shows us how the two Tenses may co-exist in the same language. Thus γέγραφα = *I have written*; ἔγραψα (ἐ-γραπ-σα) = *I wrote*.

The Latin carries us a step farther. Like the Greek, it has not only two forms, but two forms of the same construction—e.g., *mo-mordi*, from *mordeo*, where, as in γέγραφα, from γράφω, the form is attained by doubling the initial vowel of the root, and *rexi* (*rec-si*), which, like ἐ-γραπ-σα, is formed by the addition of *-s*. The two Latin forms, however, like the English, have only one meaning. The identity not only of the two meanings, but of the two modes of expressing them, must be borne in mind. *Momordi* not only means *I have bitten*, but it expresses its meaning by the same process; viz., the reduplication of the first letter of the root. Between the two forms, the conclusion that, so far as the *process of formation goes*, the Greek and Latin Reduplicate Perfects belong to the same Tense is legitimate. With *scrip-si*, and ἐ-γραπ-σα, there is

a difference of another kind; but it is only a matter of detail. The Greek prefixes ε; the Latin ignores it. Yet both agree in the use of *s* as the distinctive sign of the two Tenses of Past Time. Surely the two Tenses of the same.

Such would be the case if the Latin and Greek were identified, or separated from one another in the way of Tense, on one principle only. But such is not the case. In Greek, a word like γρά́φ-ω has, as a matter of course, *two* Tenses of Past Time; and, as such, γέ-γραφ-α, and ἔ-γραπ-σ-α, are classified in Greek grammars. Each has its proper form, and each has its appropriate meaning; and no one thinks of their being the same Tense in a different Conjugation, still less of one being an irregular or exceptional form of the other. There are, simply, two forms with two corresponding meanings. But in Latin (and here begins the antagonism) there are *two* forms, but only *one* meaning; which, so long as we hold that difference of Tense implies difference of Time, suggests that there is but *one* Tense.

§ 148. It may be replied, that two meanings in the way of Time, if they are sufficiently near one another, may be treated as one, and that they will, then, meet the real or apparent difficulty.

But this is not all. As a general (though not an universal) rule, the words in Latin which have a Past Tense in -*s*, have no Tense at all formed by a reduplication; and *vice versâ*. There are a few exceptions. *Mordeo* has the so-called double form *mor-si*, and *mo-mordi*. *Pango* has, in like manner, *pang-s-i* (*panxi*) and *pe-pig-i*. But, generally speaking, the exception confirms the rule, *i.e.*, it shows that, in Latin, some words had both forms.

Be this, however, as it may be. It is easily intelligible that, when two forms were invested with the same meaning, one would predominate and exclude the other in some words, while some would do the same in other; and this explains the difference between the Latin and the Greek grammars. The Greek found two forms with two different

meanings to match; and treated the forms as two different Tenses. The Latin found two forms, but only *one* import; and treated the two as belonging to the same Tense.

§ 149. *The Mœsogothic Reduplication.*—What the Greeks and Romans did in the way of Reduplication, the Germans did also. That the Mœsogothic gives us the earliest form of the languages in general of the German family has already been stated: but, upon this peculiar point, it gives us the most valuable point of its information. It gives us the Greek Reduplicate Perfect.

Sometimes it gives it after the manner of *curro=I run*, and *cu-curr-i=I have run* (or *ran*); or *mord-e-o=I bite*, and *mo-mord-i=I have bitten* (or *I bit*); *e.g.*—

MŒSOGOTHIC.

Present and Past.

Salt-a, sái-salt=I leap, I leapt.
Háit-a; hái-háit=I bear the name; I bore the name,

without a change of vowel.

Elsewhere it gives us the same Reduplication *with a change of vowel; e.g.*—

Slép-a, sái-slép=I sleep; I slept, or *have slept.*

Thirdly, it gives us the form which presents itself in *spoke*, *swam*, *sang*, *rose*, and the like, as opposed to the forms in *-d* or *-t*, or the forms like *mov-ed* and *wep-t*: forms in which the Reduplication has disappeared.

In English, as in Latin, the verbs which have forms like *spoke* have, as a general rule, no forms like *moved*, and *vice versâ*; and in English, as in Latin, the two forms are assigned to the same tense. But in English, as in Latin, these are, as far as *history* and *structure* go, *two* distinct tenses.

§ 150. Historically, and in the way of structure, the forms like *spoke*, &c., belong to the same tense as the Greek τέ-τυφα. This tense is the Greek *Perfect.*

In the way of meaning, or import, the English forms

like *moved* belong to the same tense as the Greek ἔ-γραπ-σ-α; though not identical in the details of their structure. This tense is called, in Greek, the *Aorist*, in Latin the *Preterit*. This latter word is the better suited for the English.

If so, it is easy to see what the two forms belong to. Forms like *spoke* are Perfects: forms like *mov-ed* Preterits. They are two tenses of the same Conjugation.

But it is better to fix our attention on what they are *not*. They are *not* different forms of the same tense, in different Conjugations; least of all are they what is called *Irregular*.

Such is the real character of a class of verbs which, until lately, have been treated in a very summary manner. Their historical identity with such true and genuine Perfects as τέ-τυφα and γέ-γραφα is undoubted. Whether, however, the recognition of them as two Past Tenses, each limited to certain words, and both conveying the same meaning, in our ordinary Grammars is practicable, is another question.

§ 151. That the class is a natural one is beyond doubt.

a. The same words, as a general rule, that appear in our own language as Perfects appear as Perfects in all the languages of the German family; in other words, the list of the so-called Irregulars is nearly the same in Dutch, German, Mœsogothic, Frisian, Danish, Swedish, and Icelandic. Some languages have more than others; but more than half of the list, in any one of the above-named languages, will be found in all the others.

b. With very few exceptions they are of German, and none of foreign, origin.

c. No new word ever takes the Perfect as its tense for past time, but always the Preterit.

d. Derived verbs form their Past tense as Preterits, even when the words from whence they are derived have a Perfect—*lie, lay; lay, laid—rise, rose; raise, raised—drink, drank—drench, drenched.*

e. In the few cases where we find *both* tenses, the Perfect is Intransitive, the Preterit Transitive—though this, by some, may be considered a refinement: 'It *hung* till it fell to pieces'—'It *swoll* till it burst'—'He *hanged* the offender'—'He *swelled* it by blowing air into it.'

f. Verbs which, in the earlier stages of English, took the Perfect form, change it in the course of time for the Preterit: *sowed*, *mowed*, *rowed*, *leapt*, *slept*, *helped*, *melt*, *sheared*, *shaped*, *squeezed*. *wash*, and others, were originally *sew*, *mew*, *rew*, *lep*, *slep*, *holp*, *molt*, *shore*, *shope*, *squoze*, and *wesh*. The converse change rarely takes place. Hence, the number of Perfects is gradually decreasing. Many, however, of the tenses which are Preterit in the Literary English are current in our Provincial dialects as Perfects: the old form being there retained longest.

That they were 'native and home-born words' is the remark of so old a writer as Ben Jonson. The great Ben, however, despairs of 'beating them into proportion.' He does his part 'in tolling this bell to draw others to a deeper consideration of the matter.'

Wallis writes that '*Anomaly* scarcely touches introduced (*Exotica*) words, but only those that are native—which are all Monosyllables, or derived from Monosyllables, and, for the most, allowing for a slight change, common to us with the Germans, Flemings (*Belgæ*), and Danes.' He does, however, venture to classify them.

§ 152. '*Strong*' *and* '*Weak*' *as terms.*—At present I think it safe to say that (except so far as *Defect* is Irregularity) the belief that the words in question are Irregular has died away, and that it has been doing so for the last forty years. That the recognition of them as words of different Tenses, is delayed for no very distant period is what I hope. Unless such a recognition be accomplished sooner or later the great principle of historical examination, which has thrown so much light upon the darker regions of Philology, will have done less than we expect

from it. Meanwhile, the opinion of the present time is that of a period of transition and compromise.

In the exposition and illustration of this opinion the two terms which have recommended themselves are '*Strong*' and '*Weak.*' Forms like τέτυφα, *momordi*, and *spoke* are constructed out of the original verb itself, by the process of changing the vowel and doubling the consonant. Forms like ἔτυπσα, *scripsi*, and *moved* are constructed by *adding* to the fundamental word something from a wholly different source. The former are called *Strong*, or self-supporting; the latter are called *Weak*, or constituted by additions extraneous to the theme or the fundamental word. As applied to such forms as *spoke* and *moved*, &c., except that they are somewhat fanciful, and (a graver objection) are used in another sense in the Declension of the Nouns, they are good terms. But except when we limit them to the *form* of the particular words to which they apply, and that in respect to the process from which it results, and the materials out of which it is made, they suggest something either more or less than the bare facts of the case, which are simple in character and two only in number.

1. A system of Inflection which is manifest and recognised in the Greek was originally common to the languages of the German family, and the Latin; not to mention the fact of its being as manifest in the Sanskrit as in the Greek. This gave each verb *two* Tenses of Past Time.

2. The loss of the distinction between these two sorts of Time, and the result of some words retaining the form of the Perfect and some that of the Preterit Tense.

The closer we keep these two forms to their old names of *Perfect* and *Preterit*, the more clearly do they carry with them their history.

§ 153. *The Perfect Tense.*—The characters that in the first instance determine the divisions of this class, are (1) the quantity of the Vowel, and (2) the number and nature of the consonants which follow it.

After this the numbers of times that the vowel is changed demands notice, for sometimes it is changed in the Perfect only, sometimes in the Participle as well, and sometimes in the Perfect itself it is (or was) changed with the number, e.g., in Anglo-Saxon.

	Present.	Perfect Singular.	Perfect Plural.	Participle.
A. S.	*Bleawe*	*bleow*	*bleow-on*	*ge-blaw-en*
	Swimme	*swam*	*swumm-on*	*ge-swumm-en*
English.	*Blow*	*blew*	*blew*	*blown*
	Swim	*swam*	*swam*	*swun*

§ 154.

Vowel Long.

(1.) Here the *sound* in the present English is that of a Vowel, but, according to the *spelling*, the words end in the Semivowel *w*. Change from *o* or *a* to *e*. The vowel in the Participle the same as in the *Present*.

Present.	Perfect.	Participle.
Blow	*blew*	*blown*
Crow	*crew*	*crown*
Grow	*grew*	*grown*
Know	*knew*	*known*
Throw	*threw*	*thrown*
Draw	*drew*	*drawn*
Fly	*flew*	*flown*
Slay	*slew*	*slain.*

In the first five of these words *w* represents *v*. In *fly*, *draw*, it represents *g* softened into *y* or *h*, as in A. S. *ic drage*=I draw; *ic droh*=*I drew*; *dragen*=*drawn.*

In *slay* the *w* represents a *g*, softened into *h*; A.S. *ic sleahhe*=I slay; *ic sleôh*=I slew; *slagen*=*slain.*

(2.) The Vowel (long) and spelt *ea* with two letters followed by *l* or *r* (two of the four liquids) and *k* as a mute: change to *o*. The Vowel in the Participle the same as in the *Perfect.*

Present.	Perfect.	Participle.
Steal	*stole*	*stolen*
Bear	*bore*	*borne*
Swear	*swore*	*sworn*
Tear	*tore*	*torn*
Wear	*wore*	*worn*
Break	*broke*	*broken*
Speak	*spoke*	*spoken*
Weave	*wove*	*woven*

Most of these Perfects have, or have had, a second, obsolete, or obsolescent form, as *bare*, *stale*, *sware*, *tare*, *ware*, *brake*, *spake*. *Borne* when it means *carried* or *supported* is spelt with an *-e*; when it means *brought into the world* (Latin, *natus*) it simply ends in *-n*, born (Latin, *latus*).

(3.) The vowel (long), the consonant by which it is followed being a Sibilant—*s* or *z*.

Present.	Perfect.	Participle.
Freeze	*froze*	*frozen*
Choose	*chose*	*chosen*

This is rather a sub-section of the previous division than a class by itself. The difference, however, between a Sibilant and an ordinary Mute is important. It has a tendency to change into *r*, sometimes in the Plural alone, sometimes in the Participle alone, and sometimes in both the Participle and the Plural. In the present English the single word *forlorn* represents this class, and that only as a Participle, or perhaps as an Adjective. In form, however, and origin, it is the Perfect Participle of the word *lose*.

Frore, in Anglo-Saxon *gefroren*, is used by Milton.

> The parching air
> Burns *frore*, and cold performs the effect of fire.
> *Par. Lost*, II., 595.

The Anglo-Saxon conjugation of these words was more than usually complex; the Vowel changes being

four, two for the Perfect and two for the *Present* Tense, with which the Participle agreed. For *was*, which belongs to this class, see below.

Prsnt. 1st Per.	S. P.	F. P.	Perfect S.	Perfect P.	Participle.
Lese	*lest*	*lest*	*læs*	*læs-on*	*ge-les-en*
(Ge)-nese	*genist*	*genist*	*genæs*	*genæson*	*ge-nes-en*
Ceôse	*cŷst*	*cŷst*	*ceâs*	*cur-on*	*ge-coren*
Dreôse	*drŷst*	*drŷst*	*dreâs*	*drur-on*	*ge-dror-en*
Freôse	*frŷst*	*frŷst*	*freâs*	*frar-on*	*ge-fror-en*
Be-greôse	*begrŷst*	*begrŷst*	*greâs*	*grur-on*	*ge-gror-en*
Hreôse	*hrŷst*	*hrŷst*	*hreâs*	*hrur-on*	*ge-hror-en*
Forleôse	*forlŷst*	*forlŷst*	*forleâs*	*forlur-on*	*for-loren*

(4.) Vowel long, spelt with a single letter, and followed by a mute. Change from *a* to *v* (spelt *o o*). Vowel on the Participle the same as on the Present.

Present.	Perfect.	Participle.
(For)sake	*(for)sook*	*(for)saken*
Shake	*shook*	*shaken*
Take	*took*	*taken*
Wake	*woke*	*waken*

(5.) Vowels of the Present spelt with the letter *i*; but, in sound, a diphthong. Changed into *o* in the Perfect, in the Participle into *ĭ* (the *i* in pit). The vowel of the Participle that of the Present, rather than the Perfect.

Present.	Perfect.	Participle.
Bide	*bode*	*bidden*
Bite	*bit*	*bitten*
Drive	*drove*	*driven*
Ride	*rode*	*ridden*
Shrive	*shrove*	*shriven*
Smite	*smote*	*smitten*
Strike	*stroke*	*stricken*
Strive	*strove*	*stridden*
Thrive	*throve*	*thriven*
Write	*wrote*	*written*

Here, in Anglo-Saxon, the vowel was changed in the Plural, with which the Participle agreed. In both cases,

however, it seems to have been long; or, at any rate, the consonant is not doubled.

Present.	Perfect. 1st Pers.	Perfect. 2nd Pers.	Participle.
Scîne	*scân*	*scin-on*	*ge-scin-en*
Bite	*bât*	*bit-on*	*ge-bit-en*
Smite	*smât*	*smit-on*	*ge-smit-en*
Ride	*râd*	*rid-on*	*ge-rid-en*
Strice	*strâc*	*stric-on*	*ge-stricen*

§ 155.

Vowel Short.

Followed by *m*, *n*, *ng*, or *nk*. Change to *a* for the Perfect in the Singular, to *u* for it in the Plural number. The vowel of the Participle that of the *Plural* of the Perfect.

Present.	Perfect Singular.*	A. S. Plural.	Participle.
Swim	*swam*	(*swumm-on*)	*swum*
Begin	*began*	(*begunn-on*)	*begun*
Run	*ran*	(*runn-on*)	*run*
Spin	*span*	(*spunn-on*)	*spun*
Win	*wan*	(*wunn-on*)	*won*
Cling	*clang*	(*clung-on*)	*clung*
Fling	*flung*	(*flung-on*)	*flung*
Ring	*rang*	(*rung-on*)	*rung*
Sing	*sang*	(*sung-on*)	*sung*
Spring	*sprang*	(*sprung-on*)	*sprung*
Sting	*stung*	(*stung-on*)	*stung*
Wring	*wrang*	(*wrung-on*)	*wrung*
Drink	*drank*	(*drunc-on*)	*drunk*
Shrink	*shrank*	(*scrunc-on*)	*shrunk*
Sink	*sank*	(*sunc-on*)	*sunk*
Stink	*stank*	(*stunc-on*)	*stunk*

In the following words the *i* and *ou*, now diphthongs, represent the short sounds of *i* in *pin* and the *u* in *full*. Like *swim*, &c., they had *a* and *u* in the Plural. The Scotch retains both the short vowel and double form, the Perfect being regularly in *a*, in the Participle in *u*—as *band*, *fand*, *grand*, *wand*; *bund*, *fund*, *grund*, *wund*.

* The *second* Person *Singular*, also, takes *-u*, as *þu swumme* = *thou swummest*.

Present.	Perfect.	Participle.
Bind	*bound*	*bound*
Find	*found*	*found*
Grind	*ground*	*ground*
Wind	*wound*	*wound*

The loss of the syllabic inflections *-an*, and *-e*, &c., for the Infinitive mood and the Present tense, by shortening the word, would encourage the lengthening of the vowel; for in *find-an*, *grind-an*, &c., the *i* was doubtless sounded as in *swĭm*. So it would be in *clĭmb-an*, of which the Perfect was *clomb* or *clamb* in the Singular, and *clumb-on* in the Plural; the Participle being *clumb-en*.

§ 156. Reduplication Retained.

(1.) *Did.* This word, in the current English of the present time, stands alone; the solitary instance of the old reduplication after the manner of τέ-τυφα. The Anglo-Saxon form was *di-de*, Old Saxon *dë-da*; in which case it is the *first* of the two *d*'s which gives us the sign of tense, and the last of them the one that belongs to the root.

(2.) *Hight.* There is another word in the same condition as *di-d*, *i.e.* another word wherein the reduplication is preserved. Here the *g* is out of place; the better spelling being *hiht*; in Anglo-Saxon *hêht*, Mœsogothic *hái-háit*. *Hight*, however, scarcely belongs to the current language; being either obsolete, or obsolescent.

> An ancient fabric raised to inform the sight,
> There stood of yore, and Barbican it *hight*.'
> Dryden, *Mac Flecknoe*.

As *hight* is an Active verb, it is better translated '*bore the name*' than '*was called*;' for it is *not a Participle*, but a Perfect tense, and it agrees with the Greek κλύω (Latin *cluo*) rather than with *vocor*, *nominor*, or *nuncupor*. In both the German and Norse languages it is still the ordinary

word for '*what is your name?*'—German, *wie heissen Sie?* Danish, *hvad hede De?* The Anglo-Saxon forms were *hate, hêht, ge-hâten.*

Behight = promised. So little was this form understood in the sixteenth century that we actually find *behighteth* = promiseth, used by Sackville, as if from a present *behight*: cp. *ought* and *must*, originally past tenses which have acquired a present meaning.—Morris, *Historical Outlines of English Accidence*, p. 156.

§ 157. *Did, hight,* and *held.*—We have seen that *did* is a reduplicate form current in the present language, and by no means likely to become obsolete. It gives us two *d*'s, the import of each being undoubted. The first *d* is the sign of the tense, the second the consonant of the root. The opposite notion, to the effect that the second *d* was the *d* in *loved*, and the first the *d* of the word *do*, is exploded. The first *d* represents the reduplication.

§ 158. *Hight* differs from *did* in being obsolescent. It differs, too, in having *h* for its initial; for *h* is a breathing rather than a true articulate sound, and is by no means a very stable element at any time, especially between two vowels. In sound, then, *hight* (*hiht* best represents the old orthography *hêht* and *háiháit*) differs from *did*; for it only gives us what we may call an historical or orthographical reduplication; in other words, the *h* is only doubled to the *eye*: and if it were spelt *hite* it would show no sign of reduplication at all.

§ 159. *Held* differs from *hight*, with which it agrees in having once been a true reduplicate form, in having not even a second *h* in the spelling; *i.e.* no second *h* at all. Its history, however, is that of *hiht.*

Mœsogothic.	Old High German.	Anglo-Saxon.
Hái-háit	*hât*	*hêht* from *hait-an*
Hái-hald	*hi-alt*	— ,, *hald-an*

Let the *gh*, *g*, or *h*, one or both, drop out of *hiht*, and *held* may be looked upon as the result of *hái-hald*, *i.e.* a

reduplication for which one of the doubled letters is lost. Such is, probably, the case; the result being that in *held* it is *not* the letter of the *root* with which the word begins, but that of the *reduplication*. If so, other words may be in the same predicament; indeed, every Perfect in our language in which there has been a reduplication, and in which, now, only one of the two consonants implied by the term remains, may be like *held*, *i.e.* may have lost its radical consonant and retain only that of the prefix. How far the present doctrine favours this view is uncertain. It is certain, however, that it favours it to a great extent. The extent to which it does so is a point for which, in a work like the present, the reader can only be prepared to expect.

§ 160. The little that is here written is written mainly with the view of correcting the notion that the verbs under notice are anything like *Irregular*. They are, with few exceptions, *Defective*, inasmuch as they have no Preterit, or no case corresponding with the Greek Aorist. And as the Verbs which *have* such a tense are generally without a Perfect, more than nine-tenths of the English Verbs are Defective. That this as a characteristic is of great importance is beyond doubt. But Defect is an explicable and common phenomenon, whereas Irregularity, when real, is inexplicable and, to say the least, rare. What the English Verbs really give us is a vast number of exceptions to such rules as Grammars of ordinary magnitude can find room for.

§ 161. The two most elaborate attempts in English to throw the class of Perfects into system are those of Professor March and Dr. Morris; and to those the reader is referred. To a great extent they agree. Professor March has five classes, one of which falls into as many sub-classes; Dr. Morris six undivided classes. The American scholar, in my mind, holds closest to the principle of taking the vowel and the consonants by which it is followed as his *basis*, and subordinating to it the changes between the

vowel of the Perfect and the Participle. Dr. Morris, who connects the evidence of reduplication with the difference or likeness between these two vowels, naturally invests them with primary importance. But the two writers should be read together. The consideration of the Perfect Tense has taken precedence of the Preterit; for it has every sign of being the older one of the two. Indeed, provided that the forthcoming view be correct, it will be something more than this. It will be, in a manner, the Tense out of which the Preterit was developed. But even if it be not this, it will still be the older Tense.

§ 162. *The Preterit Tense.* — The fullest form in which the characteristic sign of the Preterit is known is in the Plural of the Mœsogothic; where *nasi*-dêd-*um*=*we saved*, from the Infinitive *nasi-an*, and Present *nasi-a*. One of these two *d*'s is certainly the *d* in *moved*, *called*, &c.

But what is *d* in *nasi-d-a?* It is believed to be the Perfect of the verb *do* (*did*). If so, it had, as a Post-positive affix, incorporated with the main verb, a power akin to its present power as an Auxiliary in combinations like *I did move.*

The Mœsogothic Preterit is found in both the Indicative and the Conjunctive Moods, and also in the Dual, as well as the Singular and Plural, Numbers.

a. *Past Tense of the Indicative Mood.*

Singular.	Dual.	Plural.
1. Nasi-*d*-a	—	nasi-*d*-ê*d*um
2. Nasi-*d*-ês	nasi-*d*-ê*d*uts	nasi-*d*-ê*d*uþ
3. Nasi-*d*-a	—	nasi-*d*-ê*d*um

b. *Past Tense of the Conjunctive Mood.*

Singular.	Dual.	Plural.
1. Nasi-*d*-ê*d*jau	—	nasi-*d*-ê*d*eima
2. Nasi-*d*-ê*d*eis	nasi-*d*-ê*d*uts	nasi-*d*-ê*d*eiþ
3. Nasi-*d*-ê*d*i	—	nasi-*d*-ê*d*eina

From the fact of this double *d* being Dual as well as Plural, the inference that that consonant is a sign of

Tense rather than one of Number is held, by the present writer, to be impaired in respect to its validity. The Dual form may have been extended to Plurals, and in the Dual the letter *d* is a very likely element.

Be this, however, as it may, the doctrine that the *-dêd-* in nasi-*dêd*-um is the *d* in *nasida*, the *d* in nasi-*d*-a, the *d* in *move-d*, and the *d* in *did*, is generally admitted. As a matter of philological fact, a small minority may demur to it. As a matter of opinion, it is a fact of a different kind; but still an important one.

§ 163. *The Connecting Vowel.*—The next element is the letter *i*—*nas*-i-*dêdum*. This is the connecting link between the theme and the sign of Tense; for it belongs neither to the Tense nor the main word. The Mœsogothic has three such connectives: *nas*-i-*da*=*I saved*; *salh*-o-*da*=*I healed*; *hab*-ai-*da*=*I had*. The first two are found in the Anglo-Saxon *ner*-e-*de*=*I saved*; *luf*-o-*de*=*I loved*. Here *d*, and *d* only, is the sign of the Tense.

§ 164. Then follow the signs of Person—*lufod-e*, *lufod-est*; *lufod-e* with *lufod-on* for all the three Persons of the Plural.

Of these the second (*loved-st*), is the only one still in existence, though scarcely common and current.

Of the connecting vowels the *o* has become obsolete, while *-e* is becoming so, or *obsolescent*. So far as we *pronounce* it in the reading of the Bible, or use it for the purposes of metre, it is, in words like *blessed*, *moved*, &c., a part of the *spoken* language. In *loved*, *moved*, *stabbed*, &c., as used in ordinary language, it is a sound to the eye only; in other words, no sound at all.

When, however, the fundamental Verb ends in an Explosive Dental (*d* or *t*), the *e* is *sounded*. This is because two Dentals require to be separated by a vowel before they can be distinctly pronounced; e.g. *mend-ed*, *augment-ed*, is more easily uttered than *mend'd*, *augment't*. After *th*, however, the *Continuous* Dental *d* is attached directly to the

verb, as *wreath-d*, *breath-d*. Here the *th* is sounded as the *th* in *thine*. With *th* sounded as in *thin* no English verb ends.

If the final sound of the fundamental Verb be a Surd, *p*, *f*, *k*, or *s*, the *d* of the affix becomes *t*; in other words, is accommodated to the original consonant in respect to its sonancy. This is what we have already seen in the *s* (or *z*) of Plural Number and Possessive Case of Substantives. Indeed the change is only a portion of a general Euphonic Law.

§ 165. Subject to these Rules the formation of the English Preterit is comparatively simple. Under the first, or the one concerning the interposition of the *e* between two Explosive Dentals, the most important exception is the rejection of one of the two *d*'s, þ, and, along with it, the connecting vowel *e*. This reduces the Preterit to the same form as the Present.

(1) Verbs ending in *-d*:

Rid	rid	rid
Shed	shed	shed
Shred	shred	shred
Spread	spread	spread

(2) Verbs ending in *-t*:

Burst	burst	burst
Cast	cast	cast
Cost	cost	cost
Cut	cut	cut
Hit	hit	hit
Hurt	hurt	hurt
Knit	knit	knit
Let	let	let
Put	put	put
Set	set	set
Shut	shut	shut
Slit	slit	slit
Split	split	split
Sweat	sweat	sweat
Thrust	thrust	thrust

When the *d* is preceded by *l*, *n*, or *r* (liquids), the *e* is ejected, and, along with it, one of the *d*'s, the other being changed to *t*.

Bend	bent	bent
Build	built	built
Gild	gilt	gilt
Gird	girt	girt
Lend	lent	lent
Rend	rent	rent
Send	sent	sent
Spend	spent	spent

In all these cases the vowel is short. When long, however, it is shortened.

Bleed	bled	bled
Breed	bred	bred
Feed	fed	fed
Lead	led	led
Read	read	read (*pronounced* red)
Speed	sped	sped
Meet	met	met

§ 166. To the second rule, or the one that *t* should follow Surd, I remember no exceptions. As it stands, however, at present it is a *general* rule of Euphony rather than a *particular* rule for the English Verbs, and as such it must be taken. Even as it stands it is not universal. Combinations like *pluckd*, *stopd*, *misd*, &c., must, doubtless, be avoided. But there are two ways of avoiding them. The first letter may be accommodated to the second, when the result would be such combinations as *plugd*, *stobd*, and *mizd*, concerning which all that can be said is that the English Language, though it might, if it chose, adopt them, does not do so.

But, when the Main Verb ends in a Vowel or a Liquid, there is no necessity for any accommodation at all. We can, if we like, say *swelt* or *heart*, *spiet* (pronounced *spite*), or the like, as easily as we say *sweld*, *heard*, or *spied*. It is not, however, the practice of the English Language to do

so. *D* is the true sign of the Tense, and to *d* it adheres where it can.

Hence the more special rule is that, in respect to the addition of *d* or *t*, the English * Language treats Vowels and Liquids as if they were Sonant Mutes.

§ 167. But to this rule there *are* exceptions. They are certain words where, after a Liquid, *t*, instead of *d*, presents itself—as *deal, dealt; feel, felt; smell, smelt; burn, burnt*; generally when the Vowel is *short*. Sometimes, however, after a *long* one—as *mean, meant; dream, dreamt*. But here the Vowel is shortened.

And here the spelling is uncertain: for we write *burnt* and *burned; dreamt* and *dreamed; learned* and *learnt*.

This takes us to another division. The great exceptional cases have, hitherto, turned upon the verbs that end in *d* or *t*; or the same sounds as those of the Affix.

In words where the Vowel before a Liquid was changed, or shortened, we begin with a new series.

§ 168. In *bereāve, cleāve, creēp, keēp, leāve, lōse, sleēp, sweēp, weēp*, of which the respective Preterits are *berĕft, clĕft, kĕpt, lĕft, lŏst, slĕpt, swĕpt, wĕpt*, we have the Vowel shortened—but still the same vowel; the Consonant that follows being *not* (as in *burnt*, &c.) a Liquid. Here the Vowel is the same; but it is changed in respect to *Quantity*.

§ 169. In *tĕll, tōld; sĕll, sōld*, it changed not only in respect to Quantity, but to *Quality* as well; and here the

* *English* here means only the English of England. In respect to the Scotch, wherein the connecting vowel is retained where it is not wanted for the purposes of Euphony only, Mr. Murray writes that the termination is *t*. 'In the old Scotch the Past Tense and Participle were formed by adding *it, yt* to all verbs of this class. In the modern dialects this full form undergoes certain euphonic changes in accordance with the character of the preceding letter or syllable.'—p. 199. The whole section shows that in Scotland, *t* was the regular, *d* the exceptional sign of the Tense. This was possible because the Scotch kept the connecting vowel; which the English did not.

Vowel that follows *is* a Liquid. In Anglo-Saxon the forms were *telle, tealde; selle, sealde.*

§ 170. The three points upon which the exceptions to the rules given for the formation of the Preterit are reducible to three cases; two of which have been already noticed.

1. Those that refer to Verbs ending in *d* or *t*.
2. Those wherein the Vowel is changed.
3. Those wherein the Consonant is changed.

The first has been considered. The second has been indicated. The third gives us the small, but important, class of apparent exceptions: which now come under notice.

§ 171. *Verbs in which the final Consonant is* k *or* g. The allied sounds of *k* and *g* (as in *gun*) undergo the same, or nearly the same, changes; and they are numerous.

a. They pass into the sound of *y*. The Anglo-Saxon forms of *lay* and *say* were

Present.	Preterit.	Participle.
Lecge	*lægde*	*ge-lægd*
Secge	*sægde*	*ge-sægd*
Lay	*laid*	*laid* (pronounced *lade*)
Say	*said*	*said* (pronounced *sed*)

b. Also into that of *h*, originally a guttural *g*. The Anglo-Saxon forms of *seek* were

	Present.	Preterit.	Participle.
	Sece	*sohte*	*ge-soht*
Hence	*Seek*	*sought*	*sought*

c. Also into that of *ng*.

	Present.	Preterit.	Participle.
Anglo-Saxon	*Bringe*	*brohte*	*ge-broht*
Modern English	*Bring*	*brought*	*brought*

d. Also into that of *ngk*.

	Infinitive.	Preterit.	Participle.
Anglo-Saxon	*þencan*	*þôhte*	*ge-þôht = think*
	þincan	*þuhte*	*ge-þuht = seem*

Compare the German *Ich denke=I think*; *mich dünkt=meseems*.

e. Also into that of *tsh*.

	Present.	Preterit.	Participle.
Anglo-Saxon	*Tæce*	*tæhte*	*ge-tæht*
Modern-English	*Teach*	*taught*	*taught*

Here the Preterit is like that of the preceding instances. The *Present*, however, is changed: the *k* becoming *tsh*.

Catch, caught, caught does not occur in the oldest English. In Layamon we find *cacche, cahte, caht*. This verb has conformed to the Past Tense of *teach*, &c.—Morris, *Historical Outlines*, &c., p. 171.

Buy. In A. S. *bycge, bohte, ge-boht*.

Work. In Ac. *wyrce=*I work: *worh-te=I worked*; *ge-worht=worked*. In addition to the change in the consonant, *r* is transposed. *Beseech*.—The main Verb is *sêc-e =I seek*. In English *be-seech, be-sought*. The simple Verb *seek* preserves the *k*. The compound changes it after the manner of *teach*, &c.

Owe—for this see § 179.

Participles.

§ 172. *Voice in connection with the Participles*.—Considered from one point of view the Participle is a Noun: considered from another it is a Verb. Now, although so far as Moods, Tenses, and Persons are concerned, we have, in English, no *Voices*, we have them in respect to the Participles. The form in *-ing*, as in *moving*, &c., is a Present Participle in point of Time, but it is Active in the way of *Voice*. The forms in *-en* and *-ed*, as *taken* and *moved*, are Passive in the way of Voice, but Past in their character of Participles. There is nothing in the nature of Language that makes this necessary. The Greek Language has its Active and Passive Participle for each Tense; as *τύπτω=I beat, τύπτων=one in the act of beating*; *τυπτόμενος=one who is being beaten*; and, for the Passive Voice, it has *τύπτομαι=I am being beaten*; *τε-τυμμένος=one who has been beaten*. In English, however,

there is only one form for each. Hence, though we have no Passive Voice for the Verb Proper, we have both an Active and a Passive Participle—the Active Participle being Present, and the Present Participle Active; whilst the Passive Participle is Past, and *vice versâ*. As it is universally agreed that, whether Perfect or Preterit, the Participles of Past Time are Passive, *Passive* will be the name under which they will be considered. The Active will be considered first. As far as its form goes, this is the most regular one in the English Language; and the rule for it has the merit of being absolutely without an exception. It is not even affected by the laws of Euphony. The sign of the Active, or Present, Participle is *-ing*, which can be added without alteration to every Verb in the language, with the exception of *is*, *was*.

§ 173. Though all this is clear and simple, the form in *-ing* is one of the most difficult in our language; for it has been, and is at present, doubted whether it be a Participle at all.

There are *four* Parts of Speech with which the termination *-ing* may be connected: the Substantive, the Adjective, the Adverb, and the Participle.

Let us consider, in the first place, its attachment to the Substantive. In expressions like the *blessings of a poor man*; *the wanderings of a traveller*; *the risings* (*insurrections*) *of the North*, and others like them, it has a Plural Number.

In *I was going a-hunting*, *I was a-saying*, &c., the *a* stands for *on*, and the word *hunting* is in that particular Oblique Case which the Preposition *on* governed. That these combinations are now condemned as provincial, old-fashioned, or colloquial, does not make them bad English. They had, then, when the preposition *on* was prefixed, an Oblique Case; and this, along with its Plural Number, makes the termination Substantival.

As for the word *morn-ing*, it is at the present moment a

Substantive, and nothing else. The Verb *morn*, if it exist at all, is a scarce one.

The original Vowel of these Substantives was *-u—clæns-ung=cleans-ing*; *hwistlung=whistling*. The sign of its oblique case, which was governed by *on*, was *-e*. Hence *Ic was on cleansunge*, &c., *Ic was on hwist-lunge*, was the original of I was *a-cleansing* and *I was a-whistling*; and these were the older forms of *I was whistling* and *I was cleansing*. But these are now called Present Participles.

Taking such a combination as *a-cleansing*, *a-whistling*, *a-hunting*, by itself, and looking at the parsing of it, we may say that in its *Syntax* it is *Adverbial*. It is not, in its origin, an Adverb; but its place in a proposition is that of one.

Such is the history of the old Verbal, or Verbal Abstract, in *-ung*.

If no other word had changed in the same direction, it is probable that nothing would have to be said about it. But the Present Participle in the existing English also ends in *-ing*; as *I am moving*. Moreover the Participle is used as an Adjective; as *a moving* (*emotional*) *scene*. Then we have phrases like *a dying day*, which, though it sometimes means *a day that is dying* (*passing away*), generally means *a day on which some one dies*; or *a death-bed day*. The construction here is substantival; and still more so is that of *a wedding day*; which certainly very seldom means *a day that is being wedded*.

This brings us round to the previous series, that of the changes of the Verbal Abstracts in *-ung*, to which few would hesitate to assign the word *morning* exclusively, and the words *wedding* and *dying* particularly.

Finally, as the Verbal Abstract in *-ing* began in *-ung*, so did the Participial *-ing* begin in something different from its present form. The older and oldest forms of the Verbs of the Anglo-Saxon middle periods of our language ended in *-nd*.

If this is nothing else, it is the history of two forms originally distinct becoming confluent, interchangeable, or identical; and, what is more, their meanings, however different at first, do the same.

So long as English Grammar is studied on the principles of the Grammars of the Latin and Greek languages only, this complication or parallelism commands but little attention. We know, however, what will happen when it is studied critically. If the combination *I am hunting* be reducible to *I am on hunting*, other so-called Participial constructions may be reduced in the same way—other, and perhaps all.

This view of the nature of the Present Participle, with special reference to its identity (in form) with the Verbal Abstract, was taken by the grammarians of the last generation and their predecessors almost exclusively in reference to its bearing upon our *Syntax*: when the parsing of such a sentence as *what is the meaning of the lady holding up her fan?* was a question of which grammar-reading students might read a good deal. Which was the better English—*lady holding*, or *lady's holding*? And then if we say *lady's holding*, should we not also say *holding up* of *her fan?* Answer as we may, there are always authorities on the other side. The one point, however, which is certain is that the question, when thus put, is one of *Syntax*.

Within the last forty years, however, its character has changed. It has become mainly a question of Etymology. It has borne less upon the Government and Concord of words like *holding* and *fan* in certain combinations than upon the history of the terminations *-ing* as a form of *-ung*, and *-nd* as the old sign of the Participle. Which does the present form come from? Does it come from one exclusively, or does it sometimes come from the one and sometimes from the other? This suggests a very complicated investigation.

§ 174. *What are the forms ending in -ing?*—Are they Participles or are they Verbal Substantives? A few are

certainly Verbal Substantives: e.g. *morning*. But words of this kind are not numerous. Every Verb, whether old or new, can be the basis of a form in *-ing*; some of them, as *waltzing*, of such late origin that they have come into our language since the prefix *a-* (as *a-hunting*) became obsolete. But these, again, are only a fraction of the whole. What is the rule for the inordinately vast majority wherein the Verbs are from two to nine hundred years old, and which are known to have had undoubted Participles ending in *-nd*, and, in many cases, to have corresponding Verbal Abstracts in *-ung*? What is the general rule for these? Or is there a general rule at all? Are forms of this kind *always* Participles, or are they *never* Participles? The extreme opinions, as is natural, are most in favour of the *-ing* denoting a Verbal. And this is what we expect. A new doctrine is adopted, if adopted at all, with a tendency to extend, rather than to limit, its application. Hence, there is a fair amount of influential authority which goes to the length of implicitly abolishing the Present Participle. But this is an extreme one; for it is clear that, though such combinations as *I am going hunting* may be reduced to *I am a-going a-hunting*, combinations like *a growing tree*, or *a moving crowd*, cannot so be reduced. Still, they may be combinations like *wedding morn* or *dying day*. Now, it is difficult to deny that every one of the so-called Present, or Active, Participles can be so explained. On the other hand, combinations like *early rising is good for the health*, though not inexplicable, are not so easily reduced to Participles.

Presuming then that the rule must be general, we may easily see that a case may be made out strongly in favour of the Participle, as such, having become displaced and superseded by the Verbal Substantive; and the doctrine that it is more likely that the Verbal Substantive should, as a Part of Speech, have displaced the Present Participle, rather than that the termination *-nd* should have been changed into *ng*, becomes, to say the least, plausible.

This shows the real gist of the question. Is it, as a matter of history, a case of forms in *ing*, into which the Participle of the older English has transmuted forms in *-nd*, in the way of letter-change; or is it, as a matter of history, one of the Verbal Substantive in *-ng*, as a Part of Speech displacing, or superseding, the Participle in *-nd*?

It is difficult to form an opinion on this point; so difficult that we must decide that it is one for which *no general rule can be laid down*. And such is the case. We cannot well, even in the most formal and theoretical grammar, abolish the Present, or Active, Participle; whilst to enter upon the individual history of each word, and every difference of meaning with which it may be invested, is impracticable. Few, too, even as a matter of letter-change, now hold that the change from the *-nd* of the Participle to the *-ng* of the Verbal Participle is improbable. On the other hand, the doctrine that the two forms have become what we may call Confluent is recognised; and that Confluence is not an exceptional process in language is, also, recognised. Still, this undoubted Confluence of the Participle and the Verbal is Confluence on a very large scale. Instances of it on a smaller one may be seen elsewhere. (See § 184.)

The Passive Participles in *en*.

§ 175. The Passive Participles are two in number, both indicating Past time. There is no *Present* Participle for the Passive, and there was no *Past* Participle for the Active, Voice; though there is no reason, beyond the practice of the English Language, why there should not be both. The Greeks have τετυφώς=*one who has beaten*, as well as τύπτων=*one who is in the act of beating*. They have also τυπτόμενος=*one who is being beaten*, as well as τετύμμενος and τυφθείς=*one who has been beaten*.

§ 176. *The Perfect Passive Participle*.—The sign of the Perfect Passive Participle is *-n* or *-en*. Sometimes the vowel

is that of the Present Tense, as *take*, *taken*. Sometimes it is that of the Perfect, as *stole*, *stolen*. When the Perfect had one vowel for the Singular and another for the Plural, as *Ic swam*, *Wi swummon*, the one which the Participle takes is (as has been already indicated) that of the Plural.

The chief points connected with the Participle that are not involved in the history of the Perfect are—

a. *Omission of the final -n* or *-en*.—Sometimes this is wholly obsolete; as in *swum*, *found*, *run*, &c. Sometimes it is obsolescent, or archaic; as *shapen*, *graven*, *gotten* (commonest in compounds, as *forgotten*, *begotten*), *bidden*, *trodden*, &c. Sometimes both forms are equally current, but with a difference of meaning; as *drunk* and *drunken*, *bound* and *bounden*; *he had drunk too much*; *a drunken man*; *we are bound* to do it; *it is our bounden duty*. The *e* in *borne* is a mere artificial expedient for indicating a difference of this kind—*born*=*natus*, *borne*=*latus* in Latin.

b. When the *-n*, or *-en*, is thus dropped, the difference between the Participle and the Perfect is reduced; and when the vowel of the two forms is the same it is entirely abolished; in other words the two forms become confluent. The result of this is a great deal of very exceptionable English in admirable and influential writers:

> The widows of Ashur are loud in their wail;
> And the idols are *broke* in the Temple of Baal;
> And the might of the Gentile, *unsmote* by the sword,
> Hath melted like snow in the glance of the Lord.
>
> Byron, *Hebrew Melodies*, *The Destruction of the Army of Sennacherib*.

This is, perhaps, to be excused on the score of its being found in poetry. There is, however, full as much of it in prose.

c. Upon the extent to which the Preterit, as a Tense, has superseded and displaced the Perfect, so much has already been said that it need only be added that the prin-

ciple which applies to the two Tenses applies to the two Participles also; indeed, their histories have been considered together.

When one changes the other generally changes also, though not necessarily at the same time; and it is the Participle which, as a rule, retains its form the longest.

Present.	Perfect.	Participle.
Hew	*hewed*	*hewn*
Mow	*mowed*	*mown*
Show	*showed*	*shown*
Sow	*sowed*	*sown*
Melt	*melted*	*molten*
Swell	*swelled*	*swollen*

d. In A.S., as in the present Dutch and German, the syllable *ge-* was prefixed to both the Participles of Past—as *ge-boren*, *ge-lufod=borne*, *loved.* The archaic word *y-clept=called*, from the A.S. *clepean=call*, still retains it.

§ 177. *Clad*—the Participle of *clothe.*

In the oldest English *clôthian = to clothe*; perf. *clâthode*, p. p. *clôthod.* In the thirteenth and following centuries we find *clothien*, *clethen*, *to clothe*; perf. *clethed*, *clothed*, and *clad*, *cled*, p. p. *clôthed*, *clad.*

Clad seems to have arisen out of analogy with such O. E. forms as *ladde = led*, *radde = read*, *cleth-de = cledde = clad-de = clad.*—Morris, *Historical Outlines*, &c., p. 171.

§ 178. *Sodden.* Two words ending in *th* in A.S. changed it, in the Participle, into *d.*

Cwethe	*cwæth*	*ge-cweden*
Seothe	*seâth*	*ge-soden*

Seothe changed its vowel in the Plural of the Perfect belonging to the same class as *choose*, *freeze*, and *lose.*

In *writhe* the *th* was retained.

Present.	Perfect S.	Perfect Pl.	Participle.
Writhe	*wrâth*	*writhon*	*writhen*

See list in March; Grammar, &c., p. 104.

In *scathe* the consonant was changed in Tense, but retained in the Participle.

Present.	Perfect S.	Perfect Pl.	Participle.
Sceathe	*sceôd*	*sceôdon*	*sceathen*

See list in March; Grammar, &c., p. 107.

§ 179. Present Perfects.

A state or an action which, at the time of speaking, is a matter spoken about, is of course *Present*. So far, however, as it has to be done, it is *Future*, and so far as the motive for doing, or the power to do it depends upon antecedent conditions, it is *Past*. Hence, Perfects may become invested with the power of Presents. In Greek we see this in words like *οἶδα*=*I have experienced* or *learned* which=*I know*. In Latin *memini*, *I have called to mind*=*I remember*.

In the German languages, words of this kind are something more than mere logical Presents. They serve as formal and fundamental Presents upon which a fresh Past Tense can be founded. This is always a *Preterit*, i.e. never a Perfect. *Can*, *shall*, and *may* are the most notable words of this class. So far as form and origin go, they are Perfects after the manner of *οἶδα* and *memini*. But they are, also, the bases of such Preterits as *could*, *should*, and *might*; just as if they were Present Tenses, Infinitive Moods, or the word in its original form. There are others beside: though the class is a small one. It falls, however, into two divisions.

I. *Shall*.—Second Person Singular *shal-t*: in Mœsogothic *skal-t*. Preterit *shoul-d*.

May.—Second Person Singular in Anglo-Saxon, *meaht*: Preterit *meahte—meght*. Mœsogothic *mag-t*.

Can.—Second Person Singular *canst*, in Anglo-Saxon and Modern English. Preterit *cuthe* in Anglo-Saxon, *cou(l-)d* in Modern English, Mœsogothic *kan-t*.

II. *Owe*.—Anglo-Saxon form *âh*, where the *h* represents

the *g* in the Infinitive *âgan* and the Participle *âgen*. Preterit *âhte*, *ought*.

Dare and *Durst*.—The *s* is part of the root, Greek θαῤῥεῖν and θαρσεῖν. In Mœsogothic it appears in all the persons except the second. 1. *dars*, 2. *dar-t*, 3. *dars*. Pl. *daurs-um*. In A.S. it is 1. *dear*, 2. *dearst*, 3. *dear*. Plural *durr-on*—Preterit *dors-te*—Infinitive *durr-an*.

Must.—In M. G. Pr. Ind. Sing. *môt*, *môst*, *môt*—Pl. *motum*—Pr. *môsta*. *Mote*, when used, had the sense of *may*.

Mind.—In A.S. *ge-man*, *ge-munde*—Inf. *ge-munan*.

§ 180. In these Verbs we have seen a Perfect comport itself, in its character as the theme or basis for a secondary or derivative Tense, like a Present. All the secondary forms we have hitherto seen have been Preterits; or forms by the addition of *t* or *d*. But have we any assurance that they might not have changed their vowel and formed Perfects as well? or have we any assurance that other Verbs might not do so? If so, obsolete Perfects may be revived, though not exactly in the same form. Upon this point I can only quote the following extract. Other Verbs (writes Dr. Murray)

> Develop a new strong form, as English *let*, *let*, *let*; Scotch *læt*, *luit*, *luiten*; so *sæt*, *suit*, *suiten*; *pyt*, *pàt*, *putten*. . . .
>
> This is as old, at least, as the 16th century:—
>
> Thay *lute* the leiges pray to stocks and stanes.
> Alexander Scot, *New Year's Gift to Queen Mary*.
>
> Witht in the quilk he *pat* five thousand fut men and horsemen.—*Complaynt of Scotland*, fol. 133, (138) *b*.
>
> I met Gude Counsail be the way,
> Quha *pat* me in ane fellon fray.
> Lyndsay's *Satyre*, l. 686.

Auxiliary Verbs.

§ 181. *The root in -s*.—In the inflection of this Verb, which is the same as the Latin *sum*, the forms *am*, *art*, *is*, and *are* are the only ones that have to be considered: the *chief* question concerning them being the extent to which

they are all forms of the same word, and, when they are shown to be so, how the differences are explained.

The radical letter is *s*; so that the Third Person is the one which in English alone represents the original form. In *ar-t* and *are* it is changed into *r*. In *a-m* it is dropped altogether. *M* and *t* are signs of the first and second persons respectively.

The form *is* is exceptional: for though it is found in the *Anglo*-Saxon, the *Old* Saxon form is *is-t*, as it, also, is in the present Dutch and German, and as it is in the Mœsogothic. In the Scandinavian languages the *s* becomes *r*. In Greek the form is ἐστὶ (also εἶ).

It is in the Present Tense that this root is most especially found; and in the Past Tenses—whether Perfect or Preterit—that it is most conspicuously absent. It is found in the Infinitive Mood and in the Active, but never in the Passive, Participle. In the Present Indicative it is *always* found, though not always throughout, e.g. in German:—

Ic bin = *I am*	*Wir sind* = *We are*
Du bist = *Thou art*	*Ihr seyd* = *Ye are*
Er ist = *He is*	*Sie sind* = *They are.*

Here a second root (*be*) presents itself. In the Imperative and Present Subjunctive this *be* is common.

Like the Personal and Demonstrative Pronouns, the Auxiliary Verbs *am* and *be* are among the oldest words of our languages, indeed of the Indo-European class, in which they are found throughout. This being the case, we are prepared to find that they have undergone more than an ordinary amount of change. That such is the fact we find by an inspection of the Present Tense, where *am*, *is*, and *are* are undoubted forms from the same root. In West-Saxon, however, and in German, the Plural runs *wi*, *ge*, *hi sind* or *sindon*—*wir sind*, *ihr seyd*, *sie sind*; yet these we may hold (truly) are, word for word, the present Plural *are* under another form. Then there are words as unlike as *es*, *sunt*, and *sim* (*sis sit*), and *eram*, &c., all from the same root.

This root is *s* preceded by a Vowel, *i. e. as* or *es*, and all the changes it undergoes may be reduced to the four following processes :—

1. The retention or omission of the vowel before *s*—Latin *sum*, for *e-sum*.

2. The changes of *s-* itself—

a. Before the sign of a Person—as *ahmi* in *Zend*, εἰμὶ in Greek=*asm-i* in Sanskrit.

b. Int. *r-* ; as in *art* and *are* in English, and *ert* and *er* in Scandinavian.

In Greek εἰμὶ=*sum*=*am* has its *maximum* of Conjugation, and its *minimum* use as an Auxiliary. Indeed, the Persons and the Tenses in that language are so numerous that Auxiliaries can scarcely be said to form a class. Where in Latin it is necessary to say *verberatus sum, es, est*, &c., we can say in Greek τέτυμμαι, τέτυψαι, τέτυπται, &c. The *σ* in Greek, though sometimes rejected, always retains its character as a sibilant, *i. e.*, never becomes *r*.

In Latin, where the Inflections are fewer than in the Greek, the Auxiliary character of *sum, es, eram, esse*, &c. is more decided, and the Conjugation is more defective; inasmuch as in Latin, the root *fu-* plays a conspicuous part. In Latin the *s* becomes *r* in *ero, eram*, &c. In Sanskrit, as in Latin, it is defective; the parts which are wanting being made up from the inflection of the root *bh-*, *i.e.* the German *be*, and the Latin *fui*.

In Lithuanic, as in Sanskrit and Latin, the two roots *s-* and *bu*, each in itself defective, are complementary to one another, *i. e.* the inflection of one makes up for what is wanting in that of the other.

The same is the case in the Slavonic.

In German or Gothic, both roots are defective. The extent, however, to which they are complementary to one another is modified by the use, throughout all the languages of the family, of a third auxiliary, viz.—*was*.

§ 182. *Was*.—Of this Verb there are in the present

English four forms: two current, *was* and *were*; and two obsolete or obsolescent, *was-t* and *wer-t*.

Of the three auxiliaries, *was* is the only one which is limited to the languages of the Gothic family.

Like the other two, it is defective; the Present *Indicative* being the Tense from which it is the most conspicuously absent. Professor March gives for this Tense the forms *wese*, *wesest*, *wesep*, adding that they are rare. Dr. Morris gives no instances at all. In the Present Imperative we find *wes* and *wesath*. *Wesan* Infinitive; *wesende* Present Participle; and *ge-wesen*, Perfect, are ordinary forms. Hence the Past Tense then *was*, and the Conjunctive Mood *were*, are the parts to which at present this word is limited in English.

a.

I was	*We were*
Thou wast	*Ye were*
He was	*They were*

b.

If I were	*If we were*
If thou were	*If ye were*
If he were	*If they were*

In Frisian and Dutch we find the Preterit Participle *ge-weest*.

We have seen that all strong verbs in the oldest English had the suffix *-e* for the second person singular. In the Gothic *was-t* we have an older suffix *t* (suffix of the second person, as in *ar-t*), altogether lost in O. E. (Old English). But *wast* is not found in the oldest English it is quite a late form, not older than the fourteenth century. The O. E. form was *were* (that is *wese*), from which we have formed, after the analogy of *shall* and *will*, *wer-t*, which is sometimes, but wrongly, used for the subjunctive *were* (second person singular), as '*thou wert grim*' (*King John*, ii. 3).—*Morris, Outlines, &c.*, p. 183.

In Mœsogothic the *s* of the Singular and Indicative is retained in the Plural and Subjunctive—as *was*, *was-t*, *was*; *wês-um*, *wês-uth*, *wês-un*=*was*, *wast*, *was*, *were*, &c.; *wês-ja-u* (*if I*) *were*; *wês-ei-ma* (*if we*) *were*.

As a Tense *was* is like *can*, and a Perfect rather than a true Present. As such it belongs to that small and peculiar class wherein the vowel is long, the succeeding consonant is a Sibilant, and the *s* or *z* is changed into *r*. Nevertheless, the Gothic, German, Dutch, and English Participles are all formed in *s*. M.G. *wis-ans*, A.S. and German *ge-wes-en*; Dutch *ge-wees-t*.

In the Scandinavian languages, however, the *r* has wholly superseded the *s*.

It is, also, in the Scandinavian languages that *var-* has its greatest importance as an Auxiliary: being used both in the Infinitive and the Participle to the exclusion of *bê*. Still it is excluded from the Present.

§ 183. *Be*, *being*, *been*, are the present forms of the word: in Anglo-Saxon *be*, *beonde*, *ybeu*—besides which there were two forms for the *Second* Persons Singular, *bist*, *beest* (used by Milton); and Plural *beoth*. No special form for the Third Person present Indicative, which is always some form of *is*. It is this even in the literary German, where the First and Second Persons are *bin* (*bim*, *beom*) and *bist*—the third being *ist*.

Be, with its *maximum* of inflection, in the German family of languages, has the following forms:—

Infinitive; *beon*, *ben*, *be*.
Present Participle; *beonde*, *being*.
Perfect Participle; *ybeu*, *been*.
Indicative Present { Singular; 1. *beom*, *bin*; 2. *bist*; 3. *bith*. Plural; 1. *beoth*; 2. *beoth*; 3. *beoth*.
Imperative Present { Singular; 2. *beo*, *be*. Plural; 2. *beoth*, *be*.
Conjunctive Present { Singular; 1, 2, 3. *be*, *beo*. Plural; 1, 2, 3. *beon*.

This tells us that, like *am*, *sum*, εἰμὶ, &c., it formed its First Person Singular in *-m*; so corresponding to the Greek Verbs in *-μι*; also, that it changed the *m* into *n* (German *bin*).

Forms of the Latin *sum* = *esum*.

Sanskrit.	Latin.	Lithuanic.	Bohemian.	Servian.
Asmi	*sum*	*esmi*	*gsem*	*yesam*
Asi	*es*	*esu*	*gsy*	*yesi*
Asti	*est*	*esi*	*gest*	*yest*
Smas	*sumus*	*esme*	*gsme*	*yesme*
Stha	*estis*	*este*	*gste*	*yeste*
Sánti	*sunt*	—	*gsau*	*yesy*

Forms of the Greek φῦμι.

Sanskrit.	Latin.	Lithuanic.	Bohemian.	Servian.
Bhaváme	*fui*	*buvao*	*budu*	*budem*
Bavasi	*fuisti*	*buvac*	*budeš*	*budesh*
Bhavati	*fuit*	*buvo*	*bude*	*bude*
Bhavamas	*fuimus*	*buvome*	*budeme*	*budemo*
Bhavate	*fuistis*	*buvote*	*budete*	*budete*
Bhavante	*fuerunt*	—	*budau*	*buti*

The Greek is the language in which the root *be* plays the smallest part as an Auxiliary. On the other hand it is the Greek where its character as an independent word is the most manifest. Both as a Verb in *μι* and as a Baryton, with a regular Conjugation, the word denotes *coming into being*, *birth*, *passage from one state to another*, *development* rather than a Present state of anything that is not going on, or a Past state of any thing that is over and done. Φύω is the Latin *nascor*, and *φύσις*=*natura*; and with Nature we connect the notion of *growth* or the progress of *becoming something*. The Past Tense, then, in which the root presents itself is the Perfect rather than the Preterit. In the Slavonic it is the Future with which it is most specially connected. It is the Slavonic, too, in which it has its most peculiar functions as an auxiliary.

§ 184. *Defective Verbs.—Quoth.*—The sections upon the two Tenses of Past Time, the Perfect and the Preterit, have shown that in some degree almost every Verb in English is defective. Those that have a Perfect Tense are, as a rule, destitute of a Preterit, and *vice versâ*. This is *defect* on a great scale; and there is defect in many intervening

degrees throughout our language. The present section, however, omits these intermediate instances, and deals with it in the opposite extreme, viz., defect limited to a single Verb; and this is either obsolete or obsolescent.

The Verb, however, is *quoth*. We sometimes say *quoth I*. We never say *quoth thou*. We rarely if ever say *quoth we*, *quoth ye*, or *quoth they*. The Infinitive and Participial forms are unknown. No one living has ever said—*to quoth* or *quothing*.

On the other hand, however, the compound *bequeath* is perfectly regular. To *bequeath; bequeathed, I bequeathed*, &c. are ordinary Verbs with the usual inflection.

The word *quoth*, then, so far as it is not obsolete, is a signal, typical, or representative instance of Defect in its most limited form.

Nor is it this as a single word only. It impresses its character on the Syntax. We rarely, if ever, say *he quoth*, but *quoth he*; in other words, it is *followed* by its Pronoun, which in other Verbs, as a rule, comes first.

Add to this that the Pronoun itself is, from a comparatively late period, not given in full, but abbreviated (*quoth-a*), and, to a great extent, incorporated with the main word as a Postpositive Affix.

§ 185. *Confluent Forms.*—In words like the Anglo-Saxon Participle in *-nd* on the one side, and the Abstract Substantives in *-ung* on the other, we had in § 173 forms originally distinct, but which (as the language advanced) were merged into the single form *-ing*. Hence undoubted Participles, like *clænsi-and*, and undoubted substantives, like *clæns-ung*, are, at present, represented by the single termination which gives us *clæns-ing* for both. How ambiguous this form is, we have seen.

When words originally different thus merge into a third form, they may be called *Confluent*; and *Confluence* is a phenomenon which becomes common as languages become recent, or modern. There is not a little of it in the present English. In considering the forms in *-ing* we treated of

Confluence on a large scale. On a smaller scale we have it in certain individual verbs:

(1) *Do, did, done.*—These forms have two meanings, each of which was originally conveyed by a different verb.

Do, in the sense of *perform an act*=the Latin *facio*, had as its Past Tense the reduplicate Perfect *dede*.

Do, in the sense of *be sufficient or suitable*=the Latin *valeo*, had as its Past Tense the Preterit *dohte*.

The root was *dug-*; Infinitive *dug-an*; Present *duge* (?); Perfect *deâh*; plural *dugon*.

In German *do=facio*, is *thun, thue, thut, ge-than*: while *do=valeo* is *taugen, taugede, ge-taught*. From this there is the Substantive *Tugend=efficiency, virtue*, and the like. In English we have *doughty=strenuous, efficient*.

(2) *Become.*—When this word corresponded with the Latin *fio*, as it does in such expressions as *he became powerful*, the Present was *becommen*, the Perfect *becam*, the Participle *becuman*.

When it corresponded with the Latin *decet*, as it does in *that dress becomes you*, the Present was *becwæmen*, the Preterit *becwæmede*, the Participle *becwæmed*. In the present German they have both the Verb *bequemen=to suit, befit*, and the Adjective *bequem=suitable, fitting, convenient*.

(3) *Think, thought, thought.*—In the sense of *consider*, &c. =the Latin word *puto* and the A. S. forms were—

Þencan, Þôhte, ge-Þôht.

In the sense of *seem*, as in *me-seems=mihi videtur*, and the A. S. forms were

Þincan, Þûhte, ge-Þuht.

The first of these words corresponds with the German *denken*; as *Ich denke*=I think; the second *dünken*; as *mich dünkt*—(it) seems to me. So far as being limited to the third Person constitutes an Impersonal Verb *thinks*, when it corresponds to the German *dünkt*, is Impersonal; for it is

only in the third person that it is found in either language. But it does more than in the way of Impersonality. It has no Nominative Case by which it is preceded. The word *me-thinks*, when analysed and parsed, is *me=mihi* in an oblique case; while *thinks* (*it*) *seems*, the Pronoun of the Person being omitted.

§ 186. *Comparison of Adverbs.*—Adverbs form their Degrees of Comparison like Adjectives; so that when we say *the sun shines* brighter *to-day than it did yesterday*—the word *brighter=more brightly* may be the Comparative Degree of either the Adverb or the Adjective; and, as Adjectives may be used Adverbially, there is no proof in the numerous words like *bright*, *soft*, and the whole list of Adjectives, that Adverbs have any *proper* Comparative or Superlative Degrees.

In words, however, like *often-er* and *seldom-er*, there is no doubt as to *often* and *seldom* being Adverbs.

In Anglo-Saxon this Adverbial system of Comparison, in detail, though not in principle, varied with the Part of Speech. The Adjectival forms were *-re* and *-est*, or *-este*; the Adverbial *-or* and *-ost*.

Heard,	*heardre*,	*heardest* or *heardeste*.
Hard,	*harder*,	*hardest*.
Heard,	*heardor*,	*heardost*, i.e.
Hardly,	*more hardly*,	*most hardly*.

§ 187. *Adverbs originating in Cases.*—Of these, *then* and *when*, *then* and *there*, along with *here*, have been already noticed.

Needs—as *I needs must go*.

Else—for *elles*=otherwise.

Once, *twice*, *thrice=ones*, *twies*, *threes*; from Genitives or Possessives.

Seldom, *whilom*; archaic, from *while=time*, *pause*; from Datives.

Some adverbs thus formed are still in common use, such as *needs=of necessity*. Compare the expression in our Prayer Book:

Any ways afflicted or distressed.

Others explain this as a corruption of *wise*.

'Days' is similarly used:
'Tis but early days.—
Troilus and Cressida, iv. 5, 12.

i.e. 'in the day,' as the Germans use '*morgens*.' Compare *now-a-days*. —*Abbott, Shakesperian Grammar*, p. 35, 1870.

§ 188. *Forms in -ing.*—In such an expression as—

The candle went out and we were left *darkling*.—*King Lear*.

the last word is no participle of the verb *darkle*, even if such a one exist.

Again, in Cowper—

Dick heard; and tweedling, ogling, brideling,
Turning short round, strutting and *sideling*.

the word *sideling* by no means implies the verb *sidle*, though such a verb might easily grow out of it.

That the verb *grovel* has actually grown out of the supposed participle is shown in a masterly monograph by Dr. Morris, to which the reader is referred.

This Adverbial form in *-ling* or *-lung* is common throughout the German family.

Genitive forms—*blindlings*=*blindly*, German, &c.

Dative forms—*darnungo*=*secretly*, Old Saxon; *backlinga*=*backwards*; *nichtinge*=*by night*, Dutch.

In modern English they are rare, and disguised in form—*headlong*, *middling*, and a few others being formations of the same kind as *darkling* and *groveling*.

In Scotch they are common, chiefly with the form *-ins*—*blindlins*, *backlins*, *darklins*, *middlins*, *scantlins*, *stridelins*, *stowlins*. This *-s* extends even to the adverbs in *-ly*.

The Adverbs of Manner, which in English are formed by the termination *-ly*, Ags. *-lice*, O. E. *-liche*, are in Scotch as in most of the Teutonic dialects, identical with the Adjective; thus *a lood synger*, *hey syngs lood*; *nærr duin*, nearly done; *schui can eisie dui'd*, she can easily do it. *Guid* is an adjective only, the adverb being *weill*. From adjec-

tives in *-lie* we sometimes find adverbs in *-lies*, as if genitive forms, like *once*, *thrice*, *needs*; thus *leyklie*, *leyklies*, *rædilies*, probably; compare *stridlings*, astride, *gruvelings* (also *a-gruif*), prone, *eäblins*, *eäbles* perhaps, *mæbey*, *mæbeys*, mayhap.—Murray, *Dialect of the Southern Counties of Scotland*, p. 226.

In these formations, though the Case is an Oblique one, it must not be supposed to imply a corresponding Nominative. In most of the terminations, *-ng* is like the *-ly* in such words as *man-ly*, Adverbial, or at least Adjectival.

§ 189. This Adverbial use of the Cases of certain Nouns explains those words which, like *toward* and *towards*, *backward* and *backwards*, present them under two forms—one a Genitive; the other either an Accusative or the Dative that has dropped the final *-e*.

PART IV.

SYNTAX.

§ 190. The word *Syntax* is derived from the Greek words *syn* (*with* or *together*) and *taxis* (*arrangement*). It relates to the arrangement or putting together of words. Etymology deals with the forms of single words; Syntax, with the combination of more words than one.

§ 191. The notice of the Compounds of a language leads from Etymology to Syntax; for it is clear that in expressions like *hot-headed* and *horn-blower*, &c., we have something more than an individual word, and, consequently, something which, in some sense, belongs to Syntax. We have *two* words at least. In some cases, as in *midshipman*, &c., we have *three*. We also have them in a state of combination. The combination, however, constitutes but a single word.

It is not always an easy matter to distinguish between two separate words and a Compound; a fact which has already been suggested. A crow is a *black bird*. It is not, however, a *blackbird*. The best criterion is the accent. When the two words are equally accented, the result is a pair of separate words, connected with one another, according to the rules of Syntax: *the crow is a bláck bírd*. When the two words are *un*equally accented the result is a Compound, as *the bláckbird is akin to the thrush*.

§ 192. In etymology we *decline* and *conjugate*; in syntax we *parse*. Parsing is of two kinds; logical and etymological. Logical parsing gives the analysis of sentences

according to their terms and copulas, telling us which is the subject and which the predicate, which the chief, and which the secondary, parts of each. Etymological parsing gives the analysis of sentences according to the parts of speech of which they are composed. It tells us which is the noun, and which the verb, &c. It separates adjectives from substantives, pronouns from adverbs, and the like. It deals with numbers, cases, persons, &c.

§ 193. Speech chiefly consists of (1) commands, (2) questions, and (3) statements. The combination of words by which these are effected is called a proposition. There are, at least, three kinds of propositions; one to express commands, one questions, and one statements.

Propositions which convey commands are called imperative, as *do this, do not delay, walk.*

Propositions which convey questions are called interrogative, as—*what is this? who are you? Is it here?*

Propositions which convey statements are called declaratory,—as *summer is coming, I am here, this is he.*

Sentences like *may you be happy* are called optative, from the Latin word *opto=I wish.* By more than one good authority, they are placed in a class by themselves as a fourth species of proposition. And it cannot be denied that they are expressions of a peculiar character. *Would I could* is also optative, meaning *I wish I could*, or more fully,

I wish
that
I could.

Such being the case, we have two propositions conveyed by three words. There is the omission of the conjunction *that;* and (more remarkable) that of the personal pronoun as well.

Sentences like *how well you look!* convey an exclamation of surprise, and have been called exclamatory. Optative propositions are, to a certain extent, imperative, and to a

certain extent declaratory. In *may you be happy*, change the place of *may* and *you*, and the result is an ordinary assertion, *you may be happy*. On the other hand, *you be happy* is a command. There is no command, however, without a real or supposed wish on the part of the speaker.

Exclamatory propositions are, to a certain extent, interrogative, and to a certain extent declaratory. In *how well you look!* change the place of the essential parts, and the result is an ordinary assertion, *you look well*. Meanwhile, *how* indicates the degree or extent of your well-looking. But it only *indicates* it. The degree itself is undefined; and (as such) the possible object of a question. *How do you look?* is an actual interrogation. These belong to that part of general syntax which is called Collocation.

Besides being imperative, interrogative, or declaratory, propositions are either affirmative or negative—*Summer is early—summer is not early.*

§ 194. In respect to their structure, propositions consist of terms and copulas.

Terms are of two kinds, subjects and predicates.

The subject is the term by which we indicate the person or thing concerning which the statement is made or the question asked. In imperative propositions it denotes the person to whom the command is given. Thus:—*summer is coming—what is this?—make* [*thou*] *haste.*

The predicate is the term by which we express what we declare, ask, or command. There is no subject without its corresponding predicate; no predicate without its corresponding subject; and without both a subject and predicate there is no such thing as a proposition. Without propositions there are no questions, commands, or declarations; and without these, there would scarcely be such a thing as language. The little which there would be would consist merely of exclamations like *oh! ah! pish*, &c.

§ 195. The simplest sentences are those which consist of single simple propositions; as

The sun is shining.
The moon is shining.
The sun is red.
The sun is bright.

Sentences like

The sun and moon are shining;
The sun and moon are shining bright,

are anything but simple; for although, when we consider them merely as sentences, they are both short and clear, they each consist of *two* propositions, as will be stated again.

§ 196. The simplest propositions are those that consist of the simplest terms; as

Fire is burning,
Summer is coming,
Man is mortal,
I am glad,

and the like; wherein the number of words is three—three and no more; one for the subject, one for the predicate, and one for the copula.

§ 197. The shortest propositions are not always the simplest. When each word represents either a term or a copula, their grammatical elements coincide accurately with their logical, as was the case with the preceding examples. When, however, these contain fewer than three words, it is clear that either something must be supplied or that a term and copula are combined in the same word; as is the case with such expressions as

Fire burns,
Summer comes,

where *comes* and *burns* are both predicate and copula at once.

§ 198. The simplest propositions, then, are those that consist of what are called *single-worded* terms. Most terms, however, are *many-worded.* If it were not so, what would

become of those words which, though incapable by themselves of forming a name, are still used for forming a *part* of one—words like *the*, *of*, and the like? Very simple propositions can easily be converted into their opposite; as may be seen by the following operations upon the words

Fire is burning.

1. Prefix the definite article.—*The fire.*
2. Insert an adjective.—*The bright fire.*
3. Add an adverb.—*The very bright fire.*
4. Add a participle, and convert *bright* into its corresponding adverb.—*The very brightly-burning fire.*
5. Introduce a second substantive, showing its relations to the word *fire* by means of a preposition.—*The very brightly-burning fire of wood.*
6. Insert *which* after *fire*, followed by a secondary proposition.—*The very brightly-burning fire which was made this morning of wood.*
7. Add another secondary *proposition* relating to *wood*.—*The very brightly-burning fire which was made this morning out of the wood which was brought from the country.*
8. Add another secondary proposition by means of a conjunction.—*The very brightly-blazing fire which was made this morning out of the wood which was brought from the country, because there was a sale.*

It is clear that processes like this may be carried on *ad infinitum*, so that a sentence of any amount of complexity will be the result. Meanwhile, the predicate may be made as many-worded as the subject. Notwithstanding all this, the primary and fundamental portion of the term is manifestly the word *fire*. To this all the others are subordinate. In like manner, the following lines from the opening of the Paradise Lost give us but a single term, of which the word *fruit* is the fundamental element.

The *fruit*
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe,
With loss of Eden; till one greater Man
Restore us, and regain the blissful seat, &c.

§ 199. In declaratory propositions the subject precedes the predicate. We say *fire is hot*, rather than *hot is fire*.

§ 200. In interrogative propositions the predicate

precedes the subject; as *what is this?* rather than *this is what?*

§ 201. In imperative propositions the name of the subject is usually suppressed; *e. g.* we say, *shut the door*, instead of *shut thou the door.*

Propositions in Logic and in Grammar.

§ 202. Considerable prominence has been given to the word *Proposition.* Propositions do not form the *whole* of either written or spoken language. Nevertheless, they form the greatest and the most important part of it. Nine hundred and ninety-nine thousandths, at the very least, of the ordinary discourse of Mankind consists in them. Every complete sentence contains one at least; many contain more. Indeed, it is scarcely too much to say that where there is no proposition there is no sentence. A few combinations of words, no doubt, are to be found, which fail to deliver a proposition. They are, however, very few. In the so-called Interjections, words like *oh*, *ah*, *pish*, &c., there is no proposition: neither is there a sentence. In broken and incomplete utterances, there is neither a full sentence nor a proposition; and in the case of the Conjunctions, there is and there is not a proposition. But upon this more will appear in the sequel. At present, it is enough to say, that combinations of words which fail to deliver a proposition are extremely rare. As a general rule, discourse consists of propositions, and of nothing but propositions. *Man is mortal; Summer is pleasant; Winter is cold; Life is short; Art is long; Fire is hot; Iron is useful; Bread is cheap*; to which may be added innumerable others, are all propositions. And it may be added, that they are all propositions of one sort, and that of the simplest. They all contain three words, neither more nor less. They all, too, contain a statement or assertion. In the first, for instance, it is asserted of *man* that he is *mortal*; in the second, it is asserted of *summer* that it is *pleasant*, and so on throughout.

§ 203. Propositions are,* *at least*, of three kinds, (1) Declaratory, (2) Interrogative, and (3) Imperative. Such, indeed, is the view that is taken by the *grammarian*. In treatises, however, upon *Logic*, Declaratory Propositions are the only ones recognized; it being expressly stated that Questions and Commands are incapable of constituting Propositions.

§ 204. However much this may be the case in the Art and Science of Reasoning, it is not the case in the Art and Science of Language. Grammar, as has just been stated, not only recognizes, but peremptorily requires three kinds of Propositions. It should be added, however, that the Declaratory ones are of much the most importance; for which reason they will be taken as the type and sample of the others, and be described in full. The structure of these being understood, that of the others is easy: the parts being the same in all.

§ 205. Propositions are divided according to their *Quality*; as may be seen by adding to the ones under notice the word *not*, and writing *man is not mortal*, *summer is not pleasant*, and so on. This gives us the two classes; one of Affirmatives and one of Negatives. Hence, a Declaratory Proposition is often described as a sentence, in which something is either affirmed or denied.

To say *man*——*mortal*, *summer*——*pleasant*, *winter*——*cold*, *life*——*short*, &c., is to combine words to no purpose. They form only *parts* of propositions.

Again to say,——*is mortal*,——*is pleasant*,——*is cold*,——*is short*,——*is long*, &c., is to combine words to no purpose. They form only parts of propositions; conveying no meaning, and requiring the addition of something else in order to complete the sense. If a person use them, we ask the questions *what is mortal? what is pleasant? what is cold?* &c. Something or other must be *mortal*, or *pleasant*,

* Optative and Exclamatory Propositions will but rarely be noticed in the present work.

or *cold*. What this *something* is we wish to know. We wish to know the *something* to which the words *mortal*, *cold*, *warm*, apply.

Again; if we say, *man is*—, *summer is*—, *winter is*—, *life is*—, *art is*—, *fire is*—, &c.; or if we say, *man is not*—, *summer is not*—, *winter is not*—, *life is not*—, &c., we combine words to no purpose. They form only parts, fragments, or rudiments of propositions. We speak, indeed, of *man*, *summer*, &c., but we state nothing concerning them: we say nothing about them. As to whether they are *mortal* or *not mortal*, *cold* or *not cold*, we make no assertion.

§ 206. The object concerning which we make an assertion is called the *Subject*. *Man*, *summer*, *winter*, &c., are Subjects; and we can assert of them that they are *mortal*, or *warm*, or *cold*, &c.; or the contrary.

The assertion made concerning any object, or concerning the subject of our discourse, is called the *Predicate*. *Mortal*, *warm*, *cold*, &c., are Predicates: and we can speak of certain things as *mortal*, *warm*, *cold*, or the contrary.

That part of a proposition which connects the Subject and Predicate is called the *Copula*. If the word *is* stand by itself, the proposition is Affirmative; if it be accompanied by the word *not*, it is Negative.

§ 207. The following words, amongst many others, are capable of forming, by themselves, Subjects:—

man	bow	wealth	ox	pen	atmosphere
mother	fishing-rod	length	ass	ink	firmament
daughter	hunter	fire	bird	virtue	sky
horse	shooter	water	egg	vice	essence
dog	book	soul	winter	apple	truth.

The following words, amongst many others, are capable of forming, by themselves, Predicates:—

good	deep	shooting	hot	fatherlike	moved
great	happy	laughing	cold	bodily	beaten
red	womanly	conquered	strong	essential	sifted
weak	atmospheric	drifted	weak	important	buried.

There are, *at least*, three sorts, or classes of words: (1) those that can, by themselves, form *either* subjects or predicates; (2) those that can, by themselves, form predicates *only*; (3) those that can, by themselves, form copulas. To these must be added a fourth class, consisting of words like *not*, that can convert an affirmative copula into a negative one.

§ 208. The form of proposition which is at once the simplest and the most regular, is that where the number of words and the number of parts coincide; that is, where an affirmative proposition consists of *three* words, and a negative one of *four*. In this case, each part consists of a single word; *e. g.* the subject of one, the predicate of one, the affirmative copula of one, the negative copula of two;—*man is mortal, man is not mortal.*

It is not, however, the usage of language for propositions to take always the simple and regular form exhibited above. Language may be so constructed as to admit of two of the parts of a proposition being included in a single word; and, in reality, most languages are so constructed. Thus—

The copula and predicate may be expressed by a single word. To say *men die*, or *fires burn*, is to make an assertion concerning *men* and *fires*. This assertion is that they *are dying*, or that they *are not dying*; that they *are burning*, or that they *are not burning*. Instead, however, of saying *are dying*, or *are burning*, we say *die*, and *burn*.

The following words, amongst others, are capable of forming, by themselves, both a predicate and a copula, at once:—

eat	teach	shoot	see	sigh	murmur
die	petrify	laugh	hear	hunt	astonish
hunger	impeach	beat	speak	fish	pine.

§ 209. Inasmuch as the copula connects the subject and predicate, it comes between them: *man* is *mortal*. Hence the copula forms the middle part of a proposition. Conse-

quently, the subject and the predicate form the two limits, boundaries, or extremities of a proposition. Now the Latin word for a *limit*, *boundary*, or *extremity*, is *terminus*. Hence the subject and predicate of a proposition are called, in logical and grammatical language, the *terms* of a proposition. The subject is one *term*, the predicate another.

§ 210. The following list of words indicates a fresh series of facts :—

wisely	then	in	once	for	near
justly	to-morrow	over	twice	by	on
slowly	of	through	thrice	with	about, &c.

Not one of these words can form a term by itself; that is, not one of them can be either subject, predicate, or copula, so long as it stands alone. No one says *wisely is good, from is black, man is wisely*.

This, for the present, is sufficient. As we proceed we shall hear of Nouns, Pronouns, Verbs, Adverbs, Prepositions, Conjunctions and Interjections, &c., and the so-called Parts of Speech. When we do this it will be most especially necessary to remember that, in the present English, the Part of Speech to which a word belongs *is determined by the place it takes in the Structure of a Proposition.*

§ 211. *Names and Nouns.*—The word for Noun is, in French, *nom.* It is the Latin *nomen*; which means *name.* Hence, the two words are the same in respect to their derivation. But the word *Name* is a current English word; used by every Englishman who has a name, which means by everybody. *Noun*, on the other hand, is a word used in a limited sense; or mainly, if not exclusively, in Grammar only. This suggests that the two forms may not, in all cases, bear the same meaning; and such is the case. As words of the same origin they are the same. As words of *similar* meaning they are also the same. But, whether they are words of the *same* meaning has now to be considered.

A great deal depends upon this, because the ordinary division of the English and other Grammars runs thus—

Substantives and Adjectives are Nouns; the former a Noun Substantive, the latter a Noun Adjective; a classification which implies that they are both *Names*—one as good a name as the other. Then come the *Pronouns*. These are considered not true Names, but substitutes for them. If so, the Adjective is more of a true Noun, and a better *Name*, than the Pronoun.

Again, between the Verb and the Noun, whether Substantive, Adjective, or Pronoun, there is, always, drawn a wide difference.

As for the Participle, it is a Verb in one respect and Adjective in another. But, if so, how comes the difference between the Verb and Noun to be so decided? for, surely, the Participle graduates into both.

This is manifestly a preface to an objection against this use of the terms.

§ 212. *Names.*—There is more than a million of persons in London, and each of these has a name. There are more than ten thousand towns and villages in England, and each of these has one also. There are more than fifty racehorses at Newmarket, no one of which is without its name.

Of the persons, then, in London, of towns and villages in England, and of the racehorses at Newmarket, every individual has its own designation: *John—Hammersmith—Eclipse*, &c., &c. And as the number of other persons, other towns and villages, and other racehorses, is great, the number of names, in England only, becomes enormous. There is more than a million for the Londoners only. Yet London and Newmarket are only parts of England, and England is only a part of the world in general. Persons, too, and towns, villages, and racehorses are mere fractions of the whole collection of the innumerable somethings, real or imaginary, of the universe. Have all these names? They have and they have not. They have not names in the way that the persons of London, the towns and

villages of England, and the racehorses of Newmarket have. They have not names like *Thomas*, *Hammersmith*, or *Eclipse*. Nevertheless they have all names. The thousands of *Johns*, *Thomases*, *Janes*, and *Marys*, that occupy London, are all *persons*, *men*, *women*, *boys*, *girls*, *children*, as the case may be. The numerous *Hammersmiths*, *Londons*, *Newmarkets*, &c., are all *places*, *towns*, *villages*, *hamlets*, &c., as the case may be. The fifty *Eclipses*, &c., at Newmarket, are all *horses*, *mares*, &c., as the case may be. The *Hammersmiths*, &c., constitute part of an indefinite collection of individual places, towns, or villages; the word *place*, *town*, *village*, being names for the class or collection thus constituted. The *Eclipses*, &c., of Newmarket constitute part of an indefinite collection of individual horses, the word *horse* being a name for the classes to which these *Eclipses*, &c., belong. This leads us to a great twofold division of all names whatsoever; names being either *Individual* or *Common*.

§ 213. An *Individual* name is one which denotes a single object and no more. A *Common* name is one which denotes a whole class of objects.

Thomas is a single and particular individual of the class called *man*: *Julius Cæsar*, a single or particular individual of the class called *conquerors*. Or it may be that we look upon him rather as a *hero*. In that case he is an individual of the class of *heroes*. Whether, however, he be a *conqueror*, a *hero*, or a *man*, he is still *Julius Cæsar*; for this is what he is as an individual, irrespective of the particular class under which it may please the speaker to place him, and independent of any class at all.

Examples of this sort may be given *ad infinitum*. The main point, however, to be remarked, remembered, and reflected on, is the following: *Common* names apply to things of which there may be more than one. *Individual* names apply to things of which there is one and no more.

There are many *towns*, but there is only one *London*; many *men*, but only one *Thomas*; many *conquerors*, but only one *Julius Cæsar*.

§ 214. Individual names are also *proper* names, and there are many good writers who habitually call them so, preferring the term *proper* to either *singular* or *individual*. The reason for this lies in the fact of individual names being *appropriated* or made *proper* to certain single individual objects to which they are exclusively attached.

§ 215. Common names are also called *general*; and there is no objection to the term. It is possible, indeed, that it may be the better one of the two.

§ 216. Individual names are essentially *singular*, and it is a common as well as true statement, that no *individual name can be plural*. A grammarian would say that *no proper name can be plural*. How, then, can we use such expressions as *both the Bostons are important sea-ports*, or, *as long as Mæcœnases abound Maros will be plentiful—Sint Mæcœnates non deerunt, Flacce, Marones?*

The *Boston* in Lincolnshire is a different town from the *Boston* in Massachusetts; so, though the same combination of sounds or letters applies to both, it cannot be said that the same *name* is so applied. The same name is one thing; the same word applied to different objects is another. A name is only so far individual as it applies to some individual object. The two Bostons, however, are different objects.

The case of *Mæcœnas* and *Virgil* is different. Here there are but two individuals; one Mæcœnas, and one Virgil. But the famous Mæcœnas is something more than the particular patron of Virgil. He is the sample, type, or representative of *patrons in general*. Virgil, in like manner, is something more than the particular poet patronized by Mæcœnas. He stands for *poets in general*. Hence, the meaning of the Latin line, and of the English sentence that preceded it, is this:—*As long as there are men like Mæcœnas, there will also*

be men like Virgil. But a man like Mæcænas is a patron, and a man like Virgil a poet. Hence—*As long as there are patrons there will be poets also.*

§ 217. We now come to four new terms, that mutually illustrate each other. They run in pairs: (1 and 2), *Substance* and *Attribute*; (3 and 4), *Abstract* and *Concrete.*

Take (for instance) an orange. It strikes our senses. We see with our *eyes* that it is more or less round, *i. e.* that it is endowed with the *property or quality of roundness.* We see, too, that it is more or less *yellow*, *i. e.* that it is endowed with the *property or quality of yellowness.* We see that it is more or less *smooth*, *i. e.* endowed with the *property or quality of smoothness.* Our eyes tell us all this; the sight being the sense by which our belief as to the properties in question is conveyed to us. They tell a great deal more; but this it is unnecessary to enlarge on.

Then comes the evidence of our other senses.

By our *ears*, we detect a sound if we rub the skin with our fingers.

We *smell* it and find a peculiar and not unpleasant aroma.

We *taste* it and are gratified with a not unpleasant flavour.

We *feel* that it is elastic, or endowed with the attribute of elasticity. We feel, too, that it has a certain figure and size. We feel, too, that it has a certain weight.

On the strength of all this we say that an orange is *round*, *yellow*, *smooth*, *capable of exciting sounds*, *fragrant*, *sapid*, *elastic*, &c.

When we say that an orange is this, we *attribute* to it certain properties, or qualities. What are they? The qualities, or properties, of *roundness*, *yellowness*, *smoothness*, *sonorousness*, *fragrancy*, *sapidity*.

And how do we speak when we say that we do so? It is convenient to begin with saying how we do *not* speak. We do *not* say that an *orange has the property of round*,

yellow, *smooth*, &c. On the contrary, we say that it has the property of *round-ness*, *yellow-ness*, *smooth-ness*, &c.

So much for the attributes of an *orange*; at least, for some of them. The attributes of a *guinea*, a *loaf*, a *man*, a *fish*, or anything else, may be considered in the same way. They are, of course, when taken altogether, different from those of an orange. The principle, however, of considering them is the same.

Let us now suppose that all these attributes are, one by one, taken away, *and replaced by others;* that instead of an orange striking our eyes and sense of touch as round, it strikes them as square, or rhomboid; that it loses its fragrance and becomes fetid; that it sounds like a bell, and tastes like a loaf of bread. Would the object still be an orange? Would it not be something else? This leads to the question of the *essential* attributes or *essences* of things. We need not mind them for the present; but may turn our thoughts in a somewhat different direction.

Divest the orange of all its attributes *without supplying it with new ones.* What will it be then? Take away its original colour without replacing it by any fresh one. Let it lose its softness without becoming hard, its roundness without becoming of any other form. Annihilate its weight, taste, and smell. Let it have no means of appealing to eye, ear, taste, smell, or touch, so that it become, at one and the same time, impalpable, invisible, imperceptible. What will it be then? Will it be anything at all?

What becomes of the attributes? We have seen that they were taken away. What was done with them? They were taken away *separately*, and it is separately that they are put aside. *Roundness and yellowness* no longer go together. Each is in its own place; and that is a place by itself. No link now unites them; the orange in which they met being no more.

But we may unite them afresh; say in the idea of a golden ball, a guinea, a full moon, &c. And we may, also,

separate them, again and again. United, they give the idea of an object clear, palpable, sensible. Separated, or abstracted from those objects, they do nothing of the kind. Yet the mind takes cognizance of them. The idea of the particular attribute of yellowness, abstracted from an orange, is not much more difficult than the idea of the orange *minus* the attribute of yellowness. It is merely a case of difference and remainder; the additions and subtractions being made unconsciously and instinctively.

What becomes of the orange? Is it annihilated by the abstraction of its attributes, one and all? Few are prepared to say *yes* to that question. Few divest themselves of the notion that sensible, and material, objects are nothing more than the combination of certain properties, qualities, and attributes, each and all of which may be removed in such a way as to leave an absolute nothing. We rather imagine that, where there are certain attributes in union, there is a certain link which connects them; a basis, or foundation, which supports them; a basis or foundation different from the attributes themselves, but upon which they rest.

This *something supports* them. This something stands *under* them. This something is the *sub-stance*, or *under-standing*, of objects opposed to, and contrasted with, their *attributes*. Now Concrete terms are the names of Substances; whilst Abstract terms are the names of Attributes; *e. g.* :—

Abstract.		Concrete.
Brightness,		*Sun.*
Heat,		*Fire.*
Light, &c.		*Spark.*
Mortality,	are Attributes of the Substances	*Animal.*
Vitality,		*Man.*
Animality,		*Horse.*
Solidity,		*Wood.*
Resistance, &c.		*Stone.*
Fluidity, &c.		*Water.*

Vice Versâ.

CONCRETE.		ABSTRACT.
The Sun,		*Brightness.*
Moon,	are Substances with the	*Heat.*
Stars, &c.	Attributes	*Warmth.*
Man,		*Mortality.*
Horse, &c.		*Animality.*

§ 218. *Variable and Invariable Names.*—Besides being either Proper or Common, and Abstract or Concrete, names are Invariable or Variable.

Words like *stone*, *tree*, *man*, &c., denote certain objects which constitute a class including an indefinite number of individuals. To any of these the name may apply; but we cannot apply it to an object belonging to a different class. It is nonsense to call a *tree* a *stone*, or a *stone* a *tree*. Each name applies to the individuals of a certain group, and, as it cannot be applied otherwise, it is an *invariable* name.

All names, however, are not invariable. The word *I*, for instance, is *variable*. It changes its meaning with the person speaking. When William says *I*, it means William; when John says *I*, it means John. So, again, with *you*—it denotes the person to whom I happen to be speaking at the moment; but the next moment I may alter its meaning by speaking to some one else. The same applies to *that*, *this*, *these*, and several other words.

If a *mother* say *I*, it means a *mother* and a *female*; if a *father* say *I*, it means a *father* and a *male*. Even if an inanimate object be personified and be supposed to speak about itself and to say *I*, it means that inanimate object. It denotes the speaker, whoever he may be; but it is not the invariable name of any speaker whatever. Or, it denotes the object spoken of, whatever it may be; but it is not the invariable name of any object whatever. The word *this* means a *table*, when the speaker is talking of *tables*; a *dog*, when he is talking of *dogs*, &c.

§ 219. *Relational and Notional Names.*—Why are Pro-

nouns *Variable*? The answer to this lies in the meaning of the word *Attribute*. An Attribute, as we have seen, is some property that we separate, or *abstract*, from a substance. It may be a permanent or inherent one, like the weight, colour, or form of a material object; or it may be a fundamental or characteristic one, like the power of growth in a vegetable or an animal. But it may, also, be one which has no fixed or permanent character whatever; and may apply to an object only so far as it is in a certain relation to the speaker, or to something spoken about. Thus the word *I*, by which Thomas calls himself when he is speaking to John, means Thomas only so long as Thomas speaks of himself. When he is addressed by John, he is addressed as *thou* or *you*; and, so long as John addresses him, that is his name. It is, of course, his name only so long as John uses it; but it is his name *for the time being*. When Thomas addresses John, the two names change their application, and *I* means Thomas, *thou* John. Again, when, with two oranges lying before me at different distances, I call one *this* and the other *that*, the meaning, import, or application of the two words is reversed when I change their places. Still, they are names *for the time being*.

Now names of this kind depend on the *Relations* of the objects to which they apply; and as *Relations* change, the import of the name changes with them. Hence, they are *Variable* in respect to their application, and *Pronominal* as Parts of Speech.

The permanent *Attributes* of an object are called its *Qualities*. As names they are called *Notional*, as Parts of Speech they are *Substantival*.

Number is a Relation rather than a Quality; and hence the Numerals are Pronouns.

The Pronouns of which the Relations are the most direct and definite are those of the First and Second Person—*I*, *thou*; *we*, *ye*.

The next in order are the Demonstratives, *this* and *that*;

of which the Pronoun of the *Third* Person is merely an applied variety. When we get into the class of the Adjectival Pronouns, the direct character of the Relation is greatly reduced. The word *same* denotes identity; but the name of the object with which the identity is connected may, itself, require explanation: e.g. A. *This is the same as the other.* B. *But what is the other?* A. *The same as that* (or *this*). Still the fundamental attribute is a Relation.

§ 220. Parts of Speech.

The Syntax of a language is always regulated by its Etymology; so that in those languages where the etymological details are numerous, the rules of syntax are also numerous. On the other hand, where the etymology is simple, the syntax is of moderate dimensions.

In English, as has been seen, our etymological forms are few. The adjective is wholly destitute of them: yet it is a part of speech which, in many languages, has at least two genders—often three. In French, for instance, we say *le bon père=the good father;* but *la bonne mère=the good mother.* In Latin *bonus pater=good father; bona mater=good mother; bonum telum=good weapon.* Meanwhile, the plural runs *boni patres, bonæ matres, bona tela.* The Frenchman who said *bon mère* or *bonne père* might be accused of making a false concord; inasmuch as he would join an adjective in one gender to a substantive in another. No Englishman can possibly commit an error of this kind; because in the word *good* there is no change at all, and because, in English, we say *good father, good mother, good thing, good fathers, good mothers,* and *good things* indifferently.

The same applies to the articles. In French there are the forms *un* and *une=a* (or *an*); along with *le, la, les,* meaning *the.* Meanwhile, the German says *der, die, das, einer, eine, eines,* where the Englishman says simply *the* and *a* (or *an*). Of course, then, the details of the syntax of the article must be simpler in English than in German.

This, however, will be shown in detail as we proceed; since the points which the previous remarks suggest are that, as the outward and visible signs of concord, government, &c., are, to a great extent, wanting, the place that a word takes in the structure of propositions is of more than ordinary importance.

Some parts of speech can form terms by themselves. Others can only form *parts* of terms. This distinction should be attended to.

§ 221. *Details.*—The pronoun and the substantive.

The pronoun and the substantive can, *by themselves*, form *either* the subject or the predicate. They are both *names*. But the pronoun is a *convertible*, the substantive an *inconvertible* one.

The adjective and the participle can, *by themselves*, form the predicate of a proposition. The participle differs from the adjective in implying a corresponding verb.

The *finite* verb (for the verb in the infinitive mood is a noun rather than a verb) can form *both* the predicate and the copula.

The adverb can form no term by itself, but can, when associated with a verb, a participle, or an adjective, form *part of one*.

The preposition can form no term by itself; neither can it without *two* terms capable of doing so. It connects the two by *government*.

The conjunction can form no term by itself, neither can it (with a few exceptions) enter *into* a proposition at all. Its presence implies two propositions *between* which it finds place, and which it either connects or disconnects.

The affirmative and negative words *yes* and *no* can, *by themselves*, constitute a proposition. But they always imply, and depend upon, a previous one.

Have you done this? *Yes.*
Have you done this? *No.*

The interjection neither forms nor enters into a proposition.

The article, in respect to its *origin*, is a pronoun; a *numeral* in the case of *an* or *a*; a *demonstrative* in the case of *the*. As an element in the structure of a proposition it must be looked upon as a part of its noun rather than as an independent word. In some languages it actually coalesces with it and forms part of its declension; and in others it coalesces with the proposition which precedes the noun.

§ 222. *The concords.*—Concord is derived from the Latin word *concordia*, and signifies *agreement*.

The word *man* is the name of a male, and, in respect to its gender, is masculine. The word *she* relates to a female, and, in respect to its gender, is feminine. We do not, when speaking of the same person, say I saw the man and *she* saw me; or I saw *him* and *she* saw me. If we do, there is a *discordance* in the matter of gender. On the other,

I saw him and he saw me,
I saw her and she saw me,

are concords; and, as there are more kinds of concords than one, this is called the concord of *gender*.

The other concords will be noticed in their details as we proceed. But a general view of their nature and numbers may be given now.

If I say *I saw* these *man*, or *I saw* this *men*, there is a discord. *This man* and these *men* are the true combinations. This gives us a concord of *number*.

If I say *he is* him, there is a discord of case. The true combination is *he* is *he*. This gives us a concord of *case*.

If I say *I speaks*, there is a discord. What I ought to say is *I speak*. This gives us a concord of *person*. This is peculiar to the verb. So is *we speaks*, which gives us a discord of number; but this has been already noticed under the noun.

If I say *I do this that I* might *gain by it*, or I *did this that I* might *gain by* it, this is a *dis*cord. The right expression is either *I* did *this* that I *might gain by it*, or *I* do *this that* I may gain by it. This gives us a concord of tense. This is not generally recognized as a concord; but it

evidently is one. The recognized concords are four in number; *the* four concords—*i.e.* those of gender, number, case, and person; the latter being limited to the verb, which, on the other hand, has no concord of gender.

There is another kind of concord, which, from having a special and conspicuous name of its own, has not been classed among THE FOUR recognized concords—viz. Apposition—which see under Compound Sentences.

§ 223. *Apposition.*—In expressions like *George, King of England*, we must notice—

1. That the words *King* and *George* are in the same case.

2. That they denote the same object. The word *George* applied to that particular monarch means the same person as the *King* of England; and the words King of England applied to the same monarch mean the same person as *George*.

3. That they explain each other. If we say simply the *King of England*, we do not sufficiently explain ourselves; since we may mean a *Henry*, an *Edward*, or a *William*. And if we say simply *George*, we do not sufficiently explain ourselves; since we may mean any person in the world whose name is *George*. But if we say *George, King of England*, we explain what *king* and what *George* is meant.

Words that thus explain each other, mean the same thing, and are in the same case, may be said to be *placed alongside of each other*, or to be in *apposition*. The Latin word *appositio* means *putting by the side of*. The following are specimens of apposition:—*Solomon, the son of David.*—*Crœsus, King of Lydia.*—*Content, the source of happiness.*—*John's the farmer's wife.*—*Oliver's the spy's evidence.*—*Cæsar, the Roman emperor, invades Britain.*—Here the words *Roman emperor* explain, or define, the word *Cæsar*; and the sentence, filled up, might stand, *Cæsar, that is, the Roman emperor*, &c. Again, the words *Roman emperor* might be wholly ejected; or, if not ejected, they might be thrown into a parenthesis. The practical bearing of this fact is exhibited

by changing the form of the sentence, and inserting the conjunction *and*. In this case, instead of one person, two are spoken of, and the verb *invades* must be changed from the singular to the plural. Now the words *Roman emperor* are said to be in apposition to *Cæsar*. They constitute, not an additional idea, but an explanation of the original one. They are, as it were, *laid alongside* (*appositi*) *of* the word *Cæsar*. Cases of doubtful number, wherein two substantives precede a verb, and wherein it is uncertain whether the verb should be singular or plural, are decided by determining whether the substantives be in apposition or the contrary. No matter how many nouns there may be, so long as it can be shown that they are in apposition, the verb is in the singular number, provided that the main noun is also singular. There is still another concord; but it must be put into logical rather than grammatical phraseology. It is that the *predicate must agree in case* with its subject. It was noticed in § 219.

§ 224. *Government.*—So much for the concords, or for concord in general. It means what its name denotes, *agreement* in certain points between any two words of which number, gender, &c., have been the chief. The effect of all concords is to keep such words in the same grammatical place as they were.

The opposite to concord is *government*, or *regimen*. This puts each word out of two in a *different* place. Thus in *I strike him*, while *I* is in the nominative case, and *strike* in the corresponding person, *him* is in the objective case, and, so being, agrees with neither of them.

The chief forms of government are:

1. Government of a noun by a noun, as the *father's son*.
2. Government of a noun by a verb, as *I strike him*.
3. Government of a noun by a preposition, as *the father of the son; speak to me*.
4. Government of a verb by a conjunction or a relative pronoun, *e.g.*:

He strikes me; as opposed to *if he* strike *me, I shall strike again.*

The man who did this shall die, whoever *he be.* This is generally considered more correct grammar than *the man who did this shall die,* whosoever he *is.*

§ 225. *Caution.*—A great deal of government in the way of grammar is done by the *verb;* and as a general rule, the verb *governs* an objective case. But it is only the *transitive* verb that does so. Still, the transitive verbs are the chief members of their class. Hence the ordinary government of the transitive verb has been identified with that of the verbs in general; and as the transitive verbs govern their noun in the objective case, any instance of any other case being governed by a verb has been treated as exceptional. Whether it is so or not is a matter, *practically*, of small importance, because, in English, all the cases of *substantives*, except the possessive, end alike. Hence, the rule that verbs govern an objective case has been made to imply more than is legitimate. It puts all the cases with the exception of the nominative on the same level. Yet we know that even the possessive case had originally certain verbs that governed it—*he weold middangeardes*=*dominatus est terræ.*

There is confusion here, but it is not this particular form of confusion we are guarding against. The notion that the verb *governs* has unduly extended itself. The verbs *be* and *am* are known as substantive verbs; and it has not only been admitted, but it has been specially taught, that the verbs substantive *govern* a nominative case. Sometimes it is stated in a more general way, that they are followed by the case by which they were preceded. The fact is true enough, but what the reader is especially cautioned against is that the result is not a case of *government* at all. When Milton wrote

If thou beest *he*, &c. &c.,

he would have been wrong in writing

If thou beest *him.*

But the rule which (had he done so) would have been violated is a rule of concord, *not* of government. It is a rule of concord, and a very general one. It is the rule that the *Predicate agrees in case with the Subject.*

§ 226. *Collocation.*

The order or arrangement of the words of a sentence is in English a matter of more than ordinary importance; and it is easy to see why it should be so. In languages, like the Latin, where the inflections are numerous, words like *bonus dominus* or *pulchra filia* may be placed far apart from one another, and so may words like *milites pugnant*, or *pueri ludite*, and thousands of others in similar circumstances. This is because in the terminations *-us*, *-a*, we have certain outward and visible signs of gender, and these show that the words in which they occur agree with one another in that respect. And the same is the case with *-es*, *-i*, *-nt*, and *-ite*, except that the agreement here is in the way of number, and it is number of which these syllables are the signs. But in English, where the adjectives have no signs of anything at all, or, in other words, no inflection, while the remaining parts of speech have but few, no such latitude is admissible. Hence, words which agree with one another must, as a general rule, be kept in one another's neighbourhood.

§ 227. Such are the three chief heads under which the great majority of the rules of syntax may be arranged. There are none of them of an abstruse character; indeed, the class of concords is so thoroughly a matter of common sense that, at the first view, it seems scarcely worth explanation; for it is clear enough that in the concords of number, gender, case, and person, the two words in agreement are really two names of the same object, and such being the case, *must*, in both cases, be of the same gender, number, and the like. This is so simple a matter, that, at the first view, it appears that we want no grammarian to enlarge upon it.

§ 228. Such would, doubtless, be the case if the concords, &c., stood alone, *i.e.* if there was nothing to disturb them.

But this is not the case. The following is a notice, not of all, but only of some of these disturbing influences. They are well known and generally recognised. They have been, to some extent, classified, and some of them have names—old names dating back to the classical time of Greek language; and thus showing that they have belonged to grammar ever since it was first cultivated.

§ 229. *Ellipsis.*—Such a name is *Ellipsis*, signifying 'omission,' 'deficiency,' or 'falling short,' or 'short coming.'

This was bought at *Rundell and Bridge's*, i.e. shop, warehouse, or place of business. I am going *to St. Paul's*, i.e. cathedral.

§ 230. *Pleonasm.*—Such a name is *Pleonasm*, signifying excess.

The king *he* is just.	I saw *her*, the queen.
The men *they* were there.	The king *his* crown.

In the comparative degree we occasionally find, even in good writers, besides the syllable *-er*, the word *more;* as, *the more serener spirit.* Expressions like these are pleonastic, since the word *more* is a superfluity.

In the superlative degree we occasionally find, even in good writers, besides the syllable *-est*, the word *most;* as, *the most straitest sect.* Expressions like these are pleonastic, since the word *most* is a superfluity.

§ 231. *Personification.*—Such a name is Personification, of which the following are instances:

Gold, whose touch seductive leads to crime.
The cities who aspired to liberty.

The unexceptionable forms for these two texts are: 1. gold, the touch *of which*, &c.; 2. the cities *which* aspired, &c.

Still the exceptionable texts can be explained, perhaps excused. We may say that *a city* is what it is on the strength of human individuals that constitute it; and we say *Gold* is treated as a personal agent, like Sin, Death, Virtue and Vice, &c.

§ 232. *Violations* (*real* or *apparent*) *of the concord of number.*—*I have not travelled this twenty years.*—As *this* is

singular, and *twenty years* plural, there is an apparent violation of the concord of number. Still, it is only apparent. The words *twenty years* may be considered to mean, not *twenty separate years taken severally*, but *a number of years amounting to twenty dealt with as a single period.* In this latter case the words *twenty years*, though plural in form, are singular in sense.

These sort of people.—Here *these* is plural, and sort is singular: so that there is a violation (real or apparent) of the concord of number. Still, as the word *sort* implies the existence of more persons than one, the expression is open to the same kind of explanation as the preceding one.

The reason of this confusion of number is clear. There are in all languages certain substantives called Collectives. Of these collectives the word *sixpence* is a good example. It involves two notions: (1) that of *six separate pennies*; (2) that of *six pennies dealt with as a single sum.* In the first case it is plural; since in talking of *six separate pennies* we contemplate a plurality of parts. In the second case it is singular, since in talking of *a single sum* we lose sight of the plurality of parts, and contemplate only the unity of sum that results from them. In all collective substantives there is a mixture of two notions. *Army, parliament, people, mob, gang, set, family*, &c. are collectives.

By remembering that in all languages there is a tendency to *personify*, we can explain many apparent violations of the concord of gender.

By remembering that in all languages there is a certain number of *collective* substantives, we can explain many apparent violations of the concord of * gender.

§ 233. The special details of English syntax now come under notice. They will be arranged according to the several parts of speech. As has been already stated, the place which a word takes in a proposition will determine its place as a

* For *Attraction*, which belongs to the Syntax of Compound Sentences, see § 280, *note*.

part of speech. As a preliminary, however, we must divide propositions into two classes: (1) simple propositions; (2) complex, or compound, propositions.

SIMPLE PROPOSITIONS.

Articles.

§ 234. In the generality of grammars, the definite article *the*, and the indefinite article *an*, are usually the very first parts of speech that are considered. This is exceptionable. So far are they from being essential to language, that, in many dialects, they are wholly wanting. In Latin the words *filius patris* mean equally *the son of the father*, *a son of a father*, *a son of the father*, or *the son of a father*. But, though the Latin language has no article, each and all of the languages derived from it have one. The French has the article *le=the*, and *un=one*. So have the Italian, the Spanish, &c. But the Wallachian is the most remarkable. In Wallachian, or Moldavian, the article *follows* the noun to which it belongs. It also coalesces with it, so that the two form one word. Thus if *om=man*, the combination *om-ul=the man*. In this case it is *post*-positive, or placed after the substantive. This post-position is, by no means, rare. Neither is its amalgamation with the substantive. What occurs in the Wallachian occurs in the Icelandic also. So it does in the Danish, Swedish, Norwegian, and Feroic, derived from it. All this suggests the likelihood of the article being one of those parts of speech which originate during the later rather than the earlier stages of language. It also suggests a manner in which a part of speech, originally non-existent in a language, may be developed. If the Latin be the mother-tongue of the French, &c., and these contain articles, how came those articles there? Though wanting in the old Roman, the materials out of which they might be developed were present. The Latin had the word *unus=one*. It had also the words *ille*, *illa=he* and *she*. Now the French *un*

=*a*=*unus*; the indefinite article having grown out of the numeral. And the French *le*=*ille*; the definite article having grown out of the demonstrative pronoun. Neither was the French process of evolution or development peculiar. The articles of *all* the allied languages arose out of *unus* and *ille*; and, *mutatis mutandis*, the origin of the articles in the languages allied to our own is the same. What is *the* but a word of the same origin with the demonstrative *th-is* or *tha-t?* What is *a* but *an;* and *an* but *án* or *ane*, and *án* or *ane* but *one?* The article, then, in respect to its *history* is a pronoun, but, in respect to its syntax, it is a part of speech by itself. This is because it cannot, like the pronoun, form a term. The article is *incapable of existing, except in conjunction with either a substantive or some other pronoun.*

§ 235. The articles in English are *the*, *an*, *no*, and *every*. More than one competent writer has already suggested that *no* is an article. If so, it must, of course, be considered as different in its construction from the ordinary negative. It has no independent existence. It *has* an existence when coupled with a substantive or another pronoun. It=*not one*, and *none*, in power. The construction of *every* is exactly the construction of *no*. We can say *every man* as we can say *no man*, and *every one* as we can say *no one;* but we cannot say *every* and *no* alone.

§ 236. When two or more substantives, following each other, denote the same object, the article precedes the first only. Thus—we say, *the secretary and treasurer*, when the two offices are held by one person. When two or more substantives following each other denote different objects, the article is repeated, and precedes each. We say *the* (or *a*) *secretary and the* (or *a*) *treasurer*, when the two offices are held by different persons. This rule is much neglected.

§ 237. Before a consonant, *an* becomes *a;* as *an axe*, *a man*. In *adder*, which is properly *nadder*, and in *nag*, which is properly *ag*, there is a *misdivision* (*a nag* for *an ag*, *an adder* for *a nadder*). So, also, in the old glossaries.

Hec auris	a *n*ere	*i. e.* an ear.
hec aquila	a *n*eggle	— an eagle.
hec anguilla	a *n*ele	— an eel.
hec erinaceus	a *n*urchon	— an urchin.
hic comes	a *n*erle	— an earl.
hic senior	a *n*ald man	— an old man.
hic exul	a *n*owtlay	— an outlaw.
hic lutricius	a *n*otyre	— an otter.
hec alba	a *n*awbe	— an aube.
hec amictus	a *n*amyt	— an amice.
hec securis	a *n*ax	— an axe.
hec axis	a *n*axyltre	— an axletree.
hec ancora	a *n*ankyre	— an anchor.

Numerals.

§ 238. The numeral *one* is naturally singular. All the rest are naturally plural. Nevertheless such expressions—*one two* (=*one collection of two*), *two threes* (=*two collections of three*), are legitimate. They are so because the sense of the word is changed. We may talk of several *ones* just as we may talk of several *aces*; and of *one two* just as of *one pair*.

§ 239. Expressions like the *thousandth-and-first* are incorrect. They mean neither one thing nor another: 1001st being expressed by *the thousand-and-first*, and 1000th + 1st being expressed by *the thousandth and the first*. In words of this kind the construction is that of *the king-of-Saxony's army*.

§ 240. It is by no means a matter of indifference whether we say the *two first* or the *first two*. The captains of two different classes at school should be called the *two first boys*. The first and second boys of the same class should be called the *first two boys*.

Pronouns.

§ 241. A Pronoun is a convertible name which can, by itself, form either the subject or the predicate of a proposi-

tion. It agrees with the substantive in this respect, but differs from it in being convertible.

I am he.
This is the man.
What is *that?*

We have seen that as the Pronouns have the fuller inflection, they preceded both the substantive and the adjective when we treated of their etymology. For the same reason they come before them in syntax. Whether we say *feed the horse* or the *horse feeds* is indifferent; inasmuch as, in *substantives* like *horse*, there is no difference between the objective and nominative. Whether we say *a good book* or *good books* is indifferent; inasmuch as, in *adjectives* like *good*, there is no difference between the plural and the singular. Whether we say *feed he* or *feed him* is by no means indifferent; inasmuch as, in *pronouns* like *he*, &c., the objective and the nominative cases differ in form.

Whether we say *this book* or *these books* is by no means indifferent, inasmuch as in *pronouns* like *this*, &c., the plural and the singular numbers differ in form.

§ 242. *You and ye.*—As far as the present English is concerned *you* is a nominative form and *ye* is obsolete. The following passages show that, at one time, the two forms were nearly changing place.

As I have made *ye* one, Lords, one remain,
So I go stronger, *you* more honour gain.—*Henry VIII.* 2.

What gain *you* by forbidding it to teaze *ye?*
It now can neither trouble you nor please *ye.*—*Dryden.*

§ 243. *Pronomen reverentiæ.*—When we say *you* instead of *thou*, it is doubtful whether, in strict language, this is a point of grammar. I imagine that instead of addressing the person we speak to as a single individual, and applying to him a plural pronoun, we treat him as a collection of persons. If so, the practice is other than grammatical. We treat one person as more than one. There is, evidently, some courtesy in this; inasmuch as the practice is very

general. The Germans change, not only the number, but the person, and say (*e. g.*) *sprechen sie Deutsch=speak they German?* rather than either *sprichst du* (*speakest thou*), or *sprechet Ihr* (*speak ye*).

§ 244. *Dativus ethicus.*—In the phrase

Rob me the exchequer.—*Henry IV.*

the *me* is expletive, and is equivalent to *for me*. This is conveniently called the *dativus ethicus*. It occurs more frequently in the Latin than in the English, and more frequently in the Greek than in the Latin.

§ 245. *The reflected personal pronoun.*—In the English language there is no equivalent to the Latin *se*, the German *sich*, and the Scandinavian *sik*, or *sig;* from which it follows that the word *self* is used to a greater extent than would otherwise be the case. *I strike me* is awkward, but not ambiguous. *Thou strikest thee* is awkward, but not ambiguous. *He strikes him* is ambiguous; inasmuch as *him* may mean either the *person who strikes* or some one else. In order to be clear we add the word *self* when the idea is reflective. *He strikes himself* is, at once, idiomatic, and unequivocal. So it is with the plural persons. *We strike us* is awkward, but not ambiguous. *Ye strike you* is the same. *They strike them* is ambiguous. Hence, as a general rule, whenever we use a verb reflectively, we use the word *self* also. The exceptions to this rule are either poetical expressions or imperative moods.

He sat *him* down at a pillar's base.
Sit *thee* down.

§ 246. *Reflective neuters.*—In *I strike me*, the verb *strike* is transitive. In *I fear me*, the verb *fear* is intransitive or neuter; unless indeed *fear* mean *terrify*—which it does not. Here, after a neuter or intransitive verb, the reflective pronoun appears out of place, or as an expletive.

The system of the syntax of the Reflective Pronouns thus formed is developed in different degrees in the diffe-

rent Gothic languages; but in all more than in the English.

Sometimes the construction is equivocal. The place of the reflective is *after* the verb. The place of the governing pronoun is, in the indicative or subjunctive moods, *before* the verb. Hence in expressions like the preceding there is no doubt as to the power of the pronoun. The imperative mood, however, sometimes presents a complication. Here the governing person may *follow* the verb; so that *mount ye*=either *be mounted* or *mount yourselves*. In phrases, then, like this, and in phrases

Busk ye, busk ye, my bonny, bonny bride,
Busk ye, busk ye, my winsome marrow,

the construction is ambiguous. *Ye* may either be a nominative case governing the verb *busk*, or an accusative case governed by it=*yourself*.

The words *his* and *her* are possessive cases, and *not* adjectives; being equivalent to

Mater *ejus*, not mater *sua*.
Pater *ejus*, not pater *suus*.

§ 247. In expressions like *they say*, &c., *they* means *the world at large* or *people in general*. This is the indeterminate use of the pronoun. *One says* is also an indeterminate expression.

It is also indeterminate. It stands for an unexpressed, but understood, *subject*.

Closely connected with the indeterminate sense of *it* is that of *there*, in such expressions as *there is something wrong —there is no one here—there are thieves in the house*. In such expressions *there* stands for an unexpressed, but understood, *predicate*.

In such phrases as *it rains, it snows, it freezes*, it would be hard to say, in express terms, what *it* stands for. Suppose we are asked *what rains? what snows? what freezes?*

—the answer is difficult. We might say *the rain*, *the weather*, *the sky*, or what not? Yet, none of these answers are satisfactory. To say the *rain rains*, *the sky rains*, &c., sounds strange. Yet we all know the meaning of the expression—obscure as it may be in its details. We all know that the word *it* is essential to the sentence; and that if we omitted it and simply said *rains*, the grammar would be faulty. We also know that it is the subject of the proposition.

A curious way of giving precision to this indefinite power of the word *it* is seen in the following list:—

Pluit	. .	raynes	. . Deus meus.
Gelat	. .	freses	. . „ tuus.
Degelat	. .	thowes	. . „ suus.
Ningit	. .	snawes.	. . „ ipsius.
Tonat	. .	thoners	. . „ sanctus.
Grandinat	. .	hayles	. . „ omnipotens.
Fulgurat	. .	lownes	. . „ Creator.

Instead of the true nominative *ye*, we use (with few exceptions) the objective case *you*; as *you speak*, *you two are speaking*. In this case we substitute one case for another.

Instead of the true pronoun of the second person singular, *thou*, we use (with few exceptions) the pronoun of the second person plural, *ye*; and that in the objective rather than the nominative case, *you speak=thou speakest*.

There are very few languages where the pronoun of the second person singular is used, except in solemn discourse. Sometimes that of the second person plural, sometimes that of the third person plural, serves as its substitute.

§ 248. The words *my*, *thy*, *his*, *her*, *its*, *our*, *your*, *their*, in respect to their syntax or construction *to a great extent*, are *cases*, in the same way that the word *father's* is a case. They are this to a great extent, but not wholly.

The words *mine*, *thine*, *ours*, *yours*, *hers*, *theirs*, are adjectives, in the same way that *good* is an adjective.

If the words *his*, *her*, and *its* were not *cases*, such expres-

sions as *his mother*, *her father*, would violate the concord of gender; since *his* is masculine, whilst *mother* is feminine; *her* feminine, whilst *father* is masculine.

This is a discovery of Sir Isaac Newton's is different in sense from *this is a discovery of Sir Isaac Newton.* The latter means *this is how Sir Isaac Newton was discovered:* the former means *of Sir Isaac Newton's discoveries this is one.*

In all such sentences there are *two* substantives: one with which the article agrees, and which is expressed; and one by which the possessive case *s* is governed, and which is omitted, as being understood.

The pronominal possessive cases, *my*, *thy*, &c., are not in *all* respects like the possessive cases of the substantives (*father's*, *mother's*, &c.)

We cannot say *an enemy of my* —, *a notion of thy* —, &c. Yet—

We *can* say *these are good books*, but we cannot, *now*, say *these are mine books.* Hence—

Rule 1.—The adjectival pronouns like *mine*, *thine*, *ours*, &c., are only used when the substantive is *understood;* as *this book is mine*, *i. e. my book.*

Rule 2.—The possessive cases are only used when the substantive is *expressed;* as *this is my book* (not *this is mine book*, nor yet *this book is my*).

§ 249. *Construction of the word* self *in composition with pronouns.*—1. In the words *my-self*, *thy-self*, *our-selves*, *your-selves*, the word *self* (or *selves*) governs the words *my*, *thy*, *our*, *your*, just as in the expression *John's hat* the word *hat* governs the word *John's;* so that *my*, *thy*, are possessive cases.

2. This is not the case with the words *him-self* and *them-selves.* Here the words *self* and *selves* are in apposition with the words *him* and *them* respectively.

3. The word *her-self* is ambiguous; since it is doubtful whether *her* be a possessive or an objective case.

4. The word *it-self* is also, sometimes, ambiguous; since it is doubtful whether it originated in *it-self* or *its-self*.

This inconsistency in the use of the word *self* in composition dates from the earliest stage of our language.

§ 250. The indeterminate pronouns are admirably illustrated by researches into the history of the language. The word *one* in the expression *one says* has nothing to do with the numeral *one*. The numeral *one* was, in Anglo-Saxon, *áne*, and in Latin *unus*. But the indeterminate *one* had no existence in Anglo-Saxon at all; and it was foreign to the soil of England until the battle of Hastings. Hence, common as it is, it is of French origin. The older forms in French were *om* and *homme*, which are neither more nor less than the Latin *homo=man*. So that *one says=man says* or *men say*. Now this is what our Anglo-Saxon ancestors actually said. Before *on* was introduced from France we said *man* or *men*. At the present time the German for *one says* (*on dit*) is *man sagt*. In West-Saxon we find *me*.

Substantives.

§ 251. A substantive is an *inconvertible* name, which can, by *itself*, form either the subject or the predicate of a proposition.

Summer is coming.
This is *gold*.
Gold is *metal*.

It differs from the pronoun in its *in*convertibility.

It differs, too, from the pronoun in its declension, which is simpler. The substantive has only *three* signs of case and number; and, besides this, all the three signs that it has are identical in form—to the *ear*, though not to the *eye*.

The ship's sail.
The ships are sailing.
The ships' sails.

Its syntax from the want of cases is simple. For phrases like *Rundell and Bridge's*, *St. Paul's*, see § 229.

Government of the substantive.—When one governs, or determines the case of another, the noun which is governed is in the possessive case—as the *man's hat, the father's son, the master's house.*

The *order* of the words thus governing and governed by each other gives us almost the only rule without an exception in the English language. The possessive case or the case of the noun governed always precedes, and never follows, the case that governs it. Attention is called to this not only on account of the generality of the rule, but because in the allied language of Germany no such regularity exists. The Germans say *Geschichte Roms* = *History of Rome.*

The meanings of *a man's hat*, &c., and the *hat of a man*, are so closely allied that the preposition *of* has been called the sign of a genitive case. It is not the *sign* of a case at all; but the *substitute* for one.

§ 252. *The Case Absolute.*—It is only from the possessive case that the nominative is distinguishable. It is the same in form as the objective, at least for the *substantive.* In the pronoun there is a difference.

This leads to a question often raised, and perhaps even now not finally answered. In sentences like the following,

The *door* being *open*, the steed was stolen.
The *sun* having *arisen*, the labourers began to work.

In what case are *door* and *sun*, *open* and *arisen*?

To answer this we must frame a similar sentence, and in it substitute a pronoun for the substantive; for, as the pronoun has *two* cases, it will help us to decide the question.

1. *He made the best proverbs of any one*, him *only excepted.*

2. *He made the best proverbs of any one*, he *only excepted.*

Which of these two expressions is correct? This we can decide only by determining in what case nouns standing absolutely in the way that *door*, *sun*, and *him*, (or *he*) now stand, were found in that stage of our language when the

nominative and objective cases were distinguished by separate forms.

In Anglo-Saxon this case was the *dative;* as *up-a-sprungenre sunnan=the sun having arisen.*

In A. S., also, *him* was a dative case, so that the case out of which expressions like the ones in question originated, was dative. Hence of the two phrases, *him excepted,* and *he excepted,* the former is the one which is *historically* correct.

It is also the form which is *logically* correct. Almost all absolute expressions of this kind have reference, more or less direct, to the *cause* of the action denoted. In sentences like *the stable door being open, the horse was stolen,—the sun having arisen, the labourers got up to work,* this idea of either a cause, or a coincidence like a cause, is pretty clear.

Now the practice of language in general teaches us this, *viz.* that where there is no proper instrumental case expressive of cause or agency, the ablative is the case that generally supplies its place, and where there is no ablative, the dative. Hence the Latins had their ablative, the Anglo-Saxons their dative absolute. The genitive absolute in Greek is explicable upon other principles.

In spite, however, both of history and logic, the so-called authorities are in favour of the use of the nominative case in the absolute construction.

The Adjective.

§ 253. An Adjective is a word which can, *by itself,* form the Predicate of a Proposition, but not the Subject.

Fire is *warm,*
but not
Warm is *fire.*

When such an arrangement as the latter occurs (and it does occur in the well-known text, *Great is Diana of the Ephesians*), we have not only the formation of a Subject by the

Adjective, but a transposition of the Predicate. The Adjective is wholly destitute of Inflections ; so that its Syntax is simple in proportion to their paucity.

§ 254. The Adjective generally precedes the Substantive; as a *good man*, not a *man good*. In many other languages the order is reversed. Even in English we may use such expressions as *a man just and good, a woman wise and fair, a hero devoted to his country.*

§ 255. When two objects are compared, the Comparative, when more than two, the Superlative Degree, should be used—*this is the better of the two, but this is the best of all.*

§ 256. The Positive preceded by the word *more* may stand instead of the Comparative. We may say *more wise*, instead of *wiser.*

The Positive preceded by the word *most* may stand instead of the Superlative. We may say *most wise* instead of *wisest.*

§ 257. That they can be used is universally known. Neither is there anything remarkable in their syntax. Common sense tells us what they mean. When, however, do we use the one form, when the other? This depends upon the nature of the Adjective. In general terms, we may say that the object of the circumlocution is to keep the length of the word within certain limits. It is, *probably*, better to say *more fruitful* than *fruitfuller.* It is *certainly* better to say *more pusillanimous* than *pusillanimouser.* But it is doubtful whether this is the only rule to go by. A great many Adjectives (*fruitful* amongst the number) are Compounds, in which case the addition of an *extra* syllable presents an accumulation of subordinate parts, which, to some speakers, may be inconvenient or disagreeable. Thirdly, there is a large number of Adjectives which are of foreign origin. To some of these an English affix *-er* or *-est* would be exceptionable.

§ 258. Thus much, however, may safely be said—

1. That when the word is, at one and the same time,

monosyllabic and English in origin, the forms in *-er* and *-est* are preferable.

2. That when the word is trisyllabic, compound, and of foreign origin, the combinations in *more* and *most* are to be resorted to.

For intermediate cases the writer may consult his own taste. Of dissyllables, the words that end in *-y* are those that, next to our native monosyllables, have the best claim to be inflected—as *holy*, *holier*, *holiest*—*manly*, *manlier*, *manliest*; upon which we may remark, by the way, that they are all Anglo-Saxon.

§ 259. The adjective *like* governs a case, and it is, at present, the only adjective that does so. When we say this is *good for John;* the government proceeds not from the adjective *good*, but from the preposition *for*. The word *like*, however, really governs a case.

Verbs (*Finite*).

§ 260. A *Finite* Verb is a word which can form, by itself, both the Predicate and the Copula of a Proposition, as *Fire burns*.

The Concords of the Finite Verb are those of Number and Person, in Simple Propositions. In Complex Propositions there is a third Concord; that of Mood.

§ 261. *Persons.*—In Latin, and certain other languages, the Pronoun is omitted, it being enough to say—

Voco,	*I call.*	*Vocamus,*	*We call.*
Vocas,	*Thou callest.*	*Vocatis,*	*Ye call.*
Vocat,	*He calls.*	*Vocant,*	*They call.*

In English, however, except in three small classes of words, the subject is always expressed. We cannot say *speakest*, however much the termination *-est* may suffice to show that the word is in the second person. On the contrary, *thou speakest* is the form that must be used.

The three cases where the subject may be omitted are

(1) that of the Imperative Mood, (2) that of the Optative Preterit, and (3) that of the three Impersonals.

In Imperative Propositions, the subject, being the name of the person spoken to, is suppressed without either ambiguity or inconvenience. We may say, *walk thou—hold thou thy tongue*: but we may also say, *walk—hold thy tongue.*

The Preterit *would*, when Optative, or expressive of a wish, can stand by itself, *i.e.* without any personal pronoun to precede it. We may say, *I would I could*: but we may also say, *would I could.*

The three Impersonals are (1) Methinks, (2) Meseems, (3) Me listeth.

In Anglo-Saxon *þincan* signified *think*, whilst *þencan* meant *seem.* Hence, *methinks* and *meseems* mean the same, viz. *it seems*, or *appears*, *to me.* Here *me* is in the condition of the Dative Case, and *it* is suppressed or understood. *Me listeth* means *it pleases me.*

The Personal Pronoun generally precedes the Verb. Expressions like *said I*, or *says he*, instead of, *I said*, or *he said*, are only admitted in very familiar discourse. One verb, however, *always* precedes its pronoun, viz. *quoth*—we always say *quoth he*: never *he quoth.*

The Pronoun of the Second Person is only used in solemn discourse, and by members of the Society of Friends. Instead of *thou speak-est*, we say *you speak.*

§ 262. *Government of Verbs.*—Verbs are of two sorts: (1) Transitive, (2) Intransitive.

In saying *I strike the iron*, the verb *strike* denotes an action. It also does something more: it denotes an action that has an effect upon an object; since the word *iron* is the name of an object, and the word *strike* is the name of an action that affects that object. In this case the *action* may be said to *pass off* from the agent (i.e. *the person who strikes*) to the object (i.e. *the iron*). Verbs expressing action capable of affecting objects are called Transitive Verbs, from the Latin word *transire*=*to pass over.*

In saying *I walk*, the verb *walk* denotes an action. It does not, however, denote an action that has any effect upon any object whatever. The action alone, in its simplest form, is stated to take place. Verbs like *walk* are called *Intransitive*, because *no* action can be said to pass off from them to any object.

Respecting the Government of these two sorts of verbs, there are the two following rules: —

1. Transitive verbs always govern the substantive in the objective case; as *I strike him, he strikes me, they teach us, the man leads the horse*, &c.

2. Intransitive verbs govern no case at all; as *I sleep, I walk, I think*, &c.

The same word has often two meanings, one of which is transitive, and the other intransitive; as, 1. *I move*,— where the verb is intransitive, and denotes the mere act of motion. 2. *I move my limbs*,—where the verb is transitive, and where the action affects a certain object (*my limbs*); or, 1. *I walk*,– where the verb is intransitive, and denotes the mere act of walking. 2. *I walk the horse*,– where the words *I walk* are equivalent to *I cause to walk*, and are also transitive, denoting an action affecting a certain object (*the horse*).

Unless this fact of the same verb having transitive and intransitive meanings be borne in mind, transitive verbs will appear to be without an objective case, and intransitive verbs to govern one.

SYNTAX OF THE PARTICIPLE.

§ 263. This follows that of the *Adjective* and *Verb*; for the Participle partakes of the character of both.

A Participle, like an Adjective, is wholly destitute of actual inflection.

A Participle, however, like an Adjective, must be considered in respect to its *virtual* Cases, *virtual* Numbers, and *virtual* Genders.

The Past Participle combines with both *am* and *have*, as *I am called*, *I have spoken*.

§ 264. When preceded by *have*, the Participle is in the Accusative Case and the Neuter Gender. This is explained by what follows.

In phrases like *I have spoken*, *I have slept*, *I have moved*, *I have written*, the verb *have* is in the present tense, whilst *spoken*, *slept*, *moved*, *written*, are past passive participles. Here *have* indicates past time. It indicates past time, even although it be itself in the present tense.

As, however, the natural meaning of the word denotes *possession*, it may naturally be asked how it comes to mean *past time*. To say *I own written a letter*, *I possess written a letter*, *I hold written a letter*, sounds as nonsense; at any rate, it gives no such a meaning as is given by the words *I have written a letter*. Nevertheless, it is very evident that, in order for a person to possess an object, the object must be in existence. We cannot say that a man *owns*, *possesses*, or *holds*, *a written letter*, without also implying that a *letter has been written*.

Now comes the notice of the construction. The participle *written* has the same form for all cases, genders, and numbers; and this conceals the fact of its following the case, gender, and number of the substantive with which it is connected. Add to this the circumstance that the participle has in the present English a peculiar position in the sentence. If we said, *I have a horse ridden*, we should connect the fact of past time with the idea of *possession*, much more clearly than we do in the current phrase, *I have ridden a horse*. The proofs that the view above is the true one are as follows: —

1. In certain languages we find other words besides *have*, expressive of possession, used for the sake of denoting past time: *e. g.* in Spanish the word *tengo*=*I hold*, and in Old High German and Old Saxon the word *eigan*=*to own*. In these tongues, phrases like *I hold ridden*, *I own ridden*=*I have ridden*, are actually existing.

2. In Old High German, Old Saxon, and Anglo-Saxon, we have the order of the participle and substantive occasionally reversed; *e. g.* instead of saying *I have forgotten it, I have chosen him, I have made one*; the phrases run, *I have it forgotten, I have him chosen, I have one made.*

3. In languages where there is a sufficient amount of inflection to exhibit the participle as agreeing in case, number, and gender with the substantive to which it applies, such agreement is exhibited. In the Latin of the Middle Ages we find expressions like *literam scriptam habeo*=*I have a written letter*, or *I have written a letter.*

§ 265. In *I have ridden a horse*, and *I have ridden a mare*, the word *ridden*, although *horse* is masculine, and *mare* is feminine, is in the same gender. Moreover, the word *ridden* is in the *neuter* gender, and, as such, equally different in gender from the two substantives *horse* and *mare.*

Apparently this violates the statement made above, *viz.*, that the participle agrees with the noun in case, number, and *gender.* In reality it does not. Sentences like the one in question are elliptical, the word *thing* being understood: so that *I have written a letter* is equivalent to *I possess a letter as a written thing. I have ridden a horse* is equivalent to *I possess a horse as a ridden thing. I have ridden a mare* is equivalent to *I possess a mare as a ridden thing.*

Hence it is not with the substantive that appears in the sentence, but with the substantive *thing* understood, that the participle agrees. As such it is in the neuter gender.

§ 266. *Syntax of the Verb Substantive in the Present Tense with the Past Participle.*—The Participles *moved, beaten, struck, given*, are Participles of a *past* tense. Hence, *I am moved* should mean, not *I am in the act of being moved*, but *I am a person who has been moved;—he is beaten* should mean, not *he is a person who is in the act of suffering a beating*, but *one who has suffered a beating*: in other words the sense of the combination should be *past*, and not *present.* By a comparison between the English and Latin languages

this anomaly becomes very apparent. The Latin word *motus* is exactly equivalent to the English word *moved*. Each is a Participle of the passive voice, and of the past tense. Besides this, *sum* in Latin equals *I am* in English. Yet, the Latin phrase *motus sum* is equivalent, not to the English combination *I am moved*, but to the combination *I have been moved; i. e.* it has a past and not a present sense. In Greek the difference is plainer still, because in Greek there are two Participles Passive, one for the present, and another for the past tense; *e. g.* τυπτόμενος εἰμὶ (*typtomenos eimi*)=*I am one in the act of undergoing a beating*; τετυμμένος εἰμὶ=*I am one who has undergone a beating.* The reason for this confusion in English lies in the absence of a passive form for the *present.* In Mœso-Gothic there existed the forms *slahada=he is beaten* (*percutitur*, τύπτεται) and *slahanda=they are beaten* (*percutiuntur*, τύπτονται), &c. Now, as long as there was a proper form for the present, like those in Mœso-Gothic, the combinations of the present tense of the Verb Substantive with the Participle Past Passive had the same sense as in Latin and Greek; that is, it indicated past time: *e. g. ga-bundan-s im=I* have been *bound* (not *I* am *bound*), *gibans ist=he* has been *given* (not *is given*), &c. When the passive form, however, was lost, the combination took the sense of a present tense.

Adverbs.—§ 267. Take three words, *e.g. summer is pleasant.* Prefix any such word as *cheerfully, warmly, brightly, mildly.* Ask what sort of sense is made by the combination. The answer will be, that, whether we say *cheerfully summer is pleasant*, or *summer cheerfully is pleasant*, we can only get a meaning by taking the word *cheerfully* along with the word *pleasant*; in other words, that, although we may talk of *cheerful summer*, we cannot talk of *cheerfully summer.*

1. In the first place, they cannot form by themselves the subjects of propositions; since we cannot say, *cheerfully is pleasant*, or *cheerfully is summer.*

2. Neither can they form by themselves the predicates of propositions; since we cannot say *summer is cheerfully.*

3. Nor yet can they form the copulas of propositions: since we cannot say *summer cheerfully pleasant.*

4. Nor yet can they form the copula and predicate at once: we cannot say *summer cheerfully* in the way we say *summer cheers.*

Speaking generally, they cannot constitute *by themselves* any of the parts of a proposition.

Although, however, they cannot do this, they can combine with certain words which *can* constitute some of the parts of a proposition, and so form subordinate parts of subjects and predicates.

The class of words with which words like *cheerfully* combine are the Adjectives. We can say *summer is* cheerfully *pleasant*, *summer is* ardently *hot*, *man is* certainly *mortal*, *John is* tolerably *good*, *James is* exceedingly *bad*, *this is* enormously *big*, *that is* contemptibly *little*, &c.

They also combine with the Participles; as *he is hunting* eagerly, *we are fishing* earnestly, *they are shooting* continually, *the sun is shining* brightly, *the wife is weeping* immoderately, &c.

Every verb contains a Participle. Now, words like *cheerfully* can combine with Verbs. This they do on the strength of the Participle involved—*John eats* heartily, *James drinks* deeply, *he speaks* loudly, *she breathes* difficultly, *he lives* piously, *he died* calmly, *he fears* exceedingly, &c. As it is generally with the Verb that words like *cheerfully* are combined, they are called *Adverbs.*

An Adverb, then, is a word that can enter into the proposition only when combined with an Adjective, a Participle, or a Verb; as—*Man is* certainly *mortal*, *John is* certainly *riding*, *John* certainly *rides.* The following words, along with many others, are Adverbs:—

once	never	badly
now	yet	much
then	here	brightly, &c.

§ 268. In expressions like *the sun shines bright*, the word *bright*, an Adjective, is equivalent in meaning to the Adverb *brightly*. In English there is, with Adjectives, no distinction of gender; if there were, *bright*, and words like it (used adverbially), would be neuters.

Adjectives in the Neuter Gender are, above all other parts of speech, used in an adverbial sense, and that not only in English, but in most other languages.

§ 269. Adverbs are susceptible of the degrees of comparison. This takes place in three manners:—

1. By adding *-er*, or *-est*, to the Adverb; as *bright-ly*, *bright-li-er*, *bright-li-est*; *tight-ly*, *tight-li-er*, *tight-li-est*.

2. By taking the comparative or superlative form of an Adjective, and using it adverbially; as *the sun shines brighter to-day than it did yesterday, and probably it will shine brightest to-morrow.*

3. By prefixing the word *more*; as *the sun shines more brightly than it did yesterday, and will probably shine most brightly to-morrow.*

Of these three methods of denoting the degrees of comparison of Adverbs, the last is most used by the best authorities.

Prepositions.—§ 270. Besides the Adverbs, there is another class of words that can enter into the construction of a proposition only when combined with others. Take the word *to* or *from*, and deal with it in the way that the Adverb *cheerfully* was dealt with.

We cannot make it the subject of a proposition. We cannot say *to is summer*, or *from is summer.*

Neither can we make it the predicate of a proposition. We cannot say *summer is to* or *summer is from.*

Nor yet can it become a copula. We cannot say *summer to pleasant, summer from pleasant.*

Just as little can either *to* or *from* form copula and predicate at once. We cannot say *summer to, summer from*, in the same way that we say *summer cheers.*

In order to admit words like *to* or *from* into a proposition, we must combine them with other words.

Now, words like *to* and *from* will not combine with the same parts of speech as words like *cheerfully* combine with.

1. They will not combine with Adjectives. We cannot say, *summer is from pleasant, summer is to hot.*

2. They will not combine with Participles. We cannot say, *he is hunting from, they are shooting to.*

3. They will not combine with Verbs. We cannot say, *he comes from, he drinks to.*

The class of words with which words like *to* and *from* will combine are the Substantives and Pronouns. We can say, *he comes from London, he comes from the country, he drinks to me, she drinks to him,* &c.

All words like *to* and *from* require a Substantive or a Pronoun to be combined with them.

§ 271. In many languages, where a word like *to* and *from* is combined with a Substantive or Pronoun, the word like *to* and *from* comes first; whilst the Substantive or Pronoun follows after; as *he comes from London*, not *he comes London from.*

Owing to the fact of words like *to* and *from*, when combined with a substantive or pronoun, coming, in many languages, first, they are called *Pre*positions, from the Latin words *præ* (*before*) and *positus* (*placed*), or words *placed first.* In languages where they *follow* the substantive or pronoun, the term preposition is somewhat inapplicable.

A preposition is a word that can enter into a proposition only when combined with a substantive or pronoun; as

John is going to *London.*
James is coming from *London.*

The following words, along with several others, are prepositions—*in, on, of, at, up, by, to, for, from, till, with, through.*

§ 272. Every preposition governs a case; that is, every preposition is followed by a substantive or a pronoun in some case or other.

Complex Sentences.

§ 273. *Syntax of Complex Sentences.*—Sentences consisting of two propositions are called complex. They always contain either a relative pronoun or a conjunction—(1) *The sun* which *shines to-day will shine to-morrow*, (2) *the sun shines, and therefore the day will be fine.*

§ 274. *Relative Pronouns.*—Sometimes the structure of complex sentences is simple. This is the case when the second proposition follows the first, and the two stand apart from each other, in such a way as to be easily separated. If I say the *man is coming who brings the letters*, we know exactly where one proposition ends, and where the other begins. We find, too, that the analysis of the expression is of the easiest. We see that *the man is coming* constitutes one proposition; *who brings the letters*, another. We see that the two actions are denoted, (1) the act of *coming;* (2) the act of *letter-carrying.* We see, too, that, although there are two actions, there is but one agent; for the man *who comes* and the man who *carries the letters* are the same person. Such being the case, the word *who* means *the man*, and *relates* to it; whilst the word *man* explains what is meant by *who*, and *goes before it* as an *antecedent;* for in Latin, *ante=before*, and *cedo=go;* so that *ante-cedent* is *that which goes before.* All this is clear, and may be made clearer by writing the two propositions separately: as

The man is coming;
Who brings the letters.

Here, the separation of the two propositions is complete; so complete, that we may, if we choose, consider that they form two distinct sentences.

To show that *who* means *the man*, we may, if we please, write

The man is coming,
He brings the letters.

Or,

The man is coming,
The man brings the letters.

The result is the same. There are two actions and one agent. Instead, however, of naming the agent twice, we use a word that *relates* to him.

All this is clear. Nevertheless, it is well known that although complex sentences, like the one just given, are easily constructed, they are, by no means, very common in the actual course of language; wherein few persons keep the two propositions separate. On the contrary, they blend them together, and say *the man who brings the letters is coming*. This, although it adds a little to the complexity, ought not to create a difficulty. A little consideration tells us that we may say

1. The man is coming; the man brings the letters; *or*,
2. The man is coming; he brings the letters; *or*,
3. The man is coming; who brings the letters; *or*,
4. The man [who brings the letters] is coming.

The Relative here means the same as the Antecedent, and is only the Antecedent under another form.

§ 275. The Relative and the Antecedent are, of necessity, in the same Gender.

The Relative and Antecedent are, of necessity, in the same Number.

These rules are universal; for they apply not only to the English language, but to all others. Such being the case, their importance becomes manifest. Such, too, being the case, it may be well to devote some time and attention to obtaining a clear view of them. Every Relative has its Antecedent, and every Antecedent its Relative. A Rela-

tive without an Antecedent, or an Antecedent without a Relative, is impossible. The one, indeed, is necessary to the other; so that the words belong to the same class as *father* and *son*, *husband* and *wife*, *ruler* and *subject*, and the like. There would be no such thing as *husbands* if it were not for the *wives*. There would be no such things as *rulers* if it were not for the *subjects over whom they rule*, and *vice versâ*. In like manner an Antecedent without a Relative is no Antecedent at all, and a Relative without an Antecedent is a contradiction in terms.

As the Relative is the Antecedent in another form, it follows that the Gender and Number must be the same; so that the principle of the second and third general rules is explained.

On the other hand, the Relative is *not* necessarily in the same *case* as the Antecedent; *e. g.*

1. John [*who* trusts me] comes here;
2. John [*whom* I trust] comes here;
3. John [*whose* trust is in me] comes here;
4. I trust John [*who* trusts me].

§ 276. The Antecedent may appear in either the Subject or the Predicate.

He steals trash
Who steals my purse.

I punished him
Who stole my purse.

Who steals my purse steals trash.

Contrast with this—

He who fights and runs away
May live to fight another day;
But *he* who is in battle slain
Will never live to fight again.

If it were not, however, for the metre, *he* might be omitted; and the sentence run *who fights and runs away may live*, &c.

§ 277. The Relative is occasionally omitted; *i. e.* we may say *the books I sent for are come*, instead of *the books which I sent for*, &c.

§ 278. The construction of the Relative is by no means easy, and some well-known inaccuracies connected with it are to be found even in our best writers. For instance—each of the following passages is inaccurate.

——— *him* I accuse
The city gates by this has entered.

Coriolanus.

Better leave undone, than by our deeds acquire
Too high a fame when *him* we serve's away.

Antony and Cleopatra.

Here, instead of *him* we should have *he*.

The explanation, however, of the error is, by no means, difficult. There is an Ellipsis. The full forms would be *he whom I accuse has entered the city gates—he whom we serve is away*.

Now Rule 276 has shown that the Antecedent may be omitted; so that we may, if we choose, write *whom I accuse has entered the city gates*, or *whom we serve is away*.

And Rule 277 has shown that the Relative may be omitted; so that we may, if we choose, write *he I accuse has entered*, &c., or, *he we serve is away*.

No rule, however, says that *both* can be dispensed with. Hence, we find that in the instances before us there is a confusion. It is the Relative, which is omitted, whilst, as if by way of compensation, the Antecedent is put in the Relative's case.

§ 279. The following instance is also exceptionable.

——— Satan, than *whom*
None higher sat, thus spake.

Paradise Lost.

Whom ought to be *who*.

By writing sentences like these in full we easily ascertain the true construction.

Satan spake:
None higher sat than Satan* sat.

§ 280. The Syntax of Conjunctions is closely allied, specially to that of Adverbs, Prepositions, Verbs, and Relative Pronouns. In these relations consists a great part of its difficulty; a difficulty of which the general character is easily understood. Whilst other words connect only the parts of the same proposition, Conjunctions connect different propositions. In order to understand how many different kinds of Conjunctions can exist, we must know all the ways in which one proposition may be connected with another. Many propositions are wholly unconnected. Propositions delivered at long intervals, or by different persons, have, for the most part, no relation to each other. In consecutive conversation, however, one statement is connected with another. Thus—

I am pleased,
because
This has happened;
but
I should have been disappointed,
if
It had fallen out otherwise,
and
I think
that
My friends will be more surprised
than
Satisfied with the arrangement.

§ 281. Conjunctions which connect two or more Terms are called Copulative; as *and*.

Conjunctions which connect one of two Terms, but disconnect the other, are called Disjunctive; as *or*.

* This figure of speech is called *Attraction*. There are two names for one object. But they differ in their relation to the context. This difference, however, is merged in their identity of import; and one *attracts* the other.

Disjunctives are either true Disjunctives or Subdisjunctives.

A true Disjunctive separates *things*. When we say *the sun, or the moon is shining*, we separate two different objects, one of which shines by day, the other by night.

Subdisjunctives separate *names*. When we say *Victoria, or the Queen of England, is our sovereign*, we speak of the same object, under different names.

The idea expressed by a Copulative may be strengthened and made clearer by the addition of the words *each*, *both*, *all three*, or the like. We may say *both sun and moon are shining. All three, Venus, Jupiter, and the Dogstar, are visible.* We may also say *sun and moon are both shining —Venus, &c., are, all three, visible.*

The idea expressed by a Disjunctive may be strengthened and made clearer by the addition of *either*. We may say, *either the sun or the moon is shining.*

The idea expressed by a Subdisjunctive may be strengthened and made clearer by the phrase, *in other words*. We may say, *Queen Victoria, in other words, the Queen of England*, &c.

In all these cases the words *both*, &c., *either*, &c., and *in other words*, &c., are no true Conjunctions. They strengthen the Conjunction. The Conjunction, however, exists without them; for the operation of the strengthening words is generally Adverbial.

§ 282. *Or* and *either* have their corresponding Negatives—*nor* and *neither*. *I will either come or send* is right. So is *I will neither come nor send.* But I will *neither come or send* is wrong.

§ 283. When a question is either asked or implied, *whether* takes the place of *either*.

§ 284. Words like *either*, &c., are generally treated as Conjunctions. This, however, they are not. The most that can be said of them is that they form part of certain Conjunctional expressions. They never stand alone.

Meanwhile, the words with which they correspond can, as a general rule, do without them. We say *this or that*, *mine or his*, quite as correctly as *either this or that*, *neither mine nor his*. *Both*, *neither* and *whether*, seem to be both Pronouns and Adverbs. When *either* means *one out of two*, it is a Pronoun. When it means *in the way of an alternative*, it is an Adverb.

§ 285. Conjunctions which denote the dependence of one act on another are Causal, Illative, Final, and Conditional.

Causals give the cause of a given effect.

The day is warm
because
The sun shines.

Illatives give the inference from a given premise.

The sun shines,
therefore
The day is warm.

Finals give the object for which a given action is effected.

I do this
that
You may follow my example.

Conditionals give the conditions on which a given event depends. *The night will be fine if the stars shine.*

§ 286. Copulatives, Disjunctives, and Subdisjunctive Conjunctions must be considered in respect to the *Number* of the Verb with which they come in contact.

Copulatives require the Plural, Disjunctives and Subdisjunctives the Singular, Number.

The concord of persons.—A difficulty that occurs frequently in the Latin language is rare in English. In expressions like *ego et ille*, followed by a verb, there arises a question as to the person in which that verb shall be used. Is it to be in the first person in order to agree with

ego, or in the *third* in order to agree with *ille*? For the sake of laying down a rule upon these and similar points, the classical grammarians arrange the persons (as they do the genders) according to their *dignity*, making the verb agree with the most *worthy*. In respect to persons, the first is more worthy than the second, and the second more worthy than the third. Hence, they said—

Ego et *Balbus sustulimus* manus.
Tu et *Balbus sustulistis* manus.

Now in English, the plural form is the same for all three persons. Hence we say *I and you are friends, you and I are friends, I and he are friends*, &c.; so that, for the practice of language, the question as to the relative dignity of the three persons is a matter of indifference. Nevertheless, it *may* occur even in English. Whenever two or more pronouns of different persons, and of the *singular* number, follow each other *disjunctively*, the question of concord arises. *I or you,—you or he,—he or I.* I believe that, in these cases, the rule is as follows:—

1. Whenever the word *either* or *neither* precedes the pronouns, the verb is in the third person. *Either you or I is in the wrong—neither you nor I is in the wrong.* In this case *either* is a pronoun, and means *one of us two.*

2. Whenever the disjunctive is simple, *i. e.* unaccompanied with the word *either* or *neither*, the verb agrees with the *first* of the two pronouns.

I or *he am* in the wrong.
He or *I is* in the wrong.
Thou or *he art* in the wrong.
He or *thou is* in the wrong.

§ 287. *Conditional Conjunctions.*—Conditional Conjunctions govern the Subjunctive Mood. The chief Conditional is *if*. To say *if the sun shines the day will be clear* is considered inaccurate. The proper expression is, *if the sun shine*, &c.

Although the word *if* is the type and specimen of the Conditional Conjunction, there are several others so closely related to it in meaning as to agree with it in requiring a Subjunctive Mood to follow them.

1. *Except* I be by Silvia in the night,
   There is no music in the nightingale.

2. Let us go and sacrifice to the Lord our God *lest* he *fall* upon us with pestilence.

3. Let him not go *lest* he die.

4. He shall not eat of the holy thing *unless* he *wash* his flesh with water.

5. *Although* my house *be* not so with God.

6. — revenge back on itself recoils.
   Let it. I reck not *so* it *light* well aimed.

7. Seek out his wickedness *till* thou *find* none.

And so on with *before, ere, as long as.*

§ 288. On the other hand, *if* itself is not always conditional, being occasionally equivalent to *since*; in which case it may be followed by an Indicative Mood.

§ 289. *As* follows Adjectives or Adverbs of the Positive Degree, preceded by *so*. *Be so kind as to come here.*

§ 290. *Than* follows Adjectives and Adverbs of the Comparative Degree. *This is sharper than that. I see better to-day than yesterday.*

Than, in respect to its etymology, is neither more nor less than *then*. It is not difficult to see the connection in sense between such sentences as *I like this better than I like that*, and *I like this—then* (*afterwards or next in order*) *I like that.*

Than is sometimes treated as a preposition when it seems to govern a case.

Thou art a girl as much brighter than *her*.
As he is a poet sublimer than *me*.—Prior.

You are a much greater loser than *me*.—Swift.

It is better, however, to treat it as a Conjunction, in which case the Noun which follows it depends upon the

Verb of the antecedent clause. 1. *I like you better than he=I like you better than he likes you.* 2. *I like you better than him=I like you better than I like him.*

§ 291. *But*, in respect to its etymology, is *be-utan=by out.* It is not difficult to see the connection in sense between such sentences as *all but one*, and *all without* (or *except*) one.

But, then, is a Preposition and an Adverb, as well as a Conjunction. Prepositional Construction.—*They all ran away but me*, i. e. *except me.* Conjunctional Construction.—*They all ran away but I*, i. e. *but I did not run away.*

No Conjunction can govern a Case. A word that governs a Case, be it ever so like a Conjunction, is no Conjunction but a Preposition.

§ 292. *Yes* and *No* are, perhaps, words sufficiently peculiar to justify us in treating them as a separate Part of Speech; for it may be observed that, unlike any word hitherto noticed, they constitute a whole Proposition by themselves. *Yes=it is*, while *no=it is not.* At the same time, they depend upon what has preceded, for unless a question has been asked how is an answer to be given? There is nothing to reply to.

§ 293. The Negative follows the Verb unless it be in the Infinitive Mood; in which case it precedes it;—*He spoke not, he moved not, he did not, he could not*; but *not to advance is to retreat*; *he did not speak, he could not move.*

Two Negatives make an Affirmative. *I have not not seen him=I have seen him.*

A question to which no answer can be given is much the same as a Negative. A person who, in extreme perplexity, says *what am I to do?* really means *I know not what to do.* These are called Questions of Appeal.

§ 294. In all questions there is a transposition of the Terms. In *what is this?* the word *what* is the Predicate. Yet it begins the sentence. In *are you at home?* the word *are*, though it begins the sentence, is a *Copula.*

When the Copula precedes the Predicate, the question is categorical, and its answer is *Yes* or *No*.—Question. *Is John at home?* Answer. *Yes* or *no* as the case may be.

When the Predicate precedes the Copula the question is Indefinite, and the answer may be anything whatever. To *where is John?* we may answer *at home, abroad, in the garden, in London, I do not know*, &c., &c.

The Reciprocal Construction.—§ 295. In all sentences containing the statement of a reciprocal or mutual action there are in reality two assertions, one that A. *strikes* (or *loves*) B.; and another that B. *strikes* (or *loves*) A. Hence, if the expression exactly coincided with the fact signified, there would always be two full propositions. This, however, is not the habit of language. Hence arises a more compendious form of expression, giving origin to an ellipsis of a peculiar kind. Phrases like *Eteocles and Polynices killed each other* are elliptic, for *Eteocles and Polynices killed—each the other.* Here the second proposition expands and explains the first, whilst the first supplies the verb to the second; so that each clause is elliptic. The first is without the object, the second without the verb. That the verb must be in the plural number, that one of the nouns must be in the nominative case, and the other in the objective, is self-evident from the structure of the sentence.

This is the syntax. As to the power of the words *each* and *one*, I am not prepared to say that in the common practice of the English language there is any distinction between them. A distinction, however, if it existed, would give precision to our language. Where *two* persons performed a reciprocal action, the expression might be, *one another*; as, *Eteocles and Polynices killed one another.* Where *more than two* persons were engaged on each side of a reciprocal action, the expression might be, *each other*; as, *the ten champions praised each other.* This amount of perspicuity is attained, by different

processes, in the French, Spanish, and Scandinavian languages.

(1.) French.—*Ils* (*i. e.* A. and B.) *se battaient—l'un l'autre. Ils* (A. B. C.) *se battaient—les uns les autres.*

(2.) In Spanish, *uno otro*=*l'un l'autre*, and *unos otros*=*les uns les autres.*

(3.) Danish.—*Hin*ander=the French *l'un l'autre*; whilst *hverandre*=*les uns les autres.*

PART V.

PROSODY.

§ 296. The term *Prosody*, derived from a Greek word (*prosodia*) signifying *accent*, includes not only the doctrines of accent and quantity, but also the rules of metre and versification.

Take the sentence last written, count the syllables, and mark those that are accented.

The tẽrm Prósody, derived from a Greek wórd signifying áccent, ínclúdes nót only the dóctrines of áccent and quántity, but álso the rúles of métre and vérsificátion.

Here the accented syllables are the 2nd, 3rd, 7th, 10th, 11th, 12th, 14th, 16th, &c.; that is, between two accented syllables there are sometimes one, sometimes two, and sometimes no unaccented syllables intervening. In other words, there is no regularity in the recurrence of the accent.

Proceed in the same way with the following lines.

The wáy was lóng, the wind was cóld,
The mínstrel wás infírm and óld.

Here the syllables accented are the 2nd, 4th, 6th, and 8th; that is, every other syllable.—Again, in

At the clóse of the dáy, when the hámlet is still,

the syllables accented are the 3rd, 6th, 9th, and 12th; that is, every third syllable.

Now, the extract where there was no regularity in the recurrence of the accent was prose; and the extracts where

the accent recurred at regular intervals formed metre—*metre being a general term for the recurrence within certain intervals of syllables similarly accented.*

§ 297. *Measures.*—For every accented syllable in the following line, write *a*, and for every unaccented one *x*, so that *a* may stand for an accent, *x* for the absence of one—*The wáy was lóng, the wínd was cóld*—or expressed symbolically, *x a x a x a x a*, where *x* coincides with *the*, *a* with *way*, &c.

§ 298. Determine the length of the line in question.—It is plain that this may be done in two ways. We may either measure by the syllables, and say that the line consists of eight syllables; or by the accents, and say that it consists of four accents. In this latter case we take the accented syllable with its corresponding unaccented one, and, grouping the two together, deal with the pair as one. Now, a group of syllables thus taken together is called a *measure.* In the line in question *the way* (*x a*) is one measure; *was long* (*x a*) another.

In lines like the following the measure is the reverse of the preceding. The accented syllable comes first, the unaccented one follows; the formula being *a x*.

Láy thy bów of peârl apárt,
A'nd thy sílver shining quíver.

The number of dissyllabic measures is necessarily limited to two, expressed by *a x* and *x a* respectively. The number of trisyllabic measures is necessarily limited to three, viz.: *a x x*, *x a x* and *x x a*.

§ 299. *Rhyme.*—Observe, in each of the following couplets, the last syllable of each line. These are said to *rhyme* to each other, or to constitute *rhymes.*

O'er the glad waters of the dark blue sea,
Our thoughts as boundless, and our souls as free;
Far as the breeze can bear, the billows foam,
Survey our empire and behold our home;
These are our realms; no limits to our sway;
Our flag the sceptre all who meet obey.—BYRON.

Syllables may be similar in their sound, and yet fail in furnishing full, true, and perfect rhymes.

I.

The soft-flowing outline that steals from the *eye*
Who threw o'er the surface,—did you or did *I*?

WHITEHEAD.

II.

'Tis with our judgments as our watches; *none*
Go just alike, yet each believes his *own*.—POPE.

III.

Soft o'er the shrouds aërial whispers *breathe*,
That seem'd but zephyrs to the train *beneath*.—POPE.

§ 300. *Analysis of a pair of Rhyming Syllables.*—Let the syllables *told* and *bold* be taken to pieces. Viewed in reference to metre, they consist of three parts or elements: 1. The vowel (*o*); 2. the parts *preceding* the vowel (*t* and *b* respectively); 3. the parts *following* the vowel (*ld*). Now the vowel and the parts following the vowel are alike in both words; but the part preceding the vowel is different in the different words (*told*, *bold*). This difference between the parts preceding the vowel is essential; since, if it were not for this, the two words would be identical, or rather there would be but one word altogether. This is the case with *I* and *eye*. Sound for sound, although different in spelling, the two words are identical, and, consequently, the rhyme is faulty.

Again—compared with the words *bold* and *told*, the words *teeth* and *breeze* have two of the elements necessary to constitute a rhyme. The vowels are alike, whilst the parts preceding the vowels are different, and, as far as these two matters are concerned, the rhyme is a good one, *tee* and *bree*. Notwithstanding this, there is anything rather than a rhyme; since the parts following the vowel, instead of agreeing, differ. *Breathe* and *beneath* are in the same predicament, because the *th* is not sounded alike in the two words.

Again—the words *feel* and *mill* constitute only a false and imperfect rhyme. Sound for sound, the letters *f* and *m* are different. This is as it should be. Also, sound for sound, *l* and *ll* are identical; and this is as it should be also: but *ee* and *i* are different, and this difference spoils the rhyme. *None* and *own* are in the same predicament; since one *o* is sounded as *o* in *note*, and the other as the *u* in *but*.

We have now got the notion of full, true, and perfect rhymes as opposed to false and imperfect ones. For two words to fully, truly, and perfectly rhyme to each other, it is necessary—

1. That the vowel be the same in both.
2. That the parts following the vowel be the same.
3. That the parts preceding the vowel be different.

Beyond this it is necessary that the syllables should be accented. *Sky* and *lie* give good rhymes, but *sky* and merri*ly* bad ones, and *merrily* and *stony* worse.

§ 301. *Varieties of imperfect Rhymes.*—*None* and *own* are better rhymes than *none* and *man*; because there are degrees in the amount to which sounds differ from one another; and the sounds of the *o* in *none* and the *o* in *own* are more alike than the sounds of the *o* in *none* and the *a* in *man*. In like manner *breathe* and *teeth* are nearer to rhymes than *breathe* and *teal*. In imperfect rhymes there are degrees, and some approach the nature of true ones more closely than others.

In matters of rhyme the letter *h*, being no articulate sound, counts as nothing. *High* and *I*, *hair* and *air*, are imperfect rhymes:

> Whose generous children narrow'd not their *hearts*
> With commerce, giv'n alone to arms and *arts*.—Byron.

Words where the letters coincide, but the sounds differ, are only rhymes to the eye. *Breathe* and *beneath* are in this predicament; so also are *cease* and *ease* (*eaze*).

In the fat age of pleasure, wealth, and *ease*,
Sprang the rank weed, and thrived with large *increase*.—POPE.

On the other hand, if the sounds coincide the difference of the letters is unimportant.

Bold in the practice of mistaken *rules*,
Prescribe, apply, and call their masters *fools*.—POPE.

§ 302. Accent is essential to English metre. Rhyme, on the other hand, is only an ornament. Of all the ornaments of English versification it is undoubtedly the most important. Still it is not essential. Metres where there is no rhyme are called Blank Metres.

§ 303. The English measures are as follows:—

1. *a x.—týrant, sílly,* 2. *x a.—presúme, detér,*	Dissyllabic.
3. *a x x.—mérrily, fórtify,* 4. *x a x.—disáble, preferring,* 5. *x x a.—refugée, cavalíer,*	Trisyllabic.

§ 304. *The last measure in a line or verse is indifferent as to its length.*—By referring to the section upon single rhymes, we shall find that the number of syllables is just double the number of accents. Hence, with five accents, there are to each line ten syllables. This is not the case when the rhymes are double, and the last accented syllable has *two* unaccented ones to follow it. With five accents there are to each line *eleven* syllables. In the last measure, however, of any verse, supernumerary unaccented syllables can be admitted without destroying the original character of the measure.

Now in the last pair of couplets in § 305 the original character cf the measure is *x a* throughout, until we get to the words *disséver* and *for éver*; when a change takes place, and the line contains an *extra* syllable. At the first view it seems proper to say that in these last-mentioned cases *x a* is converted into *x a x*. A different view, however, is the more correct one. *Disséver*, and *for éver*, are rather *x a* with

a syllable over. This extra syllable may be expressed by the sign *plus* (+), so that the words in point may be expressed by *x a* +, rather than by *x a x*. It is very clear that a measure whereof the last syllable is accented can only vary from its original character on the side of excess; that is, it can only be altered by the *addition* of fresh syllables.

With the measures *a x*, *a x x*, *x a x*, the case is different. Here a syllable or syllables may be subtracted.

Queén and húntress, cháste and faír,
Nów the sún is laíd to sleép,
Seáted in thy silver chair,
Státe in wónted spléndour keép.
Hésperús invókes thy líght,
Góddess, éxquisítely bríght.—Ben Jonson.

In all these lines the last measure is deficient in a syllable, yet the deficiency is allowable, because each measure is the last one of the line. The formula for expressing *faír*, *sleép*, *chaír*, &c. is not *a*, but rather *a x* followed by the *minus* sign (—), or *a x* —.

A little consideration will show, that *x a* and *x x a* naturally form single, *a x* and *x a x* double, and *a x x* treble rhymes.

§ 305. *Measure.*—Dissyllabic.

Four measures:—

And a gentle consort made he;
And her gentle mind was such,
That she grew a noble lady,
And the people loved her much.
But a trouble weigh'd upon her,
And perplex'd her night and morn
With the burden of an honour
Unto which she was not born.—Tennyson.

Five measures:—

Then methought I heard a hollow sound,
Gath'ring up from all the lower ground.
Narrowing in to where they sat assembled,
Low voluptuous music winding trembled.—*Id.*

Six measures :—

O'n a moúntain, strétch'd beneáth a hoáry willow,
Láy a shépherd swaín, and víew'd the rólling billow.

Seven measures :—

Wé have hád enoúgh of áction ánd of mótion ; wé--
Lét us sweár an oáth, and kéep it, with an équal mínd.
Id.

Eight measures :—

Cômrades, leáve me hére a little, whíle as yét 'tis eárly mórn :
Leáve me hére ; and, whén you wánt me, sóund upón the búgle hórn.
Id.

Accent on the *even* syllables.

Two measures :—

Unheárd, unknówn, | The straíns decáy,
He mákes his móan— | And mélt awáy.

What soúnds were héard ! | Upón a moúntain,
What scénes appéar'd— | Beside a foúntain.

'Twas when the seas were roaring
With hollow blasts of wind,
A damsel lay deploring,
All on a rock reclined.—GAY.

Four measures :—

His aspect and his air imprest
A troubled memory on my breast ;
And long upon my startled ear
Rung his dark courser's hoofs of fear.—BYRON.

Five measures :—

Fond fool ! six feet of earth is all thy store,
And he that seeks for all shall have no more.--BISHOP HALL.

The meeting points the sacred hair dissever
From her fair head for ever and for ever.—POPE.

§ 306. The general term for metres of five accents, with the accent on the even syllables, is Heroic. The first division into which the heroic metres fall is into, *a*. Blank heroics ; *b*. Rhyming heroics.

Blank Heroics.—Blank heroics, or blank verse, as it is generally called, falls into two varieties, determined by the nature of the subject-matter; *a*. Dramatic blank verse; *b*. Narrative blank verse.

Dramatic Blank Verse.—With the exception of the earliest dramas in the language, and some rhyming tragedies written in imitation of the French in the time of Charles II., the works for the English stage consist chiefly of either prose or blank verse. It is in blank verse that most tragedies and many comedies are either wholly or partially written.

Dramatic blank verse not only admits, but calls for supernumerary syllables. In rhyming metres these would constitute double rhymes.

OTHELLO'S SPEECH BEFORE THE SENATORS.

Most potent, grave, and reverend seigniors,
My very noble and approved good *masters*,
That I have ta'en away this old man's *daughter*,
It is most true: true, I have married her:
The very head and front of my of*fending*
Hath this extent, no more.—SHAKESPEAR.

Narrative Blank Verse.—The metre of Paradise Lost, Paradise Regained, Young's Night Thoughts, Cowper's Task, Cowper's Homer, &c.

Nine times the space that measures day and night
To mortal men, he, with his horrid crew,
Lay vanquish'd, rolling in the fiery gulf
Confounded, though immortal.—MILTON.

Here the admission of a supernumerary final syllable is rare; lines of *eleven* syllables like the following being uncommon.

Of sovran power with awful ceremo*ny*.—MILTON.

Six measures:—

He lifted úp his hánd that báck again did stárt.

Seven measures:—

The Lórd descénded fróm abóve, and bówed the heávens most hígh,
And úndernéath his feét he cást the dárkness óf the sky.

STERNHOLD AND HOPKINS.

Eight measures:—

Where vírtue wánts, and více aboúnds, and weálth is bút a baíted hoók
Wherewíth men swállow dówn the báne befóre on dánger dárk they loók.

§ 307. The Three Trisyllabic Measures—Accent on the 1st, 4th, &c., syllables.

Two measures:—

Píbroch o' Dónuil Dhu!
Píbroch o' Dónuil!
Wáke thy shrill voíce anew,
Súmmon Clan Cónnuil.
Cóme away, cóme away,
Hárk to the súmmons!
Cóme in your wár array,
Géntles and cómmons.—

Cóme every híll-plaid, and
Trúe heart that wéars one;
Cóme every steél-blade, and
Stróng hand that beárs one.—
Leáve the deer, leáve the steer,
Leáve nets and bárges:
Cóme with your fíghting-gear,
Broádswords and tárges.

SCOTT.

Three measures:—

Peáce to thee, ísle of the ócean,
Peáce to thy bréezes and billows.—BYRON.

Four measures:—

Wárriors or chiéfs, should the sháft or the swórd
Piérce me in leáding the hóst of the Lórd,
Heéd not the córpse, though a king's in your páth,
Búry your steél in the bósoms of Gáth.—BYRON.

Two measures:—

Besíde her are laíd
Her máttock and spáde—
Alóne she is thére,
Her shoúlders are báre—
Ever alone
She máketh her moán.

TENNYSON.

But vaínly thou wárrest;
For thís is alóne in
Thy pówer to déclare,
That, ín the dím fórest,
Thou heárd'st a low moáning.

COLERIDGE.

The blǻck bands came óver
  The A'lps and their snów;
With Boúrbon, the róver,
  They pássed the broad Pó.

The Boúrbon! the Boúrbon!
  Sans coúntry or hóme,
We 'll fóllow the Boúrbon
  To plúnder old Róme.

BYRON.

Four measures:—

Oh, húsh thee, my bábie, thy síre was a knight,
Thy móther a lády both lóvely and bright:
The woóds and the gléns and the tówers which we seé,
They áll are bélonging, dear bábie, to theé.

One measure:—

As ye sweép
Through the deép.—CAMPBELL.

Two measures:—

In my ráge shall be seén
The revénge of a queén.—ADDISON.

Three measures:—

And the spárkles they flásh from their éyes!

Mixed.

See the snákes, how they reár,
How they híss in the aír,
And the spárkles they flásh from their éyes.—DRYDEN.

Four measures:—

And the king seized a flámbeau with zeál to destróy.—DRYDEN.

§ 308. Lines or verses grouped together constitute stanzas, couplets, triplets, &c. It is only a few of the English metres that are known by fixed names. These are as follows:—

1. *Octosyllabics.*—Butler's Hudibras, Scott's poems, The Giaour, and other poems of Lord Byron—*eight* measures.

The way was long, the wind was cold,
The minstrel was infirm and old;
His haggard cheek and tresses gray
Seem'd to have known a better day;
The harp, his sole remaining joy,
Was carried by an orphan boy,
The last of all the bards was he
That sung of ancient chivalry.—SCOTT.

2. *Octosyllabics.*—Same as the last; except that the rhymes are regularly alternate, and the verses arranged in stanzas.

And on her lover's arm she leant,
  And round her waist she felt it fold,
And far across the hills they went,
  In that new world which now is old:
Across the hills and far away,
  Beyond their utmost purple rim,
And deep into the dying day
  The happy princess follow'd him.—TENNYSON.

3. *Octosyllabic Triplets.*—Three rhymes in succession. Generally arranged as stanzas.

I blest them, and they wander'd on;
I spoke, but answer came there none:
The dull and bitter voice was gone.—TENNYSON.

4. *Blank Verse.*—*Five* dissyllabic measures, with accents on the even syllable, without rhyme.

All these and more came flocking; but with looks
Downcast and damp, yet such wherein appear'd
Obscure some glimpse of joy to have found their chief
Not in despair, to have found themselves not lost
In loss itself.—MILTON.

5. *Heroic Couplets.*—Five measures, as before, with pairs of rhymes.

O'er the glad waters of the dark blue sea,
Our thoughts as boundless, and our souls as free;
Far as the breeze can bear, the billows foam,
Survey our empire and behold our home:
These are our realms; no limits to our sway;
Our flag the sceptre all who meet obey.—BYRON.

6. *Heroic Triplets.*—Five measures, as before. Three rhymes in succession. Arranged in stanzas.

7. *Elegiacs.*—Five measures, as before; with regularly alternate rhymes, and arranged in stanzas.

The curfew tolls the knell of parting day,
  The lowing herds wind slowly o'er the lea,
The ploughman homewards plods his weary way,
  And leaves the world to darkness and to me.—GRAY.

8. *Rhymes Royal.*—Seven lines of heroics, with the last two rhymes in succession, and the first five recurring at intervals.

This Troilus, in gift of curtesie,
  With hauk on hond, and with a huge rout
Of knightes, rode, and did her company,
  Passing all through the valley far about;
  And further would have ridden out of doubt.
Full faine and woe was him to gone so sone;
But turn he must, and it was eke to doen.—CHAUCER.

This metre was common with the writers of the earlier part of Queen Elizabeth's reign. It admits of varieties according to the distribution of the first five rhymes.

9. *Ottava Rima.*—A metre with an Italian name, and borrowed from Italy, where it is used generally for narrative poetry. The Morgante Maggiore of Pulci, the Orlando Innamorato of Bojardo, the Orlando Furioso of Ariosto, the Gierusalemme Liberata of Tasso, are all written in this metre. Besides this, the two chief epics of Spain and Portugal respectively, the Araucana and the Lusiados, are thus composed. Hence it is a form of poetry which is Continental rather than English, and naturalized rather than indigenous. The stanza consists of eight lines of heroics, the six first rhyming alternately, the two last in succession.

Arrived there, a prodigious noise he hears,
  Which suddenly along the forest spread;
Whereat from out his quiver he prepares
  An arrow for his bow, and lifts his head;
And lo! a monstrous herd of swine appears,
  And onward rushes with tempestuous tread,
And to the fountain's brink precisely pours,
So that the giant's join'd by all the boars.—BYRON.

10. *Terza Rima.*—Like the last, borrowed both in name and nature from the Italian, and scarcely yet naturalized in England.

The Spirit of the fervent days of old,
  When words were things that came to pass, and Thought
  Flash'd o'er the future, bidding men behold
Their children's children's doom already brought
  Forth from the abyss of Time which is to be,
  The chaos of events where lie half-wrought
Shapes that must undergo mortality:
  What the great seers of Israel wore within,
  That Spirit was on them and is on me;
And if, Cassandra-like, amidst the din
  Of conflicts, none will hear, or hearing, heed
  This voice from out the Wilderness, the sin
Be theirs, and my own feelings be my meed,
  The only guerdon I have ever known.—BYRON.

11. *Alexandrines.*—Six measures; like the last, generally, perhaps always, with rhyme. The name is said to be taken from the fact that early romances upon the deeds of Alexander of Macedon, of great popularity, were written in this metre. One of the longest poems in the English language is in Alexandrines, viz. Drayton's Poly-olbion.

Ye sácred bárds that tó your hárps' melódious strings
Sung th' áncient héroes' deeds, the mónuméuts of kings;
If, ás those Drúids taúght who képt the Brítish rites,
And dwélt in dárksome gróves, there cóunsellíng with sprítes,
When thése our soúls by deáth our bódies dó forsáke,
They ínstantly again to óther bódies táke,
I cóuld have wísh'd your soúls redóubled ín my breást,
To gíve my vérse applaúse to time's etérnal rést.—DRAYTON.

12. *Spenserian Stanza.*—A stanza consisting of nine lines, the eight first heroics, the last an Alexandrine.

It hath been through all ages ever seen,
That with the prize of arms and chivalrie
The prize of beauty still hath joined been,
And that for reason's special privitie:
For either doth on other much rely.
For he meseems most fit the fair to serve
That can her best defend from villanie;
And she most fit his service doth deserve,
That fairest is, and from her faith will never swerve.

SPENSER.

Childe Harold and other important poems are composed in the Spenserian stanza.

13. *Service Metre.*—Couplets of seven measures. This is the common metre of the Psalm versions. It is also called Common Measure, or Long Measure. In this metre there is always a pause after the fourth measure, and many grammarians consider that with that pause the line ends. According to this view, the service metre does not consist of two long lines with seven measures each; but of four short ones, with four and three measures each alternately. The Psalm versions are printed so as to exhibit this pause or break.

The Lord descended from above, | and bow'd the heavens most high,
And underneath his feet He cast | the darkness of the sky.
On Cherubs and on Seraphim | full royally He rode,
And on the wings of mighty winds | came flying all abroad.

STERNHOLD AND HOPKINS.

In this matter the following rule is convenient. When the last syllable of the fourth measure in the one verse *rhymes* with the corresponding syllable in the other, the long verse should be looked upon as broken up into two short ones; in other words, the couplets should be dealt with as a stanza. Where there is no rhyme except at the seventh measure, the verse should remain undivided. Thus:—

Turn, gentle hermit of the glen, | and guide thy lonely way
To where yon taper cheers the vale | with hospitable ray—

constitute a single couplet of two lines, the number of rhymes being two. But,

Turn, gentle hermit of the dale,
And guide thy lonely way
To where yon taper cheers the vale
With hospitable ray.—GOLDSMITH.

constitute a stanza of four lines, the number of rhymes being four.

14. *Ballad Stanza.*—Service metre broken up in the way just indicated. Goldsmith's Edwin and Angelina, &c., from which the last stanza was an extract.

15. *Poulterer's Measure.*—Alexandrines and Service metre alternately.

§ 309. *Symmetrical Metres.*—Allowing for the indifference of the number of syllables in the last measure, it is evident that in all lines where the measures are dissyllabic the syllables will be a multiple of the accents, *i.e.* they will be *twice* as numerous.

Similarly, in all lines where the measures are trisyllabic, the syllables will also be multiples of the accents, *i.e.* they will be *thrice* as numerous.

Lines of this sort may be called symmetrical.

§ 310. *Unsymmetrical Metres.*—Lines, where the syllables are *not* a multiple of the accents, may be called Unsymmetrical. Occasional specimens of such lines occur (as may be seen from several of the examples already quoted) interspersed amongst others of symmetrical character. Where this occurs the general character of the versification may be considered as symmetrical also.

The case, however, is different where the whole character of the versification is unsymmetrical.

In the yéar since Jésus diéd for mén,
Eighteen húndred yeárs and tén,
Wé were a gállant cómpany,
Ríding o'er lánd and sáiling o'er séa.
O'h! but wé went mérrily!
We fórded the ríver, and clómb the high hill,
Néver our steéds for a dáy stood still.
Whéther we láy in the cáve or the shéd,
Our sleép fell sóft on the hárdest béd;
Whéther we cóuch'd on our róugh capóte,
Or the róugher plánk of our glíding bóat;
Or strétch'd on the beách or our sáddles spréad
As a pillow beneáth the résting héad,
Frésh we wóke upón the mórrow.
A'll our thóughts and wórds had scópe,
Wé had héalth and wé had hópe,
Tóil and trável, bút no sórrow.

These lines are naturally trisyllabic; from any measure of which one of the unaccented syllables may be ejected. Where they are symmetrical they are so by accident. A metrical fiction, that conveniently illustrates their structure, is the doctrine that they are *lines formed upon measure x a x, for which either x x a or a x x may be substituted, and from which either a x or x a may be formed by ejection of either the first or last unaccented syllable.*

§ 311. *Convertible Metres.*—Such a line as

Ere her faithless sons betray'd her

may be read in two ways. We may either lay full stress upon the word *ere*, and read

E're her faithless sons betray'd her;

or we may lay little or no stress upon either *ere* or *her*, reserving the full accentuation for the syllable *faith-* in *faithless*, in which case the reading would be

Ere her faithless sons betray'd her.

Lines of this sort may be called examples of *convertible metres*, since by changing the accent a dissyllabic line may be converted into one partially trisyllabic, and *vice versâ*.

This property of convertibility is explained by the fact of accentuation being *a relative quality*. In the example before us *ere* is sufficiently strongly accented to stand in contrast to *her*, but it is not sufficiently strongly accented to stand upon a par with the *faith-* in *faithless* if decidedly pronounced.

The real character of convertible lines is determined from the character of the lines with which they are associated. That the second mode of reading the line in question is the proper one, may be shown by reference to the stanza wherein it occurs.

Let E'rin remember her days of old,
Ere her faithless sons betray'd her,
When Malachi wore the collar of gold,
Which he won from the proud invader.

Again, such a line as

Fór the glóry I′ have lóst,

although it may be read

For the glóry I′ have lóst,

would be read improperly. The stanza wherein it occurs is essentially dissyllabic (*a x*).

Heéd, oh heèd my fátal stóry!
I′ am Hósier's ínjured ghóst,
Cóme to seék for fame and glóry—
Fór the glory I′ have lóst.

§ 312. *Metrical and Grammatical Combinations.*—Words, or parts of words, that are combined as measures, are words, or parts of words, combined *metrically*, or in *metrical combination*. Syllables combined as words, or words combined as portions of a sentence, are syllables and words *grammatically combined*, or in *grammatical combination*.

The syllables *ere her faith-* form a metrical combination.

The words *her faithless sons* form a grammatical combination.

When the syllables contained in the same measure are also contained in the same construction, the metrical and the grammatical combinations coincide. Such is the case with the line

Remémber | the glóries | of Brían | the Bráve;

where the same division separates both the measure and the subdivisions of the sense, inasmuch as the word *the* is connected with the word *glories* equally in grammar and in metre, in syntax and in prosody. So is *of* with *Brian*, and *the* with *Brave*.

Contrast with this such a line as

Lay vanquished, rolling in the fiery gulf.

Here the metrical division is one thing, the grammatical division another, and there is no coincidence.

Metrical,

Lay ván | quished, róll | ing ín | the fiér | y gúlf.

Grammatical,

Lay vanquished, | rolling |·in the fiery gulf.

The variety which arises in versification from the different degrees of the coincidence and non-coincidence between the metrical and grammatical combinations may be called *Rhythm.*

§ 313. *English Metres and Classical.* — The English metres are based upon *Accent*, the Latin and Greek metres upon *Quantity*. By treating an accented syllable as the equivalent to a long, and an unaccented syllable as the equivalent to a short one, we get a loose kind of analogy, which, from the fact of its having been, to some extent, recognized, requires notice. Subject to this view, the metrical notation for—

The wáy was lóng, the wínd was cóld—
Mérrily, mérrily, shall I live nów—

would be, not—

x a, x a, x a, x a,
a x x, a x x, a x x, a

respectively, but—

⏑ – ⏑ – ⏑ – ⏑ –
– ⏑⏑ – ⏑⏑ – ⏑ –

Again—

As they splásh in the blóod of the slippery streét,

is not—

x x a, x x a, x x a, x x a,

but—

⏑⏑ – ⏑⏑ – ⏑⏑ – ⏑⏑ –

From this point of view there is a certain number of Latin and Greek *feet* with their syllables affected in the way of *quantity*, to which there are equivalent English *measures* with their syllables affected in the way of *accent*. Thus if the formula

– ⏑	be a classical,	the formula	*a x*	is an English	*trochee.*
⏑ –	„	„	*x a*	„	*iambus.*
– ⏑ ⏑	„	„	*a x x*	„	*dactyle.*
⏑ – ⏑	„	„	*x a x*	„	*amphibrachys.*
⏑ ⏑ –	„	„	*x x a*	„	*anapæst.*

And so on in respect to the larger groups of similarly affected syllables which constitute whole lines and stanzas; verses like

Cóme to séek for fáme and glóry—
The wáy was lóng, the wind was cold—
Mérrily, mérrily, shall I live nów—
But váinly thou wárrest—
At the clóse of the dáy when the hámlet is stíll—

are (*a*) trochaic; (*b*) iambic; (*c*) dactylic; (*d*) amphibrachych; and (*e*) anapæstic, respectively. And thus, with the exception of the word *amphibrachych* (which I do not remember to have seen), the terms have been used. And on this principle, with the same exception, systems of versification have been classified.

To show, however, that this view is exceptionable, let us compare a so-called English anapæst like—

As they splásh in the blóod of the slippery streét—

with

Δέκατον μὲν ἔτος τόδ' ἐπεὶ Πριάμου.

For the latter line to have the same movement as the former, it must be read thus —

Dekatón men etós to d' epéi Priamóu.

Now we well know that, whatever may be an English scholar's notions of the Greek accents, this is not the way in which he reads Greek anapæsts. In applying Latin names to English metres we can get a 'loose analogy,' but we can get nothing more.

§ 314. *Alliteration of the Anglo-Saxon and other Metres.* In Anglo-Saxon, the metres were, what is called, Alliterative, *i.e.* a certain number of accented initial syllables,

within the space of either a single line or a couplet, began with the same letter: the vowels passing for identical. This system was not only Anglo-Saxon, but Norse as well, and in a less degree, German also.

§ 315. Specimens.

Anglo-Saxon.

OPENING OF BEOWULF. (*Tenth Century.*)

Hwæt we *G*ár-Dena,	Lo! we of-the-Gar-Denes
in *g*ear-dagum,	In the days-of-yore,
þeód-cy̆ninga,	Of the people-kings,
þry̆m ge-frunon—	Glory have-heard—
hú ðа *Æ*þelingas	How the Athelings
*e*llen fremedon	Strength promoted —
oft *Sc*y̆ld *Sc*efing,	Of Scyld Scefing
*sc*eaþen(a) þreátum,	Of enemies to-the-hosts,
*m*onegum *m*ægþum,	To many nations,
*m*eodo-setla of-teáh—	The mead-settles off-drove—
*e*gsode *e*orl—	The earl terrified—
syððan *æ*′rest wearð	Since erst was
*f*eá-sceaft *f*unden;	Fee-ship found—

LANGLAND'S PIERS PLOWMAN. (*Thirteenth Century.*)

In a somer sesun,	Wende I wydene in þis world,
Whon softe was the sonne,	Wondres to here.
I schop me into a schroud,	Bote on a Mayes morwnynge,
A scheep as I were;	On Maluerne heilles,
In habit of a hermite,	Me bifel a ferly,
Vnholy of werkes,	A feyrie, me þouhte;

I was weori of wandringe,
And wente me to reste,
Vndur a brod banke,
Bi a bourne syde;
And as I lay and leonede,
And lokede on the watres,
I slumberde in a slepyng,
Hit sownede so muerie.
þenne gon I meeten
A meruelous sweuene,
þat I was in a Wildernesse;
Wuste I neuer where.
And as I be beo-heold into þe Est,
An-heigh to þe sonne,
I sauh a tour on a toft,
Trizely i-maket,
A deop dale bi-neoþe,
A dungun þer-inne,
With deop deck and derk,
And dredful of siht.

Godes Engil cuman;
The im tegegnes sprac.
Het that im thea uuardos—
'Uuiht ne antdredin
Ledes fon them liohta.
Ic scal eu quadhe liobora thing,
Suido uuarlico
Uuilleon seggean.
Cudean craft mikil.
Nu is Krist geboran,
An thesero selbun naht,
Salig barn Godes,

Then it was to many known,
Over this wide world.
The words they discovered,
Those that there, as horse-grooms,
Without were,
Men at watch,
Horses to tend,
Cattle on the field.
They saw the darkness in two
Dissipated in the atmosphere,
And came a light of God
—through the welkin;
And the words there
Caught on the field.
They were in fright then
The men in their mood.
They saw there mighty
God's angel come;
That to them face-to-face spake.
It bade thus them these words—
'Dread not a whit
Of mischief from the light.
I shall to you speak glad things.
Very true;
Say commands;
Show strength great.
Now is Christ born.
In this self-same night;
The blessed child of God,

An thera Davides burg,	In the David's city,
Drohtin the godo.	The Lord the good.
That is mendislo	That is exultation
Manno cunneas,	To the races of men,
Allaro firiho fruma.	Of all men the advancement.
Thar gi ina fidan mugun,	There ye may find him
An Bethlema burg,	In the city of Bethlehem,
Barno rikiost.	The noblest of children.
Hebbiath that te tecna,	Ye have as a token
That ic eu gitellean mag,	That I tell ye
Uuarun uuordun,	True words,
That he thar biuundan ligid,	That he there swathed lieth,
That kind an enera cribbium,	The child in a crib,
Tho he si cuning obar al	Though he be king over all
Erdun endi himiles,	Earth and Heaven,
Endi obar eldeo barn,	And over the sons of men,
Ueroldes ualdand.'	Of the world the Ruler.'

3.

Yore was of ages
Then when Ymer built,
Was (*nor*) sand nor sea,
Nor cool waters;
Earth found-its-self never,
Nor up-heaven,
Gaping was yawning,
And grass nowhere.

The following is from Thorlakson's Translation of 'Paradise Lost' :—

MODERN ICELANDIC.

Um fyrsta manns
felda hlyðni
ok átlystíng
af epli forboðnu,
hvaðan óvægr
upp kom dauði,
Edens missir,
ok allt böl manna;
Þartil annarr einn,
ærði maðr,
aptr fær
oss viðreista,
ok afrekar nýan
oss til handa
fullsælustað
fögrum sigri;

Sýng þú, Menta-
móðir himneska!
þú sem Hórebs fyrr
á huldum toppi,
eða Sínaí,
sauðaverði
innblèst fræðanda
útvalit sæði,
hve alheimr skópst
af alls samblandi;
Eða lysti þik
lángtum heldr
at Zíons hæð
ok Síloa brunni,
sem framstreymdi
hjá Frètt guðligri, &c.

Of Man's first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe,
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat,
Sing, heavenly Muse, that on the secret top
Of Oreb, or of Sinai, didst inspire
That shepherd, who first taught the chosen seed,
In the beginning how the Heavens and Earth
Rose out of Chaos: or if Sion's hill
Delight thee more, and Siloa's brook that flow'd
Fast by the oracle of God, &c.

§ 320. SWEDISH (*Present Century.*)

FROM TEGNÉR—FRITHIOF'S SAGA.

1.

Sitter i högen,
högättad hofding;
slagsvärd vid sidan
skölden på arm
Gångaren gode
gnäggar derinne
skrapar med gullhof
grundmurad graf.

1.

Sits on high,
High-ancestered, noble;
Sword-guard by side,
Shield on arm.
Steed good
Neighs therein;
Scrapes with gold hoof
Turf-raised grave.

2.	2.
Nu rider rike	Now rides rich
Ring öfver Bifrost	Ring over Bifrost (*The rainbow*)
svigtar för bördan	Sways for the burthen
bågiga bron.	The bowlike bridge.
Upp springa Vallhalls	Up spring Valhalla's
hvalfdörrar vida;	Valve-doors wide
Asarnas händer	The Asas hands
hänga in hans.	Hang on his.

It is in the Icelandic, Scandinavian, or Norse where the Alliterative Metres are the commonest; and next to the Norse, the Anglo-Saxon. In the High German they are, comparatively, rare.

ADDENDUM (*omitted in p.* 19).

Now we should praise
Heaven's-kingdom's guardian,
The might of the Lord,
And his mood-thought;
The glory-father of works;
As he, of wonder each,
Everlasting Lord,
Erst established:
He erst shaped,
For earth's bairns,
Heaven to roof;
Holy shaper.
Then mid-earth,
Mankind's home,
Everlasting Lord,
After formed,
For the homes of men,
Lord Almighty.

PREFACE.

My first work on the structure of the English Language, and the allied subjects, such as its history, dialects, and its place in the Indo-European family, was published in 1841. These were questions that, in the main, were held to be important because they were introductory to others of a higher kind; i.e. the study of Comparative Philology, in general.

This, however, is an object which may be put forth too exclusively. Nor does it apply to the English Language in particular. It is the case with every other language in the world, provided only that it be the native language of the student. Every other language he has to learn; and, when he has learned it, it is never so familiar to him as his own. If he learn it from books, many (perhaps most) of the rules are of artificial character. But, in the mother-tongue, the necessary materials present themselves spontaneously, and the study of principles can be pursued without any secondary object to distract the thought or divide the process between the memory and the reflective powers.

A doctrine of this kind, as a reason for the study

of one's mother-tongue, when pressed either too strongly or unseasonably, invests even such an important language as the English with the character of a mere disciplinal study; or, at least, that of a preparatory study in which the language itself plays but a secondary part. There are times, however, when recommendations of this kind are not without their use. Say what we may, every man in England knows a great deal about the English Language (perhaps more than he knows about anything else), and all this knowledge he has got without an effort. If he can read, he has had to be taught spelling; and with this he may, not unnaturally, think that he should be satisfied. At any rate, he knows that he can read English with pleasure to himself, and write it with average accuracy; and that others can carry the use of it to the highest degree of excellence, both in writing and in speaking, with little or no theoretical knowledge of its structure.

The time, however, for a reason being required for the study of English has gone by: and with it has gone by the necessity of a good deal of preliminary information which thirty or forty years ago was, by no means, generally diffused. At present, illustrations of the dialects of the Thames and Tweed may be taken from those of the Indus and Ganges, without any preliminary notice of the relations between the Sanskrit and the German, simply because the affinities of the German family are known. Writers of the Middle English may be studied in adequate Reading Books, or in well-edited texts which replace the limited supplies of the Roxburghe Club publications, and the similar *œuvres de luxe* of the

last generation. Instead of indistinct and perfunctory renderings of passages from the Old English, we parse and construe with as scrupulous a sense of responsibility as we have in Latin and Greek—and in all this there is progress and improvement.

The present work is one of three; the smaller one being a more elementary, the larger a more expanded form of it. I find it difficult to say whether, between the three, I have done most in the way of re-writing or most in that of retrenchment. It is certain that a great deal has been done in both ways. The general character, however, of the earlier editions has been preserved.

There has, of late, been progress and improvement. Yet, it is doubtful whether the progress has been uniform throughout. It by no means follows, that because one part of a field is cultivated with success, the other is not neglected. It is the opinion of the present writer that within the last ten or fifteen years, two tendencies have been prevalent. One is the somewhat overhasty promulgation of doctrines which, though certainly what we may call *advanced*, have either not been sufficiently verified or, else, not sufficiently limited and defined in their application. The other is the accumulation of particular details to the neglect of general principles. This is what is sure to happen whenever any department of investigation makes a sudden progress; and that the rule in English Philology has been one of progress no one can doubt. Still less can anyone doubt that it has been rapid. With this promulgation of general rules, and accumulation of instances, the present writer thinks that the processes

of verification and classification have not gone *pari passu*. Arrangement, however, or classification is the very essence of special Grammar; and the exact measurement and limitation of the extent of a rule or law, that of Comparative Philology.

The present work is called a 'Handbook of the Language.' Be it so. To say nothing about what a student may get for himself from the direct study of our older writers—and this is, in reality, the only knowledge that he can call his own—it is mere trifling to induce him to believe that he can get anything of much value from one book only—albeit it may call itself a *Handbook*. There are many *Handbooks*—though under different names—and of these no one is all-sufficient. There are four writers, at least, whose works are simply necessities to anyone who seeks an adequate notion of what the English language really is. There is something of course, in the present work which is found in none of them; otherwise it would not have been published. · It is certain, however, that, whether we take the writings of Dr. Morris, Dr. Murray, Professor March, or Dr. Abbott, there is something to be found in one of them that is not to be found in the others; something, moreover, which no one can well do without. The English is in no sense whatever *lingua unius libri*.

The First Part, treating as it does of the introduction, diffusion, and Continental origin of our language, is purely historical. Nevertheless, there are whole chapters wherein the criticism is that of the grammarian rather than the historian. There are many reasons

why this should be the case. Most languages have more stages, and most languages have more dialects than one. In its earlier form the English had as many inflections as the present German: in its existing form it has fewer than the French. Again, there are in English three well-marked dialects; and two of these may probably be traced to two distinct parts of Germany. The investigation, however, is by no means simple; and, if properly pursued, requires not only the testimony of the historian and the geographer as to the time and place to which such or such a form of speech is to be assigned, but, also, the internal evidence that is supplied by the language itself. Where the external testimony is ample and adequate, this reference to the language may be neglected. But in English it is absolutely indispensable; more so, perhaps, than in any other language: and the reason is manifest. The history of the centuries during which the English from the Continent displaced the original British of our island is lamentably obscure. Hence, the comparison of certain dialects of England and those of Germany, with which they are considered to correspond, becomes necessary; and, what is wanting in proper historical testimony, must be sought for in the domain and by the methods of the philologist.

Of the passages relating to either the Angles, the Saxons, or any other German population with which the early history of the English Language can reasonably be connected, I have given all that either convey, or suggest, any definite information; beginning with Tacitus and ending with Procopius. What they tell us explicitly is

very little. If anything of value can be got from them, it must be done by inference; and inference only. The inferences, however, from the Greek and Latin writers for the times under notice, whether rightly or wrongly drawn, rest on the unexceptionable evidence of writers either cotemporary or nearly so, and of writers with ample sources of information. But with the Sixth Century the assurance of a firm foundation ends.

The evidence of Beda I have treated in a reverential spirit. He writes in the middle of the Eighth Century, upon events which took place between the middle of the Fifth and Sixth. With the exception of Gildas, Constantius, and Orosius, whose texts are as accessible to us as they were to him, he quotes no authorities. I am willing, however, to believe that where he gives names, dates, and special events, he is following some account, or belief, which had a foundation in fact. I neither affirm nor deny the reality of his Ceawlins, his Cenrics, and his Hengists. Each stands or falls by the special narrative of his actions. But what I emphatically deny is the value of Beda's evidence on the negative doctrine, that there were not only intruders of German blood, who did on British soil what they are said to have done, but that they were the *first* of their countrymen who did it. The bearing of this distinction is evident. That the English language is German is beyond doubt; and it may be added that (so little is there any British admixture in it) it is just as German as if we had found it in Westphalia, or as if Britain, when Germanized, were an uninhabited island. If there is any exaggeration in this, it is of small account.

What it means is simply that, if our German, or our British blood, is to be measured by our language, we are Germans as purely and simply as any in Germany. There are those who believe this. There are those who believe just the contrary. There are those who are in no hurry to form an opinion on the question. But with all of them, one point is of great importance; viz. the *rate* at which the intrusive German element established itself. The longer the time allowed for it the more gradual will be its operation, and the greater the chances of admixture of German and British blood. The shorter the time so allotted the greater becomes the necessity of some sharp and short *coup de main*, either by the extermination of the original British, or the driving them up into the mountains of Wales, so as to create a *vacuum* in England for the displacement, rather than the amalgamation, of the superseded British. The shortening, then, of the time is little more than another name for the rapidity and violence of the change. This Beda's account favours; and Beda's account, no matter why, is very generally favoured by others. Now Beda makes the German intrusions in Britain begin within a year or two of A.D. 450; while the panegyrist, Eumenius, addressing the Imperial rival of Carausius, tells us of *Franks* in England so early as A.D. 297. This difference between the times allowed for the English language to extend itself is considerable. All that the present writer pretends to give is the evidence. The report upon it he leaves to the reader. The greater portion of it applies to the Saxons of Gaul; of whom,

although we know but little, we know more than we do of those of Britain. It is submitted, then, that such being the case, we have had no better basis for our inference than the analogy of the Litus Saxonicum * of Gaul.

To the respective meanings of the terms *Angle* and *Saxon*, unusual space is devoted; the result being that the difference between the Saxon of the Southern, and the Angle of the Northern counties of England, whether great or little (for no opinion is given as to the absolute amount of it), was greater than that between the Saxon and the Frank.

Little good, however, in the investigation of this question comes from either comparisons or contrasts between the Saxons and the Franks unless we recognize distinctions between Franks themselves; i.e. between those of the Upper Rhine, those of the Alemannic frontier (or those of Franche Compté), and those on the very mouth of the Rhine, and on the frontier of the

* There is no such name as *Litus Saxonicum* in Britain. The South and South-eastern coast of Britain was not a *Litus*, but a *Limes*, i.e. *Limes Saxonicus*—wholly or in part. The *Litus Saxonicum* was the coast of Gaul; and on this *Litus* there was a *Limes*, differing from the *Limes Saxonicus* in being called by the Latinized German term *Marca*. In this we have evidence of a German element on the *Litus Saxonicum* sufficient to effect the adoption of a German military term. But the *March* itself was not German, i.e. not held by Marchmen of the German denomination. The *Limes Saxonicus* of Britain is, in Gaul, the *Marca Dalmata in Litore Saxonico*. Whatever may be said in favour of the *Limes Saxonicus* meaning a district that had to be defended against the Saxons, rather than one occupied by them, it is certain that the nearest illustration that applies to the interpretation of the term *Saxonicus* makes against it. The *Dalmata Marca* was, probably, a March on which the German element preponderated. It was certainly *not* a March for the purpose of repelling either buccaneers, or invaders, from Dalmatia.

Saxons and Chamavi, between which the difference may have been considerable. To this frontier belong the Franks described by Julian, the Franks of the Salian denomination, i.e. the Franks that have the best claim to be considered as the German allies of Carausius, and the likeliest of all the Germans to have been described under different names according to the country of the historian. Now we have seen that '*Saxon*' was not a term of the Western Empire; and that enemies who in Italy would be *Franks*, would be in Constantinople *Saxons*. The strangeness of this latter denomination to the Romans of the Western Empire has not, hitherto, been insisted on. In the present work it may possibly be pressed too strongly. At any rate, it makes the difference between a *Salian* Frank and a Saxon of the Lower Rhine little more than nominal. The Frank dialects of which we have specimens (for of the Salian we have none) in nowise contravene this view. On the other hand, however, the Westsaxon of Britain and the Old Saxon of Westphalia, for which we *have* specimens, have long been known to be nearly identical; and we must remember that it is between Westphalia and the Gallic Litus Saxonicum that both the Franks and the Saxons of Julian present themselves.

Now, whether we trace the Frank or the Saxon to what we may call his proper occupancy in Germany, we can never trace him beyond the Delta of the Rhine; or to soil exclusively German. The Saxon, during the Fourth and Fifth Centuries, may be found on both Gallic and British waters; and on reasonable

grounds, may be assumed to have settled in certain parts of Gaul and Britain; but it is always on the Roman frontier, and, always, in contact with Roman civilization.

The evidence, however, on the strength of which we connect their dialect with that of the German of Westphalia is unexceptionable. As early as the Ninth Century we have specimens of both the Saxon of the Saxon parts of England, or Wessex, and the Saxon of Westphalia, the typically Saxon part of Germany; and that they are little more than dialects of the same language has long been recognized. But it is only with the English of the Westsaxon parts of England that this close similarity on the part of the Westphalian dialect holds good.

The character of the Angle districts is more obscure; and the evidence of a widely different character. To set against the numerous notices of the Saxons between the first one by Julian, and the statement of Prosper Tiro that A.D. 441 the '*Britains were brought under the government of the Saxons*,' we have not so much as a single instance of the use of the word *Angle*. Nor have we one for the times anterior to the Saxons of Julian except that of Ptolemy, many years before. For those after the date of Prosper Tiro, we have none earlier than that of Procopius; in other words, we have only two for nearly 300 years; or none during the time when the Saxons are mentioned—i.e. no concurrent mention of the two denominations. Nor have we any specimens of any German dialect of the Angle part of Germany.

Hence, the first step to be taken in the investigation is to look to the geography of the two countries—England and Germany. Our two notices of the Angles are consentient on this point. The Angle division of England is, in the main, consentient also. The German geography gives us the parts between Magdeburg and Lauenburg, the Slavonic frontier of Mecklenburg, or the Altmark; and, after this, the Neck of the Cimbric Chersonese (Holstein). This we know, afterwards, as the Danish *March—Den*mark.

The next step is the direction of the Saxon of South-Western Germany in the way of dialect and ethnography. Reasons are given for believing that it ran—not East and West—but North and South; and that the two forms of speech were divided—not by the valley of the Weser—but by the old district of the Angrivarii, or Angraria, which lay between the head-waters of the Weser and its lower course. This view stands or falls by its evidence. It carries, however, the line of Angle affinities along the Elbe, and along the Slavonic frontier, from Lauenburg and Altmark to Thuringia; a result which is unfavourable to the importance of the Frisian influences on the English language. They are not wholly ignored. It is held, only, that though in certain characters the Frisian has a special agreement with the Norse, Scandinavian, or Danish element, it is, on the whole, more closely allied to the Westsaxon than it is to the Northumbrian.

The Angle of the Lower Elbe is thus made little more than the German of the Danish frontier, and is held to be, for the Fifth Century, not so much either

German or Danish, or Danish or English, as a language out of which both English and Danish are hereafter to be developed—Danish *in posse* or English *in posse* if we choose to call it so. This is a doctrine which, from its very nature, is incapable of being put in any precise or definite form. A potential language, uniform, with the exception of certain mere differences of dialects, out of which between (say) the Fifth and Ninth Centuries two forms of speech as different as the Northumbrian and the Icelandic of the thirteenth century, one in England, and one in Scandinavia, could develop themselves, cannot but run the risk of being branded as vague, hazy, and equivocal. It is possible, however, that the final difference may be due to certain characteristics developed during the interval. Reasons for believing this to have been the case, in, at least, three important instances, the Postpositive Article, the so-called Passive Voice, and the Pronoun of the Third Person, are given. But these are far from standing alone. That in most of the points wherein the Northern dialects of England differ from the Southern the former agree with those of Scandinavia is admitted, and insisted on: yet South of Caithness, there is not a square mile in Great Britain where the Danish, as a separate substantive language, can be shown to have been spoken. There are signs of Danish occupancy spread over more than a dozen counties; and these are of two kinds. There are first the so-called Danicisms in the language of common life, and secondly, there are certain characteristic local names—especially those ending in *-by*—

as *Spilsby*, *Whitby*, and hundreds of others. But they are not regularly distributed. Between the Tees and the Forth, where the Danicisms are the most plentiful, there are few, if any, characteristic local names; and in Lincolnshire, where the local names are the most abundant and characteristic, the Danicisms are exceptionally rare. Much has been written on both these points; and not a little of it by myself. But the explanation makes no part of the present work. The doctrine, however, of what is generally called 'Danish,' or 'Norse influences,' and which means contact with intruders of later date than the Angles, is the one which the present writer holds to be just as liable to the objection of vagueness and indefinitude as that of what he has called the potential Danish. Of any Scandinavian form of speech, as a separate, substantive, definite language, as foreign to the English as the oldest Icelandic is to the oldest Northumbrian, he sees no sign. Indeed, he goes farther; and ventures to say, that if we apply the same criticism to the notices of the *first* Danish settlers in Scandinavia, as we have applied to the similar statements of Beda as to the *first* settlements of the Saxons and Angles in Britain, we find no reason to believe that a German form of speech was spoken in Sleswick, Jutland, or the Danish Isles a day earlier than it was spoken in England and Scotland. If the reader choose to go farther, and hold that the Germanization of Britain and the Cimbric Peninsula were concurrent events, there is nothing to deter him from doing so.

This is what is meant by the differences between

Norse influences, and the results of the common origin of the Northumbrian English and the Scandinavian languages of the present time.

Such is the line of criticism which applies to two out of our three great dialects—the Saxon, the Angle, and Mercian—with a defined though incomplete history, for the first two. They have a separate history from the very beginning; having been different dialects on the Continent before they became different dialects of England. There is consistency combined with continuity and symmetry in this; giving the Rhine and the Gallic, or Roman, frontier for the Southern German, and the English of the Saxon parts of England; the Elbe and Slavonic frontier for the Northumbrian English, and the Norse of Scandinavia. I think it useless to try for the same correspondence for the intervening districts; i.e. to find in the parts between Hamburg and Leyden the same connection with the Midland, or Mercian, forms of speech. At any rate I have not made the attempt. Neither Friesland nor Holland will give us such correspondence of dialect as we find between Westphalia and Dorsetshire, nor such a name as *English* which we find in old *Angle* area.

Still the triple division is a sound one. The characters of the Mercian are negative. Its early history is no history at all. The dialect may be one of two others with its differential characteristics obliterated. It may be a mixed form of speech. It may be Northumbrian as far as the Orwell on one side of our island, and Westsaxon as far as the Ribble on the other. It is only as a negation that we know it.

It is the dialect, however, of the present literary English: just as the Westsaxon is the literary language of the times before the Conquest, and the Northumbrian that of the Scottish of the classical period of Scotland. Each is the medium of its own distinct literature, and by that literature each is represented—we may, almost, say elevated to the dignity of a distinct language.

The Second Part of this volume, '*Phonesis*,' is devoted to the elementary sounds of our language; their properties, and their relations to each other. It is, by no means, the longest division of the book; but it is the one which, unless he be already familiar with the subject, should detain the reader the longest. On the first view the details may appear insignificant, because their immediate application is not very perceptible; and those who know when and where they will be applied may think that it will be time enough to explain the nature of such or such interchanges when they occur. It is not, however, upon this principle that I have written: but rather upon the doctrine that, where we have a certain amount of order, regularity, symmetry, harmony and system, 'the Whole is easier than Part;' and that it is better given in its proper place, and in its integrity, than left to be collected by instalments, or picked up bit by bit, from such incidental rules as happen to present themselves when some notable letter-change requires explanation. A clear comprehension of the respective properties of the elementary sounds, can only be got through a knowledge of their mutual relations as parts of a system; and this, though it may require, at first, some time and attention,

saves much trouble and distraction in the long run. It enables us, when we come to special details of Derivation and Inflection, to deal with them without interruption, without continual suggestions of some so-called law of Euphony, and without the necessity of being cautioned against confusing the sound with the spelling —all these, and much more, being matters with which it is best to be familiar beforehand. And it may be added that unless we know them familiarly, they are scarcely worth knowing at all. Nor are they adequately taught by books. Still less need they be taught by a master. Every elementary sound corresponds with certain positions of the lips, cheek, soft palate, tongue, and other parts of the mouth as accurately as every note in Music corresponds with the length, thickness, or tension on a certain chord; and anyone with a fair ear and a regularly formed mouth can, as he practises himself in pronouncing them one by one, with a little attention ascertain the exact position of the speech-forming parts of the mouth as each sound is produced. In some he can see that it is the closing and opening of the lips; for others that it is the contact with the tip of the tongue with the teeth which is essential; and from this he may anticipate such terms as *Labial* and *Dental*; applied to such series as *p*, *b*, *f*, *v*; *t*, *d*, *th*, *dh*, in the first of which the lip, and the second the tongue and teeth play the chief part. And what he finds in such groups as those he may find elsewhere. But whatever is to be found he can find for himself; provided only that he will take the trouble to do so: and he can not only do it without a master, but, unless he practises

the investigation on himself, he cannot do it with one. It may not, indeed, be so elegant a practice to puff, and blow, and hiss, and buzz in forming such sounds as *s*' or *z*', or *p*', or *m*' or *r*' or the like, as it is to draw forth correct notes from a musical instrument; but it is, nevertheless, a practice full of usefulness.

The Third and Fourth Parts treat respectively of Etymology and Syntax; and it may be that, in the eyes of some, I have exaggerated the importance of drawing a hard and fast line between them. It seems, at first, a very simple matter to say that, while Etymology deals with *single* words and the various forms they may take, Syntax treats of the rules by which *two or more* separate words may be combined. But it is only in Greek that this distinction is acted on. In Greek the Perfect Passive (*τέτυμμαι*, &c.) is not only a Tense, but a Tense which is, beyond all doubt, a part of Etymology. In Latin, however, the single word is rendered by *verberatus sum*. Here, the *-atus* belongs to Etymology; and so does the *-m* in *sum*; and so does each of the two words singly. But *singly* they are not equivalent to *τέτυμμαι*. The equivalent to *τέτυμμαι* consists of two separate words, or a combination equivalent to a Tense; and, as such, is a point of Syntax. In English, combinations of this kind, i.e. combinations in Syntax used as substitutes for single words in Etymology, are far more numerous than either true Tenses and Persons in Verbs, or true Numbers and Cases in Nouns; indeed in English the resolution of the inflectional forms of Etymology into corresponding circumlocutions of Syntax is the rule rather than the

exception. When this is the case the language is said to be Analytic; just as when inflectional forms prevail over combinations of different words, it is said to be Synthetic.

The English may safely be said to be the most Analytic language in the world. But it is not the one in which the change from Synthetic to Analytic has been the greatest. This is because it was not a highly Synthetic language to begin with. The Latin, the Greek, and the Sanskrit are all languages in which both the Declension of Nouns and the Conjugation of Verbs were far more rich in their number of distinctive signs for Gender, Number, Case, Voice, Mood, Tense, and Person, than was the oldest representative of the English; viz. the Mœso-Gothic. So far as the Declension of Nouns went, the Slavonic and Lithuanic are not only richer than any German language was at any time, but richer at the present time than the richest of them. In respect to the Conjugation of the Verbs the difference is less. But the English is still more Analytic than any of them; and if it is not the one which best shows the changes from Synthesis to Analysis, it is because it had, from the beginning, less of a Synthetic character to lose. But what it had it has lost to an extreme degree. Of the outward and visible signs by which a word in Latin or Greek shows that it belongs to a particular Part of Speech, of the signs of Case, &c., to show that it is a Noun, and of Voice and Mood, &c., to show that it is a Verb, the English has but eight. And (what is more to be noted) when we have got them, four of them are identical. The signs of

the Third Person Singular in Verbs, of the Nominative Plural, and of the Possessive Singular and Plural in Nouns, all end in the same sound, viz. that of the letter *-s*. These are, certainly, distinctive as inflections; but they are not distinctive between one inflection and another. Two other such signs are those of the Preterit Tense, and its corresponding Participle. But both are *-d*, *-t*, or *-ed*. Of the *-ng* in the Participle we can only say that, if it is a sign of the Present Participle, it is, also, the sign of the Verbal Abstract—as in words like *morning*, &c.; whilst the *-en* in the Perfect Participle appears in words as unlike in sense as the Verb *strengthen*, the Adjective *wooden*, and the Plural form *oxen*. Hence, we have few distinctive terminations at all; and those that we have are only distinctive up to a certain point. I make no secret of having kept this view of the extreme Analytic state of the English, as much as possible, before the reader. It is in its proper place when, after exhibiting the Declension of the Noun, and after doing the same with the Conjugation of the Verb, I draw attention to the small amount we have of either. It is, perhaps, out of place when, in the First Part, which is mainly ethnographical, I draw attention to the extent to which each of our dialects has either lost or retained its original Synthetic structure. However, whether in place or out of place, I have drawn special attention to it; for the difference between the two terms is in no language so important as it is in the English.

(1) The English Language has been more Synthetic than it is now; and the result of this is that numerous

words which now look like isolated uninflected forms, are in reality fragmentary remains of a fuller inflection. There are no better instances of this than the so-called Adverbs *then* and *there*, which, in form and origin, are simply cases of the Demonstrative Pronoun —the substantive meaning *time* or *place* being understood. But they are no longer Pronominal in sense. Hence the *historical* study of our Grammar is mainly that of the change from one of these forms to the other; and we know that to the historical method a great deal of deserved importance is attached. This is mainly because the change itself is one of a pre-eminently orderly, regular, and general character—at least for the class of languages to which the German Family belongs. Throughout all the Indo-European languages signs of the change present themselves; and, in all cases, their character is the same. The direction is, invariably, from Synthetic to Analytic, and never *vice versâ*. The inflections that are dropped in one language are, generally, those that are dropped in another. The order in which they are dropped is generally regular; *e.g.* the sign of the Accusative is lost sooner than that of the Dative, and that of the Dative sooner than that of the Genitive. The character of the substituted circumlocutions is to a great degree uniform—*e.g.* if *have*, in English, is the Auxiliary Verb which helps us to such a combination as *I have written* =the Greek γέγραφα, *habeo*, in some form or other, plays a similar part throughout the languages of Latin origin. In short, the historical method, and the study

of the change from Synthesis to Analysis, are, in most cases, one and the same.

(2) Another reason for the importance of the distinction (indeed the contrast) between these two terms, is found in its application to pure and simple Grammar —Grammar in which the historical is wholly subordinated to the formal element. The arrangement of the so-called '*Parts of Speech*' generally presents itself on the threshold; so that, as soon as we get through the spelling and pronunciation of a language, we come to the characteristics of Nouns and Pronouns, Substantives and Verbs, and the like. These have to be distinguished from one another; and it is clear that in highly Synthetic languages where the Noun, with perhaps half-a-dozen different cases and three Genders, has one Declension, while the Pronoun and Adjective have another, it is not a very difficult matter to lay our own hand on each as a separate Part of Speech. This is because each of them, in its inflections, carries with it a sign more or less characteristic; and one which, independent of the context, is generally sufficient to mark the place in Grammar of the word to which it belongs.

The Greek is a highly Synthetic language, and with most words in Greek, even when divested of any context, and standing alone, we can see, by mere inspection, whether they are Nouns or Verbs. In English, which is Analytic in the extreme, there is not one word in a hundred, upon which, from the evidence of its form only, and without reference to a context, we can

safely pronounce an opinion as to whether it is a Substantive, an Adjective, a Pronoun, or a Verb.

It is manifest that with such a difference between them as the one under notice, a different principle of arrangement must be recognised; and the principle of the present work is that the place a word takes in the structure of a Proposition determines its place as a Part of Speech.

It was the suggestion of the late Mr. Taylor, of the firm of Taylor and Walton, under whose auspices my first work on 'The English Language' was published, that the title should be '*An English Grammar on English Principles.*' It was thought, however, somewhat too pretentious. Be this as it may, *English Principles* are realities which English grammarians must recognise; and a nomenclature and classification founded upon tongues like the Latin and the Greek must be abandoned: though they need not be abandoned at once. A vast mass of detail in the history of individual words, a great number of useful notes both for writing and reading, may be got from almost any Grammar; and, in many cases, without any Grammar at all. But if Language, as such, is to be our study, we cannot be too careful to have our rules and our principles of arrangement as little artificial as possible. We cannot, however, always get this so in the study of foreign languages; because in these there is a great deal of detail which must be taught as quickly and easily as possible, and, for this, artificial, but compendious, rules may be advantageous, or, at least, excusable. But, in our mother-tongue, all this detail lies ready to our hand,

and has come to us as a birthright, and artificial compendiums are out of place. We have time to reflect; time to classify; time to understand what lies before us. We have time to realize the fact that it is not so much the English Language itself that we are learning, as principles of Language in general; and laying a foundation for the not ignoble study of Comparative Philology.

AN INTRODUCTION

TO THE STUDY OF THE

ENGLISH LANGUAGE.

PART I.

ORIGINES.

CHAPTER I.

THE ANGLES AND SAXONS TILL A.D. 441.

§ 1. *The English Language not British.*—The English language was not the native language of Britain. It was of foreign origin; the country to which it was indigenous being Germany. After its first introduction it spread itself westward, displacing the original forms of speech. From these it differed as the language of a different family; for the British, like the Gaelic of Scotland, Ireland, and the Isle of Man, was a Keltic language. At what rate the intrusive German extended itself is uncertain. Remains, however, of the original languages are still found in Wales, North Britain, and Ireland; and, as late as the last century, were found in Cornwall.

§ 2. *Languages with which it came in contact.*—It was the British branch of the Keltic family with

which this intrusive German first came into contact; for it is reasonably believed that the Gaelic of Scotland extended no further southward than the Forth; so that the Lothians and the Border Counties of North Britain were British rather than Gaelic. That the Picts may have spoken a language different from both is the opinion of several investigators; but there is little that can safely be said about the Picts.

Upon the whole we may conclude that, in the first instance at least, it was with only *one* of the *native* languages that the intrusive German came in contact, and that that language was the British; represented, at present, by the Welsh.

§ 3. *The Latin.*—Nevertheless, there was a *second* language in the island — a second language, though not a native one. This was the Latin of the Romans, for Britain was a Roman province; and in the provinces of Spain, Gaul, and Dacia, the Latin language displaced that of the natives, leaving the several languages of their descendants as decidedly Latin in their general character as the English is German. It has *not*, however, done so in other parts of the Empire, viz. Austria, Servia, and parts of Turkey, or the Provinces of Rhætia, Vindelicia, Pannonia, the Mœsias, and Thrace. Hence, one of the two series must be exceptional. Which, however, gives us the exception, and which the rule?

Reasons will be given as we proceed which show that there was *some* Latin in Britain; but they, also, suggest that it was not a true vernacular like the British, but a learned, or ecclesiastical, language. Still there was a second language of some kind, and that language was the Latin. More than this, in respect to the languages with which the German came in contact, we are unable to say.

§ 4. *Relations of the English to older languages of*

Britain.—What did the new language get, or take up, from the older ones? This is simply a matter of more or less; and, from this point of view, we may safely say, at the very least, thus much, viz.: that it was not enough, nor anything like enough, to impair or obscure the genuine and original German character of the English.

We *know* this; and it is not from any external evidence that it is known. The three great philological groups of the Keltic, Latin, and German languages are as well understood at the present moment as ever they were (indeed better); and we know that the English language belongs to the German family.

We know, therefore, from the mere inspection of a map the direction in which the German extended itself; and we know from the philological characters of the three groups to which of them it belonged. What it took up from the other two is, and can be, only known with certainty from what we find in it; and the amount of this, real or supposed, practically depends on the finder. Some find more than others; but no one of any authority makes the English language other than German. A *mixed* language it may be made; for it is, perhaps, impossible to find any language wholly *un*mixed. But mixture may be of any degree. No one, however, has discovered so much of any second element in English as to make it an ambiguous, an equivocal, or a transitional language; or, indeed, anything like it.

§ 5. For anything like certainty, for anything that can serve as a basis of either philological or ethnological criticism, this is all we have in the way of *knowledge*; viz. (1) the foreign origin of our language; (2) its German character; (3) its contact with one true native vernacular, viz. the British; (4) its contact with a second language—*the Latin—which* was certainly not native,

and, almost certainly, not vernacular; (5) the direction in which it spread; (6) its present distribution over the British Isles, and, indeed, the world at large; and (7) its present long recognized name—*English.*

§ 6. What we know imperfectly, or only profess to know by inconclusive inference, is (1) the rate at which it spread; (2) the date of its introduction; and (3) the names and blood of the men who introduced it. This requires a special investigation; and, though the first question as to the allied facts of rate and date will be short, the second will be of unexpected length.

§ 7. *Rate and date.*—The rate of extension manifestly depends upon the date of introduction. But, for this, the margin is a wide one. The earliest ostensible date, or that of the presence of Germans *of any kind* on British ground, is A.D. 290—the latest A.D. 600—each there or thereabouts.

§ 8. *The names 'Angle' and 'Saxon.'*—The names of the particular divisions of the German family that can be assigned to English ground, are numerous; and all except two will be noticed as they present themselves.

These are the two which stand forward with such familiar and conspicuous prominence, that they may be said to represent the whole German intrusion, invasion, migration, or whatever we call it. We find them, even without looking for them, at the present time, and we find them in Tacitus and Ptolemy in the first and second centuries. The name of the *Saxons* we preserve in that of the counties of Ess*ex*, Middles*ex*, and Suss*ex*; and that of the *Angles* in every quarter of the world. What, however, was the import of these names in the fifth century? Each of them has a special history of its own; but on the important matter of chronology they agree. Each will have a history that

falls into three different stages; and each of these stages will begin and end about the same time. Yet the details in the way of geographical and historical importance will be different.

a. In the first period both names are mentioned; but neither of them is connected, or shows any likelihood of ever being connected, with either Gaul or Britain.

b. In the second the Saxons alone are mentioned: and that in connection with either Gaul or Britain exclusively. These are never assigned to the district to which they are assigned in the first period.

c. In the third both the Saxons and the Angles are mentioned; and with this begins the history of the Anglo-Saxons *in* England, and that of the Saxons *in* Germany.

It is clear that, of these three periods, the only one that can bear directly upon the present subject, or the introduction of the English language into Britain, is the second. The first, however, leads us towards it; and, so doing, is a necessary preliminary.

§ 9. *The Angles of Tacitus and Ptolemy.*—Tacitus mentions the Angles; and, as he does not mention the Saxons, the notice of the Angles takes precedence.

Tacitus, though he includes the Suevi in his 'Germania,' makes them a separate and peculiar division of it; and his Angli belong to the Suevic class or section. They, along with others, immediately follow the Langobardi, to whom he assigns no special locality, but writes that, though they were few in numbers, their nobility was to be valued by their bravery, their independence, and fighting power. The order, however, in which they come in his narrative makes them either on or near the Angle frontier, and on the western side of it. The parts between the Hartz and the Elbe are generally considered to have been the Langobard occupancy.

This brings the Langobards to the parts about the junction of the Saale with the Elbe. The Reudigni and Aviones succeed the Langobards, evidently on the north-east.

Tacitus.

Then come the Reudigni, and the Aviones, and the *Angli*, and the Varini, and the Eudoses, and the Suardones, and the Niuthones, protected by either rivers or forests. There is nothing remarkable here except their common worship of Herth, the Mother.

Reudigni deinde, et Aviones, et *Angli*, et Varini, et Eudoses, et Suardones, et Niuthones, fluminibus aut sylvis muniuntur; nec quidquam notabile in singulis, nisi in commune Herthum, id est Terram Matrem colunt, &c.—*Germania*, § xl.

Ptolemy, too, mentions the Angles, placing them, as Tacitus does, east *and north* of the Langobards; on the *Middle* Elbe; and, besides this, specially calling them *Suevi*, as he also calls the Langobards and the Suevi, with whom they are connected, implicitly, though not *totidem verbis* by Tacitus.

Ptolemy.

Of the nations of the interior, the greatest are those of the Suevi *Angli* (who lie east of the Langobardi, stretching northwards to the middle course of the river Elbe), and of the Suevi Semnones, who reach from the aforesaid part of the Elbe, eastward to the river Suebus, and that of the Buguntæ in continuation as far as the Vistula.—*Lib.* ii. c. xi.

§ 10. *The Saxons of Ptolemy.*—Tacitus mentions the Angles, but not the Saxons. Ptolemy mentions both. He places the latter on the Cimbric Chersonese, or in Lauenburg. This is so nearly the locality that Tacitus assigns to the Cimbri that, although we cannot say that he describes the Saxons under the name Cimbri, we may say that he places them in the district which Ptolemy assigns to the Saxons.

The Frisians occupy the sea-coast beyond the Busacteri as far as the river Ems. After these the Lesser Chauci, as far as the river Weser; then the Greater Chauci, as far as the Elbe; then in order on

the Neck of the Cimbric Chersonese, the *Saxons*; then the Sabalingii, &c.; and, after the Saxons from the river Chalusus to the Suebus, the Pharodini.

In another part of the work there is a notice of '*Three Islands of the Saxons*,' but without comment or explanation.

Ptolemy's is the only notice of the Saxons for the first period in the history of the name. The interval between this and the first of the next series is probably 220 years, but certainly not less than 150; so that the division is manifestly natural.

§ 11. *Germans of any kind in Britain. The Franks of Eumenius.*—In reference, however, to the introduction into Britain of a language from which the present English may be derived, the mere names are of less importance than the nations or communities which they denote; and the earliest notice of Germans *of any sort* on the soil of Britain is one that it most behoves us to investigate. This is to the effect that a body of *Franks* was defeated by the Emperor Constantius A.D. 290.

By so thorough a consent of the immortal Gods, O unconquered Cæsar, has the extermination of all the enemies whom you attacked, and of the *Franks* more especially, been decreed, that even those of your soldiers who, having missed their way on a foggy sea, reached the town of London, destroyed promiscuously and throughout the city the whole remnant of that mercenary multitude of barbarians which, after escaping the battle, sacking the town and attempting flight, was still left—a deed whereby your provincials were not only saved, but delighted by the sight of the slaughter.

This extract gives a Frank army in the parts about London A.D. 290; and its value upon this point is unimpeachable. The evidence is that of a panegyrist, and, as such, cotemporary with the events alluded to. Moreover, it is addressed to hearers who had taken part in them. Whether the victory was as glorious as

the orator makes it, or whether the arch-pirate Carausius, on whose side the Franks were manifestly engaged, was much injured by it, are matters of minor importance.

§ 12. *The Alemanni of the Younger Victor*, A.D. 306.—When Constantius with his son Constantine (the Great) passed over from Gaul to Britain he was attended, not only by the Roman legions which sided with him against his rival Galerius, but by a body of Alemanni, under their king Eroc (?).

> Cunctis qui aderant annitentibus, sed præcipue Croco (alii *Eroco*) Alemannorum Rege auxilii gratiâ Constantium comitat, imperium cepit.—*Victor Junior*, c. 41.
>
> This is perhaps the first instance of a barbarian king who assisted the Roman arms with an independent body of his own subjects. The practice grew familiar, and, at last, became fatal.—*Gibbon, Decline and Fall*, &c., chap. xviii., *Note*.

The Alemanni, though not so decidedly a German population as the Franks, were, still, more German than aught else. We have traced them into Britain, but we never trace them out of it. On the other hand, their dialect, even so far as it was German, would not be the dialect of the literary English in its West Saxon form.

§ 13. *The Saxons of the army of Magnentius*, A.D. 348—351.—The great battle of Mursa, which decided the contest for the empire between Constantius and Magnentius, is now about to be fought. Gibbon writes as follows concerning the mixed army of the pretender:—

> The approaching contest with Magnentius was of a more serious and bloody kind. The tyrant advanced by rapid marches to encounter Constantius at the head of a numerous army, composed of Gauls and Spaniards, of Franks and *Saxons*; of those provincials who supplied the strength of the legions, and of those barbarians who were dreaded as the most formidable enemies of the Republic.—*Decline and Fall*, &c., chap. xviii.

That there were barbarians of the same race and

character as the Saxons in this heterogeneous army is certain; nor is it improbable that the name *Saxon* may have been borne by, or applied to, them—indeed, it is very likely. Still the evidence of Zosimus, who is our authority, is not that of a cotemporary; but on the contrary one who, from his familiarity with the use of the name in his own times (the fifth century), was likely to antedate it.

§ 14. *The Franks.*—But these Saxons, whatever may have been their name, are associated with the *Franks*; and the association, for at least the next fifty years, will be so close as almost to form a part of the history of the word *Saxon* itself. This invests the earlier Frank movements with importance.

Though the name appears earlier than that of the *Saxons*, it is not quite so old as that of the Alemanni, the second quarter of the third century being the date assigned to its first appearance. Hence, the only Franks that have hitherto been mentioned are those of Eumenius, who are not the first of the name who show themselves in history; and, as here, it is only on the soil of Britain that we find them, it is clear that we have yet to trace them to their own proper country. This, though easily ascertained in a general way, is by no means very definite in its details. There were Franks on the Lower Rhine, or in Brabant and Flanders; and there were Franks on the Middle Rhine, for the parts about Cologne; and there were Franks on the Upper Rhine, on the parts about Maynz. The first of these represent the Franks who, under Clovis, conquered Gaul; the third, the Franks of the present district of Franconia. If any community is to be either associated or identified with the Franks, it is necessary to ask to which division of the name it is to be referred.

Now, the Franks of Carausius were the Franks of the Lower Rhine; the Franks of the country of the Toxandri (Brabant) more especially. There were some on the north bank of the river, and some on the islands. They had been troublesome to the Empire during the reign of Gallienus; they had overrun Spain; they had crossed over into Africa, and they had been chastised by the Emperor Probus before we hear of them from Mamertinus. The notices of them, all by cotemporary writers, fix them in a region of swamp and marsh, more specially in Batavia and the parts south of the Rhine (i.e. within the boundaries of the Empire). They fell into diverse nations (*diversæ gentes*). They were specially coerced by Constantius; some of them settled as colonists within the Empire, and some disarmed, and some civilized, more or less.

Quæ mundi pars est quem ille vincendo non dedicerit? Testes sunt Marmaridæ in Africæ solo victi; testes *Franci inviis strati paludibus.*—*Vopiscus, Vit. Prob.* 12.

These *paludes* will appear in the sequel.

Multa illa *Francorum* millia qui, qui Bataviam aliasque cis Rhenum terras interfecit, depulit, cepit, abduxit.—*Pacatus*, chap. 4.

Dum ædificandis classibus Bononiæ recuperatio comparatur terram Bataviam sub ipso quondam alumno suo (*Carausio*) a *diversis Francorum* gentibus occupatam omni hoste purgavit, nec contentus vixisse ipsas in Romanas abstulit nationes, ut non solum arma, sed non solo etiam feritatem, deponerent.—*Ibid.* chap. 5.

§ 15. *The Saxons of the Emperor Julian.*—The earliest definite cotemporary notice of the name *Saxon* in connection with Gaul is that of the Emperor Julian, who not only speaks from personal knowledge, but tells us that he does so.—A.D. 358. He is on the Rhine; in the parts where three different denominations of Germans meet, viz.: (1) the Franks, (2) the Chamavi, and (3) the Saxons. The Franks are those of the

Salian division. Brabant seems to be more especially the Frank; Overijsel, the Chamavian; and parts of Zeeland and Flanders, the Saxon occupancy. Thus near does he bring them to Britain.

On the testimony of a cotemporary speaking to the name and place of a community called *Saxon*, the notice of Julian is, for the purposes of our present enquiry, the first in existence. It is the *second* if we count that of Ptolemy; but Ptolemy's is divided from it by an interval of more than a hundred and fifty years, is applied to a population as far from the Saxons of Julian as Hamburg is from Leyden, and is written on the principle of constructive geography from book-work, rather than on the special details of personal knowledge. But Julian's notice connects them with *Gaul*. Still we are not doing too much when we consider that with Julian begins the history of the Saxons in connection with Britain; at any rate, we are justified, when we find Saxons in Britain, in assigning to them Gaul, which is nearest to, rather than to the Cimbric Chersonese, which is the farthest point from, Britain. Of course by referring them to Germany, or the area between the two, we can reconcile the two localities; but, upon this point, it is better to say at once, that for any part of Germany between the Maas and the Elbe, the name *Saxon* will not be found until it has been established in Gaul and Britain for at least two centuries. With this preliminary we shall have no difficulty in seeing how far the history of the name of the Saxons connected with Britain not only begins with Julian, but is regularly continued from his time until we find them on British ground. It is continued with such regularity that until it ends in Britain no name of any of the so-called Barbarians will be more conspicuous. The Saxons will be as formidable and ever-present by sea as the

Franks have hitherto been by land. They will, as a rule, be associated with the Franks; but it will be with the Franks of the *Lower* Rhine. They will never, so far as they are traced to the land at all, be assignable to any district further from either Gaul or Britain than the parts between Leyden and Antwerp, or, roughly speaking, to the Dutch Province of Zeeland. They will, so far as Britain is concerned, be this and more for about sixty years; when their history as that of Germans who can first be definitely traced to Britain will have come to an end. The whole period of their history is no longer than this. No other Saxons but those of Gaul have any ostensible history during the time in question. The Saxons of Ptolemy, whom he assigns, about A.D. 139, to the Cimbric Chersonese, have never been heard of since. The Saxons of Beda, who assigns them to Germany, will not appear till the eighth century.

§ 16. *The Littus Saxonicum.*—This important notice from the *Notitia Dignitatum Utriusque Imperii* runs thus:—

SUB DISPOSITIONE VIRI SPECTABILIS COMITIS LIMITIS SAXONICI PER BRITANNIAM.

Præpositus Numeri Fortensium, Othonæ.
Præpositus Militum Tungricanorum, Dubris.
Præpositus Numeri Turnacensium, Lemanis.
Præpositus Equitum Dalmatarum, Branodunensis, Branoduno.
Præpositus Equitum Stablesianorum Garionnonensis, Gariannono.
Tribunus Cohortis Primæ Vetasiorum, Regulbio.
Præpositus Legionis II. Aug. Rutupis.
Præpositus Numeri Abulcorum, Anderidæ.
Præpositus Numeri Exploratorum, Portu Adurni. (Cap. lxxi.)

The Captain of the Company of the Turnacenses, at Lympne.
The Brandon Captain of the Dalmatian Cavalry, at Brandon.
The Burgh Castle Captain of the Stablesian Cavalry, at Burgh Castle.
The Tribune of the First Cohort of the Vetasians, at Reculvers.
The Captain of the Second Augustan Legion, at Richborough.
The Captain of the Company of the Abulci, at Anderida.
The Captain of the Company of Pioneers, at Port Adur.

The coast under his administration seems to have lain between the Wash and the Solent.

There was a similar and corresponding *Littus* in Gaul, in which we find the German word *March* (= *Limes*).

> ***Sub dispositione viri spectabilis Ducis Belgicæ Secundæ Equites Dalmatæ Marcis in Littore Saxonico.***—C. xxxvii. 1.

This must be taken with—

§ 17. *The Notice of Carausius by Eutropius.*—This is not the evidence of a cotemporary; but it looks as if it were.

> ***Carausius*** apud Bononiam per tractum Belgicæ et Armoricæ pacandum mare accepit, quod Franci et *Saxones* infestabant.—*Eutropius*, ix. 15.

It is well known that a very important use has been made of this passage. With few, if any, exceptions, the histories of England, when they treat of the German Conquest, give very little prominence to the *Littus Saxonicum*; and, when they notice it at all, they generally add that *Saxonicum* need not be supposed to mean '*inhabited by Saxons*,' but simply '*harassed, or threatened by the Saxons*,' or '*exposed to the ravages of the Saxons*.' That this meaning is, to some degree, a forced one, few deny; but it is probably admitted, on all sides, that, from one point of view, it is not unnecessary. The authority of Beda, supported by that of the Anglo-Saxon Chronicle, makes the history of the German Conquest begin with Hengist and Horsa, Vortigern and Vortimer, and their cotemporaries; and it is clear that if this be the case, the *Littus Saxonicum* must be explained away. This, to say the least, excuses a construction which, under other circumstances, might be condemned as non-natural.

This passage of Eutropius does more. It makes it

almost natural. It suggests that the *Littus Saxonicum* may date from the time of Carausius, and that it was because the Franks and Saxons had to be *kept away from it*, rather than because *they occupied it*, that it took its name.

But it is the value of Eutropius as an authority for the word *Saxon*, rather than the application of his evidence, that is now under notice; and it is the opinion of the present writer that he took the word *Saxones* as connected with the name of Carausius, not as it was in the time of Carausius himself, but according to the meaning it bore in his own time.

(1) This connection between the names *Carausius* and *Saxones* is here made for the first and last time. Julian, who is the earliest writer who connects the Saxons with either Gaul or Britain, wrote about seventy years after the death of that Usurper; but says nothing about him.

(2) The usurpation of Carausius was anterior to the division of the empire.

(3) The word Saxon has not yet appeared in any writer of the western division of the empire: not even in the Germania of Tacitus. Ptolemy, in whom alone we find it, writes in Greek.

(4) Julian seems to have introduced the name, which as a soldier, scholar, and emperor, he might easily do. He connects it with that of the Franks; and the connection was real: and henceforth the two words often occur in conjunction.

This must be borne in mind; because, if Eutropius connected the *Saxons* with Carausius on adequate evidence, but evidence that has not come down to us, the inferences that may be drawn from his text are important. If, however, he merely associated the names after the manner in which we associate words like '*Goths*

and Vandals,' it goes for very little. At present it is enough to say that Gibbon, for one, thinks that the word was used in the looser and less important sense. He wrote—

> Aurelius Victor calls them Germans. Eutropius gives them the name of Saxons. But Eutropius lived in the ensuing century, and *seems to have used the language of his own times.—Decline and Fall*, chap. xxxvi. *Note.*

§ 18. These three notices of Julian, of the Notitia, and of Eutropius—for the reigns of Constantius, Valentinian I., and Theodosius—are all that need be given in detail. The period is a short one; and attention has been drawn to its shortness. They give us, in the way of material and relevant facts, all that we know concerning the *Saxons* in connection with either Gaul or Britain, until we find them *in* Britain. It is necessary to add that they do not stand alone. They are supported by the testimony of Ammianus Marcellinus and Pacatus as actual contemporaries; while notices of what they did are found in Orosius, and the chronicles of Marcellinus and Idatius, who wrote somewhat later, but with adequate materials. Though none of them name the *Littus*, the earlier point to the same Saxons—the men who, when driven back as pirates, were driven back to their islands and marshes; the men who lay on the Frank frontier; the men who were sufficiently formidable to be mentioned oftener than most other barbarians. They are certainly mentioned as being all this; but it is more important to remember that, except during this period, they are not mentioned at all—except as actual occupants of either Gaul or Britain. It may be that the Saxons of the Gallus Littus are hypothetical; but, for this century, the Saxons of any other district are still more so.

§ 19. After the death of Theodosius a slight change

takes place. The Saxons are associated with new enemies of The Empire—the Picts and the Scots; and some of the notices, chiefly from Claudian, carry the name so far north that it brings the Saxons connected with the history of Britain for this period even up to the latitude of Holstein, the Saxon locality of Ptolemy. Hence, in passages like the following, we have to consider whether the Saxons of the Pict alliance were Saxons of the Gallic frontier pursued northwards, or Saxons of the present Danish frontier who had formed an independent alliance with the Picts and Scots.

> Quid rigor æternus cæli; quid sidera prosunt
> Ignotumque fretum; maduerunt Saxone fuso
> Orcades; incaluit Pictorum sanguine Thule,
> Scotorum tumulos flevit glacialis Ierne.
>
> *Die Quart. Consulatu Honorii*, ll. 30-34.

This is a point upon which the reader must form his own judgment. There is evidence as to the Saxons having been in what we may call 'British waters;' and if they were as formidable as soldiers as they were as sailors, there could scarcely be a second opinion upon the question as to whether they had been on the soil of our island. Individually I think that they had; but I also think that whether they had or not, they were the Saxons of the Gallic frontier and the Littus. I do not, however, profess to have traced any Saxons to the soil of Britain so definitely as to satisfy one of a different opinion on this point. The next extract is conclusive; but there will be a break of thirty years before we come to it.

CHAPTER II.

BRITAIN UNDER THE SAXONS.

§ 20. *Notice of Prosper Tiro.*—With Eutropius and Claudian we get the last two writers who supply us with evidence which conveys anything like a fact or a suggestion as to the Saxons of the fourth century. So far as it goes such evidence points to the *Littus Saxonicum*; perhaps exclusively.

Now the present enquiry is one concerning the introduction of a German language into Britain, and not one concerning the downfall of the Romans. If it were otherwise, the history might be made continuous, and each particular withdrawal of any portion of the Roman or British population would claim attention. And upon this point we are not without details. Transfers, of no inconsiderable amount, of soldiers in the Roman service from Britain to Gaul began as early as the time of Maximus; for, though the usurper was chosen by the legions of Britain, it was in Gaul that he fought his battles. The same was the case with Constantine twenty years afterwards. Here we have an undoubted reduction of the Roman and Romanising populations in Britain, but not an evacuation or abandonment.

Nor is either of these words found, or even implied, in the only known notice of the transfer in Britain of the Roman predominance to the Saxons. The notice is that of Prosper Tiro.

THEODOSII, xviii. (?). Britanniæ usque ad hoc tempus variis cladibus eventibusque latæ (laceratæ) in ditionem Saxonum rediguntur.

One of the Britains is, doubtless, Bretagne, or Armorica. The other may safely be supposed to be

Britain. The bare possibility of getting more than one *Britannia* in Gaul will be noticed § 23.

§ 21. *Sidonius Apollinaris.—His Saxons, and Heruli.*—The interval between this notice and the next for the Saxons of *Britain* is more than a century; but for those of *Gaul* only ten years. This difference in favour of Gaul is because Britain is the first of the two provinces which is lost to the Empire; whereas Gaul, even when other than Imperial, retains the Latin language, and to some extent continues the Latin literature. At first, this is transitional in character between the classical Latin and the proper Frank style. In Britain there is no such continuity or transition, and consequently a much greater break in the evidence.

Another element in the history of Gaul for this period is the Gothic. Like the Franks and Saxons the Goths were Germans, but they were Christian and lettered Germans. As much as this, however, may be said of the Ripuarian Franks and the Burgundians. Unlike the other Germans of the Empire, the Goths, so far as they were Romanised, were Romanised after the manner of the Greeks, or, at least, that of the Eastern Empire; and the writers of Latin who next to those of the Empire mention the Saxons at all are those of the Gothic kingdoms of Gaul, Spain, and Italy.

> Aremoricus piratam Saxona tractus
> Sperabat, cui pelle salum sulcare Britannum
> Ludus, et assuto *glaucum* mare findere lembo.—*S. A. Carm.* vii. 369.

Again:—

> Contra Saxonum pandos **myoparones* quorum tot remiges videns, totidem te cernere puto archipiratas.—*Id. Epist.* viii. 6.

---

* Myoparo.—Navigii piratici genus a Paro insula et Myunte urbe, ut placet Turnebo . . . nomen adepti. Melius Scaliger a forma *μυοῦρες*, hoc est, angusta et oblonga, dictum tradit.—*Dufresne* (Du Cange), *Glossarium, &c.*

This tells us what kind of vessels these *lembi* were.

The next notice connects the Saxons with a new name—that of the Heruli.

> Hic *glaucis* Herulis genis vagatur
> Imos oceani colens recessus,
> Algoso prope concolor profundo.—*Id. Ep.* viii. 9, &c.

In these extracts the Saxon is a marauder on the coast of Brittany, i.e. he is a marauder from either the *Littus Saxonicum* or the locality assigned to the Saxons by Julian, rather than a Saxon from the parts between the Gallic frontier and the Elbe; and, still more so, rather than one from the mouth of the Elbe, or Holstein. The *lemnus* of the metrical is the *myoparo* of the prose extracts—a coasting boat rather than a vessel for crossing the sea.

The word '*archipirata*' is not a mere rhetorical term. It means a second '*Carausius*,' for so that usurper is called in the Panegyric* of Eumenius; and Panegyric literature was one in which Sidonius was well versed.

The epithet '*glaucus*' applies to the *water* which washed the Saxon Islands in one extract, and to the complexion of the Heruli in the other; and this, again, has its special meaning. The Heruli can be found as Legionaries in the Roman service in the *Notitia*; and not only this, but as part and parcel of the Roman *sea*-service, and here, as mariners, in the same class as the Saxons; and, still more, as mariners who can be traced to a district so far from the mouth of the Loire as the Sea of Azof (*Palus Mœotis*). We need not enquire too nicely whether, in their native country, they were, ethnologically, Fins, Mongols, or Turks, but they were certainly Scythians; and to the Scythian or Mongolian complexion the term

* Delivered A.D. 297, § xii.

glaucous undeniably applies. The only question is whether the *weedy sea* (*algosum profundum*) applies to the Palus Mæotis, their original home, or to the *glaucum mare* of the Saxons, with whom, in the time of the writer, they are geographically associated. My own opinion is that the *glaucum mare* of the Saxons was also the *algosum profundum* of the Heruli. This, however, is a point for the reader to determine for himself.

These Heruli, though only mentioned directly in this passage in connection with Gaul, probably played a greater part than is assigned to them. They were certainly in the Roman service; and, as certainly, not German. They may have acted, however, as Germans, and have been at first partially, afterwards wholly, Germanized. If so, this is the only instance in which we get any single member of the Saxon denomination (for so we must call it) under his own proper name.

§ 22. *The Saxons of Adovacrius.*—A.D. 464-5. These we find on the Loire. They attack Angers (Andegavi), and take hostages from it. The name of their captain is *Adovacrius*, whom Gibbon is inclined to identify with the famous Odoacer, who (A.D. 476) dethroned the last of the Western* emperors.

It is *against* the Empire that Adovacrius leads the Saxons. Eventually they are defeated, while their *islands* are taken and subverted. They then form an alliance with Childeric, the father of Clovis; and, under the name of *Saxons*, we hear no more about them.

The evidence for these Saxons of Adovacrius is Gregory of Tours; no cotemporary, but a writer with whom we can see our way clearly to his authorities. For another notice of them he is a cotemporary authority, viz., for the † *Saxones Bajocassini*, or Saxons of Bayeux.

* 'I am almost inclined to believe that he (Odoacer) was the same who pillaged Angers and commanded a fleet of Saxon pirates on the ocean.' —*Decline and Fall*, chap. xxxvi.

† *Historia Francorum*, x. 9: also *Fredegarius; Epitomata*, 80.

Again, his cotemporary Venantius Fortunatus congratulates the Bishop of Nantes for having civilized, if not Christianised, the rough Saxon.

Aspera gens Saxo, vivens quasi more ferino,
Te medicante, sacer, bellua fecit ovem.

These surely represent the Saxons of the *Littus*. Of Saxons from any other quarter there is, in Gaul, no notice whatever.

§ 23.—*Confusion between Britain and Brittany, &c.*

Some points now require notice, because they complicate the history of both Gaul and Britain in the fifth century, and perhaps earlier. Without going into the details, I will merely indicate them for the sake of showing that they have not been overlooked; and will add that I have taken pains to avoid the use of them where there is any doubt as to their application.

(*a*) There are certain names, each of which has two, or more, meanings.

1. There is the word *Britanni*, which may mean either the Britons of Britain proper, or the Bretons of Brittany, Bretagne, or Armorica.

2. There is the root *G-t*—which may mean either the *Goths* of France under the Visigoth Kings, or the *Jutes* of Jutland. *Euthio* and *Geta* are varieties of this name; the latter, probably, merely used as a rhetorical term.

The *Saxons*, &c., *of Theodebert's Letter to Justinian.*—Theodebert, the grandson of Clovis, in the first half of the sixth century, enumerates to the Emperor Justinian the *gentes* over which he had, or claimed to have, dominion. The conquest of Thuringia was complete. The Saxons of Lower Saxony he threatened, if he had not to some extent reduced: but we know that the complete subjugation of them was not effected till the time of Charlemagne.

(*b*) *The Getæ, Dani, Euthiones, Saxones, and Britanni of Venantius Fortunatus.*—Venantius Fortunatus writes the following perplexing couplet, addressed to the Frank King:—

Quem *Geta*, *Vasco*, tremunt, *Danus*, *Euthio*, *Saxo*, *Britannus*;
Cum patre quos acie te domitasse ferunt.

We may safely say that the *Britannus* was a Breton. *Saxo* certainly means the Saxons of *Germany*; whose independence is now seriously impaired: indeed, some of them have paid tribute. This *Saxo* is separated from the *Euthio*; as we expect. *Euthio* and *Geta* are the same word; and, so far as this is the case, one seems to denote the Goth of Gaul, the other the Jute of Jutland. But the first notice of

Jutes on the soil of Jutland by a cotemporary writer will not appear till the time of Alfred, *i.e.*, three hundred years later: and the first by any writer at all will lie latent till the time of Beda, A.D. 750 (circiter). The same applies to the name *Danus*; though as early as A.D. 615 the famous 'Chochilaicus *Danus*' had been defeated within the Frank boundaries. Still this difference from an actual geographical conquest of Denmark is a wide one. These last need not be enlarged on; but the confusion between the two Britains will be noticed in the sequel.

(*c*) The well-known letter to the Roman general Ætius, in his third consulship, sometimes quoted as 'the Groans of the Britons,' in most works (and in none more than my own) finds its place, A.D. 449. It is now excluded from the text, and that purposely. This is to show that the omission is not accidental. It runs thus:—

Ætio ter consuli gemitus Britannorum. Repellunt nos barbari ad mare; repellit nos mare ad barbaros. Inter hæc oriuntur duo genera funerum. Aut jugulamur, aut mergimur.

It is doubtful whether the Britons of this epistle are not, instead of the Britons of Britannia, the Bretons of Armorica (Brittany). When Ætius was in Gaul, St. Germanus was in Britain. On his return he passed through Armorica. The Armoricans at that time had offended Ætius, and he sent his ally, the barbarous king of the Alani, to chastise them. The barbarians, then, are the Alani.

Letter of Theodebert.

Id vero quod dignamini esse solliciti in quibus Provinciis habitemus, aut quæ gentes nostræ sint, Deo adjutore, ditioni subjectæ, Dei nostri misericordia feliciter subactis Thuringis, et eorum Provinciis acquisitis, extinctis ipsorum tunc temporis Regibus, *Norsavorum* gentis nobis placata majestas colla subdidit, Deoque propitio Wisigotis, qui incolebant Franciæ septemtrionalem plagam, Pannoniam [Aquitaniam?], cum *Saxonibus Euciis*, qui se nobis voluntate propria tradiderunt, per Danubium et limitem Pannoniæ usque in Oceani litoribus, custodiente Deo, dominatio nostra porrigitur.—*Zeuss*, 357.

For *Saxones Eucii* and *Norsavi*, see Ch. VII.

For the Saxons of Gaul during the fifth century we have a small amount of testimony; for those of Britain none. In default of this the analogy of the Saxons of Gaul is our best and only guide.

CHAPTER III.

ON THE NAME ANGLI, ANGLE, ETC.

§ 24. With the exception of the two notices of Tacitus and Ptolemy with which we began, and which preceded those of the Saxons, nothing has hitherto been said about the *Angli*. Much, no doubt, has been said about the Saxons; and even the Franks and Alemanni have been found in connection with Britain; but, in spite of their having given their name to the island, not a line has been written about the Angli. This has been the case simply because there was nothing to say. From the date of Ptolemy, about A.D. 139, to that of the forthcoming notice from Procopius, about A.D. 548, their name, in either Greek or Latin literature, never appears.

The Angili of Procopius, A.D. 5.—The strange character of his narrative, and the character, stranger still, of his geography, have made the text of Procopius familiar.

His geography calls the Britons Βρίττωνες, and Britain Βριττία. He makes it an island. For its relations to the Rhine and Elbe see Chapters VII., VIII.

The Βρίττωνες were a prolific people, and they sent out annually a certain number of their population to establish themselves in fresh countries. But their area of conquest must be limited; for they always go on foot. They must do this, for such an animal as the horse has never been known in Britain. Should an embassy, or the like, from the riding part of the world enter Britain, there is no means of getting them either off, or on, horseback except by lifting them up or down. For rowing, however, they are unrivalled. Every man on board ship takes an oar, and, such being the case, sails

are wholly dispensed with. Still more extraordinary are the functions of these islanders as conveyers of the dead. They take turns with each other in the business of conveying the spirits of the departed to a mysterious island—Brittia—which seems, name for name, to be the island in which they themselves dwell. However, they have to cross a sea or strait. This being their general duty, each division, as its turn comes round, retires at nightfall to its own dwelling, and waits for the call of its conductor. The sudden shaking of the doors and the voice of one unseen announce his approach. An irresistible influence carries them to the seaside, where they find vessels in readiness—not their own, but strange and unknown ones. These they man, each taking his oar. Not a passenger, however, can they see. Yet they *feel* the presence of many, for the vessel sinks to within finger's breadth of the water. An hour brings them to Brittia—provided they have *rowed*. If they *sail*, the voyage takes a night and a day. There they discharge their unseen cargo, and return; the vessel sinking no deeper than the keel. From first to last they *see* no one; but a voice announces to them the names and dignities of their passengers; 'also if women happen to cross over with them, they call over the names of the husbands with whom they lived. These, then, are the things which the men of that district declare to take place.'

§ 25. The ethnology, however, of Procopius is more definite than his geography.

From Procopius.

Three nations extremely populous occupy the island of Britain. One king is at the head of each. The names for these nations are *Angli*, Phrissones, and (of the same name as the island) Britons. Such is the manifest populousness of these nations, that every year, in great numbers, they migrate from thence, and with their wives and children go over to the Franks.

Βριττίαν δὲ τὴν νῆσον ἔθνη τρία πολυανθρωπότατα ἔχουσι. Βασιλεὺς δὲ εἷς αὐτῶν ἑκάστῳ ἐφέστηκεν. Ὀνόματα δὲ κεῖται τοῖς ἔθνεσι τούτοις Ἄγγιλοι καὶ Φρισσόνες καὶ οἱ τῇ νήσῳ ὁμώνυμοι Βρίττωνες· τοσαύτη δὲ ἡ τῶνδε τῶν ἐθνῶν πολυανθρωπία φαίνεται οὖσα ὥστε ἀνὰ πᾶν ἔτος κατὰ πολλοὺς ἐνθένδε μεταναστάμενοι ξὺν γυναιξὶ καὶ παισὶν ἐς Φράγγους χωροῦσιν.

Bellum Gothicum, iv. 20.

This is the first notice since that of Ptolemy, and it is the only one between Ptolemy and Beda. (See Chapters VII., VIII.)

CHAPTER IV.

THE VENERABLE BEDA.—THE FRANK MISSIONARIES AND ST. AUGUSTIN.

§ 26. A.D. 597.—Ethelbert is king of Kent; his queen is a Frank princess. Gregory I., then Pope, enjoins a Frank mission to promulgate the Christianity of the Franks. The Frank king sends interpreters, and St. Augustin is at the head of the mission.

Hence in 597 there is no doubt as to the fact of the mother-tongue of the present English having become thoroughly established in Britain; in the southern parts at least. It was a language, too, intelligible to the Franks; at least to the Franks of the western division of the Frank kingdom.

The evidence of this lies in the Papal Letters, which, though they did not reach England until the latter part of the next century, are to be found in Beda.

§ 27. *The Angli of Pope Gregory I.*—The evidence of Beda himself as a cotemporary witness is about a century later. He died A.D. 737. For the mission of St. Augustin it is the Papal Letters that constitute the evidence. The story of the Pope's interview with

the English children in the slave-market, and his play on the words *Angli* and *Angeli*, rests on that of Beda. It is, of course, conclusive to the fact of certain occupants of Britain bearing the name *Angle* or *Engle*; and of what is of more importance, *Angle* or *Engle* being a name by which they spoke of themselves, not merely a name which was applied to them by others. The truth of the story has but little to do with the matter; and the date not much. But that the children from the kingdom of Deira, or the district of Northumberland, were English in the way that a German is a *Deutsche*, and *not* in the way that he is *German* or an *Allemand* (i.e. something that he is called by other people), is a fact of great importance, though one that we may easily undervalue. We best appreciate it by remembering how little, in this respect, we know about the concurrent name *Saxon*, concerning which we have no evidence whatever that any occupant of any one of the Saxon districts ever applied it to himself. Neither do we know what the *Saxons did* call themselves. They were called Saxons by the Romans, by the Britons, and by the Gauls; but what they called themselves is unknown. The name *may* have been *Angle*, but it is quite as likely that it was something else.

§ 28. *Authorities of Beda—for the Seventh and Sixth Centuries.*—If full justice is to be done both to Beda and the earlier authorities with whom he is at variance, his account may be divided into three parts.

1. *The Century in which he wrote, i.e. the Eighth.*—Here he writes of what was to be found in England during the time of his own life; and, doing this, writes with an authority which it would be vain to impugn.

2. *The Seventh Century.*—This gives us, within a few years, the introduction of Christianity and several

of its immediate results, one of which would be the use of the Latin language as that of the Church, and (unless it existed before) the use of the alphabet. Under these conditions we get the elements of a truly historical record; and, although *we* have no remains of it, it is probable that Beda may have had the opportunity of availing himself of it. More than this, for the latter half of the century, there were the early cotemporaries of Beda, to whom he may have applied. This we know to have been the case. We know, too, that there was a fair amount of literary activity during the period. One of the Christian duties of the recent converts to Christianity in England was that of preaching the Gospel to their near kinsmen on the Continent, who, in the parts north of the Rhine and Ems, were still pagans. This they performed honourably. They called the Germans of these districts *Old* Saxons, an important name, because it shows that the descent of the English from them was recognised. It is also a convenient name, because it means the Saxons of the Continent as opposed to the Saxons of England. These latter, even in Beda's time, are called *Anglo*-Saxons.

Between Beda and his cotemporaries we get trustworthy evidence for at least the latter half of the seventh century, especially as the cotemporaries whom we appeal to are not imaginary or merely possible ones. Beda himself tells us, not only that there were some of them to whom he applies, but he tells us who they were and upon what points they instructed him. Thus he mentions by name Albinus and Nothelm for Kent; Bishop Daniel for Sussex and the Isle of Wight; the monks of Lestingham for Mercia and part of Essex; with Cyneberct and others for Lincoln. For the province of Northumberland Beda was his own authority.

For the *first* half, however, of the century the value of Beda's statements decreases, though not to any great degree. There is still, without doubt, some learning in the country, and some records; and certain statements founded upon them, whether found in Beda himself, or the Anglo-Saxon Chronicle, or in a British historian, deserve credit. Hence, the statement that Eadwin defeats Ethelfrith, and soon after invades Elmet, and that Elmet is, then, British, is one which we may safely adopt as a *datum* for calculating the *rate* at which our language extended itself.

§ 29. *Beda's Authorities for the Fifth Century—what where they?*—Of the authorities (possible or probable) of Beda for the interval between the evacuation of Britain by the Romans in the middle of the fifth century and the date that may reasonably be given to the earliest English writers upon England, about the middle of the sixth century, there are four divisions.

1. The traditions, or legends, or whatever we may call them, of the Germans themselves. Tacitus mentions their *carmina antiqua.* So do the historians of the time of Charlemagne. It is doubtful, however, whether they would supply what is very conspicuous in the account of Beda, a series of dates. The genealogies are not improbable; but each must be tried by its own merits.

2. The British records, notices, or allusions.—Of these the value, whatever it may be, is possibly undervalued rather than over-valued.

3. The Frank records, notices, allusions, or collateral illustrations.—These, as we have seen, fall into two divisions.

a. Those that bear the old classical type of the Empire; like the extracts from Sidonius Apollinaris and Venantius Fortunatus; and

b. Those that represent the proper Frank literature. Between the two we get a continuity of some kind, plain, visible, and self-asserting; and in this, as has been indicated, we get, imperfect as it is, our best basis for historical investigation.

4. The authorities he especially mentions. Of these the three that have come down to us, viz., Constantius, the author of a Life of St. Germanus, and written about forty years after his death; Gildas, and Orosius. The first two tell us little more than that there were Saxons on the island in the middle of the fifth century. The third tells us even less.

§ 30. As a cotemporary witness the facts to which Beda most especially speaks are—

1. The name Angles, which has already been noticed.

2. The presence, at the time he was writing, of Jutes in Hampshire and the Isle of Wight. This will be noticed in the sequel.

3. The existence of a language in Britain which was neither Latin nor German, neither Scotch nor British, viz., the Pict. This there is no need to discuss.

Between the different current accounts of this period the dates and details are as follow :—

A.D. 449. Hengist and Horsa, in Kent and Hampshire, and the Isle of Wight—*Jutes*.

A.D. 477. Ella, in Sussex—*Saxons*.

A.D. 495. Cerdic and Cynric, in Wessex—*Saxons*.

A.D. 527–530. Settlement in Essex—*Saxons*.

A.D. 547. Settlement in Northumberland, under Ida—*Angles*.

A.D. ?—But earlier than the last, and later than the last but one. In Norfolk and Suffolk (East Anglia)—*Eastern Angles*.

§ 31. *Beda's Geography*.—What Beda writes as a geographer, though written by a cotemporary, is by no means unexceptionable, partly because the history connected with the countries he mentions is retrospective, and, partly, because the positive geographical knowledge

of the time was imperfect. The knowledge that even the most special geographers had of the countries to which certain populations were to be referred bore no proportion to the knowledge they had of the populations themselves apart from the original occupancies. This means that they knew the Saxons as they appeared in Gaul or Britain without knowing what they were in their own country or where that country was. They knew the Dánes as invaders of the Netherlands before they knew anything about Denmark; and they knew almost every one of the so-called northern barbarians in the same imperfect way. What Beda writes is as follows:

'Advenerant autem de tribus Germaniæ populis fortioribus, id est *Saxonibus, Anglis, Jutis.* De Jutarum origine sunt *Cantuarii* et *Vectuarii*; hoc est ea gens, quæ Vectam tenet insulam, et ea, quæ usque hodie in provincia Occidentalium Saxonum *Jutarum* natio nominatur, posita contra ipsam insulam Vectam. De *Saxonibus*, id est ea regione, quæ nunc *Antiquorum Saxonum* cognominatur, venere *Orientales Saxones, Meridiani Saxones, Occidui Saxones.* Porro de *Anglis*, hoc est de illa patria, quæ *Angulus* dicitur, et ab eo tempore usque hodie manere desertus inter provincias Jutarum et Saxonum perhibetur, *Orientales Angli, Mediterranei Angli, Mercii*, tota *Nordhumbrorum* progenies.'

The following, little more than a translation from the Latin, is from the 'Saxon Chronicle' (A.D. 449):—

'Ða comon þa men of þrim megðum Germaniæ, of Eald-Seaxum, of Anglum, of Jotum.

'Of Jotum comon Cantware and Wihtware, þæt is seo mæiað, þe nú eardaþ on Wiht, and þæt cyn on West-Sexum ðe man gyt hæt Iútnacyn. Of Eald-Seaxum comon Eást-Seaxan, and Suð-Seaxan, and West-Seaxan. Of Angle comon (se á siððan stód westig betwix Iútum and Seaxum) Eást-Engle, Middel-Angle, Mearce, and ealle Norðymbra.'

'They came from three powers of Germany, from Old Saxons, from Angles, from Jutes.

'From the Jutes came the inhabitants of Kent and of Wight, that is, the race that now dwells in Wight, and that tribe amongst the West-Saxons which is yet called the Jute kin. From the Old-Saxons came the East-Saxons, and South-Saxons, and West-Saxons. From Angle (which has since always stood waste betwixt the Jutes and Saxons) came the East-Angles, Middle-Angles, Mercians, and all the Northumbrians.'

Thirdly; Alfred writes—

'Comon of þrym folcum þa strangestan Germaniæ, þæt of Saxum, and of Angle, and of Geatum; of Geatum fruman sindon Cantwære and Wiht-sætan, þæt is seo þeód se Wiht þat ealond on eardað.'

'Came they of three folk the strongest of Germany; that of the Saxons, and of the Angles, and of the Geats. Of the Geats originally are the Kent people and the Wiht-settlers, that is the people which Wiht the Island live on.'

In the way of geography there is one of long standing, viz., the derivation of the Angles from so insignificant a district as the present Angeln: a district which Beda himself derives from *Angulus*. In some sense the statement may be true, inasmuch as there may have been Angli in parts between Flensburg and Sleswick (the present district of Anglen, rather less than the county of Rutland), just as they were in Britain. But that Beda's Angulus was, in any sense, the country of the Angles of Ptolemy and Tacitus, few believe.

The second is, I believe, one of my own making, and it is to the effect that the Jutes of Beda were not the Jutes of Jutland, but the Goths of Gaul. As little in the present enquiries depends upon it, and as I have gone into my reasons elsewhere, nothing more will be said about it.

§ 32. The fair, and, at the same time, the legitimate way of dealing with a great writer in a dark age like Beda is to value him according to the lights of his time, not only when they are against him, but when they are for him. Something he may have known about an age to which he was nearer by many centuries than his critics, from the mere fact of his proximity; though we of the nineteenth century fail to see our way to it. And when this is the case he may be followed in faith rather than on conviction. But that which he records must not only be in itself probable, but must

have nothing that can be set against it. From this point of view his details as to the several invasions of Britain must be taken each on its own particular merits. As a rule, we may assign some reality to the dates; because they are not the elements in a narrative that can easily, or without grounds of some kind, be invented. But, though real in themselves, they may readily be associated with wrong events. Hengist, as an important agent of some kind, is probably real; but not as the brother of Horsa, and the father of Æsc, and a race of Kentish kings.

The objections to Beda's evidence, so far as our language is concerned, are reducible to a single point. But it is an important one.

His Hengists, and even his Horsas and Ports, may have done all that he, along with the Anglo-Saxon Chronicle, assigns to them. But they are not the first Germans who did work of the same kind; and these Germans must not be excluded. '*Angles*' the men of East Anglia and Northumberland may have called themselves; but that the *Saxons* did so is, in my mind, as unlikely as it is that a German called himself an Allemand; though that, in time, both may have adopted it I do not deny. This is as much as need be said at present. How Germans, under some designation or other, are likely to have found a footing in Britain, and how the name *Saxon* may have followed them, we have seen; but of evidence that either a real Angle population, or such a name as Saxon, existed in any part of Germany between the Rhine and the Elbe, we have not a fraction.

§ 33. The conclusions from the review of the evidence that has been laid before us, even when taken for everything connected with the names *Angle* and *Saxon*, are, at the best, but limited; and when we bring them to bear

upon the single point of the introduction of either the Saxon name or a Saxon population into Britain, we only get two authorities, Prosper and Beda.

Between these the contrast is decided. Prosper manifestly considers the Saxons as men who had, for some time before, been in relations with Britain, Gaul, and the Empire. He writes at the close of a period in which we know that such was really the case; and he writes from Gaul, where he had the opportunity of knowing who and what these Saxons actually were. Moreover, he evidently makes the reduction of Britain the final act of a contest of some previous duration. Beda, in this respect, is his exact opposite. With Beda, until the time of Hengist, South Britain has been exclusively Roman and British; harassed, indeed, by the Picts and Scots of the north, but still unvisited by any Germans whatever *; for the first Germans that Beda mentions are the Jutes of Hengist that are called in by Vortigern as allies against the invaders from Scotland; Britain itself having been abandoned by its original and natural protectors, the Romans. That the Saxons were known for, very nearly, a century earlier, either as enemies or friends of the Romans, he does not tell us. He rather leaves us to infer the contrary. Least of all does he tell us that they had been the scourges of Roman Britain; and that in alliance with the Picts. In short, with Prosper Tiro the history of the Saxons as the conquerors of Britain ends; whilst with Beda it begins.

* For these, as well as for the Jutes of Hampshire and the Isle of Wight, see §§ 116–117.

CHAPTER V.

INTERNAL EVIDENCE.—THE OLD SAXON OF THE CONTINENT.

§ 34. *The Old Saxon.*—The political and geographical history of the Saxons of Britain must be read by the light we get from *Gaul.*

Their ethnological and philological history must be read by the light we get from *Germany.*

In respect to the language, there is no doubt as to the part of Germany with which it is the most convenient to begin; for there is one old dialect that almost forces itself upon us. It was for more than a century treated as the Saxon of Britain, or England, i.e. as *Anglo*-Saxon; the first manuscript (for a long time the only one) having been discovered in an English library, and treated as English accordingly. It is known by the title of *Heliand*, i.e. *Healer* or *Saviour of Mankind.* It was a metrical Gospel Harmony.

But though found in England its character was so peculiar as to require an hypothesis to account for it; and the doctrine that a certain amount of Danish influence was the cause of it so far took form as to establish the term *Dano*-Saxon. In the eyes, then, of Hickes, Lye, and the older Anglo-Saxon scholars, the Heliand was a *Dano-Saxon* composition, and so it continued until the present century; when not only was its Danish character denied, but its Westphalian origin was indicated. It is now called *Old* Saxon.

Specimen.

Heliand, pp. 12, 13. (*Schmeller's Edition.*)

Luc. II. 8–13.

Tho uuard managun cud,	Then it was to many known,
Obar thesa uuidon uuerold.	Over this wide world.

Uuardos antfundun,
Thea thar, ehuscalcos,
Uta uuarun,
Ueros an uuahtu,
Uuiggeo gomean,
Fehas aftar felda.
Gisahun finistri an tuue
Telatan an lufte;
Endi quam lioht Godes,
Uuanum thurh thui uuolcan;
Endi thea uuardos thar
Bifeng an them felda.
Sie uurdun an forhtun tho,
Thea man an ira moda.
Gisahun thar mahtigna
Godes Engil cuman;
The im tegegnes sprac.
Het that im thea uuardos—
'Uuiht ne antdredin
Ledes fon them liohta.
Ic scal eu quad he liobora thing,
Suido uuarlico
Uuilleon seggean.
Cudean craft mikil.
Nu is Krist geboran,
An thesero selbun naht,
Salig barn Godes,
An thera Davides burg,
Drohtin the godo.
That is mendislo
Manno cunneas,
Allaro firiho fruma.
Thar gi ina fidan mugun,
An Bethlemaburg,
Barno rikiost.
Hebbiath that te tecna,
That ic eu gitellean mag,
Uuarun uuordun,
That he thar biuundan ligid,
That kind an enera cribbium,
Tho he si cuning obar al
Erdun endi himiles,
Endi obar eldeo barn,
Ueroldes uualdand.'
Reht so he *tho that uuord gesprac,*

The words they discovered,
Those that there, as horse-grooms,
Without were,
Men at watch,
Horses to tend,
Cattle on the field.
They saw the darkness in twain
Dissipated in the atmosphere,
And came a light of God
—through the welkin;
And the words there
Caught on the field.
They were in fright then
The men in their mood.
They saw there mighty
God's angel come;
That to them face-to-face spake.
It bade thus them these words
'Dread not a whit
Of mischief from the light.
I shall to you glad things,
Very true,
Commands utter.
Show strength great.
Now is Christ born.
In this self-same night;
The blessed child of God,
In the David's city,
The Lord the good.
That is exultation
To the races of men,
Of all men the advancement.
There ye may find him
In the city of Bethlehem,
The noblest of children.
Ye have as a token
That I tell ye
True words,
That he there swathed lieth,
The child in a crib,
Though he be king over all
Earth and Heaven,
And over the sons of men,
Of the world the Ruler.'
Right as he that word spake,

So uuard thar engilo te them
Unrim cuman,
Helag heriskepi,
Fon hebanuuanga,
Fagar folc Godes,
Endi filu sprakun,
Lofuuord manag,
Liudeo herron;
Afhobun tho helagna sang,
Tho sie eft te hebanuuanga

Uundun thurh thiu uuolcan.
Thea uuurdus hordun,
Huo thiu engilo craft
Alomahtigna God,
Suido uuerdlico,
Uuordun louodun.
'Diurida si nu,' quadun sie,
'Drohtine selbun,
An them hohoston
Himilo rikea;
Endi fridu an erdu,
Firiho barnum,
Goduuilligun gumun,
Them the God antkennead,
Thurh hluttran hugi.'

So was there of Angels to them,
In a multitude, come
A holy host,
From the Heaven-plains,
The fair folk of God,
And much they spake
Praise-words many,
To the Lord of Hosts.
They raised the holy song,
As they back to the Heaven-plains
Wound through the welkin.
The words they heard,
How the strength of the Angels
The Almighty God,
Very worthily,
With words praised.
'Love be there now,' quoth they,
'To the Lord himself
On the highest
Kingdom of Heaven,
And peace on earth
To the children of men,
Goodwilled men
Who know God,
Through a pure mind.'

To this add 'The Legend of St. Boniface, or Fragmentum de Festo Omnium Sanctorum,' from an Essen MS.

Vui lesed tho Scs Bonifacius Pauos an Roma uuas, that he bedi thena Kiesur aduocatum, that he imo an Romō en hus gefi, that thia luidi uuilon Pantheon heton, wan thar uuorthōn alla afgoda inna begangana. So he it imo tho iegiuan hadda, so wieda he it an uses Drohtines era, ende usero Fruen Sce Marium, endi allero Cristes martiro; te thiu, also thar er inna begangan vuarth thiu menigi thero diuuilo, that thar nu inna begangan uuertha thiu gehugd allero godes heligono. He gibod the that al that folk this dages also the kalend Nouember anstendit (?) te kerikōn quami, endi, also that gōdlika thianust thar al gedon was, so wither gewarf manno gewilik fra endi blithi te hus. Endi thanana so warth gewonohed that man hōdigō, ahter allero thero waroldi, beged thia gehugd allero Godes heligono, te thiu so vuat so vui an allemo themo gera uergomeloson, that wi et al hōdigō gefullon; endi that vui, thur thero heli-

gono gething, bekuman te themo ewigon liua, helpandemo usemo Drohtine.

In English (literal).

We read that when St. Boniface, Pope, was in Rome, he bade the Cæsar Advocatus to give him a house in Rome, that the people whilom called Pantheon, when there were all the heathen gods therein gone. When he had given it to him so hallowed he it to our Lord's honour, and our Lady's, the Holy Mary, and all the Christ's martyrs, to the end that, even as the multitude of devils had gone therein, now should go in the thought on all God's saints. He bade that all the folk this day, the kalends of November, (?) to church should come, and also that when godly service there all done was, every man should depart glad and blithe home. And thence was the custom that all men, at the present time, over all the world, take thought of all God's saints, so that what we in all the year have forgotten, we should to-day fulfil, and that we, through their holy intercession, should reach the everlasting life, our Lord helping.

See Dorow, *Denkmäler Alter Sprache und Kunst.* 1823. (I. 40.)

§ 35. *The Old Saxon Abrenunciation.*—This is a fragment, but one that, as far as it goes, is in the form of a catechism, or sacrament, for the Old Saxon converts from Paganism. It is Westphalian, but not so specially fixed in respect to its locality as the Essen Roll, or Rotulus Essensis, the Formula Essensis Confessionis, and the Frekkenhorst Roll, of which the locality is denoted by the names. The Rolls, or Muniments, consist of little more than lists of dues or payments to the Essen and Frekkenhorst monasteries.

The Abrenunciation is as follows:—

Q. Forsachis tu diobolæ?

R. Ec forsacho diabolæ, end allum diobolgelde; end ec forsacho allum diobolgeldæ, end allum dioboles uuercum, and uuordum, Thunar ende Woden, ende Saxnote ende allum them unholdum the hiro genotas sint.

Q. Gelobis tu in Got Alamehtigan Fadaer?

R. Ec *gelobo in Got Alamehtigan* Fadaer.

Q. Gelobis tu in Crist Godes Suno?
R. Ec gelobo in Crist Godes Suno.
Q. Gelobis tu in Halogan Gast?
R. Ec gelobo in Halogan Gast.

In English.

Q. Renouncest thou the Devil?
R. I renounce the Devil, and all Devil-guilds; and I renounce all Devil-guilds, and all the Devil's works, and words; Thunar, and Woden, and Saxnot, and all the unholy (ones) who are their fellows.
Q. Believest thou in God the Almighty Father?
R. I believe in God, the Almighty Father.
Q. Believest thou in Christ, God's Son?
R. I believe in Christ, God's Son.
Q. Believest thou in the Holy Ghost?
R. I believe in the Holy Ghost.

§ 36. The *Heliand* is referred to the parts about Munster. Hence we may take Munster as a starting point; and, drawing a line due west until we reach the North Sea between the Maas and Scheldt, compare what we find in the German district of Westphalia, and the Dutch and Flemish districts of Overijsell, Brabant, and Flanders, with what we find about Essen and Frekkenhorst in Germany; and also with the nearest cotemporary Anglo-Saxon of England. The presumptions are that when we reach the old localities of the Salian Franks and the Saxons of Julian we ought to find a form of speech more English than even the Heliand. But, then, it is not certain that we shall find anything at all.

The nearest approach to this, and it probably lies north of the line, is found under two names, the *Glossæ Lipsienses* and the *Carolinian* Psalms. Of these names, the first arose out of the fact of the learned Lipsius having drawn attention to them. He contented himself, however, with selecting certain words—*Glosses*. *The first* part of the text was published by Von de

Hagen, A.D. 1810, with the opinion that they belonged to the time of Charlemagne, an opinion adopted by Ypeij and Clarisse, from whom the following extract is taken. The version is treated by the editors as the Saxon of Holland.

From the text of A. Ypeij, Taalkundig Magzijn, P. I. No. 1. p. 74.

PSALM LV.

1. Gehori Got gebet min, in ne furuur[p] bida mina; thenke te mi in gehori mi.

2. Gidrouvit bin ic an tilogon minro, in mistrot bin fan stimmon fuindes, in fan arbeide sundiges.

3. Uuanda geneigedon in mi unreht, in an abulge unsuote uuaron mi.

4. Herta min gidrouit ist in mi forhta duodis fiel ouir mi.

5. Forhta in biuonga quamon ouir mi, in bethecoda mi thiusternussi.

6. In ic quad 'uuie sal geuan mi fetheron also duuon, in ic fluigon sal, in raston sal.'

7. Ecco! firroda ic fliende, ende bleif in an eudi.

In the present Dutch of Holland.

1. Hoor, Got! mijn gebed, en verwerp niet mijne bede! denk tot (aan) mij, en hoor mig.

2. Ontroerd ben ik, en mijne bezigheden, en mistrootig ben ik van de stem des vijands en van het leed (mij) van den zondigen (aangedaan).

3. Want zij neigden op mij het onreght, en in verbolgenheid waren zij mij onzoet.

4. Mijn hart is ontroerd in mij, en de vries des doods overviel mij.

5. Vries en beving kwamen over mij, en duisterniss bede.

6. En ik zeide, 'wie zal mij geven vederen als van eene duif; en ik zal vliegen en zal rusten?'

7. Zie ik veroerde vliedende end bleef in de woestijn.

§ 37. HILDEBRAND AND HATHUBRAND.

Ik gihorta dat seggen,	I heard that say,
Dat sie urheitonænou muotin,	That they challenged in single meeting,
Hildebraht end Hadubraht,	Hildebraht and Hathubraht,
Untar heruiu tuem.	Between the two armies.
. . . . .	. . . . .
Garutun *sie, iro, guthhamum*,	They made ready their war-coats,

Gurtun sie iro suert ana,	They girt their swords on,
Helidos ubar ringa,	Heroes over the ring,
Do sie to dero ittin ritun.	When they to the war rode.
Hiltibraht gimahalta,	Hildebrand spoke,
Heribrantes sune.	Heribrant's son.
Her was hororo man,	He was a high man,
Ferahes frotoro,	Of age the wiser,
Her fragen gistuont (?)	He asked .....
Fohem wortum: 'wer sin fader wan	With few words: 'who his father was
'Fireo in folcke,	'Of men in the folk,
'Eddo weliches onuosles du sis.	'Or of what kin thou beest.
'Ibu du mi aenan sages,	'If thou me only sayest,
'Ik mideo are-wet,	'I forbear strife
'Chind in chuninchriche,	'Child in kingdom,
'Chud ist min al Irmendeot.'	'Known to me is all mankind.'
Hadubraht gimahalti,	Hathubrath answered,
Hillibrantes sune:	Hildebrand's son:
'Dat sagetun me	'That said they to me
'Usere liuti alte anti frote,	'Our people old and wise,
'Dea erhena waran,	'Who of yore were,
'Dat Hilbrant haette min fater,	'That my father hight Hildebrand,
'(Ih heittu Hadubrant).	'(I hight Hadhubraht).
'Forn her ostar gehueit,	'Formerly, hence, eastward, departed,
'Floh her Otachres nid.	'Fled Odoacer's spite.
. . . . .	. . . . .
'Tot ist Hiltibraht,	'Dead is Hildebrant,
'Heribrantes suno.'	'Heribrant's son.'
Hildebrant gimahalta	Hildebrant answered
Heribrantes suno:	Heribrant's son:
'Weln gisihu ih,	'Well see I,
'In dinem hrustim,	'In thy harness,
'Dat du habes keine herron goten,	'That thou no good master hast,
'Dat du noh bi desemo riche,	'That thou still by this kingdom,
'Reccheo ni wurte.'	'Hero art not.'
Do laettun se aerist	Then let they erst
Asckim scritan,	With axes stride,
Scarpen scurim,	With sharp showers,
Dat in dem sciltim stont.	That on the shields dashed.
. . . . .	. . . . .
Hewun harmilicco	They hewed harmfully
Huitte scilti	The white shields
Unti im iro lintun	And to them then linden
Luttilo wurtun.	Little were (became).

§ 38. *Tatian's Gospel Harmony.*—The following is called Frank. The term, however, is geographical and political rather than philological.

THE GOSPEL HARMONY OF TATIAN, v. i. 3. (Edit. Graff.)

1. Uarun thó hirta in thero lantskeffi uuahhante, inti bihaltante nahtuuahta ubar iro euuit.

Quam thara gotes engil, inti gistuont náh in, inti gotes berahtnessi bischein sie, inti giforhtun sie in thó in mihhilero forhtu.

2. Inti quad in ther engil: ni curet iú forhten, ih sagen iú mihhilan gifehon, ther is allemo folke, bi thiu uuanta giboran ist iú hiutu Heilant, ther ist Christ truhtin in Dauides burgi;

Thaz sí iú zi zeïchane, thaz ir findet kin mit tuochon bivvuntanez inti gilegitaz in crippa.

3. Thó sluimo uuard thar mit themo engile menigi himilisches heres got lobontiu inti quedentiu:

Tiurida sí in then hohiston gote, inti in erdu sí sibba mannon guotes uuillen.

§ 39. *Otfrid.*—The next is from a part further south than the *Harmony*; probably south of the Mayne; in which case it is, geographically and ethnologically, *Alemannic.* The writer himself calls it *Frank.* The extract is, again, from a Gospel Harmony. *Krist* is the title: *Otfrid* the name of the composer. It is *High* German.

KRIST, i. 12. (Edit. Graff.)

Tho uuarun thar in lante hirta haltente;
thes fehes datun uuarta. uuidar fianta.
Zi in quam boto sconi. engil siinenti,
ioh uuurtun sie inliuhte. fon himilsgen liohte.
Forahtun sie in tho gahun. so sinan anasahun;
ioh hintarquamun harto. thes gotes boten uuorto.
Sprah ther gotes boto sar. 'Ih scal iu sagen uuuntar.
fu scal sin fou gote heil. nales forahta nihein.
Ih scal iu sagen imbot. gibot ther himilisgo got;
ouh nist ther er gihorti. so fronisg arunti.
Thes uuirdit uuorolt sinu. zi euuidon blidu.
ioh al giscaft thiu in uuorolti. thesa erdun ist ouh dretenti,
Niuuui boran habet thiz lant, then himilisgon Heilant;
Theist druhtin krist guater. fon iungeru muater.
In bethleem thiue kuninga, thie uuarun alle thanana,

fon in uuard ouh giboran. iu sin muater magad sconu.
Sagen ih iu, guate man. uuio ir nan sculut findan,
zeichen ouh gizami. thuruh thaz seltsani.
Zi theru burgi faret hinana. ir findet, so ih iu sageta,
kind niuuui boranaz. in kripphun gilegitaz.
Tho quam unz er zin tho sprah. engilo heriscaf,
himilisgu menigi. sus alle singenti—
'In himilriches hohi. si gote guallichi;
Si in erdu fridu ouh allen. thie fol sin guates uuillen.'

The same, in English.

Then there were in the land herdsmen feeding:
Of their cattle they made watch against foes.
To them came a messenger fair, an angel shining,
And they became lit with heavenly light.
They feared, suddenly as on him they looked;
And followed much the words of God's messenger:
Spake there God's messenger strait, 'I shall to you say wonders.
To you shall there be from God health; fear nothing at all.
I shall to you say a message, the bidding of the heavenly God:
Also there is none who has heard so glad an errand.
Therefore becomes this world for ever blithe,
And all creatures that in the world are treading this earth.
Newly borne has this land the heavenly Saviour,
Who is the Lord Christ, good, from a young mother.
In Bethlehem of the kings they were all thence—
From them was also born his mother, a maid fair,
I say to you, good men, how ye him shall find,
A sign and token, through this wonder.
To your burgh fare hence, ye find, so as I to you said,
A child, new born, in a crib lying.'
Then came, while he to them spake, of angels a host,
A heavenly retinue, thus all singing:
'In the heavenly kingdom's highth be to God glory;
Be on earth peace also to all who are full of God's will.'

§ 40. *Muspilli.*—This is generally treated as *High* rather than *Low* German, the Saxon being *Low*, and Tatian intermediate or transitional. With Otfrid the High German characteristics increase; and the next extract will be more High German still.

MUSPILLI.

Daz hôrt ih rahhon	They have heard I relate
Dia werolt-rehtwison;	The world-wise,

Daz sculi der Antichristo	That should the Antichrist
Mit Eliase pâgen.	With Elias struggle.
Der warch ist kiwâfinit,	The traitor is armed;
Denne wirdit untar in	Then becomes between them
Wik arhapan;	War raised.
Khensun sind so kreftec;	The champions are so strong,
Diu kosa ist so mihhil.	The case is so great.
Elias stritit	Elias strives
Pî den euigon lîp;	For the everlasting life,
Will den rehtkernon	Will for the right-doing
Daz rihhi kistarkan:	The kingdom strengthen;
Pidiu scal imo halfan	Therein shall him help
Der himiles kiwaltit.	Who rules heaven,
Der Antichristo stât	The Antichrist stands
Pî dem altfiante;	By the old Fiend;
Stât pî demo Satanase;	Stands by Satanas;
Der inan farsenkan scal;	Who shall sink (*to*, or, *before*?) him.
Pidiu scal er in der wicsteti	Both shall in fight
Wunt pivallan;	Wounded fall,
Enti in demo sinde	And on that occasion
Sigalos werdan.	Be without victory.

§ 41. The Weissenbrun Hymn.

Dat chifregin ih mit firahim	That have I heard among men,
Firinuizzo meista;	Of the fore-wise most,
Dat ero ni uuas, noh ufhimil,	That erst neither was, nor heaven above,
Noh paum noh pereg ni uuas,	Nor tree, nor berg,
. . . . .	. . . . .
Ni (sterro) noh heinig,	Nor [star] nor . . .
Noh sunna noh scein.	Nor sun shone,
Noh mana ni liuhta;	Nor moon gave light,
Noh der mareo seo,	Nor the great sea;
Do dar ni wiht ni was,	For there no wiht was,
Ente ni uuenteo,	Being or monster.
Enti do uuas der eino;	And then was the only
Almahtico cot	Almighty God,
Manno miltisto.	Of men the mildest.
Enti dar uuarun auh	And there were also
Manahe mit inan,	Many with him,
Cootlihha geista;	Godlike Spirits;
Enti cot heilac,	[And] God Holy
Cot almahtico,	God Almighty;
Du himil enti erda chiworahtos,	Thou heaven and earth wroughtest,
Enti tu mannun	And thou for men

So manac coot forchipi;	So much good hast created.
Forgip mer, in dino ganada,	Grant me in thy grace,
Rehta galaupa,	Right belief,
Enti cotan uuilleon,	And good will,
Uuisdom enti spahida,	Wisdom and speed,
Enti craft tiuflun	[And] craft the devil
Za uuidarstantanne	To withstand
Enti arc za piuisanne	And evil to conquer
Enti dinan inillain	And thy will
Za chiuuarchanne.	To work.

§ 42. *High and Low German.*—A difference between these important terms is here foreshadowed.

B, *V*, *D*, *TH* (as in *there*), and *G* are called the *Sonant* Mutes; *P*, *F*, *T*, *TH* (as in *then*), and *K* the *Surd*.

The former prevail in the Old Saxon.

In *Tatian* the Surds begin to take their place—compare *Truhtin* = Lord, with *Drohtin* in the *Heliand*.

In *Hildebrand and Hathubrath* there is a mixture.

In *Otfrid* the proportion of Surds increases.

In *Muspilli* and the *Weissenbrun Hymn*, they predominate—*pidiu* for *beide*, and *kiwâfinit* = *gewaffned*, in Muspilli; *chifregin* = *gefragen* in the *Hymn*.

The same applies to the *th* in *Heliand*, which becomes *d* in the *Hymn*; and to *t* in the Heliand, which becomes *z* (*ts*) in *Otfrid*, &c., and *ss* in modern German. Compare *water*, *better*, &c., in English with *wasser*, *besser*, &c., in German. For more upon this point, see Chapter XVI.

CHAPTER VI.

INTERNAL EVIDENCE, ETC.—THE FRISIAN—THE 'SAXONIA' OF THE NINTH CENTURY.

§ 43. *The Frisian Dialects.*—We return to the parts about Munster and follow the line of dialects in a different direction, i.e. northwards; or, rather, north by west.

A line drawn from Munster to Leeuwarden takes us into a new district; one wherein the difference of dialect either simulates or amounts to a difference of language. This is the case with, what is at present, the Dutch province of Friesland, where the language, in equal contrast with the Dutch of Holland and the Platt Deutsch dialects of Germany, of the old Frisians is still spoken. The area, however, of the *old* Frisian was much wider than it is now. Upon this, more will be said in the sequel.

§ 44. Neither the northern nor the southern boundary of the Frisian area is of much consequence. We know the *philological* frontier in each case. And the exact geographical points at which the languages touch one another is a matter of minor importance. On the south the Frisian of Friesland originally extended beyond its present boundaries, and indented both the Saxon and the (Salian) Frank frontiers in Guelderland, Brabant, and Flanders. On the north it reached the Danish frontier. Whether the Elbe was the boundary we need not enquire. It is only necessary to know that the continuous contact was along the coast line.

The northern and southern boundaries of the Frisian are, as aforesaid, of minor importance. What we most require to know is the extent to which the Frisian forms

of speech ran *east*ward, i.e. inland, and in the direction of Hanover. The leading fact on this point is that the town of Meppen was *Saxon*.

Meppen is on the Ems; in Germany, and not in the Netherlands (Holland). Yet it is near the frontier. It is also near the frontier of the present Frisian language on the south-east—that being the direction in which it extends the farthest inland. Along the coast it has been superseded by the Platt Deutsch of Oldenburg and Hanover; though it is preserved in the islands from Texel to Sylt. Then it reappears on the coast of Sleswick, between the towns of Husum and Bredsted. That it was the language of East Friesland is implied by the name. A fragment for the district of Saterland carries its area a little more eastwards. The general character of the Frisian was that it followed the coast. Nowhere, however, except in the south-east, did it stretch far inland. For the parts about Cuxhaven, between the mouths of the Elbe and the Weser, it has not been traced at all.

§ 45. *The Saxonia of Poeta Saxo.*—This limitation of the Frisian area on the south and east makes the fourth district which we have to consider one of inordinate magnitude. But it is one of great importance in other respects, because it is in the parts between Westphalia and the Elbe that we must look for the *Angle* districts. And here a well-known notice of the ancient *Saxonia*, with its boundaries and divisions, helps us, if not to any new fact, at least to a convenient arrangement of its actual and possible dialects. The work, in Latin hexameters, is referred to the reign of Charlemagne, and (as the author is unknown) is quoted as '*Poeta Saxo*.' He does not include Friesland in his Saxonia, and he does not take his Saxonia further south than Westphalia. His two

great geographical landmarks are the Elbe and the parts about the present town of *Engern*, in which the older name *Angrarii* or *Angraria* is preserved; itself being an abbreviation of the *Angrivarii* of Tacitus. This Angraria is a district rather than a town, and a district of a peculiar line. Long and narrow, it reaches, on each side of the Weser, from the parts about Paderborn to the North Sea, dividing the two great blocks of land which constitute very nearly the western and eastern halves of Saxonia. The first of these is, as we expect, *West*phalia, a name that has come down to us; the second is *East*phalia, a name which has become obsolete.

Then there is an outlying division beyond the Elbe, named, according to its situation, *Nordalbingian*. The boundary of Saxony on the east is also the boundary of Germany; for the country beyond the Elbe and Saale, whatever it may have been in the time of Tacitus, was, in the eighth century, Slavonic; and even so late as the last century there were (in Lüneburg) some Slavonians on the left or German side of the Elbe.

PORTA SAXO.

Generalis habet populos divisio ternos;
Insignita quibus *Saxonia* floruit olim.
Nomina nunc remanent; virtus antiqua recessit.
Denique *Westphalos* vocitant in parte manentes
Occidua: quorum non longe terminus amne
A Rheno distat; regionem solis ad ortum
Inhabitant *Osterleudi*, quos nomine quidam
Ostphalos alii vocitant, confinia quorum
Infestant conjuncta suis gens perfida Sclavi.
Inter predictos media regione morantur
Angrarii, populus *Saxonum* tertius: horum
Patria Francorum terris socintur ab Austro,
Oceanoque eadem conjungitur ex Aquilone.

* * * * *

Saxonum populus quidam quos claudit ab Austro
Albis, sejunctim positos Aquilonis ad axem:
Hos *Nordalbingos* patrio sermone vocamus.

The political boundary of Saxony south of Westphalia we may carry in the direction of the Rhine as far as the Ruhr, and along the Weser as far as the northern frontier of Hesse; and with this the philological frontier seems to have been, at least, coextensive.

§ 46. *The Frisian.*—Of this division much is known; for we have numerous specimens of almost every one of its present dialects and subdialects, from Sleswick to Holland; i.e. for almost every one of the little islands off the coasts of East and West Friesland, and Oldenburg; for Heligoland; for the more northern islands of Sylt, Amröm, &c.; for the North Frisian of the parts on the mainland of Sleswick; for the fragmentary Saterland dialect in *East* Friesland; and, along with all this, something like a provincial literature of the Frisian of the Dutch Province of Friesland.

Besides this we have Frisian compositions for three different stages: the Old Frisian, the Middle Frisian, and New Frisian; so that, if there be any error connected with the philology and ethnology of Friesland, it is not for want of materials.

Indeed, a slight amount of error may arise from the very abundance of them: and it is possible that such may be the case here. As compared with the Frisian division of Northern (or Low) Germany, the *Ostphalian* (with which the *Angrarian* may be connected) is, in the way of *data*, a blank. It has no compositions whatever like the Westphalian Heliand, or the Essen and Frekkenhorst muniments; compositions undoubtedly belonging to the district; and of the same age and stage as corresponding compositions in England.

The bearing of this upon the Frisian is evident. As a matter of fact there is, from the first, a difference between the northern and southern forms of the

German (Angle or Saxon as we may choose to call it) from which the English language is derived: and, as a matter of fact, it is the southern that is the most especially Old Saxon. We expect this *a priori*, and we find it; for the Saxon of Westphalia itself is, as compared with the Frisian, a southern form of speech: so that the actual affinity coincides with the geographical relations.

In the same way, the Frisian, as a language of North Germany, and, also, as a language of the parts of the Continent that lie opposite to the northern counties of England, is the one to which we naturally look when the difference between the Westsaxon and Northumbrian of England has to be explained by reference to the particular districts of Germany in which the latter originated. We know that the Westsaxon is more especially Old Saxon and *vice versâ*; and, this being the case, the doctrine that the Northumbrian is more especially Frisian presents itself: a doctrine which, in the main, is true. It is clear, however, that in this respect the Frisian forms of speech are invested with an importance not wholly their own, inasmuch as there is nothing that represents the German of *Ostphalia*.

Nevertheless, the structure and distribution of the Frisian forms of speech are almost as important as those of the Saxon. Its leading characteristics are: (1) the avoidance of the sound of *-n* at the end of words, as Frisian *tung-a*, A. S. *tung-an*; O. S. *tung-on*, *tongues*; Frisian *bœrn-a*, Saxon *bœrn-an*=(to) *burn*; (2) its preference of the sound of *-r* to that of *-s*.

§ 47. It is in their oldest stages, respectively, that the two forms of speech are best compared. For fuller details, see *Rask, Frisisk Sproglære*, 1825.

Transition of Letters.

á in Frisian corresponds to *eá* in A. S.; as *dád, rád, lás, strám, bám, cáp, áre, háp*, Frisian; *deád, reád, leás, streám, beám, ceáp, eáre, heáp*, Saxon; *dead, red, loose, stream, tree* (boom), *bargain* (cheap, chapman), *ear, heap*, English.

é in Frisian corresponds to (1), the A. S. *á;* as *eth, téken, hél, bréd*, Fris.; *áþ, tácen, hál, brád*, Saxon; *oath, token, hale, broad*, English;—(2), to A. S. *æ; hér, déde, bréda*, Frisian; Fris. *hær, dæd, brædan*, A. S.; *hair, deed, roast*, English.

e to *ea* and *æ* A. S.—Frisian, *thet*, A. S. *þæt*, Engl. *that*. Fris. *gers*, A. S. *gærs*, Engl. grass.—Also to *eo; prestere*, Fr., *preost*, A. S., *priest*, Engl.; *berch*, Fr., *beorh*, A. S., *hill* (*berg*, as in *iceberg*, Engl.); *melok*, Fr., *meoloc*, A. S., *milk*, Engl.

i to *eo* A. S.—Fr., *irthe*, A. S. *eorðe;* Fris. *hirte*, A. S. *heorte;* Fris. *fir*, A. S. *feor;* = in English, *earth, heart, far*.

já = *eo* A. S.; as *bjáda, beódan, bid—thet fjárde, feorðe, the fourth—sják, seóc, sick*.

ju = *eo* A. S.; *rjucht, ryth, right—frjund, freond, friend*.

dz = A. S. *c g;* Fr. *sedza, lidzja;* A. S. *secgan, licgan;* Engl. *to say, to lie*.

tz, ts, sz, sth = A. S. *c* or *ce;* as *szereke*, or *sthereke*, Frisian, *cyrice*, A. S., *church*, Engl.; *czetel*, Fr., *cytel*, A. S., *kettle*, Engl.

ch Fr. = *h* A. S., as *thjach*, Fr. *þeóh*, A. S., *thigh*, Engl.; *berch, beórh, hill* (berg); *dochtor, dohtor, daughter*, &c.

§ 48.

Declension of Substantives.

(*a.*)

Substantives ending in a Vowel.

		Masculine.	*Feminine.*	*Neuter.*
Sing.	*Nom.*	Campa (*a champion*)	Tunge (*a tongue*).	'Are (*an ear*).
	Acc.	Campa	Tunga	'Are.
	Dat.	Campa	Tunga	'Ara.
	Gen.	Campa	Tunga	'Arà.
Plur.	*Nom.*	Campa	Tunga	'Ara.
	Acc.	Campa	Tunga	'Ara.
	Dat.	Campon	Tungon	Aron.
	Gen.	Campona	Tungona	'Arona.

(*b.*)

Substantives ending in a Consonant.

		Feminine.	*Neuter.*
Sing.	*Nom.*	Hond (*a hand*)	Skip (*a ship*).
	Acc.	Hond	Skip.
	Dat.	Hond	Skipe.
	Gen.	Honde	Skipis.
Plur.	*Nom.*	Honda	Skipu.
	Acc.	Honda	Skipu.
	Dat.	Hondum (-on)	Skipum.
	Gen.	Honda	Skipa.

With respect to the masculine substantives terminating in a consonant, it must be observed that in Anglo-Saxon there are two modes of declension. In one, the plural ends in *-s*; in the other in *-a*. From the former the Frisian differs; with the second it has a close alliance; *e. g.*:—

		Saxon.	*Frisian.*
Sing.	*Nom.*	Sunu (*a son*)	Sunu.
	Acc.	Sunu	Sunu.
	Dat.	Suna	Suna.
	Gen.	Suna	Suna.
Plur.	*Nom.*	Suna	Suna.
	Acc.	Suna	Suna.
	Dat.	Sunum	Sunum.
	Gen.	Sunena	(Sunena).

Declension of Adjectives.

(*a.*)

Indefinite.

		Masculine.	*Feminine.*	*Neuter.*
Sing.	*Nom.*	Gód	Gód	Gód.
	Acc.	Gódene	Góde	Gód.
	Dat.	Góda (-um)	Gódere	Góda (-um).
	Gen.	Gódes	Gódere	Gódes.
Plur.	*Nom.*	Góde	Góde	Góde.
	Acc.	Góde	Góde	Góde.
	Dat.	Gódum (-a)	Gódum (-a)	Gódum (-a).
	Gen.	Gódera	Gódera	Gódera.

(*b.*)

Definite.

		Masculine.	*Feminine.*	*Neuter.*
Sing.	*Nom.*	Góda	Góde	Góde.
	Acc.	Góda	Góda	Góde.
	Dat.	Góda	Góda	Góda.
	Gen.	Góda	Góda	Góda.
Plur.	*Nom.*	Góda	Góda	Góda.
	Acc.	Góda	Góda	Góda.
	Dat.	Góda (-on)	Góda (-on)	Góda (-on).
	Gen.	Góda (-ona)	Góda (-ona)	Góda (-ona).

In respect to the Pronouns, there is in the Old Frisian of *Dutch* Friesland no dual number (the *North* Frisian has one), as there is in Anglo-Saxon. On the other hand, however, the Frisians (whilst they have no such form as *his*) possess, like the Icelandic, the inflected adjectival pronoun *sin*, corresponding to the Latin *suus*: whilst, like the Anglo-Saxons, and unlike the Icelanders, they have nothing to correspond with the Latin *se*.

In Frisian there is between the demonstrative pronoun used as an article, and the same word used as a demonstrative in the limited sense of the term, the following difference of declension:—

Article.

		Masculine.	*Feminine.*	*Neuter.*
Sing.	*Nom.*	*Thi*	*Thjú*	Thet.
	Acc.	Thene	Thá	Thet.
	Dat.	Thá	There	Thá.
	Gen.	Thes	There	Thes.
Plur.	*Nom.*		Thá.	
	Acc.		Thá.	
	Dat.		Thá.	
	Gen.		Théra.	

The Demonstrative in the limited Sense of the Word.

		Masculine.	*Feminine.*	*Neuter.*
Sing.	*Nom.*	Thi	**Se*	Thet.
	Acc.	Thene	*Se*	Thet.
	Dat.	Tham	There	Tham.
	Gen.	Thes	There	Thes.

In the inflection of the verbs there is between the Frisian and A. S. this important difference. In A. S. the infinitive ends in *-an*, as *macian*, to make, *læran*, to learn, *bærnan*, to burn; whilst in Frisian it ends in *-a*, as *maka*, *léra*, *berna*.

Sing.	1.	Berne	*I burn.*
	2.	Bernst	*Thou burnest.*
	3.	Bernth	*He burns.*
Plur.	1.	Bernath	*We burn.*
	2.	Bernath	*Ye burn.*
	3.	Bernath	*They burn.*

The Auxiliary Verbs.

Indicative.

		Present.	*Past.*
Sing.	1.	Ik ben	1. Ik 2. Thú } Was.
	2.	?	
	3.	Hi is	3. Hi
Plur.	1.	Wi 2. I } Send	1. Wi 2. I } Weron.
	3.	Hja	3. Hja

Subjunctive.

Present.	*Past.*
Sing. 1. 2. 3. Se	1. 2. 3. Wére.
Plur. 1. 2. 3. Se	1. 2. 3. Wére.

Infin. Wesa. *Pr. Part.* Wesande. *Past Part.* E-wesen.

§ 49. *Old Frisian Laws.*

Asega-bog,† i. 3. pp. 13, 14. (*Ed. Wiarda.*)

Thet is thiu thredde liodkest and thes Kynig Kerles ieft, theter allera monna ek ana sina eyna gode besitte umberavat. Hit ne se thet ma hine urwinne mith tele and mith rethe and mith riuchta thingate.

---

* Also Plural. † *Date*, A.D. 1212–1250: Parts, about the Jahde.

Sa hebbere alsam sin Asega dema and dele to lioda londriuchte. Ther ne hach nén Asega nenne dom to delande hit ne se thet hi to fara tha Keysere fon Rume esweren hebbe and thet hi fon da liodon ekeren se. The same, in English.

That is the third determination and concession of King Charles, that of all men each one possess his own goods (house?) unrobbed. It may not be that any man overcome him with charge (tales), and with summons (rede), and with legal action. So let him hold as his Asega (judge) dooms and deals according to the land-right of the people. There shall no Asega deal a doom unless it be that before the Cæsar of Rome he shall have sworn, and that he shall have been by the people chosen. He has then to doom and deal to foes as to friends, through the force (will) of the oath which he before the Cæsar of Rome has sworn, to doom and to deal to widows and orphans, to wayfarers and all defenceless people, to help them as his own kind in the third degree. If the Asega take an illegal reward, or pledged money, and a man convict him before two of his colleagues in the King's Court, he has no more to doom, since it is the Asega that betokens the priest, and they are seeing, and they should be the eyes of the Holy Christendom, they should help all those who may nought help themselves.

Later Form.

Friesche Volks-Almanak, pp. 84, 85. (*Bosworth*, p. lxvi.)

Dat oder landriucht is, hweerso dyo moder her kyndes eerwe foerkapet, jefta foerwixled mit har fryonda reed eer dat kind jerig is; als hit jerich se, likje him di caep, so halde hitt, ende likje him naet, so fare hit oen syn ayn eerwe sonder stryd ende sonder schulde.

So hwaso dat kind bifiucht jefte birawet op syn ayn eerwe, so breckt hy tyen lyoedmerck ende to jens dine frane (?) dat sint XXI schillingen: ende alle da lyoed agen him to helpen ende di frana, dat hij comme op syn ayn eerwe, deer hi eer bi riuchta aechte: hi ne se dat hio et seld habbe jef seth, jef wixled truch dera tria haudneda een,

deer hio dis kyndes des lives mede hulp. Dyo forme need is: hweerso een kynd jong is finsen ende fitered noerd oer hef, jefta suther wr birgh, soe moet dio moder her kyndes eerwe setta ende sella ende her kynd lesa ende des lives biheipa. Dyo oder need is: jef da jere diore wirdet ende di heta honger wr dat land faert, ende dat kynd honger stera wil, so moet dio moder her kyndes eerwe setta ende sella ende capia har bern ku ende ey ende coern, deerma da kynde des lives mode helpe. Dyo tredde need is: als dat kynd is al stocknaken jefta huusleas ende dan di tiuestere nevil ende calda winter oencomt, so faert aller manick oen syn hof ende oen syn huus ende an waranne gaten, ende da wylda dier seket dyn holla beam ende der birgha hly, aldeer hit syn lyf oen bihalda mey: sa weynet ende scryt dat onjeriga kynd ende wyst dan syn nakena lyae ende syn huusleas ende syn fader deer him reda schuld to jenst dyn honger ende winter nevil cald dat hi so diepe ende dimme mitta flower neylen is onder eke ende onder da eerda bisloten, ende bitacht; so moet dio moder her kyndes eerwe setta ende sella, om dat hio da bihield habbe ende biwaer also lang so hit onjerick is, dat hit oen forste ner oen hoenger naet forfare.

In English.

The other landright is: whenever the mother sells the inheritance of her child, or exchanges (it) with rede (counsel) of her friends before the child is of age; when he is of age, likes he the bargain, let him hold it, and does he not like it, let him fare (enter) on his own inheritance without strife and without debts.

Whoever fights or bereaves the child on his own ground, he forfeits ten ledemarks, and to the king's attorney the mulct is XXI schillings; and all the lede (people) ought to help him and the king's attorney that he may come to his own inheritance, which he owned before by right: unless she has sold, or set (pawned) or exchanged it through one of the three headneeds (necessities) by which is helped the life of the child. The first need is: whenever a child is made prisoner and fettered northward over the sea, or southward over the mountains, the mother must set (pawn) and sell her child's inheritance and release her child and save its life. The other need is: if the years become dear, and sharp hunger goes over the land, and the child will starve of hunger, then the mother must set and sell her child's inheritance, and buy her child's cows and ewes, and corn, wherewith the life of the child is helped. The third need is: when the child is stark-naked, or houseless, and then the dark fog and the cold winter come on, when every man fares (enters) his house and its appurtenances, and lurking-holes, and the wild deer (beasts) seek the hollow beam (tree) and the lee of the mountains, where it may save its life: then moans and weeps the minor child, and shows his naked limbs, and his being houseless, and (points at) his father, who should provide for him against hunger

and the wintry fog-cold, that he so deep and dim is locked up and covered under the earth with four nails: so the mother must set and sell her child's inheritance, since she has the keeping and guarding as long as (the child) is under age, that it dies not from frost or from hunger.

§ 50. Without determining too nicely at what exact time the Old Frisian stage ceases, we may take the middle of the seventeenth century (*say* A.D. 1650) as date for the fullest development of the Middle.

1.*	1.*
Swiet, ja swiet is 't, oere miete	Sweet, yes sweet is over measure
't boaskien foar 'e jonge lie;	The marrying for the young people.
Kreftich swiet is 't, sizz' ik jiette,	Most sweet is it, I say yet,
As it giet mei Ålders rie.	When it goes with the elders' rede.
Mar oars tiget 'et to'n pleach,	But otherwise it tends to a plague,
As ik oan myn geafeynt seach.	As I on my village saw.
2.	2.
'Goune Swobke, lit uws pearje,'	'Golden Swobke, let us pair,'
Bea hy har mei mylde stemm.	He bade her with a mild voice.
'Ofke,' sei se, 'ho scoe 'ki t klearje!	'Ofke,' she said, 'How should I clear it!
Wist du! rie to heite in mem?'	Wist thou! rede father and mother?'
'Ljeaf! dat nim ik to myn laest.'	'Love! I take this to my last.'
Dear mei wier de knôte faest.	Therewith was the knot fast.
3.	3.
Da dit pear togear scoe ite,	When this pair together should eat,
In hja hiene nin gewin,	And they had no gain,
Heite seach, as woe hy bite,	Father saw as if he would bite,
Mem wier stjoersch in lef fen sin.	Mother was stern and cross of humour.
'Ofke,' sei se, 'elk jier in bern.	'Ofke,' she said, 'each year a child.
Wier ik fâem! ik woe 't so jern.'	Were I maid! I would I were.'
4.	4.
Hoite in Hoatske Sneins to keamer	Hoite and Hoatske every Sunday in the inn
Mekken it mei elkoarne klear.	Made it clear with each other.
Tetke krigge Sjolle kreamer,	Tetke got Sjolle the pedlar

* From the Preface to Dr. Bosworth's Anglo-Saxon Dictionary, where the whole subject is fully treated. Pp. xxxv.–lxxx.

To Sint Eal by wyn in bjear.
Nu rint elk om as in slet,
In bekleye 't; mar to let.

To St. Alof's by wine and beer.
Now each runs about as a slut,
And complains; but too late.

5.

Oeds die better, nei ik achtje,
Da hy Saets syn trou tosei:
Hy liet de alders even plachtje,
Hwet se oan elk ich joene mei.
Nu besit hy huws in schuwr',
In syn bern fleane all' man uwr.

5.

Oeds did better as I heed,
When he said to Saets his troth:
He let the elders even plight,
What they on each (*edge*) side gave.
Now he possesses house and barn,
And his children outdo all men.

6.

Ork, myn Soan, wolt du bedye,
Rin naet oan allyk ien moll'!
Jeld in rie lit mei dy frye,
Bern, so gean' dyn saken wol.
Den scil de himel uwr dyn dwaen

Lok in mylde seining' jaen.

6.

Ork, my Son, wouldst thou thrive,
Run not on, all like a mole;
Let age and rede woo with thee,
Child, then go thy affairs well;
Then the heaven shall over thy doings
Luck and mild blessings grant.

The chief classics of the Middle Frisian literature are Gysbert (Gilbert) Japicx, from whom the preceding specimen is taken, and Althuisen.

§ 51. Of the Frisian, as it is spoken at the present time in the Dutch province of West Friesland, the following is a specimen.

ABE IN FETSE.*

ABE.—Ho djoer binne de mieren, Fetse? Ik haw jister net nei sted weest.

FETSE.—'k wit net; sa hwat by de daelder om, eak ien kromke er oer.

ABE.—Wierne er al rju?

FETSE.—Ja, dær stiene al hele keppels. It liket dat se rom binne, mar it wier myn soarte net.

ABE.—Heste den dyn fæste mieren jiers? Hawwe se hjar eigen kost, jimmo mieren?

FETSE.—Hwet mienste? dat ik my de earen fen 'e kop frette litte wol? Ik haw simmers genoach oan twa uwthongere Waldlju, dy 't 'k by my yn de ongetiid ha'.

---

* From the *Scheerwinkel fen Joute-Baes*, pp. 1–3.—*Dimter* (*i. e. Deventer*), 1835.

ABE.—Jane jimme se den jouns eak neat?

FETSE.—Ja, den krye se sa hwat ein heal kroädfol suwpenbry, in dat behimmelje se eak suwkerswiet. Ik wit net wær se it berchje yn hjar smelle pansen. Hja binne wis oars fen binnen as ien Fries.

ABE.—Ei, kom ju! It binne ommers eak minscen as wy.

The same, in the Dutch of Holland.

ABE.—Hoe duur zyn de mieren Fetse? ik ben gisteren niet naar de stad geweest.

FETSE.—Ik weet het niet; ongeveer een daalder en ook een kruimtje er over.

ABE.—Waren er veel.

FETSE.—Ja, er waren al heele hoopen. Het schynt dat ze ruim zyn; maar het waren geen van myn soort.

ABE.—Hebt gy dan uwe vaste mieren jaarlyks? Hebben uwe mieren hunne eigen kost?

FETSE.—Wat bedoelt gy? dat ik my de ooren van het hoofd zal laten eten? ik heb in den zomer genoeg aan twee uitgehongerde Woudlieden welke ik by my heb in de hoojing.

ABE.—Geeft gy ze dan 'savonds ook niets.

FETSE.—Ja, dan krygen ze ongeveer een geheele kruiwagen vol karnemelk, en dat eten ze ook zuikerzoet op. Ik weet niet waar ze het bergen in hunne kleine darmen. Ze zyn zeker inwendig verschillend van een Fries.

ABE.—Och kom reis! het zyn immers ook menschen als wy.

In English.

ABE.—How dear are (*what is the price of*) the mowers, Fetse? I was not in the town yesterday.

FETSE.—I wot not; about a dollar a man and a bit (*crumb*) over.

ABE.—Were there plenty of them?

FETSE.—Yes, there stood whole heaps. It seemed as if there were enough of them; but it is not my sort.

ABE.—Hast thou then your mowers regular (*fast*) by the year? Do they keep themselves (*have they their own cost*) your mowers?

FETSE.—What meanest thou? That I should let my ears be eaten off my head? I had enough in summer, with two starved woodlandmen, that I had with me at the hay-time.

ABE.—Did you not then give them anything in the afternoon?

FETSE.—Yes! Then they must have (*crave*) about a whole bucketfull of porridge (*soup and barley*); and that must be as sweet as sugar. I wot not where they bury it in their small paunches. They must ywiss (*certainly*) be of a different sort in their insides from a Fries.

ABE.—Come now! They are still men like ourselves (*as we*).

It Ewangeelje fen Matthéwees.

1. Do nou Jesus berne wier to Bethlehem yn Judea yn kening Herodes dagen, hen, binne dær wîzen fen éasteradelen to Jerusalem oankomd, sizzende.

2. 'Hwæere is di kening fen di Jeuden, di berne is?' 'Wy hawwe ommers syn steárre yn it éasten sjoen ind binne komd om him to hildjen.'

3. Di kening Herodes nou, as hy dit heárde, waerd éang ind hiel Jerusalem mei him.

4. Ind di haedprêsters ind di scruftgeléarden by ienoár bringende fréagge hy hjar, hwær di Christus berne wirde moast?

5. Hja nou seinen tsjin him. 'To Bethlehem yn Judea; want sa is scréaun throch di profeet.'

6. 'Ind dou, Bethlehem lân' fen Juda; dou biste lang di minste naet onder di prinsen fen Juda; want uwt dy scil di lieder foártkomme, dy myn folk weidje scil.'

7. Do hat Herodes di wîzen stilkes roppen, ind hi fréagge hjar wakker nei di tiid, do di steárre opdéage wier.

8. Dærop hjar nei Bethlehem stjoerende sei hy, 'Reisgje hinne ind fornim flitich nei dat bernke, ind as jimme it foun' hawwe stjoer my tynge, dat ik eák kom ind it hildje.'

9. Hja den di kening heárd hawwende binne foárttein; ind hen, di steárre dy 't hja yn it éasten sjoen hiene, gong foár hjar uwt, ont hja kaem ind stoé' boppe it plak, dær it bernke wier.

10. Do hja nou di steárre séagen forhuwggen hja mei wakker gréate blydscip.

11. Ind yn it huws kommende séagen hja it boike mei Maria syn mem, ind knibbeljende habbe hja it hilde.

12. Ind hjar kastkes opdwaende brochten hja him jeften, goald ind wierk ind myrre. Ind yn di droage throch goadlike ynjouwinge formoánne, dat hja naet nei Herodes to bek géan moasten forsidden hja lâns ien oare wei wer nei hjar lân ta.

The same in Dutch.

1. Toen nu Jezus geboren was te Beth-lehem, *gelegen* in Judea, in de dagen van den Koning Herodes, ziet! *eenige* Wijzen van het Oosten zijn te Jeruzalem aangekomen.

2. Zeggende: waer is de geboren Koning de Joden? want wij hebben zijne ster in het Oosten gezien en zijn gekomen, om hem te aanbidden.

3. De Konig Herodes nu, *dit* gehoord hebbende, werd ontroerd en geheel Jeruzalem met hem;

4. En bijeenvergaderd hebbende al de Overpriesters en Schriftgeleerden des volks, vraagde van hen, waar de Christus Zon geboren worden.

5. En zij zeiden tot hem te Beth-lehem, in Judea *gelegen;* want alzoo is geschreven door den Profeet:

6. 'En gij Beth-lehem, *gij* land van Juda! zijt geenozins de minste onder de borsten van Juda; want uit u zal de Leidsman voortkomen, die mijn volk Israël weiden zal.'

7. Toen heeft Herodes de Wijzen heimelijk geroepen, en vernam naarstiglijk van hen den tijd, wanneer de ster verschenen was;

8. En hen naer Beth-lehem zendende, zeide hij: 'reist heen en onderzoek naarstiglijk naar het kindeken, en hols gij het zult gevonden hebben, boodschapt het mij, opdat ik ook kome en hetzelve aanbidde!'

9. En zij, den Koning gehoord hebbende, zijn heengereisd. En, ziet! de ster, die zij in het Oosten gēzien hadden, ging hun voor, tot dat zij kwam en stond boven *de plaats,* waar het kindeken was.

10. Als zij nu de ster zagen, verhengden zij zich met zeer groote vreugde,

11. En in het huis gekomen zijnde, vonden zij het kindeken met Maria, zijne moeder; en nedervallende hebben zij hetzelve aangebeden; en hunne schatten opengedaan hebbende, bragten zijhem geschenken, goud, en wierook en mirre.

12. En door Goddelijke openbaring vermaand zijnde in den droom, dat zij niet zouden wederkeeren tot Herodes, vertrokken zij door eenen anderen weg weder naar hun land.

§ 52. *North Frisian.*—The following is from Camerer, and, next to the short sample by which it is followed, and a few others, it is the oldest specimen of North Frisian.

Song for a Wedding.

1.

We sen hjir to en brullep,
Hjir mut we uk wat sjung;
Up sok gurdt freugeddaogen,
Da mut et lustig gung.
Hoera! Hoera! Hoera!
Da mut et lustig gung.

1.

We are here to a wedding,
Here must we eke somewhat sing;
Upon such a made (*gart*) holiday,
There must it merry go.
Hurrah! Hurrah! Hurrah!
There must it merry go.

2.

Bi 't sjungen hjerd to drinken,
Ark heed biid' slunk en smaok,
En hjir es wat djer keulked!
Dit es en foarskel saok.
Hoera! enz.

2.

By singing belongs drinking,
Each head becomes sleek and smug,
In here is what . . . . . .
This is a capital affair.
Hurrah, &c.

3.	3.
We nem da bi uus glæsen,	We nim (*take*) then by our glasses,
En leet uus hol' gefaol	And let us heartily
Rogt dugtig iens to drinken	Right well at once drink
Uus Brid en Bridmans skaol.	Our bride and bridegroom's health.
Hoera! enz.	Hurrah, &c.

In 1452, the following inscription was found on a font at Büsum.

The Original.

Disse hirren döpe de have wi thou ewigen onthonken mage lete, da schollen osse berrne in kressent warde.

Translation by Clemens into the present Frisian of Amrörn.

Thas hirr dip di ha wi tun ewagen unthonken mage leat, thear skell üs biarner un krassent wurd.

English.

This here dip have we as an everlasting remembrance let make, there shall our bairns in christened be.

The Wooer from Holstein.

Diar Kam en skep bi Sudher Sjöe	There came a ship by the South Sea,
Me, tri jung fruers ön di flöt.	With three young wooers on the flood;
Hokken wiar di fördeorst?	Who was the first?
Dit wiar Peter Rothgrun.	That was Peter Rothgrun.
Hud säät hi sih spooren?	Where set he his tracks?
Fuar Hennerk Jerken's düür?	For Hennerk Jerken's door.
Hokken kam tõ düür?	Who came to door?
Marrike sallef.	Mary-kin herself,
Me krük en bekker ön di jen hundh,	Crock and beaker in one hand,
En gulde ring aur di udher hundh.	A gold ring on the other hand.
Jü nöodhight höm en sin hinghst in,	She pressed him and his horse in.
Död di hingst haaver und Peter wün.	Gave the horse oats and Peter wine.
Toonkh Gott fuar des gud dei.	Thank God for this good day!
Al di brid end bridmaaner of wei,	All brides and bridesmen out of way!
Butolter Marri en Peter allüning!	Except Mary and Peter alone.
Jü look höm ün to kest	She locked him up in her box,
En wildh höm nimmer muar mest.	And never would miss him more.

*The Wedding-Stones of Eidum.**

Frisian.

En Faamel oon Eidum hæi her forlaavet, med en jungen Moan, en hem taasværet, dat's ier taa en Stiin vorde vil, es en vorde en oern Moans Vöf. Dii junge Moan forleet hem æv her Trauhæid, en ging taa Sæie. Man sin Faamel forgæit hem bal, en nom moit oere Freiere em Nagtem, en forlaavet her taaliast med en Stagter foan Keitum. De Brellupsdæi vord bestemt, en de Tog ordnet hem, med sen Formoan foræt, æve Væi foan Eidum taa Keitum. Der kommens onervegens en uil Vöf oontmoit, en det es en hün Fortiken for en Bræid. Man jü sæ: 'Eidumbonne, Keitumbonne, jernge Bræid es en Hex.' Æergerlik en forbittert svaart de Formoan: 'Es yys Bræid en Hex, denn vil ik, det vi her altaamoal dealsunken, en vydder opvaxten es græ Stiine.' Es hü even de Uurde sæid hæi, saank det hiile Selskab med Bræid en Bredgom deal oone Grynn, ex vaxet vydder hulv op es græ Stiine. For ei menning Jir heves hjem nog visset es grot Stiine, tveer en tveer æve Sid bei enooer med de Formoan oone Spesse. Je ston taa 'd Norden foan Tinnum, ei vid foant uil Thinghuged, en taa en Erinnering em jo Beigevenhæid vorn æve sid bei det Huged tau lait trinn Huge opsmenn, der 's *Bræidefartshuge* namden.

The same in the Danish of the district.

En Pig' i Eidum hâj forlovvet sæ mæ en ong Kael aa svorren aa, te hun ferr skuld blyvv te Stein, end hun skuld, blyvv en A'ens Kuen. Den ongg Kael trôj no godt aa hind aa drovv tilsoes. Men de var int længg inden æ Pig' forglæmt ham aa tovv om Nat æmor ander Frieres Besæg aa forlovvet sæ tesist mæ en Slavter fra Keitum. Æ Davv, te æ Brollop skuld staae, vaar bestemt, aa æ Brujskar saat sæ i Gaang fra Eidum, te Keitum mæ æ Anforer i æ Spids. Saa kom de da undervej æmor en gammel Kuen aa de betyer int novver Godt for en Bruj. Men hun öjt aa so: 'Eidumbynder, Keitumbynder, Jer Bruj æ 'en Hex!' No blovv æ Anforer ærgele aa gall i æ Hoj aa svâr aa so: 'Ja hvinner vor Bruj vaar en Hex, saa vild æ onnsk, te vi Oll saank i æ Jord aa grôj Oll hall op ægjen som graae Steen.' ---

* From Allen, *Det Danske Sprogs Historie i Hertugdommet Slesvig, eller Synderjylland.*

Literary Danish.

En Pige i Eidum havde forlovet sig med en ung Karl og svoren paa, at hun för skulde blive til Steen, end hun skulde blive en Andens Kone. Den unge Karl troede nu godt paa hende og drog tilsöes. Men det varede ikke længe, inden Pigen forglemte ham og tog om Natten imod andre Frieres Besög og forlovede sig tilsidst med en Slagter fra Keitum. Dagen, da Bryllupet skulde staae, var bestemt, og Brudeskaren satte sig i Gang fra Eidum til Keitum med Anföreren i Spidsen. Saa kom de da underveis imóde med en gammel Kone og det betyder ikke noget Godt for en Brud. Men hun vaabte og sagde: 'Eidumbönder, Keitumbönder, jer Brud er en Hex!' Nü blev Anföreren sergerlig og gal i Hovedet og svor og sagde: 'Ja hvis vor Brud var en Hex, saa vilde jeg önske, at vi Alle sank i Jorden og groede halvt op igjen som graae Steen.' Aldrigsaasnart havde han sagt de Ord, inden det hele Selskab med samt Bruden og Brudgommen sank ned i Jorden og groede halvt op igjen som graae Steen. Endnu for ikke mange Aar siden vidste de at vise de fem store Steen, to og to ved Siden af hinanden med Anföreren i Spidsen. De stode Norden for Tinum, ikke langt fra den gamle Thingpold, og for at huske, hvad der skeede den Gang, var der ved Siden af Höjen opkastet to smaa Bjerge, som de kaldte *Brudskarhöierne.*

In English.

A maiden in Eidum was engaged to a young man, and had sworn that she should be turned to stone before she should become anybody else's wife. The young man believed her, and went to sea. But it was not long before the maiden forgot him, and received by night another lover's visits, and engaged herself at last with a butcher from Keitum. The day on which the wedding should take place was fixed, and the bridal procession started from Eidum to Keitum, with its leader in front. They met on their way with an old woman—and that betokens no good for a bride. And she cried out, 'Eidum people! Keitum people!—your bride is a witch!' Then the leader grew angry, and mad in her head, and answered and said, 'Aye, if our bride is a witch, I wish we may sink in the earth, and all grow up again like grey stones!' As soon as she had said the words, the whole company, along with the bride and bridegroom, sank in the earth, and grew half up again as grey stones. And now, till within a few years ago, one could see five great stones, two and two on each side, and the leader in front. They stood north of Tinnum, not far from the old Thingfold; and, in remembrance of the event, there were thrown up, by the side of the mound, two small hills, which they called *Brudeskarehoien.*

The following seems to belong to the well-known nursery tale of Rumpelstiltsken. There is, however, no prose context.

Frisian.	*Danish.*
Ik mei di,	Ieg elsker Dig,
Wel di haa!	Vil Dig have!
Meist dü mi?	Elsker Du mig?
Skedt me faa	Skal Du mig faa
Wedt dü ek?	Vil du ikke?
Feist mi dagh!	Fæst mig dog!
Med ön Week	Midt i Ugen
Haa wat Lagh.	Have vort Lag.
Man kjenst sü	Men can Du sige
Wat ik jit?	Hvad jig hedder?
Da best frii,	Da er Du fri,
Best mi quit.	Er mig qvit.
Delling skell ik bruu,	Idag skal jeg bryggc.
Miaren skel ik baak,	Imorgen skal jeg bage,
Aurmiaren wel ik Bröllep maak.	Overmorgen vil jeg Bryllup holde.

In English.

I like you,
Will have thee!
Likest thou me?
Shalt me have.
Wilt thou not?
Fix me day!
Mid in week;
Have our law.
But kennest thou,
What I hight?
Then beest free
Beest me quit.
To-day shall I brew,
To-mcrrow shall bake,
Day-after-to-morrow will I bridal make.

§ 53. *Distribution of the Frisian.*—This is very irregular. From north to south the name may be traced from the Widaa, on the boundary of Jutland and Sleswick, to the Scheldt. But the line is very discontinuous; the name seldom spreads far inland.

In some cases the Frisian localities seem those of settlers or colonists rather than of natives or even old occupants.

In the Dutch Province of West Friesland the Frisian of the present time has its widest extension inland. In East Friesland it is extinct, except (perhaps) in the fenny district of Saterland, where it is largely Germanised. Along the coast it has long been obsolete. It is spoken, however, along the whole line of Islands, Terschelling, Wangeroog, &c. In the parts about Cuxhaven and Ritzebüttell, or the land between the Elbe and the Weser, it is not only not found, but has left no signs of its ever having been spoken there, which is the more remarkable from its being the language of Heligoland and the islands off the coast of Holstein and Sleswick. North of the Elbe it reappears. On reasonable grounds it may be claimed as the older language of Ditmarsh and Eyderstedt, which is now Low German; while in Sleswick it spreads along the coast from Husum to Bredsted; having once extended as far as the boundary of Jutland. At no point, however, does it extend across the peninsula, so as to touch the Baltic.

In respect to its characteristic peculiarities, the Frisian form of speech, in its eschewal of the sound of *-n* at the end of words, and other minor details, while it differs from the Saxon, agrees with the Norse. The bearings of this will become clearer when the dialects of our language come under notice.

Upon the position, too, of the Frisian in the classification of the languages of the German family, more will be said in its proper place. It is easy, however, to anticipate its general relations. They will be those of a transitional language (or dialect).

The more complex question as to the relations of the *Angle* form of speech, though one which promises

but few results, now presents itself, and it is with the third division of the Saxonia of the Saxon Versifier (Poeta Saxo) that it is connected.

CHAPTER VII.

THE ANGRARIAN AND OSTPHALIAN PARTS OF SAXONY—THE ANGLES OSTPHALIAN — THE SLAVONIC FRONTIER — THURINGIA AND HESSE.

§ 54. *Angraria.*—The Frisian, though it may have been spoken along the sea-coast from the present province of West Friesland to the frontier of Jutland, never runs far inland.

The Old Saxon of the Heliand and the Essen documents may, reasonably, be carried as far eastward as the Weser, possibly farther.

With the Weser began the *Angraria* of the Saxon Versifier, a long narrow tract from Bückeburg (Lippe Detmold) to Bremen, with the present town of *Engern*, preserving the old name, in the middle. In respect to its outline, it has all the characters of a march or boundary. There is no reason, however, to make any broad separation between the Angrarian dialect and the Westphalian. There are no specimens of it of the same age as those of the recognised Old Saxon.

§ 55. *Ostphalia.*—Ostphalia is, in all respects, a much more important district. It has no literature of the date of the Heliand, the Krist, and the English of the Anglo-Saxon period in England. Yet it is the district to which we must assign the *Angles*. Until, however, we find the Angles of Procopius and of Pope Gregory in England, we have nothing beyond the two notices of (1) Tacitus, and (2) Ptolemy.

This is little enough. Still, the fact that it is all that we have should be known; especially with the view that it is next to nothing.

But though the philological data for Ostphalia are sadly deficient, there is much to be collected from the geography. Whatever may have been the extent of the '*Germania*' of Tacitus, there is no doubt whatever as to its limits on the east during the seventh, the eighth, the ninth, and the tenth centuries. In the beginning of the seventh,* A.D. 625, not 100 years after the first recorded invasion of Britain by an enemy of the *Angle* denomination, our knowledge of the actual ethnology of the Elbe begins; and it begins in a way which severely tries either the accuracy of Tacitus himself, in making seven-tenths of the population of his '*Germania*' Germans in our sense of the term, or else that of the commentators who have supposed that he meant to do so. This is because, when the parts beyond the Elbe first become known to the Frank historians—the first who describe them with anything like adequate accuracy—they are, in no single instance, German in any way; but, on the contrary, from first to last, Slavonic. No trace of any previous German occupancy is recorded—no tradition of any Slavonic intrusion is preserved. The whole country beyond the Elbe when it is first known by actual inspection, is not only Slavonic, but Slavonic without a particle of admixture, or a single fact which implies that it was other than Slavonic from the first.

This, then, gives us the explanation of the text of the Versifier.

regionem solis ad ortum
Inhabitant *Osterleudi*, quos nomine quidam
Ostvalos alii vocitant, confinia quorum
Infestant conjuncta suis gens perfida *Sclavi*.
A.D. 772 (*circiter*).

* *Zeuss*, pp. 637–639.

The Angrarians, as we have seen, lie like a narrow March between the *East*- and *West*-phalias.

§ 56. *The Slavonic frontier.*—The Slavonic frontier is, in the main, formed by the Elbe; but as there were both Slavonians and Saxons to the north of that river, and as, on the south, this same Slavonic line was prolonged beyond the boundaries of Ostphalia, it will be convenient to trace it from one end to the other: i.e. from the parts about Coburg on the south, to the parts about Kiel on the north.

§ 57. *Slavonians of Holstein.*—The most northern known occupancy of the Slavonians of the eastern frontier of Germany was the country between Kiel, the Trave, and the Siegeburger Heath, in Holstein; i.e. the parts about Eutin, Plön, Preetz, Altenburg, and Lübeck, all of which stood on ground originally Slavonic. On the south the river Bille divided the Slavonic from the Saxon parts of Holstein. The Slavonic district was named *Wagria*, or the country of the *Wagri*; the Saxon districts were Sturmar, Ditmarsh, and Holsatia, or Holstein proper. Hamburg lay on the frontier, but on the Saxon side of it. The three German districts that formed Nordalbingia seem to have been Saxon rather than Frisian. Whether they were Saxon after the manner of Westphalia or Eastphalia is another question.

§ 58. *The Slavonians of Lauenburg.*—The whole of Lauenburg was Slavonic, with a *Sachsenwald* on its western frontier. Ratzeburg was the capital; *Polabingia* (from *po*=*on* and *Laba*=*Elbe*), the name of the district—the final *-ing* being German, while the preposition *po* and the substantive *Laba* are Slavonic. Of this hybrid form there are other instances; one, well known to English ethnologists and archæologists, *Kentingas*=Men of *Kent*, where the *-ing* belongs as de-

cidedly to one language as the radical form *Cant-ium* belongs to another.

§ 59. *Mecklenburg and Lunenburg.*—Mecklenburg was notoriously Slavonic. But Mecklenburg lies wholly on the Slavonic side of the Elbe.

Lunenburg, however, is in a very different position. It lies wholly on the German side. But Lunenburg is the most Slavonic part of Cisalbian Germany. It is this whether we begin with the ninth century or the eighteenth. In 808 a Frank army crossed the Elbe by a bridge against the *Linones*, the Smeldingi, and the Bethenici of the opposite bank.* Zeuss thinks that the name is still preserved in that of the present town, *Lent*zen. But, then, there is the more important town of *Lunen*burg on the other side, only a little lower down, or more to the north; and along with this there is the Duchy, which reaches to Verden and Bremen, on the western side of which we find, with its Slavonic name, the river Bomlitz. This is all we have in favour of the *whole* Duchy having ever been Slavonic. On the other hand, however, in the eastern third of Lunenburg, Slavonic was spoken in the villages of Luchow and Wustrop so late as A.D. 1751, of which we have a Paternoster in a strange mixture of Slavonic and German, but still Slavonic on the whole.

§ 60. *Altmark.*—The distinction between Altmark and Lunenburg is political rather than ethnological, for the Old Mark is a purely geographical term. Altmark denotes the great bend of the Elbe, between Magdeburg and Lentzen, on the Mecklenburg frontier. The men who lived here must have been, provided that they touched the Elbe at all, north and north-east of the men about Magdeburg. They may have extended

* *Die Deutschen und die Nachbarstämme*, p. 652.

beyond the Elbe; but whether they did so or not is irrelevant to the present question. They may or may not have gone lower down on the river, so as to occupy the parts about Magdeburg, but it is sufficient for the present purpose to place them on the great north-eastern bend.

About N. L. 52, a little to the south of Magdeburg, the Elbe of Tacitus and Ptolemy ceases to be the Elbe of the present time; for its origin in Bohemia is unknown, and the Saale is treated as the Elbe up to its source in the parts about Hof, near the Fichtelberg, N. L. 50, E. L. 12. Now the Saale, in the Frank geographers, divides the Thuringians from the Slavonians; whilst in the earlier Roman geographers the Elbe (i.e. the Saale) divides the Hermunduri (Thuringians) from the Semnones. The term Slave, or Slavonic, is unknown till the time of the Eastern Empire; and when, from a Frank historian, we get our first notice of the parts beyond the Elbe on the (Upper) Saxon and Bohemian frontier, the name Semnones is superseded by that of the Serbs, or Sorabians, who are a branch of the great Slavonic family, the name of which is now familiar and current. So is that of the Saale in place of the Elbe. That the Semnones, place for place, are the Saxons of (the Kingdom of) Saxony is universally admitted. That they were Germans rests on the fact of their being admitted into the '*Germania*' of Tacitus. But it is certain that, during the first half of the seventh century, when we know the district from inspection, they are Sorabian Slavonians, or Serb Slaves; and so they remain till Saxony is Germanised.

The reconciliation of this discrepancy does not now interest us. What really interests us is the text of Ptolemy, who calls the Semnones *Suevi* (Σούηβοι). We cannot exactly fix their northern boundary. They

are not, however, the only population that is called *Suevic.* A second population is so named—the Langobardi. That they lay on the Elbe is neither affirmed nor denied by either Ptolemy or Tacitus. The Semnones are mentioned as a *great nation* of the Suevi, and, as we have seen, assigned to the Elbe. So, as we have also seen, are the Langobardi, who are made Suevic. But they are not called *Langobardi Suevi* in the section which treats of the Suevi. Neither does their place in the other text (for they are *twice* mentioned elsewhere) correspond with the Suevic district on the Elbe. Finally, Ptolemy mentions the L*akk*obards (*Λακκόβαρδοι*) as a third denomination in a different locality from the Langobardi *Suevi*; themselves, when associated with the Semnones and the other great Suevic nation (*ἔθνος*), not called *Suevi Langobardi*, but simply *Langobardi.* I believe that in a monograph on the minute ethnology of the early Langobards these complications might be explained; but what we want now is the geography and the ethnology of the division which Ptolemy calls *Suevic.* Tacitus helps here. He does not call the Langobards explicitly *Suevi*; but the position he gives them in his arrangement makes them so. He names them immediately after the Semnones, whom he makes the typical Suevi; and follows up his short notice of them with a long list of populations, until, having reached the eastern extremity of the Baltic, he writes—*hic Sueviæ finis.*

Now a Suevia of the vast indefinite magnitude of the Suevia of Tacitus is a very impracticable name. But a Suevia like that of Ptolemy, with only three names, and the Elbe as a landmark, is a very practicable one.

That the Langobardi lay north of the Semnones, and that they lay on the German side of the Elbe, is universally admitted. It is assumed (I believe reasonably)

that they touched the Elbe (or Saale) somewhere between Leipsic and Magdeburg. But this is immaterial. The Suevic line ran along the Elbe; and whether the Langobards reached it or not depends upon the northern boundary of the Semnones on the south and the southern boundary of the population which followed them on the north. This, again, was a *great nation of the Suevi*; and it lay east of the Langobards, stretching towards the north as far as the *middle* parts of the Elbe—the *Elbe* of Ptolemy, as we must remember, beginning at the source of the Saale. That the great bend of the Elbe about Magdeburg gives us a north-westerly extension from the Langobard, which we assume to be a middle district, is undoubted; and, though nearer the mouth than the source, Altmark meets better than any spot in Germany the conditions of the occupancy of this third and northernmost member of the Suevic denomination, and the second of its two *great nations*. At any rate, it identifies a vast and not very indefinite portion of Ostphalia with the whole of the *Suevia* of Ptolemy, and with all that part of the *Suevia* of Tacitus which in the Frank period was conterminous with Germany.

Hence Altmark, there or thereabouts, was the occupancy of Ptolemy's second *great* nation of the *Suevi*, and this was the nation of the Angles—*Σούηβοι Ἀγγείλοι*. No one, indeed, would venture to say that the two districts accurately coincided, and that there were no Angles on the right bank of the Elbe; or would fix within a few miles, more or less, the Northern frontier. That it suits the text of Ptolemy we have seen. It suits also that of Tacitus, whose Varini lay in Mecklenburg, and whose immediate affinities were with the Angli. And Ptolemy and Tacitus are the only two authorities on the subject. That it suits the conditions

under which the subsequent connection with Britain and Denmark was established, may be seen from the simple inspection of the map; and it may be added that the presumptions thus suggested are confirmed rather than diminished by the little that we have of the later history of the district.

§ 61. *The Langobards.*—The geographical position of the Langobards in Germany is unfixed. More than this, they are found in three different places at once, and under not less than three different forms of the name. The one tangible notice concerning them is that of Ptolemy, which makes them *Suevi*; and this in conjunction with the Semnones and the Angli. They lay north and west of the former, south and west of the latter. When this is all we know of them, it is clear that though the Semnones and the Angli may help us in fixing the Langobardi, the Langobardi will not help us in fixing either the Semnones or the Angli. That the three populations were in contact is clear, and it is also clear that the Semnones and the Angli certainly touched the Elbe; whereas the Langobardi may or may not have done so. If they did, the Angle and Semnonian frontiers —one or both—are slightly altered.

The account of this district in Zeuss is instructive. He points to the valley of the Ohre, an affluent of the Elbe from the German side, and remarks that on the left bank there are Slavonic local names, which he enumerates. He tells us that the town of *Wolmirsted* was called in Slavonic *Ustuire*, *i.e.*, the mouth of the river *Ara* = *Ohre*. He adds that the inhabitants of the surrounding villages were Slavonians. He concludes with the remark that the Slavonic Language has kept its ground on the German, better than on the Slavonic, side of the river; alluding to the Linonian Church Service of A.D. 1751. All this refers to the first half of the Tenth century. Then he tells us how about a century later the district was Germanized; when Albert of Saxony planted a series of German (chiefly from Holland) colonies from Saltzwedel to the Bohemian Forest, and how the 'Slavonians were everywhere stamped down; and how a brave people from the boundaries of

the Ocean took their land.' The *Angles* are never named, whether as Germans or Slavonians. But this is the area which can best be assigned to them.

The Suevic character, however, of the German side of the Elbe from Bohemia to Lunenburg is the only point which is important. Whether it be made out by the Angli and the Semnones alone, or by the Angli and Semnones *plus* the Langobards, is a detail of minor importance.

A little to the south of Magdeburg, and not far from 52 N. L., we approach the southern frontier of Ostphalian, or, as we may call it, Eastern, Saxony; so that a new name meets us in that of *Thuringia*, or the *Thuringians*. The Hartz is usually treated as the boundary between Saxony and Thuringia. But the range of the Hartz is not sufficiently linear to make a definite boundary of any extent. Hence, we find the valley of the Unstrut and the parts about Merseburg assigned to the Saxons; Merseburg itself being placed on the frontiers of the Saxons, Thuringians, and Slaves.

Again, about N. L. 52, the Saale from the south joins the Elbe; and from its mouth, N. L. 52, to its source, N. L. 50, takes the place of the Elbe as a boundary between the Germans, whether Saxons or Thuringians, and the Slavonians. The rule, however, seems to be as it has been, viz., that there are always more Slavonians on the German side of the two rivers than Germans on the Slavonian.

§ 62. *Thuringia and its relations to Ostphalia.*—The indefinite character of this boundary between the Thuringian and the Saxon districts on the Elbe is of no slight importance, though the direct and immediate bearing of it is, at first, indistinct. Ostphalia, as we have seen, is, in the Poeta Saxo, a division of Saxony. Thuringia, on the other hand, is generally, perhaps universally, separated from Saxony. Nor is the contrast

unintelligible. It is the South-eastern part of Germany that is most particularly Thuringian. It is the North-western parts that are most characteristically Saxon. These it was wherein the contrast between the Saxon, the Thuringian and (we may add) the Hessian, was clear and definite; but the Saxons were then the Saxons of Westphalia only; and the names Angraria and Ostphalia were unknown; in short they were unknown in the time of the immediate successors of Clovis.

The line of Frank conquests ran southwards rather than northwards. Hesse seems to have been a Frank dependency from the first. Thuringia was the next to become one. Bavaria was attacked, or under the process of reduction. The Saxons—those of the parts about Paderborn—were about to be permanently conquered; though on the south-eastern frontier only. This was the time of the true Merovingian dynasty; and before the assumption of the practical kingship was usurped by the Mayors of the Palace of the Pepin period. Friesland was reduced by these; but the great Saxon wars in the North and the North-east were reserved for Charlemagne. Then it was that the parts between Angraria and the Elbe became a division of Saxonia, under the name of Ostphalia. But this did not make it Saxon after the manner of Westphalia. It was Saxon as opposed to the Slavonic territory beyond the Elbe; for it was in the main German. But it was not Saxon in the same opposition to Thuringia as the parts between the Werra and Saale were. It was *Norsavian*, *Nordosquavian*, or North *Suevic* (*Nordschwaben*), i.e. the Suevia of Ptolemy, with the prefix '*North*.'

What this prefix stood in opposition to is uncertain, for it might imply the whole of the *Suevia* of Ptolemy in opposition to Suabia; or it might apply to the Angle part of the Ptolemaic Suevia in opposition to the

country of the Semnones (*Upper* Saxony). However, in either case it included the district which we have assigned to the Angles; and, in some degree, to the Langobards and Varini as well: for we have seen that though Ptolemy explicitly enumerates only three Suevic nations, Tacitus, by implication, adds the Varini and others of the Angle frontier.

§ 63. *The Norsavi of the Sixth Century.*—For the notice of these see the Epistle of Theodebert to Justinian. Theodebert reigned fourteen years, from A.D. 534 to A.D. 548. He was the grandson of Clovis; but, as his uncle Chlotair I. survived him, his reign belongs to the first generation from the founder. The Norsavi of the Letter are the Suevi of Ptolemy; the more northern the more Angle. The Saxons are named in the same Letter, but they are not the Saxons of what was afterwards Ostphalia.

§ 64. *The Suevi Transbadani.*—In the parts lying between the Saale, the Bode, and the Hartz lies a *Gau* or *Pagus* named *Suevongau*. This was occupied in the sixth century by a population which, according to Gregory of Tours (a cotemporary writer, though one who wrote from a distance), Chlotair and Sigibert had planted there as settlers at the time when Alboin invaded Italy. Paulus Diaconus, writing more than two hundred years later, makes the same kings transplant *Suavos aliasque gentes, in locis de quibus iidem Saxones exierant*, II. 6. Concerning these Witichind of Corvey writes:

> Suevi vero Transbadani illam quam incolunt regionem eo tempore invaserunt, quo Saxones cum Langobardis Italiam adiere, et ideo *aliis legibus* quam Saxones utuntur.—I. p. 634—*Zeuss*, p. 364.

Again:

> Pippinus adunato exercitu per Turingiam in Saxoniam veniens, fines *Saxonum* quos *Nordosquavi* vocant, cum valida manu intravit . . .

Saxones vero, qui *Nordosquavi* vocantur, sub ditionem subactos contritosque subegit.—*Annales Mettenses*, 748. *Pertz*, *I.* 330. *Zeuss*, p. 364.

§ 65. *The Anglii et Werini.*—The Laws which Witichind so decidedly separates from those of the Saxons are, doubtless, those of the Frank Code headed '*Lex Angliorum* (*sic*) *et Werinorum.*'* In its general character and outer form it agrees with the '*Lex Salica*,' the '*Lex Langobardorum*,' and, in several specially characteristic clauses, with those of the Anglo-Saxons of England, which, in their turn, have special points of agreement with those of the Langobards. The date for the codes of the populations under the Merovingian Franks is generally assigned to the reign of Dagobert, A.D. 600 (*circiter*). But the Anglo-Werinian code is somewhat later; for it applies to the parts on the Slavonic frontier, i.e. on the drainage of the Elbe, or on the Thuringian, Slavonic, Suevic, or Thuringo-Slavonic frontier. Professor Stubbs assigns it to the time of Charlemagne. At any rate, it belongs to a time when the Saxon part of the Frank kingdom had reached the Elbe. A gloss on the only known copy of it runs: '*Lex Angliorum et Werinorum—hoc est, Thuringorum.*'*

§ 66. *North Thuringia.*—The Saxon name has been carried as far south as the Unstrut, or the parts about Merseburg. The Thuringian name will now be found as far north† as the Ohre and Upper Aller, or the parts between Magdeburg, Celle, and Lunenburg, where we find in the tenth century a †*Nord-thuringergau* and a *Nord-thuringerland.* That this applies to settlements from the south rather than to a native occupancy, is likely. Still, they separate the Cisalbian districts, whether Thuringian or Norsavian (North Suabian), from

* *Canciani, Barbarorum Leges Antiquæ*, iii. 31–36.

† *Zeuss*, p. 359.

Saxony in the ethnological and philological senses of the term; in other words, make Ostphalia, as a part of Saxony, a political and artificial division. That parts called *Saxon* are other than Saxon after the fashion of Westphalia is nothing surprising. No name on the whole continent of Europe has been more extended to populations which have little beyond the name to connect them with the Saxons of the Merovingian period. In the tenth century the whole of Upper Saxony, or the present Kingdom, was Slavonic; while, beyond the *present* frontiers of the German language, *Saxon* is the name by which the Germans both of Transylvania and the Danubian Provinces of Russia are designated.

§ 67. *Retrospect.*—Putting all this together, viz. the political rather than the ethnological, or philological, import of the term *Saxonia* as applied to Ostphalia—the recognized difference between the Saxon and the Thuringian denominations—the still stronger difference between the Ptolemaic Suevi and the rest of the Germans in general—the fact that their old name is preserved in the newer names, *Norsavi* and *Nordosquavi*, until the time of the great Slavonic wars, when Saxony means Germany as opposed to Slavonia—the fact that between the Thuringians and the Norsavians the whole of the western drainage of the Elbe is divided—and, finally, the fact that, though Thuringia is properly the term for the southern, and Norsavia that for the northern half of the district, the two names are found on both sides of the middle line—putting all this together, I submit that we have strong evidence that the old lines of philological and ethnological affinities ran from North to South rather than from East to West.

CHAPTER VIII.

ON '*ANGLE*' AND '*SAXON*' AS NAMES.

§ 68. *The value of the words 'Angle' and 'Saxon' as names.*—What has hitherto been written has had more to do with the languages, dialects, or forms of speech of Germany, the country from which our language was deduced, than with the English, Saxon, or Anglo-Saxon of Britain. *Language*, however, has not been the special object of the enquiry. The special object of it has been the import of the names of the men who introduced it. It has, perhaps, been unduly lengthy. But it is a great deal more than a mere question of names. The words Angle and Saxon are by no means synonymous. The Saxon parts of England were long distinguished from the Angle; and, even at the present moment, though the latter term has wholly superseded the former, the traces of its original character are still retained in the names of the counties ending in *-sex*, not to mention the great kingdom of *Wessex*, since broken up into counties. How far this difference coincided with a similar difference in the mother-country is a matter worth investigation; and it is something to have shown that the difference between the two was certainly as decided in Germany as it will be in Britain. Nor is the enquiry, because its results are of a very one-sided, or negative, character, useless. It is certainly one-sided; for the import of neither name is known in its integrity. The term *Saxon* is so general, and Saxons are found in so many places at once, that those of England can scarcely be assigned to any definite original locality. *Angle*, on the other hand, is so very special, that though we can trace it to its original area, we know little beyond the fact of

its being between such and such degrees of latitude and longitude.

Of the Angles of Germany we only know enough to infer that they were the Angles of England; though, in England, they are known to all the world. Of Saxons, of some kind or another, we know a great deal; but of the special Saxon districts we have no knowledge—none, at least, of the Saxons of Sussex and Wessex. There is no spot on the face of the earth of which we may say, '*here the men called themselves Saxons, and from thence spread the name.*' We only know that there were a great many populations to whom the name *Saxon* was applied *by some other population.* On the other hand, one of the few known facts concerning the *Angle* was that it was a name which the bearers applied to themselves; and it is, by no means, the least valuable fact in their fragmentary and incomplete history. Again, with the Saxons, we find the language, but not the names of the populations which can be supposed to have applied it to themselves when Britain was first Germanized. With the Angles we find the place and the name; but the only known word in their language is the name *Angle* itself. We get our knowledge of the dominant name from one quarter, the chief details of its introduction from another.

Though those complications are absolutely inherent to the subject, it may be thought that they are unimportant; for it may be said that the English, as a language, speaks for itself, and proclaims itself to be German beyond all reasonable doubt. But whether *Angle* and *Saxon* are names which are little more than synonyms, or, on the other hand, names that point to two different centres, is a matter upon which little or much may depend. If the English language be one and indivisible, with no notable differences of dialect,

or none coinciding with the distribution of the two names, there is so little to be accounted for that investigation is well nigh superfluous. But, if our language contain differences within itself, the question whether they can be referred to different and corresponding sources is one that must not be overlooked. That such is actually the case is well known; for it is certain that at no previous period has more attention been given to the study of the different dialects of our language than at present, and that most successfully.

§ 69. *Saxon as a name.*—Nevertheless, something more has still to be said about these names, of which *Saxon* is the more important.

I believe that the best we can do with it is to read its interpretation under the light thrown upon it by the name '*German*.' Of this we know the present currency in England. We know, too, what a vast import it has in Tacitus, or, in other words, what it had in Rome in his time; and how it has, at present, one of similar generality in our own language and in others as well. Yet we know that it is *not* the name applied to Germany by either the French or the Italians; nor is the name in use among any of the Slavonic nations. Least of all is it one used by the Germans themselves. Tacitus indeed says that it was a name '*of their own invention*;' but he also says that, till it was so *invented* (we have no reason to believe that it was generally adopted), they had *no general* name. The Romans got it from the Gauls, the frontagers of the Germans on the west. Now, what was done on the western frontier of Germany may have been done on the eastern also; and a name of like general import with *German* may have been used by the frontagers of Germany on the east. This means that the word *Saxon* may have been on the Elbe what *German* was on the Rhine; viz. a general name

applied by a neighbouring nation to a population which had no general name for itself; though it had one in the language of its neighbours on each side.

The recognition of such names by the world at large depends wholly upon circumstances, for it is clear that each must be promulgated in different directions. A name given to a population between the Elbe and the Rhine must spread westwards from the west, and eastwards from the east. It scarcely ever circulates in the intervening country to which it applies. Hence the name by which the Germans are known to the Gauls and Britons may be wholly unknown to the Poles, Wallachians, and Lithuanians, while the name with which these last are familiar may be strange to a Gaul and Briton. No better instance of this can be found than in the three words *Hellenes*, *Greeks*, and *Ionians*. The first is the name the Greeks took to themselves; the second the Romans took, and spread over the whole western world; the third was taken on the side of Asia, and extends from Palestine to India. Sooner or later such concurrent names meet; but an inordinate circulation for each as a general name may have preceded the meeting.

This is the sketch of the question in its widest form, and the criticism which it indicates is one that, after a wide application of it, I have found to carry me farther than any other. It points, of course, to the Slavonians of Saxony and Brandenburg. These had a general name for the Germans; but we must not be too sure that it was *Saxon*. The general Slavonic name was *Niemce*, in the Byzantine Greek Νέμετζοι. It is not the word we want, but it illustrates the case. It has, probably, as wide a circulation as *German*; but it is in the wrong quarter for Gaul, and for the Romans who reduced Gaul to a province; from whom Western Europe adopted the name *German*. The name, how-

ever, need not have been used by *all* the Slavonians; nor need the name *Saxon*, as a matter of course, come from a nation other than German. The Franks were Germans; many of them in language as Saxon as the Saxons themselves. Yet, for some reason or other, they made a very broad distinction between themselves and their Saxon neighbours.

Any German of the Southern or Eastern frontier may have done the same; or any one of the Slavonians who did not use the word *Niemce*. If this were the case, *Saxon* may have been from the Elbe to the Dniester a word of the same application and currency as *German* was from the Rhine to the Danube. The Marcomanni may have used it; the Thuringians may have used it; the Goths may have used it; and any one of these populations may have been promulgators of the name *Saxon* in the Eastern Empire, even as the Gauls were the promulgators of *German* in the Western; and how numerous the populations between the Elbe and the Lower Danube were in the Eastern Empire we know. It appears for the first time in Julian. It is current from his time till the downfall of the Empire, and it is in the Gothic kingdoms of Gaul and Spain that it first appears in any western writer; and when Britain is reduced by the Saxons there is no notice of a single Saxon between the mouth of the Rhine and the mouth of the Elbe; not a single Saxon in the whole of that vast region which, a hundred years later, was called Saxony.

§ 70. *The Saxons of Rudolf.*—I think that in this matter an undeserved censure has been passed upon a writer of the *Translatio Sancti Alexandri.** That he has not said what he meant to say so clearly as he might have said it is true. But it is impossible to believe that even what he says will bear the construction that has been put upon it by both the editor and the commentators who have followed him; this being, that,

* Pertz, Monumenta Germaniæ Scriptorum, ii. 673–681. *Translatio S. Alexandri, Auctoribus Rudolfo et Meginharto.*

in Rudolf's work, we get nothing less in the way of error and confusion than an entire reversal of the received relations between the Saxons of Britain and the Saxons of the Continent; so that instead of the English of England being originally introduced from Germany, it is the Saxon of Saxony that was brought over, and introduced into Saxony, from Britain. If this is what the writer meant, it is undoubtedly a blunder that should be stigmatised. Is it, however, one that a German writer of even ordinary common sense could make? Still less, could a reader of Tacitus make it? Yet Rudolf had read Tacitus, and is known to have done so; indeed the extent to which he mixes up the very words of the *Germania* with his own narrative has been recognised by his commentators as a drawback upon the value of his own evidence. Such a man could scarcely deduce the descendants of the Chauci and Chamavi of the great writer with whom he was so familiar from Britain.

What he was really considering was the application of the word *Saxon* as a *name*. Well might he do so. And easily may we, even now, see why he should do it. The problem is still before us. Up to the time of Clovis the name, or series of names, for the Germans beyond the Frank frontier on the north, is wholly different from what it will be in the next generation. Up to the time of Clovis, and especially to the reader of Tacitus, the North Germans are Chauci, and Frisii, and Chamavi, and Dulgubini, and Angrivarii, and Fosi, and Cherusci, and Bructeri, &c.; and no such name as *Saxon* has ever either been applied, or dreamed of as being applicable, to these definitely known divisions of Germany. But in less than fifty years all these names, with the exception of *Frisii*, either suddenly or gradually disappear, and a new name, not found in Tacitus, and, except to such as have read Ptolemy, wholly unknown except in Gaul and Britain, presents itself instead of them. The origin of this name, and not that of the people to which it applies, is the point that strikes Rudolf, and the point upon which Rudolf is thinking; while the facts that lie before him are of the simplest sort. There is no such name as Saxon in Germany at all. In Gaul it is limited to a few fragmentary communities, such as the Saxones Bajocassini. In Britain it is conspicuous, dominant, and, in the way of geography, near at hand; and in no other country does it present itself under similar conditions. That he had read Ptolemy is unlikely; and had he read the writers of the fourth and fifth centuries he would not have found the name as that of either a German population or of a population of any note. We measure his ignorance by our own knowledge.

§ 71. The history of the word *Angle* is the reverse of that of the word *Saxon*; the chief points in the contrast having been already noticed. The name gives us the locality without the language, and it is so special

in its application that, so far as we have hitherto considered it, it includes nothing but the men who applied it to themselves. This makes it of rare occurrence. But the very rarity has its advantages. A Frank or a Saxon may have been almost any one of German blood. An Angle was generally nothing but what the term denoted.

The converse, however, is by no means the case, for it is probable that many an action of some of the old conquering tribes of the Angle frontier may have been recorded under a different name from that which it would have had if the Angles had been what we may call a representative population.

But they were not on the frontier of the populations that invested the name with generality, and spread its renown over half a continent; not, at least, on the side where the area was the broadest, and the voice of fame the loudest; not on the West, the East, or the South. On the North I think it was different. I think that in Denmark they represented not only themselves but all the populations between their own frontier and the Danish which were neither Saxon nor Slavonic, and that, (before the Saxons represented Frank Germany as opposed to Denmark,) both the Saxons and the Frisians may have been in the eyes of a Dane Angles. This close affinity suggested by the phrase '*Dan and Angul were brothers*' is more likely to have been taken from a time when the Angle name extended further in the direction of the Eyder, than from the contact of the two denominations in Britain.

That the Angle district lost its name in Germany is not a matter that should surprise us. There were at least four names to supersede or overlay it; (1) the old generic name *Suevi* from historical influences; (2) the name *Marchmen*, as men of the *March*; and,

(3) though it is itself obsolete, the departmental name *Ostphalian*. For '*Chreinarii*,' see § 72.

§ 72. '*Rheine*' and '*Chreine*.'—The chief deduction from the double aspect of the name *Angle* as a very special one on the East and South, and as one of some generality on the side of Denmark and Britain, is to be got from the text of Procopius in its integrity; for it has hitherto been referred to merely as evidence to the fact that there were Angles in Britain when the extract of § 25 was first written. This is self-evidently manifest, whatever may be our way of dealing with the fabulous story about the passage of the dead, and the utter absence of horses. In the passage, as we find it in our extract, we have a *Brittia* as well as a *Britannia*; and it is at first as difficult to connect the two as to separate them. But, besides this, there is the story or romance of the Frank king Radiger, and a British queen of Amazonian character. The name of the king, however, is the only one which is here of much importance. The part of Germany from which he passes over to England is the *Rhine*, or the country of the *Warni*, opposite to Britain. But the *Warni* were on the Elbe; and the *Angles*, as we have seen, were their nearest frontagers. They are this whether we look to the text of Tacitus or to the *Lex Angliorum et Werinorum*.

Now we know that in the region of his Angli, Varini, and others, Tacitus places a mysterious island by no means unlike an outline of the Brittia of Procopius; and also that a little beyond it he places the country of the Æstyii, whose language was * *lingua Britannicæ proprior*. The ways of error are various, and one of these in my mind seems to have led to the *Brittia* of Procopius.

Its relations to the Rhine are capable of a different

* Tacitus: Germania, § XLV.

explanation. Indifferent geographer as Procopius was for Western Europe, I doubt whether he bodily mistook the Elbe for the Rhine, or the Rhine for the Elbe—river for river. I think he had heard of the Elbe by something very like, though not exactly, a different and synonymous name. I think he may have heard of the Angles and Warni by a name equivalent to *Marcomanni*, or men of the *March* or *Ukraine*, for what is now the Alt*mark* (Old *March*), and that the name of the Elbe as a boundary had been substituted for its name as a river. We shall see that this view brings us to something which, word for word, is sufficiently like *Rhine* (*Rhein*) to be confounded with it.

The Slavonians had their *Marks*, or *Frontiers*, as well as the Germans; and the name for them was some form of the root *kr-*. Sometimes it had a vowel prefix, sometimes the affix *-n*, sometimes *both*. The most undoubted and at the same time the most familiar form of it is (*The*) *Ukraine* on the Dnieper. *Wagria* in Holstein and *Wagram* in Austria are extreme forms of it. If a river were also a *March*, it might be called after its name as such; and this is, really, the case with the **Ucker* in Brandenburg, now *Ucker-Mark*, wherein we have a bilingual compound. The same bilingual compound occurs in † *Creinamarcha* (*Carniola*); elsewhere '*in regione vulgare vocabulo Chreine et in marcha*' (*Krain d. i. Grenz* land). The occupants called themselves *Krajnci*. The Germans called them *Chreinarii*, i.e. *Chreinwœre* = *Chreinicolæ* = occupants of the *Chreine* or *March*, just as *Cantuarii*, or *Cantwœre*, were occupants of Kent.

* An der *Ucker* sassen die *Ucri*, *Uncrani*, *Ucrani*, *Uncri* Bewohner der in späteren Urkunden genannten provincia *Ucra*, *Ukra*, *Ukere*, *Ucre*, *Ukermark*.—*Zeuss*, p. 653.

† *Zeuss*, p. 620.

The text of Procopius bears out this view. (*a*) It forbids us to think that he placed the Warni on the *Gallic* Rhine, for he writes that they dwelt beyond the Danube, and reached up to the *Northern* Ocean; and I think that if we apply this to the Gallo-German Rhine we do violence to the text of even an indifferent geographer. (*b*) It justifies us in treating the Elbe as a *March*, or *Ukraine*; just as it is, according to the meaning of the word Alt-*mark*, at this moment; the only difference being that one name is German, the other Slavonic.

Οὖαρνοι μὲν ὑπὲρ—Ἴστρον ποταμὸν ἵδρυνται, διήκουσι δὲ ἄχρι τε ἐς Ὠκεανὸν τὸν ἀρκτῷον καὶ ποταμὸν Ῥῆνον, ὅστερ αὐτούς τε διορίζει καὶ τἆλλα ἔθνη ἃ ταύτῃ ἵδρυται . . . Οὖαρνοι δὲ καὶ. φράγγοι τοῦτ' μόνον τοῦ Ῥήνου τὸ ὕδωρ μεταξὺ ἔχουσιν. —B. G. 4. 20. Zeuss, p. 361.

That a Slavonic name for a German March, in the mouth of ambassadors at Constantinople in the time of Justinian, concerning the present district of Altmark, is possible need scarcely be argued, for it may have been taken up by any Slavonic population between the Lower Elbe and the Lower Danube; in other words, it need not have been current on the March or Ukraine itself. But it is well to ask how far it was probable on the *March* itself, for it must be remembered that in the time of Tacitus the Varini and Angles made part of his Germania, and what they were then they may possibly have been in the days of Procopius. Upon this point we can only give the probabilities. The Elbe, as has been already stated, was wholly unknown in detail and from personal inspection till the time of the Merovingian Franks, in the reign of Dagobert; and, then, from the frontier of Bohemia to Lauenburg and Holstein, every acre of the country of the right bank was Slavonic. We know this was the case with the present *Kingdom* of Saxony as early as A.D. 625—only about

70 years after the death of Procopius. What it was in Brandenburg we do not know by any special evidence till the time of Charlemagne, about a hundred and fifty years later. But we know then that it was, like Saxony, Slavonic; and we know that for more than two centuries later there were Slavonic occupancies on its German side, and, in Lunenburg, that Slavonic was spoken in the last century. Nearer than this, upon this point, we cannot go on positive testimony; and perhaps we have gone further in the way of approximate inference than was needful.

Such are the reasons for believing that a word so like *Rheinwœre* (=*occupants of the Rhine*) as *Chreinwœre* (=occupants of the *March*) may have led Procopius to call the Elbe the '*Rhine*.' This termination *-wœre* gives us the German form in full. In Latin it is replaced by *-uarii*, as *Cantuarii*, *Boructuarii*. The shortest form in which we find it is *-ĕr*, as in *Tenctĕri* (?), *Bructĕri*, which, though the oldest forms we have, are at the same time the most disguised. For current use, or the form which when a compound of this kind had taken root and passed into ordinary language, was both the most common and the most permanent, was *-arii*, as in *Angarii*, from *Angrivarii*=*Engerwœre*. Now this is the form which we have actually found elsewhere as *Chreinarii*, a form which, as it stands, is like *Rheinarii*, and which if written in Greek, as Ῥεινάριοι, would be more so.

§ 73. *The Embassy, &c.*—The Embassy was real. More than this, it was not one that stood alone. It rather seems to have been one of a series, probably connected with the same subject—the jealousy of the Roman Emperors of the extension of the Franks. Theodoric the Ostrogoth, as King of Italy, had sent a kind of commission of three kings, those of the Thurin-

gians, the Heruli (afterwards associated with the Warni), and the *Warni* (*Guarni*), backed by the Burgundians, to check the persecution of the Visigoths of France by Clovis. These are (some of) the *Norsavi* of the letter of Theodebert his grandson: Theodebert, who was now King of the Franks. Achiulf, a captain of the Suevi in Spain, was one of the Warni, but branded by Jornandes as a degenerate or doubtful *Goth*. The Warni mixed themselves up with the affairs of Italy between Narses and the Langobards, playing fast and loose. It is difficult to believe that, with the Warni from their Eastern, and the Langobards from the Western frontier, the Angles of the central district had no share in the great conquest of Lombardy. The Heruli, after intriguing with Narses in Italy, made their way to the Warni and attacked the Danes, who here for the first time are mentioned in history. Still the Angles are never named, just as no individual tribe, section, or subsection of the Saxons is never named. Yet the Angles were, in the eyes of Ptolemy, a *great nation of the Suevi*; and when the Suevi are broken up (becoming first Norsavi, and then '*Anglii and Werini*') the name crops out.

The Angles formed the central part of the denomination *Suevi*; and the history of the Langobard and Varinian frontiers explains how their name failed to become general in the South—whether West or East. *Langobard* is the name that appears from the time of Tacitus to that of the conquest of Lombardy, and that as soldiers or auxiliaries in connection with the *Western* Empire. The *Warni* appear only after the conquest of Italy by Theodoric from the *East*. The central *Angles* are nowhere in either Empire. On the north, however, where they follow the course of the Elbe, they form the leading and representative population, as the descend-

ants of Angul, the brother of Dan; so that, however subordinate to the Warni they may have been in Spain, and to the Langobards in Italy, they are anything but underrated in Denmark and in Britain. Indeed, they have probably attained prominence at the expense of their associates, especially those Langobardi and Warni, who have similarly eclipsed them in Italy and in Spain. Their further relations to the Danes will be noticed in the sequel.

§ 74. In a larger and more general work than the present no excuse would be needed for these details. But when we remember that it is just in the reigns of Theodoric (Thierry) and Theodebert, son and grandson of Clovis, that the ordinary details for the Saxon invasions end, and the later and more indefinite notices of the Angles begin, the prolixity may be excused. The truth is, that when we have cleared the narrative of Procopius from its manifest improbabilities, such as that of the ignorance of the Britons of horses, the wonderful passage to the island of the dead, and the romantic elements of the story; when, too, we have seen our way to an explanation of the name *Rhine* as applied to the Elbe, there is a very notable, undeniable, and important residuum of historic truth in it. For whether we have accurately explained, or merely explained away, the palpable excrescences in the way of fiction, and the alleged error in the way of geography, the fact that there were Angles in Britain still remains; and so does the reality of the embassy. Neither is there a shadow of reason for believing that Radiger was other than the real name of the king of Warni. Procopius was a bad geographer; but he knew what was meant by the word Britannia, and he knew where the Gallic Rhine ran. That he was perplexed by the concurrent names *Brittia* and *Chreine* is evident. Moreover he was cotemporary

with the embassy, and, probably, in Constantinople when it arrived. Keeping, then, to these unexceptionable outlines, we shall not do wrong in comparing his evidence as to the Angles with that of Julian as to the Saxons. Both are the first of their kind; i.e. the first since the times of Tacitus and Ptolemy; Procopius after an interval of about four hundred years. Hence, it is with them that the notices of either Saxons or Angles in connection with Gaul and Britain begin. Both are supported by incidental allusions in writers who followed them; and deal with populations of which it is almost certain that we have previous notices under other names—of Julian's Saxons under that of *Franks*, of the Angli of Tacitus under that of *Norsavi*. Both writers belong to a time when there is notable change of the history of the times to which they belong. Under Julian's next successor but one (Jovian's reign lasted but five months), Valentinian I., we have the Littus Saxonicum; under Theodebert's father, Theodoric (Thierry), we not only hear of the Norsavi, but of the *Danes*, who are also named by Procopius; the difference in date between the two notices being within a few years of one another; while, under his successor, Chlotair, we first hear of the Saxons *in Germany*, the time at least of the mentioning them as occupants of Saxony being, again, within a few years assigned to their introduction from Britain by Rudolf. Their British origin, as a reason for the name, is manifestly wrong, but the dates coincide. That there is error of some kind in Rudolf is certain, and we have tried to bring it down to its proper dimensions. But that he points to intercourse between Northern Germany and Britain is certain. And so does Procopius. Finally, Beda and the Anglo-Saxon Chronicle do the same; for the times of Chochilaicus (the first Dane named in history, A.D.

615) and of Radiger in Germany are the times of Offa in East Anglia, and of Ida in Northumberland, neither of them Saxons, but both Angles.

I should have mentioned that the notice by Procopius of the *Danes* is to the effect that the *Heruli* (ubiquitous during the whole of the downfall of the Western Empire, and whom we have seen in connection with the Saxons of Gaul) having fled from Italy, reached the country of the *Warni*, and with them expelled the Danes from their own proper * occupancies. This, probably, Procopius learned from the Angle embassy.

The account of Jornandes makes the Danes expel the Heruli; but, between the two, the evidence that there was an active movement of the populations on the Lower Elbe going on during the important reign of Theodebert is evident.

§ 75. *English allusions to the Angles of Germany.* —There are two poems in the Westsaxon of the tenth century, which have long commanded the attention of Anglo-Saxon philologists—'*Beowulf*' and the '*Traveller's Song.*' In both the Angles are named; but in Beowulf they seem to be the Angles of the Danish frontier rather than those of Britain, and in the Traveller's Song they are certainly the Angles of the Elbe. At any rate, there is no allusion to any name in connection with Britain. Upon this negative evidence influential writers have committed themselves to the opinion that the two works (especially the Traveller's Song) belong not only to Germany, but to a time anterior to the accredited date for the Angle conquest in Britain, (say) the fifth century. For such an inference as this, with other facts against it, the evidence is wholly inadequate; but, for the more

* See B. G. 2, 15; and Zeuss, p. 508 (Ἔρουλοι) *ἐς τοὺς Οὐάρνους καλουμένους ἐχώρησαν· μεθ' οὓς δὴ καὶ Δανῶν τὰ ἔθνη παρέδραμον ἐνθένδε τε ἐς Ὠκεανὸν ἀφικομένοι ἐναυτίλλοντο.*

moderate view that the localities and incidents are continental, it is ample.

§ 76. *The Traveller's Song.*—The Traveller's Song manifestly points to the Angles on the Elbe.

Hreð-cyninges	Of the *Hreð*-king
Hám gesohte	He sought the home
Eástan of Ongle.	East of *Ongle.*—l. 13–15.

The country of the *Hreths*, possibly the *Reud-igni* of Tacitus, and certainly the *Reið-gothas* of the Anglo-Saxon and Icelandic writers, lay between the Oder and the Vistula, due east of the district here assigned to the Angles of the *Norsavian* region; and with the (Nor)-*savi* the *Engle* are twice mentioned in the poem under notice.

Heólden forð siþþan	Continued thenceforth
Engle and *Swæfe.*	Engles and Swæfs. ll. 86-7.
Mid *Englum* iċ wæs	With Engles I was
And mid *Swæfum.*	And with Swæfs. ll. 121–2.

The whole composition points to the same localities and the same association of Angles, and Langobards, and Suevi.

That notices of the Angleland in Britain are so conspicuous from their absence as to have engendered the doctrine of a continental origin for the poem has already been stated; and it has already been stated that, though this doctrine is incompatible with the present form of the Traveller's Song, it is quite compatible with the antiquity and continental origin of its incidents and localities.

What the poem omits is as remarkable as what it mentions. The bard, skald, gleeman, or minstrel, is supposed to be a traveller over the whole world; and the mere names of the nations which he visited constitute about half the poem, which looks more like a

narrative put into the mouth of the Wandering Jew than any real wanderer.

The traveller, or gleeman, gives the names of certain kings as well as those of certain countries. Of these, Eormanric (Hermanric), the great historical Goth of the fourth century, is the chief. Cæsar, Alexander, Wallia, and Attila he had heard of, but Eormanric he had visited in his own kingdom. Eormanric, too, like a true king, rewarded the gleeman for his narrative, and so did Guthere (Gunther) of Burgundy. Ealfwine and Eadwine of Italy (i.e. Alboin and Audoin of Lombardy) were pre-eminently liberal. All these were patrons, and are chiefly alluded to in that capacity. Offa alone appears in the character of king and conqueror exclusively. He rules the *Ongle*: *Alewih*, his rival and cotemporary, ruling the Danes. Alewih can prevail against most men, but not against Offa; Offa, who made his name as a warrior when young, and afterwards enlarged his boundaries as far as Fifeldor (? The Eyder). These are the only heroes of whom we get more than the bare name. Eormanric is the mythic hero of Germany at large. Offa, Ealfwine, and Eadwine are, as Angles and Langobards, heroes of the special Angle district. The Burgundian Guthere alone lies wide of this centre, a centre for which the special details of the text are sufficiently appropriate; whereas for any wider or more general area they are singularly deficient; so much so that we learn perhaps more from what they pretermit than from what they contain.

Next to Eormanric, or Hermanric, the greatest name both in German myth and in German history is Theodoric; and of Theodorics there are, at least, three of notoriety—Theodoric the Ostrogoth, king of Italy; Theodoric II., king of Gaul; and Theodoric the Frank, father of Theodebert, and a cotemporary of Procopius.

Of these it is the last and least that is named in the Traveller's Song. Clovis is not mentioned at all; neither is Euric; neither, with the exceptions of Guthere and Gifica of Burgundy, and of Wala (probably Wallia), is any one who has not some special connection with the district of the Middle and Lower Elbe. The only names that are assigned to Britain are those of the Scots and Picts, and the Welsh (Wala-rice). To Scandinavia, on the other hand, the allusions are numerous.

§ 77. *Beowulf.*—The poem of Beowulf, like the Traveller's Song, though not, in its present form, of continental origin, is continental in its geography and incidents, though not so decidedly as the other poem. Both are equally wanting in positive allusions to *England;* but the positive allusions to certain parts of *Germany* are less definite in Beowulf; which Thorpe makes so much more Scandinavian than German that he hints at the likelihood of the Westsaxon poem being a translation from the Danish. If so, it must be from an original, not less than a hundred and fifty years older than the oldest specimen of the Old Norse for which we have any accurate date. Be this, however, as it may, there is no doubt as to the English or Danish character of one of its heroes, viz. Higelac, who, though not the protagonist, is the second both in rank and action.

The main incidents of Beowulf; the romance, or myth, of the poem; the special exploits of Beowulf himself may be treated like the impossible parts of the geography and chronology of the Traveller's Song, and eliminated at once, just as, from the legends that have connected themselves with the names of Theodoric and Charlemagne, we may eliminate the fate of the Nibelungs, or the legends of Oliver and Roland; and just as

from the undoubted Frank Embassy of Procopius we may eliminate the account of Britain, with which the ambassadors, either knowingly or unconsciously, seem to have perplexed either Procopius or his authorities. In spite, however, of these we find (if nothing more) the names of **Radiger* in Procopius, of *Offa* in the Traveller's Song, and of *Higelac* in Beowulf, as real individuals. That Higelac has been recognised as such is well known; and that, name for name, and man for man, the *Higelac* of Beowulf was the *Chochilaic-us* of Gregory of Tours has been admitted for the last sixty years. These, then, at least are historical.

§ 78. *Retrospect.*—Thus much (and more might be added) has been written about two poems of which the language is the Westsaxon of England, and the date of the manuscripts the tenth century. They are far from constituting anything like cotemporary evidence. But it is not the present writer who has propounded the doctrine that they give us England as it was before the Anglo-saxon conquest of Britain. All the present writer does is to show how far they help us in a question where a little light goes a long way—the question as to the differentiation between the Angle and the Saxon elements in our history and in our language. Something is done if we can invest the dualism with anything like reality; and, so far as Germany is concerned, something *has* been done. But the complement to this is the consideration of the difference between the Angle and the Saxon elements in England (Britain). This, for the present purpose, is limited to a review of our own Provinçial dialects.

* Compare this, word for word, with '*Hroðgar*' in Beowulf.

CHAPTER IX.

ON THE DIALECTS OF THE ENGLISH LANGUAGE — GENERAL VIEW — THE WESTSAXON — CLASSICAL PERIOD — MIDDLE PERIOD — PRESENT DIALECTS.

§ 79. *General view of the three English dialects.*— The dialects, languages, or forms of speech of Germany as the mother-country of the English have hitherto been considered, and that with special reference to the import of the names *Saxon* and *Angle*. Those of England itself now come under consideration.

They fall into three well-marked and natural divisions, viz. (1) that of the South and East, (2) that of the North, and (3) that of the Midland, Middle, or intermediate districts.

The first is conveniently called *Westsaxon*, the second *Northumbrian*, the third either *Midland* or *Mercian*.

Each division is a natural one; the third, however, has fewer positive characteristics than the other two, and takes its place as a group rather on the score of its being neither Westsaxon nor Northumbrian than from any definite characteristics of its own.

Over and above the outward and visible differences of structure (which in the Mercian are the least conspicuous) the *history* of each of them is different. Each in its time has been the leading literary language of Great Britain, almost, though not wholly, to the exclusion of the others; so that no two have ever flourished as representative languages of England at the same time. One has been the standard, typical, or representative language of the *early*, one that of the *middle*, and one that of the *present* epochs of our literature.

For the Anglosaxon period, or from the eighth cen-

tury to the battle of Hastings, the literary language was the Westsaxon, wholly, as far as our knowledge goes, to the exclusion of the Mercian, though not wholly to the exclusion of the Northumbrian. It is also the chief language for the scanty literature of the eleventh and twelfth centuries, or the time between the Norman Conquest and the reign of Henry III.

For the fifteenth century the Northumbrian dialect was the classical form of speech; not, however, as the language of England in its present sense, but as that of the English part of Scotland. It had a literature in England proper as well; but the rise of the Scotch literature in the time of the three Henrys; the decline of the Westsaxon as the classical dialect (or language), and the incipient character of the development of the Mercian, make this what a South Briton may call the Northumbrian, a North Briton the Scotch period.

It is the Mercian or Midland division to which our present literary language belongs.

Such is the general view of the three leading forms of the English language. Of certain sectional and equivocal varieties notice will be taken in the sequel.

§ 80. *Area of the Westsaxon.*—Westsaxon is a name which requires a preliminary notice, without which it might possibly mislead. The county of Kent, for instance, belongs to the Westsaxon area, yet, so far as its name goes, it stands in contrast to such words as Sus*sex*, Es*sex*, and Middle*sex*, and in that respect is other than Saxon; while, in respect to its geography, it is the most eastern county of the southern part of England. Es*sex*, on the other hand, which in name is Saxon, will be excluded from the Saxon division altogether. Then, on the other side of our island lies Cornwall. It lies far enough westward for anything; yet it is anything but Westsaxon, being scarcely a

dialect at all. This is because, like Wales and the Highlands of Scotland, it has exchanged its own proper language for the language of England at large rather than for that of its frontier; although on the side of Devonshire there are to be found, as is natural, a few Devonian elements.

Westsaxon, in short, is a political rather than a geographical term, meaning the Saxon of *Wessex*, the kingdom of Wessex being the one wherein the language most especially was cultivated, and most especially extended itself westwards. And not only westwards, but northwards; for although, on the east, the Thames forms its northern frontier, the Westsaxon dialects and subdialects are readily traced northward as far as Gloucestershire. Of Worcestershire and Herefordshire the Westsaxon character is less generally admitted; and of Shropshire the dialect is still more equivocal. Westsaxon characteristics, however, run further north than Shropshire; a point upon which more remains to be said.

The great characteristic of the Westsaxon is that it is so thoroughly the dialect of the classical and standard literature of the times anterior to the Norman Conquest, that, in the eyes of the grammarian and the lexicographer, it is practically synonymous, and more than coextensive with *Anglosaxon*. That it does not wholly and absolutely exclude the *Northumbrian* has just been stated. That it is the representative form of speech of the epoch is beyond doubt, ever if we make the largest allowance for the loss of compositions in the other two dialects.

With the ninth century begins the classical period for the Westsaxon literature, its two great names being Alfred and Ælfric. With the decline of this literature the prerogative of the Westsaxon declines; for the history of the *literary* English is not, as we have

seen, continuous; and it is *not* the Westsaxon from which, dialect for dialect, the literary English of the present time is lineally and consecutively derived. There is continuity in the history of the literary language in general; but between the particular dialect which culminated in the eleventh century and that which is now predominant, there is no continuity. Nor are breaks or faults of this kind rare; indeed they are so common that we expect them *a priori*. Neither in France nor Germany, neither in Spain nor Italy, are the classical dialects of the present time those in which the language was first written, cultivated, promulgated, and developed.

§ 81. The inflections of the Westsaxon are as follows:

DECLENSION OF THE NOUN.

	Masc.	*Fem.*	*Neut.*		*Masc.*	*Fem.*	*Neut.*
Nom.	Blind	blind	blind	*Nom.*	Blinde	blinde	blinde
Acc.	Blindne	blinde	blind	*Acc.*	Blinde	blinde	blinde
Dat.	Blindum	blindre	blindum	*Dat.*	Blindum	blindum	blindum
Inf.	Blinde	—	blinde	*Abl.*	Blinde	blinde	blinde
Gen.	Blindes	blindre	blindes	*Gen.*	Blindra	blindra	blindra

* This (*Ablative*) is Rask's name. *Instrumental* is another.

The Adjective in its Definite Declension.

	Sing.			*Plural.*
	Masc.	*Fem.*	*Neut.*	*All genders.*
Nom.	Blinda	blinde	blinde	Blindan
Acc.	Blindan	blindan	blinde	Blindan
Dat.	Blindan	blindan	blindan	Blindum
Abl.	Blindan	blindan	blindan	Blindum
Gen.	Blindan	blindan	blindan	Blindena

The difference between the indefinite and definite declension is not a difference between two classes of adjectives, but a difference between the forms of the same adjectives according to their place in the context. Hence, it is a matter of Syntax rather than of Etymology. In the present English we say, *a blind son, a blind daughter, a blind eye; blind sons, blind daughters, blind eyes; the blind son, the blind daughters, the blind eyes; the blind sons, the blind daughters, the blind eyes*, indifferently. But in Anglosaxon the difference between the indefinite and definite article involved a corresponding difference in the form of the adjective that followed it. Thus:—

Indefinite.	*Definite.*
An blind son	Se blindā son
An blind dohtor	Seo blinde dohtor
An blind eage	þæt blinde eage
Blinde sonu	þa blindan sonu
Blinde dohtra	þa blindan dohtra
Blinde eagan	þa blindan eagan

Substantives.

Here there is not only the distinction of gender as in Latin and Greek, with certain differences of detail in the way of declension to correspond with it, but there is a higher division of the declensions into '*strong*' and '*weak.*' Rask calls them *complex* and *simple.*

Masculine Substantive—(Strong Declension).

Singular.	*Plural.*
Nom. Dæg	*Nom.* Dagas
Acc. Dæg	*Acc.* Dagas
Dat. Dæge	*Dat.* Dagum
Abl. Dæge	*Abl.* Dage
Gen. Dæges	*Gen.* Daga

Neuter Substantive—(Strong Declension).

Singular.	*Plural.*
Nom. Word	*Nom.* Word
Acc. Word	*Acc.* Word
Dat. Worde	*Dat.* Wordum
Abl. Worde	*Abl.* Worde
Gen. Wordes	*Gen.* Worda

Feminine Substantive—(Strong Declension).

Singular.	*Plural.*
Nom. Dæd	*Nom.* Dæda
Acc. Dæde	*Acc.* Dæda
Dat. Dæde	*Dat.* Dæda
Abl. Dæde	*Abl.* Dædum
Gen. Dæde	*Gen.* Dædum

Here the nominative case ends in a consonant, and the genitive case for the masculine and neuter genders ends (generally) in *-s*.

In the *weak* declension the nominative ends in a vowel, and there is no case ending in *-s*; but, on the contrary, a strong *nunnation* (or prevalence of the sound of *n*) throughout.

Weak Declension.

Singular.

Masculine.	*Feminine.*	*Neuter.*
Nom. Hana	tunge	eage
Acc. Hanan	tungan	eage
Dat. Hanan	tungan	eagan
Abl. Hanan	tungan	eagan
Gen. Hanan	tungan	eagan

		Plural.	
Nom.	Hanan	tungan	eagan
Acc.	Hanan	tungan	eagan
Dat.	Hanum	tungum	eagum
Abl.	Hanum	tungum	eagum
Gen.	Hanena	tungena	eagena

That these two declensions, especially the latter, are closely allied to the indefinite and definite declension of the adjectives is clear; and it may be added that the terms *weak* and *strong*, as the names of the forms in which the words of the two declensions present themselves, apply to the adjective as well as the substantive. Thus *blindne* is a *strong* form, characteristic of the *indefinite*, whereas *blindan* is a *weak* one for the *definite* declension. In other words, *strong* and *weak* are terms in Etymology; *definite* and *indefinite*, terms in Syntax. Substantives, which are unaffected by the character of their article, or indeed by the context at all, have only one form, and are *either* strong or weak according to their own proper structure; and what they are in one case they are in others, i.e. they are equally strong or weak whether they are definite or indefinite. With adjectives the case is different; and the same word is weak or strong according as it is indefinite or definite.

This double declension of the adjective is the point in which the English of Anglosaxon is most specially contrasted with that of the present period. In the present English the adjective is preeminently destitute of inflections, being reduced to a single form for all the cases and genders; and both the numbers—*good man*, *good man's*, &c. With the exception of the articles *the* and *an* (*a*), no part of speech is thus denuded of its old inflections. In Anglosaxon, no noun had more of them than the adjective; for it had all the ordinary

forms of the substantive and the double or concurrent declensions of definite and indefinite besides.

It is only, however, in the English that this extreme denudation of the adjective is found. In *all* the other languages of the German family the difference between the definite and indefinite adjective is retained, and so (though it does not always show itself so conspicuously) does the difference between the weak and strong declensions. Of the former the word *oxen* is a single existing fragment.

Conjugation of the Verb.

Infinitive—nerian
Gerund—to nerianne
Present, or Active, Participle—neriende
Preterit, or Passive Participle—genered
Imperative Singular—nere
Imperative Plural—neriaþ

Indicative Mood.

Present.	*Preterit.*
1. Ic nerie	1. Ic nerede
2. Ðu nerest	2. Ðu neredest
3. He nereð	3. He nerede
1. We neriað	1. We neredon
2. Ge neriað	2. Ge neredon
3. Hi neriað	3. Hi neredon

Conjunctive Mood.

Present.	*Preterit.*
1. Ic nerie	1. Ic nerede
2. Ðu nerie	2. Ðu nerede
3. He nerie	3. Hi neredes
1. We nerien	1. We nereden
2. Ge nerien	2. Ge nereden
3. Hi nerien	3. Hi nereden

Indicative Mood.

Present.	*Perfect.*
1. Ic nime	1. Ic nam
2. Ðu nimest	2. Ðu name
3. He nimeð	3. He nam
1. We nimað	1. We namon
2. Ge nimað	2. Ge namon
3. Hi nimað	3. Hi namon

Conjunctive Mood.

Present.	*Perfect.*
1. Ic nime	1. Ic name
2. Ðu nime	2. Ðu name
3. He nime	3. He name
1. Wi nimen	1. Wi namen
2. Ge nimen	2. Ge namen
3. Hi nimen	3. Hi namen

This is about all that finds place in a work like the present. The details of the Westsaxon, a study by themselves, are to be found in the ordinary Grammars. For texts the reader is referred to Thorpe's *Analecta Anglo Saxonica.*

In the foregoing sections the Westsaxon is taken as the standard of the oldest literary English. The chief parts in which the other dialects, especially the Northumbrian, differ from it, will be seen in the next two chapters.

§ 82. *The Westsaxon—Middle Period.*—For some time subsequent to the Norman Conquest the Westsaxon maintains its prerogative. English literature of any kind has notably decreased; but it may safely be said that, until the middle of the thirteenth century, there is nothing that is distinctly other than Westsaxon. Some influence, too, it exerted as a standard, or classical form of English, even during its decline.

This, however, belongs to the history of the English language in general, rather than to the Westsaxon form of speech in particular. The forms *se*, *seo*, as definite articles, are among the first old characteristics that become obsolete. *Heo* (now *hoo*) = *she*, and the present plurals in *-th*, the termination *-inde* (as opposed to *and* and *ende*) and the participial prefix *y* = *ye*, are permanent. On the other hand the final *n* is often dropped — as in *y-broke* = *ge-brocen*. As compared with the other two dialects, the Westsaxon preserves

the inflections of the Anglosaxon period, though changed.

Two changes in the *external* history of this dialect present themselves, in the thirteenth century.

(1.) The area for which we find Westsaxon characteristics is increased. Dorsetshire (as a centre), Hampshire (?), Wilts, Somersetshire, and Devon, i.e. the western parts of the area, are the districts to which the mass of the known Westsaxon compositions are referred. During the Middle Period we get them from Gloucestershire and Worcestershire (?) on the north, and from Surrey and Kent on the east.

(2.) The use of the letters *v* and *z* becomes a recognized part of the orthography. This makes it probable that, though not found in the Anglosaxon spelling, they may have been common in its pronunciation, or at least commoner than we infer from the spelling.

The two great Westsaxon works of the thirteenth century are the Brut of Layamon from Gloucestershire, and the Ancren Riwle from Wiltshire. In the latter the letters *v* and *z* are used freely, where in Anglosaxon we should use *f* and *v*. Robert of Gloucester is the great representative of the Westsaxon of the reign of Edward I., the beginning of the fourteenth century. Here we find *heo*, *heora*, &c., for *she*, *their*, &c., the plural of present tense in *-th*, and most of the other recognized characteristics.

But Midland and Northumbrian compositions have already presented themselves, and the germs of two literary fresh languages have taken root.

The Westsaxon work which now interests us the most is the one from which the following extract * is taken :—

---

* From *Bosworth—Dictionary of the Anglo-Saxon Language*, p. xxvi.

Nou ich wille þet ye ywite hou hit is ywent;
þet þis boc is ywrite mid Engliss of Kent.
þis boc ymade uor lewede men,
Uor uader and uor moder and uor oþer ken,
Hem uor to berze uram alle manyere zen,
þet inne hare inwytte ne bleve no uoul wem.
Huo as God is his name yzed,
þet þis boc made, God him yeue þet bread
Of angles of hueuene; and þerto his red,
And onderuonge his zaule huanne þet he is dyad.
Amen.

Ymende þet þis boc is uolued ine in þe eue of þe holy apostles Symond and Judas of ane brother of þe cloystre of Sauynt Austin of Cantorberi, ine þe yeare of oure Lhordes beringe 1340.—*Arundel MSS. No.* 55, *British Museum.*

The work to which this belongs is the *Ayenbite of Inwit*, or the *Againbite*, *Remorse*, *Sting*, or *Prick* of Conscience (*inner sense*). When and where it was written we have seen. Its special value in the present enquiry lies in the fact of its showing the Westsaxon character of so eastern a dialect as the Kentish, of which we have no known specimens for the times anterior to the Conquest, and which at present is scarcely a dialect at all. Besides this, the spelling, which is to some extent phonetic, represents the sounds of *v* and *z* as they are at present pronounced in the south-west of England, better than an orthography of a more classical and literary character. This, however, we have seen already in the Ancren Riwle.

For the latter half of the fourteenth century Trevisa is the representative Westsaxon writer. His work, printed by Caxton with adaptations, shows that the Westsaxon is now no longer the standard English.

§ 83. *Present State and Existing Dialects.*—Wiltshire, Dorset, Somerset, and Devonshire are the pre-eminently Westsaxon counties, the Devonshire dialect being an extreme one. In Hampshire the Westsaxon

characteristics are notably diminished, still more so in Sussex. In Kent and Surrey they are only found in fragments. Western Berkshire, and the southern parts of Worcestershire, are more Westsaxon than aught else. The boundaries, however, between the Westsaxon and the Mercian are uncertain; indeed it is probable that the divisions so graduate into one another as to leave no boundary at all.

§ 84. The *Phonesis* of the Westsaxon dialects, which is very uniform over a wide area, very decided in character, and in many cases characteristic, is best illustrated by the following examples selected, exclusively, from Mr. T. Spencer Baynes's '*Somersetshire Dialect; Its Pronunciation*':

Vowels.

Lengthened—

Bee-ast = beast
Clee-an = clean
Mee-olk = milk
Nee-ad = (need)
Shee-ape = (sheep)
Zee-ade = (seed)

Converted into Triphthongs—

a. By prefixing *y*:

Yee-ale = ale
Yee-arm = arm
Yee-abel = Abel
Yee-aels = ells

b. By prefixing *-w* or *-u*:

Buoy = boy
Buoile = boil
Guaine = going
Quoat = coat
Whoame = home

General, but not characteristic, being far from uncommon elsewhere. See Northumbrian specimens.

The Devonshire dialect has an approximation to the French *eu*, and, one closer still, to the Scotch *u* in *gude* or *guid*:

Mune
Spune
Guze
Shuze
Vuze = views

Liquids.

R (*a*) omitted—

Hoäce = hoarse
Pason = parson
Scace = scarce
Veäce = fierce

(*b*) transposed—

Birge = bridge
Curmson = crimson
Hurn = run
Hird = red
Hirddick = ruddock (Robin Redbreast)
Dird = thread
Begurge = begrudge
Hirch = rich
Hirsh = rush

Neuter.

T to D—

Bedder = better
Budder = butter
Liddle = little
Maddick = mattock

The *Th* in *Thin*, to the *Th* in *Thine*.
The *Th* in *Thine* to D :

Droo = through
Dree = three
Dreaten = threaten
Drow = throw

The change from F to V, and from S to Z, is notorious, and, at the same time, characteristic. It is the first change that an imitator of the West country dialect has resort to. At the end of words

Turve = turf
Hoaäve = hoof
Looäve = loaf
Leäve = leaf
Keeäve = calf
Weäve = wife

At the beginning of words :

The softening of F into V at the beginning of a word is all but universal in the dialect. The following short dialogues may be taken in illustration :

(1)

'Guaine to *vy*-er?'
'Eze.'
'Oh, brave! *vine* daye *vor* the *volks* at the *vy*-er. Guaine a-*voote*?'
'Aye, *vooäsed* too. Bill hurned a *voorke* into the old mare's *vet*-lock, and *her's a*-valled leeame.'

(2)

Hannah. Beänt there many *vyers* in Lunnun, Miss?

Visitor. Yes, unfortunately, too many.

Wife. What do a think, Miss, o' thic zilly lass, Hannah? **her* and vather walked sixteen miles to zee a *vyer*.

Visitor. Were there many houses burnt?

Hannah. Houses burnt—noa, Miss! There beant nothing at all burnt at *vyers*.

Visitor. Not anything burnt at fires?

Hannah. Noa, Miss, it wasn't a *vier*, but a *vyer*.

Visitor. Well, what do you call a fire?

Hannah. Why, a *vyer* be where they zell gingerbread, and cloth, and ribbons, and show wild beeastes; . . . I do like *vyers* zo much.

T. S. Baynes, pp. 16–17.

Ng.

This becomes *-en.*

Transposition of S.

Claps = clasp	Apse = aspen
Crips = crisp	Waps = wasp

That the changes between the consonants are all in one direction, so that the details can be given in a general rule, is clear. They are all changes from the Surd to the Sonant (Hard to Soft, or Sharp to Flat). The *d* for *th* Mr. Lower finds as far west as East Sussex.

1. *De* song of songs, *dat* is Solomon's.

2. Let him kiss me *wud de* kisses of his mouth, for yer love is better *dan* wine.—*Ch.* i.

§ 85. *Inflections.*—The following are still preserved:

(1.) The true *accusative* of *he*, ending in *-n*, originally *hine*, and not *him*—which was Dative.

(2.) The Infinitive in *-y*, as *milky* = A.S. *meolcan* = (*to*) *milk.* Of this Mr. Barnes writes:

The Dorset has, like the Magyar tongue, a form of the Infinitive Mood, which may be called the habitual or free infinitive, for an action unapplied to any particular object: it ends in *y*:

---

* So it stands in the text. It does not, however, mean that the word is in the Accusative case. It rather represents the older *heo*.

'*Can ye mowy?*' (Can you mow? in general).
'Can ye *mow* this grass?'

Notes to the Song of Solomon, Dorset dialect (Buonapartean Collection), p. iv.

(3.) The Participial prefix *ge-*; now *a* or *i*.
(4.) The plural of the Present in *-th*. Nearly extinct.

§ 86. *Syntax.*—Mr. Barnes writes:

In Dorset things are taken as of two classes: (1.) the personal class of formed individual things, as, *a man, a tree, a tool*; and (2.) the impersonal class of unformed quantities of things, as, a quantity of *hair*, or *wood*, or *water*. *He* is the personal pronoun for the personal class, and *it* for the impersonal. A tree is *he*, and some water is *it*.—*Notes*, &c., p. iv.

The demonstrative pronouns for the personal class are *thëase* and *thik*, and of the impersonal class, *this* and *that*. We say, '*Thëase* tree by *this* water;' *Thik* cheese and *that* curd.—*Ibid.*

§ 87. Examples.

(1.) *The Accusative in -n.* In A.S. *hine.* (For *heo*, see p. 110 note.)

Let *en* kiss me wi' the kisses ov his mouth; vor your love is better than wine.—*The Zong o' Solomon*, i. 2. *Dorset—Barnes.*

Let *un* kiss me wi' the kisses o' hiz mouth, vor thoi love be better than woine.—*The Zong o' Zolomon*, i. 2. *Somerset—T. Spencer Baynes.*

Let *un* kiss m' wi' th' kisses o' huz mouth, vor yer love is better 'n wine.—*Th' Zong o' Zolomon*, i. 2. *North Wiltshire—Kite.*

Let '*n* kiss ma way tha kisses uv es mowth; vur thy luv es better then wine.—*Tha Zong uv Zol-amen*, i. 2. *Devonshire—Baird.*

(2.) *The Infinitive in -y.* Found, also, in Somersetshire:

The most archaic inflections in the dialect are the infinitive in *-e*, or *-y-*, as *to milky* . . . and the plural in *-ath*, as *they oryath*.—*T. Spencer Baynes—Notes.*

(3.) *The Participial Prefix.* In A.S. *gecumen*= *come*:

The flowers do show on the ground; the zong o' the birds is *a-come*, an' the coo o' the culvor 's *a-heärd* in our land.—*Song of Solomon*, ii. 12. —*Dorset.*

(4.) *The plural in -th.* In A.S. *we, ge, hi, lufiaþ* = *we, ye, they love. Obsolete, or obsolescent.*

The 'vlowers *sprout'th* vwoarth in th' grown; th' taime 's *a-kimd* round ver th' whis'lin' o' birds, an' th' craw o' th' culver 's *a-yird* vur an neah.—ii. 12.

§ 88. Specimens

(The more characteristic forms are underlined.)

Wiltshire.

Everybody kneows owld Barnzo, as wears his yead o' one zide. One night a was coming whoame vrom market, and vell off's hos into the road, a was *zo* drunk. Some chaps coming by picked *un* up, and zeein' his yead was al o' one zide, they thought 'twas out o' jint, and began to pull 't into 'ts pleace agen, when the owld bwoy roar'd out, 'Barn zo (*born so*), I tell 'e!' Zo a' was allus called owld Barnzo ever a'terwards. —*Akerman—Wiltshire Tales.*

Dorsetshire.

Poems by the Rev. W. Barnes in the Dorsetshire Dialect.

Somersetshire.

Of this the following is a strong-marked, but scarcely an extreme specimen :—

Mr. Guy and the Robbers.

1.

Mr. Guy war a gennelman
O' Huntsfull, well knawn
As a grazier, a *hirch** one,
Wi' lons o' hiz awn.

2.

A oten went ta Lunnun
Hiz cattle ver ta zill;
All the hosses that a rawd
Niver minded hadge or hill.

3.

A war afeard o' naw one;
A niver made hiz will;
Liko wither vawk, avaur a went
Hiz cattle ver ta zill.

4.

One time a'd bin to Lunnun,
An zawld hiz cattle well;
A brought awa a power o' gawld,
As I've a hired tell.

---

* So, also, *urn* = *run*, a true *West*-Saxon form.

5.

As late at night a rawd along,
All *droo* a unket ood,
A ooman rauze vrom off tha groun,
An right avaur *en* stood.

6.

She look'd za pitis Mr. Guy
At once hiz hoss's pace [night,
Stapt short, a wonderin how, at
She com'd in jitch a place.

7.

A little trunk war in her hon;
She zim'd vur gwon wi chile,
She ax'd en nif a'd take er up
And cor er a veo mile.

8.

Mr. Guy, a man o' veelin
Vor a ooman in distress,
Than took er up behind *en*;
A cood'n do na less.

9.

A corr'd er trunk avaur *en*,
And by hiz belt o' leather
A bid her hawld vast; on tha rawd,
Athout much tak, together.

10.

Not vur tha went avaur she gid
A whizzle loud an long,
Which Mr. Guy thawt very strange,
Er voice too zim'd za strong;

11.

She'd lost er dog, she zed; an than
Another whizzle blaw'd,
That stortled Mr. Guy; a stapt
Hiz hoss upon tha rawd.

12.

'Goo on,' zed she; bit Mr. Guy
Zum rig beginn'd ta fear;
Vor voices rauze upon tha wine,
An zim'd a comin near.

13.

Again tha rawd along; again
She whizzled, Mr. Guy
Whipt out his knife an cut tha b
Than push'd er off; ver why?

14.

Tha ooman he took up behine,
Begummers, war a man;
Tha rubbers zaw ad lad ther plot
Our grazier to trepan.

15.

A sholl not stap ta tell what zed
Tha man in ooman's clawse,
Bit he an all o'm jist behine
Var what you mid suppanse.

16.

Tha cust, tha swaur, tha *dreate*
An ater Mr. Guy [t
Tha gallop'd all; twar niver
Hiz hoss along did vly. [ne

17.

Auver downs, *droo* dales, awa a we
Twar da-light now amawst,
Till at an inn a stapt, at last,
Ta thenk what he'd a lost.

18.

A lost! why nothin—but hiz belt
A zummet moor ad gain'd;
Thic little trunk a corr'd awa,
It gawld galore* contain'd.

19.

Nif Mr. Guy war hirch avaur,
A now war *hircher* still,
Tha plunder o' tha highwamen
Hiz coffers went ta vill.

20.

In safety Mr. Guy rawd whim,
A oten tawld tha story;
Ta meet wi' jitch a rig myzel,
I shood'n soce be zorry.

---

* This is not a provincial, but a slang, word. It is *galeor* = *enough* and is Gaelic.

Devonshire.

Rab. Zo, Bet, how is't? How de try?—Where hast a'be *thicka* way? Where dost come from?

Bet. Gracious, Rab! you gush'd me. I've a' be up to vicarige, to vet a book vor dame, and was looking to zee if there be any shows in *en*, when you wisk'd over the stile, and galled me.

Rab. And dost thee look so like a double-rose, when thee art a' galled, Bet? What dost thee gook thee head vor: look up, wo't?

Bet. Be quiet: let 'lone my hat, wol ye?

Rab. What art tozing over the book vor?

Bet. Turning out the dog's ears.

Rab. 'Ot is it—a story-book?

Bet. I wish 'twas, I love story-books dearly; many nearts I've a' zit up when all the volks have a' be a-bed, and a' rede till es have had a crick in the niddick, or a' burn'd my cep.

Rab. And dost love to rede stories about spirits and witches?

Bet. I'll tell thee. I was wan neart reding a story-book about spirits, that com'd and draw'd back the curtains at the bed's voot (and there was the ghastly pictures o' em). The clock had beat wan, when an owl creech'd 'pon the top o' the chimley, and made my blood rin cold. I zim'd the cat zeed zum 'ot: the door creaked, and the wind hulder'd in the chimley like thunder. I prick'd up my ears, and presently, zum 'un, very hurrisome, went dump! dump! dump! I would a' geed my life vor a varden. Up I sprung, drow'd down my candle, and douted *en*; and hadn't a blunk o' fire to teen *en* again. What could es do? I was afeard to budge. At last I took heart, and went up stears backward, that nort mert catch me by the heels. I didn't unray mysel vor the neart, nor teen'd my eyes, but healed up my head in the quilt, and my heart bumpt zo, ye could hear en; and zo I lied panking till peep o' day.

Rab. Poor Bet! why if a vlea had hopp'd into thy ear thee wot a' swoon'd.

Bet. You may well enew laugh at me, but I can't help et, nor vorbear reding the books when I come athort 'em.

Gloucestershire.

*George Ridler's Oven.**

1.

The stowns that built George Ridler's Oven,
And thauy qeum from the Bleakeney's quar;
And George he wur a jolly old mon,
And his yead it graw'd above his yare.

---

* From Halliwell's Archaic and Provincial Dictionary.

2.

One thing of George Ridler I must commend,
And wur that not a notable theng?
He mead his brags avoore he died,
Wee any *drce* brothers his zons z'hou'd zeng.

3.

There's Dick the treble and John the mean,
Let every mon zing in his auwn pleace,
And George he wur the elder brother,
And therevoore he would zing the beass.

4.

Mine hostess's moid (and her neaum 'twur Nell),
A pretty wench, and I lov'd her well;
I lov'd her well, good reauzon why;
Because zhe lov'd my dog and I.

5.

My dog is good to catch a hen,
A duck or goose is vood for men;
And where good company I spy,
O thether gwoes my dog and I.

6.

My mwother told I when I wur young,
If I did vollow the strong beer pwoot,
That drenk would pruv my auverdrow,
And meauk me wear a thread-bare cwoat.

7.

My dog has gotten zitch a trick,
To visit moids when thauy be zick;
When thauy be zick and like to die,
O thether gwoes my dog and I.

8.

When I have dree zispences under my thumb,
O then I'm welcome wherever I come;
But when I have none, they pass me by;
'Tis poverty pearts good company.

9.

If I should die, as it may hap,
My greauve shall be under the good yeal tap;
In vouled earms there wool us lie,
Cheek by jowl, my dog and I.

§ 89. *The Two Colonies.*—To this list may be added two localities, clearly beyond the proper Westsaxon boundary—one in Wales, and one in Ireland.

(1.) The Peninsula of Gower, in Glamorgan, and (?) Pembrokeshire. According to Higden, certain Flemings, in the reign of Henry I., were removed from Mailros, in the eastern part of England, to Haverford, in West Wales. He adds that these Flemings of West Wales now (in his time) speak good Saxon.

> Flandrenses vero qui in Occidua Wallia incolunt, dimissa jam barbarie, satis Saxonice loquuntur.—Higden, edit. *Gale*, p. 210.

The only vocabulary I know of the *Saxon* of West Wales is from the Peninsula of Gower, the *Little England beyond Wales.* It is by the Rev. J. Collins, published in the *Transactions of the Philological Society*, No. 93. It contains nothing Flemish; but, on the contrary, as much as we can expect in a vocabulary of Westsaxon, viz. the Infinitive in *y*—*seggy* = *to tease*; *firmy* = *to clean out*; *purty* = *to turn sulky*; *dreshel* = *a flail.* On the other hand, it shows no predilection for the sounds of *v* and *z* for those of *s* and *v*.

§ 90. (2.) The Irish specimens are both more decidedly Westsaxon, and more interesting in other respects. The district is the Baronies of Forth and Bargie, in the county of Wexford. The speakers are believed to be the descendants of a colony from Wales (? the West Welsh Saxonized Flemings of Higden), settled by the followers of the Earl of Pembroke (Strongbow) under Henry II.

The following short extract gives us, besides the consonantal initial *v* and *z*, the Westsaxon *dicke* = *thilk* = *thy-lik* = *this*, and the plural in *-th*; and, what is more instructive, the Gaelic pronunciation of the *wh-* in *whose* (*fose*).

Yn ercha an olo whithe yt beeth wi' gleezom o' core th' oure eene dwi*theth* apan ye *vi*gere o' *dicke* *z*overeigne, Wilyame ee *V*ourthe unnere *fose* fatherlie *z*wae oure deis be ee spant.—*Address (in the Forth language) to The Lord Lieutenant of Ireland, presented August* 1836.

This change from *hw* to *f* is, undoubtedly, due to the influence of the native Gaelic. The same occurs in the north-east of Scotland under the same conditions.

——Celtic influence has changed the *hwo, hwose, hwat, hwan, hwarc,* of Strongbow's English followers into *fo, fose, faad, fan, far*—has changed the *hwa, hwas, hwat, hwan, hwar,* of the Angles and Flemings of the north-east, and Norwegians of the north, into the *faa, faa's, fat, fan, faar* of Aberdeen, Caithness, Angus, and Moray.—*Murray. The Dialect of the Southern Counties of Scotland,* p. 28.

The indication of this coincidence and the recognition of the foreign character of the soil to which a second language attaches itself, as an efficient influence upon the phonesis of the intruding form of speech, is valuable because it has often been denied, and oftener either ignored or overlooked.

§ 91. *Later stages Analytic as opposed to Synthetic.*—The reader is now referred to the Dative Case of the substantives, especially to those ending in *-um*, or those in which *-um* is the sign of the Dative Case. They are all single words, but single words in which there are two elements, viz. the theme or part belonging to the main word, and the affix which denotes its relations to another. But the two parts give us but one word. Yet these are separable both in respect to import and to form. When we get a combination of this kind it is called Synthetic, or *put together*, and the particular instance is an example of the *Synthetic* process, or *Synthesis*. But the *-um*, in the course of time, is dropped; and the *prefix to*, a preposition, is used in its stead. This gives us *two* words; and, when this is the case, the combination is *Analytic=taken to pieces*,

and the particular instance an example of the *Analytic* process, or *Analysis*.

The same processes may be got from a reference to the Conjunctive Mood, the so-called Imperfect, Pluperfect, and Future Tenses; where in Greek and Latin, we have a single word, in most modern languages a combination of two.

In the Substantives the change is effected by the substitution of a Preposition for the inflection; and in Verbs that of an auxiliary verb. But the principle is the same.

These are examples of the important difference between *Synthesis* and *Analysis* on a small scale. As we proceed we shall find it on a larger one. The terms, however, are too important to be overlooked, whether their scale is great or small.

CHAPTER X.

THE NORTHUMBRIAN CLASS OF DIALECTS—THE GLOSSES, ETC.—THE PSALTER—MIDDLE PERIOD—ENGLISH OF SCOTLAND—MODERN DIALECTS—INFLECTION OF THE PLURAL OF THE VERB.

§ 92. *Northumbrian* means the parts north of the Humber, and south of the Forth, and, so doing, includes both Yorkshire on the south, and the Lowlands of Scotland on the north. In philology, then, the south-eastern parts of Scotland are English, whatever they may be, or may have been, politically. In its proper season the northern form of speech develops itself into a literary, or classical, language. This is during the fifteenth century, especially during the interval between the death of Chaucer and the invention

of printing, i.e. under the first Stuarts. English literature during this period has so fallen off that the Scotch may then be called the representative language of Britain. It is certainly the best-defined dialect.

It begins early; it declines early. But in the fourteenth century it revives, and in the fifteenth culminates. It is then called *English* by the Scotch themselves—a term which is not changed for *Scotch* till the time of the Reformation. Then it becomes Anglicized.

To some degree it is the first of our dialects which became a vehicle of literature. Two well-known fragments are Northumbrian: and, as these date from the eighth century, they are older than the earliest known Westsaxon compositions. They will be noticed in the Chapter on the Stages of the English Language in general. But they are too short, and stand too much alone to interfere with the early prerogative of the Westsaxon.

§ 93. By adequate specimens cotemporary with the Westsaxon of the times before the Conquest, the Northumbrian is only known by the following *Glosses*. They are sufficient, however, to give us a general view of its structure as compared with that of the Westsaxon, and this is all that is wanted; for of the Mercian for this period we know nothing.

The undoubtedly Northumbrian Glosses are the interlineations of—

(1.) The Rushworth Gospels.

(2.) The Durham, or Lindisfarn, Gospels.

(3.) The Durham Ritual.

(4.) The Bewcastle Runes. (See *Orthography—The Runic Alphabet.*)

(5.) The Ruthwell Runes. (See *Prosody—Alliterative Metres.*)

§ 94. *The Rushworth Gospels.*—The glosses on the Rushworth Gospels are referred by Wanley, whose opinion is adopted by Mr. Garnett, to the end of the ninth, or to the beginning of the tenth, century. This, however, is by no means certain. The place at which, at least, a portion of them was written seems to have been Harwood, in Wharfdale. If so, they give us the most southern sample of the division to which they belong. The names of the writers are known. There were two, one of them being named Farmenn. He it is who describes himself as a priest at Harawuda. The first part of the interlineation is his, and it is remarkable that the Northumbrian character is less marked in Farmenn's part than it is in his coadjutor's, whose name was Owen—a British designation. The following specimen is from Mr. Garnett's paper on the Languages and Dialects of the British Islands, published in the 'Transactions of the Philological Society.'

The characteristic forms are in italics. For the sake of comparison, the corresponding part of the Hatton Gospels, in the ordinary Westsaxon, is added.

Both texts were collated by Dr. Bandinel with the original MS. in the Bodleian.

RUSHWORTH GOSPELS.	HATTON GOSPELS.

§ 97. The Westsaxon being taken as the standard of the Anglosaxon in its oldest stage, and the details of its inflection being already given, it is only necessary to show where the Northumbrian differs from it.

(1.) Firstly, there is, on the part of the Northumbrian, the greater simplicity of the Demonstrative Pronoun. For this we have in Westsaxon three roots: (1) *se*; (2) *þe*; (3) *he*. The first is found in two forms only, *se* and *seo*=*der*, and *die* in German, ὁ and ἡ in Greek, serving for the masculine and feminine of the nominative singular of the definite article. The neuter is *þæt*, which is declined regularly throughout, i.e. in the *singular* number as the plural. The forms *þe* and *þeo*, though they exist, are, in writing, displaced by *se*, *seo*. *He*, like *þe*, is declined throughout, i.e. in the plural number as well as the singular; so that we have in *hi*, *heora*, *heom*, *him*, forms which are lost, being replaced by *they*, *their*, *them*. In like manner, *heo*, the true *feminine* of *he*, was used where we now use *she*.

(2.) The greater simplicity of the *auxiliary verb*. The Present Indicative of the Westsaxon ran:

Singular.	*Plural.*
Ic eom	We sind [sindon].
Du ðart	Ge sind [sindon].
He is	He sind [sindon].

In both these cases it is the Northumbrian which comes nearest to the present English, where we say *the*, *they*, *their*, *them*, and *are*, acknowledging no such forms as *se*, *hi*, *heord*, *sind* or *sindon*.

The termination in -an.—This is eschewed in the Northumbrian, both in the oblique cases and in the infinitive mood, and, to a great extent, in the definite declension.

North.	*W. S.*	*English.*
Cuoetha	cweðan	speak.
Ingeonga	ingangan	enter.
Hearta	heartan	hearts.
Noma	naman	names.

The Participial prefix -ge.—The old Westsaxon form of the passive participle consisted of the prefix *ge-*, and the affix *-en*, sometimes with a change of the vowel of the root; as, *gesoght*, *gesungen*, *gedruncen*, &c. = *sought*, *sung*, *drunk*, &c. In the middle period the *ge* became weakened into *y* or *i*, as in *ycleped*, *iseen*, &c. Moreover, the affix *-en* was often dropped. In Northumbrian the prefix is absent, and the affix *-en* most steadily retained; and that in the southern dialect to this day, with one remarkable exception.

The Past Participle ends in *-en*, but this termination is dropped whenever a nasal (*m*, *n*, or *ng*) is found in the preceding syllable. Thus *beyte*, *bait*, *bytten*, but *clym*, *clam*, *clum*, for *clumben*; *fynd*, *fand*, *fund* (for *funder*); *ryng*, *rang*, *rung* (for *rungen*), &c., &c. This rule is of course unwritten, but it is invariable. I have not observed the same regularity in the dialect of any other district or any other period. —*Murray. Dialect of the Southern Counties of Scotland*, p. 201, *and Note.*

The first person singular of the present indicative ends (1) in *-u*; as *ic getreow-u*, *ic cleopi-u*, *ic sell-u*, *ic ondred-u*, *ic ageld-u*, *ic getimbr-u* = *I believe*, *I call*, *I give*, *I dread*, *I pay*, *I build*—(2) in *-o*; as *ic drinc-ó*, *ic fett-o*, *ic wuldrig-o*, = *I sit*, *I drink*, *I fight*, *I glorify*.

The second person singular ends in *-s*, rather than *-st*.

The plural termination was *-s*. This form, however, was not universal. It is in the imperative mood where we find it most generally, and where it is retained the longest. Elsewhere the form in *þ* is found besides.

§ 98. That the Rushworth, the Durham (or Lindisfarn) Gospel, and the Durham Ritual Glosses are Northumbrian is universally admitted. The Northumbrian character, however, of another series is open to criticism. These are the Glosses of a Latin *Psalter* (Cotton MSS. Vespasian, A. 1), of which the Latin element is referred to the Seventh, the Angle to the Ninth, century. (1) The orthography is other than Westsaxon. (2) The plurals end in *-u*. (3) The second persons singular in *-s*. (4) There is no prefix *-ge* in the participles. (5) The personal pronouns are *mec*, *þec*, *usic*, *eowic*. All these are Northumbrian; but, in the Psalter, the infinitives end in *-an*—which is not Northumbrian.

Psalmus XLII.

1. doem mec god and to-scad intingan minne of ðeode noht
   Judica me Deus et discerne causam meam de gente non
   haligre from men un-rehtun and factum ge-nere me for-ðon
   sancta ab homine iniquo et doloso eripe me Quia
2. ðu eard god min and strengu min for-hwon me
   tu es Deus meus et fortitudo mea quare me
   on-weg a-ðrife ðu and for-hwon un-rot ic in-ga ðonne swenceð
   reppulisti et quare tristis incedo dum adfligit
   mec se feond
   me inimicus
3. on-send leht ðin and soð-festnisse ðine hie mec
   Emitte lucem tuam et veritatem tuam ipsa me
   ge-laedon and to-ge-laeddon in munte ðaem halgan ðinum
   deduxerunt et adduxerunt in monte sancto tuo
   and in ge-telde ðinum
   et in tabernaculo tuo

9. in gode we bioð here allne deg and in noman dinum we-
In Deo laudabimur tota die et in nomine tuo confi-
ondettað in weorulde
tebimur in saecula.

§ 99. The bearing of the forms in *-an* and *-a* upon the history of the Northumbrian English is important. The Psalter has a claim to be considered as old as, and possibly older than, any one of the other three; whilst, philologically, *-an* is an oldėr form than *-a*. If so, the *-n* may have been lost to the Northumbrian dialects on Northumbrian soil; in other words the forms in *-a* need not be assigned to the Angle in its older stages, but referred to the influence of the Danes of the eighth, ninth, tenth, and eleventh centuries. The complications of opinion to which this view may give rise are numerous. Thus the notion that the Danish influence in Britain is later than the English is one that, though long current, is now gradually losing its supporters; the tendency of opinion being in favour of the earliest Danish invasions having been as old as those of the Angles; or (if this be not exactly the case) that the difference between the oldest English and the oldest Danish is not very great. Then comes the tendency to explain the use of the *-a* for *-an* through the Frisian, which is, practically, identified with the Angle. That in all this we have the elements of a very complex and doubtful question as to the actual relations of the three languages to each other is

manifest. Nor is the existence of considerable differences of opinion concerning it doubtful.

The most important peculiarity in which the Durham Evangeles and the Ritual differ from the Psalter is the form of the infinitive mood in verbs. This, in the Durham books, is, with the exception of one word, beon, *esse*, invariably formed in *-a*, not in *-an*, the usual form in all the other Anglosaxon dialects. Now this is a peculiarity of the Frisic, and of the Old Norse, and is found in no other Germanic tongue; it is then an interesting inquiry whether the one or the other of these tongues is the origin of this peculiarity; whether, in short, it belongs to the old, the original Frisic form, which prevailed in the fifth, sixth, and seventh centuries, or whether it is owing to Norse influence, acting in the ninth and tenth through the establishment of Danish invaders and a Danish dynasty in the countries north of the Humber.—*Kemble, Philological Transactions, No.* 35.

§ 100. Though this is, to some extent, an anticipation of certain remarks which will be made hereafter, I take the earliest opportunity of stating that, unless we recognise the probability of certain forms of the Danish being sufficiently near to certain forms of the Frisian, or some dialect sufficiently like the English, to pass for members of the same class, the place of the Danes in the Germanization of Britain can never be adequately investigated. The ordinary accounts are that in certain years of the eighth century certain Danes invaded certain parts of England; and that, after a time, they wintered in the districts on which they made their attack. These inroads are notified in the Anglosaxon Chronicle under their several dates: the general tenor of the entries is that they were the earliest of their kind; just as the invasions of Hengist and Horsa were, *mutatis mutandis*, the first of *their* kind. If so, they exclude any previous ones —except, of course, that of the Jutes in Kent, who, whether real or not, have left no trace of Danish occupancy behind them. Putting these, however, out of

the question, we get the two specific dates of A.D. 787, and A.D. 789, as approximations for the beginning of the Danish invasions; and they are sufficiently precise.

ANGLOSAXON CHRONICLE.

A.D. 787. Cvomon ærist III scipu Northmanna of Heretha lande. . . . That wæron þa ærestan scipu Deniscra monna the Angeloynnes land gesohton.

ASSER (A.D. 789.)

Eo etiam tempore *primum* tres naves *Normannorum*, id est *Danorum*, applicuerunt in insula quæ dicitur Portland.

The question is whether these dates, though good for Wessex, are good for the north of England in being so decided as to exclude all other Danes from any part of our island.

§ 101. After these Glosses comes a great break; for, until the last quarter of the thirteenth century, there will scarcely be any Northumbrian compositions of even the dimensions of a Gloss.

Of these the earliest are referable to Durham and Yorkshire. During the first half of the fourteenth century the literature increases. Still it belongs to the country south of the Tweed; in other words is English, rather than Scottish, Northumbrian.

For the literature north of the Tweed, or of the Northumbrian of Scotland, A.D. 1375 is a convenient date. Barbour's Bruce, as the author himself tells us, was partly written at this time; and Barbour's Bruce is in some respects, though not altogether, the oldest specimen of the Scotch Northumbrian. Fragments of a song on the siege of Berwick under Edward I., 1296; on the battle of Bannockburn, 1314; and, earlier still, one on the troubles that followed the death of Alexander III., are older. But they are only known as preserved by later writers; and, with certain undoubted changes of text. The objection here involved applies

to Barbour himself. His text is later than that of the date of his work.

Hence the date of the earliest known specimen both of the language and the orthography of the Northumbrian of Scotland during the middle period is A.D. 1385, the composition being the 'record of an award made by Andrew Mercer, Lord of Mekylhour, in a dispute as to the ownership of certain lands, between Robert Stewart, Earl of Fife (afterwards Regent Albany), and Sir John of Logie.' The original is in the Charter chest of the Stewarts of Grandtully, and has been reproduced in facsimile in a volume privately printed by the late Sir William Stewart under the title of 'The Red Book of Grandtully.'

'Tyl al þat þire lettrys herys or seys Androw *mercer* lorde of Mekylhour*e* gretyng in god ay lestand tyl yhur*e* vniu*er*site be wyttyn þat my redoutyt lorde syr Robart stewart Eryl of ffyfe and Menteth and Ion of Logy squyer*e* þe sune and þe ayre of syr Ion of Logy knycht of þair*e* fre wyl nane beand p*re*sent bot we thre before nemnyt put in myne ordenans al þe debate and þe questyo*un* þat wes be twene þaim for þe landys of logy and of Stragartnay and how evyr þat I ordaynyt and de*ter*mynyt þaim to do þe forsayde syr Robart and Ion faythfully heht strekand þair*e* handys in myne bodely makand gude fayth þat þai sulde halde sekr*e* ferme and stabyl and þis ilke forsayde Cunand made apon þis cause before wrytyn þe forsayde syr Robart and Iõn reuuleyt and afermyt in þe p*re*sens of myne excellent prynce Robart thrw þe grace of god kyng*e* of Scotland and his Eldeste sune Ion Eryl of Carryke / Mayst*ir* Dunckane petyte Ersdene of Murrefe and thom*e* of Rate and In þe tyme þat I þe forsayde Androw assentyt to resayve þis cause before wrytyn in myne ordenans and þar*e* of to gyf Iugement be þe recorde of my twnge I made bodely fayth it ryhtwysly to deme.' *

From the date of this record to the present time the history of the English of Northumbria *north* of the Tweed is mainly that of a national literature; and, so far as it is this, it forms a separate subject. Moreover

* From an 'Addition to Dr. Murray's Dialect of Southern Scotland.' P. 92 (A note (— 4 pp.) published a few weeks after the main work).

this, one which is better in the hands of Scotchmen than of Englishmen.

Of the Northumbrian *south* of the Tweed, as a literary language, there is not much more to be said. As far south as Hampole (near Doncaster) it was, during the fourteenth century, quite as Scotch in character as the difference of date and place would lead us to expect; perhaps more so. But it is only on the east that this uniformity is found. In Cumberland and Westmorland (?) the dialect, though undoubtedly Northumbrian, was far more unlike the Northumbrian of Edinburgh, Durham, and South Yorkshire than those dialects (if the difference amounts to one of dialects) are unlike each other.

Hence, if it were incumbent upon us to divide the great Northumbrian class of dialects into two divisions, they would not be those of north and south so much as those of east and west. And this is what we expect *a priori*. The British, both of South Britain and North Britain, maintained itself longer in Cumberland and in Galloway than the Lothians. Without bringing in the mysterious Picts we may safely assert this.

The more definite evidence for the closer philological connection between York and Edinburgh than between York and Carlisle must be sought in the dialects themselves. And these are, to say the least, fairly represented by the literature of the Middle period, as are the *West* Mercian dialects; for which see Chap. XI.

§ 102. Upon the relations of those dialects which lay north-west, rather due north of the Humber, those of Cumberland, and part of Lancashire most especially, more will be said in the notice of the Mercian, or Midland class. At present, however, the Northern forms of speech will be considered, as far as South Lancashire, as Northumbrian; and certain divisions

or subdivisions of them considered. In Cumberland, there is, doubtless, a sectional division of some kind; but it is, in my mind, formed too much on single characters to be one of any great breadth. I cannot forbear thinking that the Danish element for these parts is overvalued. The hard and sharp line which Mr. Dickinson draws for his *Central* Cumberland dialect is scarcely tenable. He carries it from the mouth of the Eden to Egremont; thence by an irregular line to Kirkland, Croglin, Sebergham, Warnell Fell, Brockle-bank, and Aspatria, to Allonby, south of which line it gradually merges into the Lancashire, and, on the north, becomes intermixed with Scotch, and dashed with the Northumberland. This gives us the southern part of West Cumberland, and a small part of East Cumberland; the remainder (by far the greater part) being, more or less, Lancastrian. This range of the chief characteristic, the elliptic article (*t'* for *the*), goes far beyond these limits. As compared, however, with the North Cumbrian it differs; for North Cumbrian (*Rayson*) gives the full form *the*. And so does the Scotch. So, also, the Northumbrian. There is every reason why the elliptic form should claim attention. On the other hand, it is easily overvalued.

Again, the extent to which this line separates the Danish from the non-Danish districts is not beyond objection. If we take the syllable *-by*, when it implies an occupancy (like *-ton* in English), as a presumption in favour of the town or village to which it applies having been a Danish occupancy, it is by no means good. That local names thus ending are rarer to the north of the line than to the south of it is true. But even in the north we have them; viz. *Willanby*, *Scaleby*, and others.

That these may represent the Danes of Eskdale and Annandale, while the more numerous *-bys* of Central

Cumberland may represent those of Yorkshire (crossing the watershed of the Ouse and Eden about Kirkby Lonsdale), is likely; but, still, they abate the value of the line as a Danish, or non-Danish, frontier. That in Durham and Northumberland there are no *-bys* is well known, and that the watershed of the Wear and Eden gives us a natural boundary of some value is true; but even this gives the elliptic *t'* to Durham, as, indeed, it does to other districts besides. As opposed, however, to Durham and Northumberland, Cumberland (so long as the affix *-by* is a test) is Danish.

For the Northumbrian dialects south of the Tweed, to which we limit ourselves, no specimens of what may be called the native provincial literature will be given. They were given in the notice of the West-saxon because they were needed to show how certain inflections were still retained. But the inflectional system of the Northumbrian was comparatively simple from the beginning; and here the only important one of which we find trace is the plural of the verb in *-s*, i.e. *they loves = they love*. The distribution of this, as determined by the Buonapartean versions of the Canticle, is as follows. They give us the same matter in different forms; and as the chief point in recent Northumbrian philology is the exhibition of the phonetic variations, they are, in a work like the present, sufficient.

§ 103.

Northumberland (J. P. Robson).

Chap. II.

1. Aw's the rose o' Sharon, an' the lily o' the valleys.
2. Like a lily mang thorns is maw luve amang the dowtors.
3. Like a napple-tree mang the trees o' the wud, is maw luve amang the sons. Aw sets me ways doon anunder his shador wiv a leet heart, an' his froot teastid verra nice.

4. He fetcht us intiv his feastin-hoose, an' his flag abeun us wis luve.

5. Haud us up wi' drinkin-cups, cumfort us wiv apples, for aw's bad o' luve.

6. His left han's anunder me heed, an' his reet hand cuddles us.

7. Noo aw chairge ye, O ye dowtors o' Jerus'lum, be the bucks an' the does o' the field, thit ye dinnet stor, to roose up maw luve till he hes a mind.

8. Wheest! it's the voice o' maw luve! Leuk! thondor he cums lowpin' upon the moontins, an' skurryin' ower the hills.

9. Maw troo-luve 's like a buck or leish deer: assa! he 's stannin' ahint wor wa': he 's leukin' oot o' the windors, an' showin' hissel' thro' the panes.

Newcastle (J. P. Robson).

Chapter II.

1. Aw's the rose o' Sharon, an' the lily o' the valleys.

2. Like the lily amang thorns, se is maw luve amang the dowtors.

3. Like the apple-tree amang the trees o' the wud, se is maw beluv'd amang the sons. Aw sat doon anun'er his shador wi' greet plishur', an' his froot wis sweet te me teyst.

4. He browt us te the feastin'-hoose, an' his flag ower us wis luve.

5. Stop us wi' tankerts, cumfort us wiv apples: for aw's seek o' luve.

6. His left han's anun'er me heed, an' his reet han' diz cuddle me.

7. Aw chairge ye, O ye dowtors o' Jeruzalum, be the roes an' the stegs o' the field, thit ye divent stor, nor weykin maw luve tive he likes.

8. The voice o' maw beluv'd! lucka, he cums lowpin' on the moontins, skippin' ower the hills.

9. Maw beluv'd 's like a roe or a young buck: seest the', he stan's ahint wor wa', he luiks oot it the windis, an' shows hissel' throo the stainchils.

Durham (as spoken at St. John's Chapel, Weardale.—T. Moore).

Chapter II.

1. A' as t' rose uv Sharon, an t' lilley ud valleys.

2. As t' lilley amang thowrns, sees me luv amang t' dowters.

3. As t' apple-tree amang t' trees ud wood, sees me beluved amang t' sons. Ah sat doon unnonder his shaddow wih greet deleyght, an his frewt was sweet to me taaste.

4. He browght mah tud banqueting hoose, an his banner ower mah was luv.

5. Stay mah wih flaggons, cumfurt mah wih apples: fer a' as seek uv luv.

6. His left kneaf 's unnonder me heed, an his reat kneaf duth cuddle mah.

7. Ah charge ye, O ye dowters uv Jerewsalem, be t' roes, an be t' heynds ud field, at ye stur nut up, ner waaken me luv, till he please.

8. T' voice uv me beluved! behowld, he cumeth lowpin atoppa t' moontens, skippin atoppa t' hills.

9. Me beluved 's leyke a roe er a young hart: behowld, he stands ahint our wo, he lewks furth at t' windows, showen hissel through t' lattice.

North Riding of Yorkshire (*parts about Whitby*).—By the Author of 'A Glossary of Yorkshire Words and Phrases, collected in Whitby and the Neighbourhood.'

CHAPTER II.

1. Hah am the rose o' Sharon, and the lily of the valleys.

2. As the lily amang the breers, sae is mah honey amang the dowters.

3. As the apple-tree amang the trees o' the wood, sae is mah beluvved amang the sons. Hah sat down under his shadow wi' greeat deleet, an' his fruit was sweet to mah teeast.

4. He browt me to t' feeasting-hoose, an' his banner ower me was luv.

5. Stay me wi' flagons, cumfort me wi' apples, for hah's seek o' luv.

6. His left hand is under mah heead, and his reet hand laps round me.

7. Hah chaarge ye, O ye dowters o' Jerusalem, by the roes an' by the hinds o' the field, that ye stoor nut up nor wakken mah luv till he list.

8. The voice of mah beluvved! seesthee, he comes lowpin upon the mountains, boundin ower the hills.

9. Mah beluvved is like a roe or a young hart; lothee! he stands ahint oor wall, he looks out at the windows, showing his-sel at the keeasment.

Cumberland (J. Rayson).

CHAPTER II.

1. I am the rwose o' Sharon, an' the lillie o' the vallies.
2. As the lillie amang thworns, sae is my luive amang the dowters.
3. As the apple-tree amang the trees o' the wud, sae is my beluivet

amang the sons. I sat doun anunder his shaddow wi' muckle deleyght, an' his frute was sweet tui my teaste.

4. He brong me tui the banquetin' hwous, an' his bannir ower me was luive.

5. Stay me wi' flaggans, cumfert me wi' apples: for I am seek o' luive.

6. His left han' is anunder my heed, an' his reet han' infauls me.

7. I wearn you, O ye dowters o' Jerusalem, by the rwoes, an' heynes o' the fiel', that ye stur nit up, ner awaeken my luive till he pleese.

8. The voyce o' my beluivet! behauld, he cums loupin' upon the mwountans, skippin' apon the hills.

9. My beluivet is leyke a rwoe, or a young buck: behauld, he stans ahint our waw, he luiks owt at the wendaws, showin' hissel owtseyde the lettice.

Central Cumberland (W. Dickinson).

Chapter II.

1. Ise t' rwose o' Sharon, an' t' lily o' t' valleys.

2. My leuvv wad leukk amang t' rest as a lily wad leukk amang thorns.

3. An' he wad leukk amang other men as a apple-tree i' full bleumm wad leukk in a wood of other sworts o' trees.

4. He brought ma to t' feast, an' aa fand as if his leuvv was o' ower ma.

5. Stop ma wid flagons, comfort ma wid apples, for aa 's seek o' leuvv.

6. His left hand 's onder my heed, an' his reet hand coddles ma.

7. Aa forbid ye, O ye dowters o' Jerusalem, by t' roes an' t' hinds in t' fields 'at ye disturb nut, ner woken my leuvv, till he pleases.

8. My leuvv's voyce! see ya, he comes lowpan ower t' fells, an' skippan ower t' knowes.

9. My leuvv is like a roe, or a young buck: see ya, he stands ahint our wo', he leuks out o' t' windows, an' shows his-sel through t' lattice.

Westmorland (Rev. John Richardson).

Chapter II.

1. I 's t' rooas' o' Sharon, an' t' lily o' t' valleys.

2. As t' lily amang t' thworns, sooa 's my lūv amang t' dowght'rs.

3. As t' apple-tree amang t' trees o' t' wood, sooa 's my belūv'd amang t' sūns. I sat me doon ūnd'r his shaddo' wi' gert plizzir, an' his frewt was sweet to my teeast'.

4. He fetcht me to t' feeastin'-hoose, an' his banner ower me was lūv.

5. Prop me up wi' flagons, cūmf'rt me wi' apples: for I 's siek o' lūv.

6. His left hand is ūnd'r my heead, an' his reeght hand coddles me.

7. I cawtion ye, O dowght'rs o' Jerewsalem, by t' roes, an' by t' hinds o' t' fields, 'at ye nowd'r stir ūp, nor weeak'n my lūv, while he chewses.

8. T' voice o' my belūv'd! loo' the', he cū's lowpin' o' t' fells, skelpin' o' t' hills.

9. My belūv'd is like a roe, or a yūng hart: loo' the', he stan's ahĭnt oor wo', he glimes oot at t' windo's, shewin' hissel' through t' lat-wark.

North Lancashire (James Phizackerley).

Chapter II.

1. I 'm t' rose a Sharon, an t' lily a t' valleys.

2. As t' lily amang t' thorns, saäh iz me lov amang t' dowters.

3. As t' apple-tree amang t' trees a t' wood, saäh iz me belov'd amang t' sons. I saät down under hiz shada we graät delight, an hiz fruit was sweet ta me taäst.

4. He browt ma ta t' feästin house, an hiz banner ower ma was love.

5. Stop ma we flagons, pleäz ma we apples: for I 'm sick a love.

6. Hiz left hand iz under me heäd, an hiz reight hand embraäces ma.

7. I charge ye, O ye dowters a Jeruslem, by t' raäs, an t' hinds a t' field, that ye stir nut up, nur awaäk me lov, wal he pleäz.

8. The voice a me belov'd! Luke ya, he comes loupin on t' mountains, skippin on t' hills.

9. Me belov'd iz like a raä or a young hart: luke ya, he stans behint owr woe, he lukes owt a t' windas, shewin hissel through t' lattice.

South Lancashire, parts about Bolton (James Taylor Staton).

Chapter II.

1. Awm th' rose o' Shayron, un th' lily oth' valleys.

2. As th' lily amung thurns, so is ma love amung th' dowters.

3. As th' appo-tree amuug th' trees oth' wood, so is ma beloved amung th' sons. Aw keawrt deawn under his shadow wi' greight deleet, un his fruit wur sweet to my taste.

4. He browt me to th' banquetin-heawse, un his banner o'er me wur love.

5. Stay me wi' flagons, comfort me wi' appos: for awm sick o' love.

6. His left hont is under my yed, un his reet hont clips me.

7. Aw cherge yoa, O yoa dowters o' Jerusalem, by th' roes, un th' hoinds oth' fielt, that yoa stur not up, nor wakken ma love, tell he pleos.

8. Th' veighce o' ma beloved! lucko, he comes leopin uppo th' meawntins, skippin uppo th' hills.

9. Ma belov'd is loike a roe, or a yung hert: lucko, he stonds behaind eawr waw, he gloors at th' windows, showin hissel through th' lattis.

West Riding (Charles Rogers).

Chapter II.

1. Ah'm t' roaz a' Sharon an' t' lily a' t' valleys.

2. As t' lily amang thorns, soa iz my luve amang t' dowters.

3. As t' apple-tree amang t' trees a' t' wood soa iz my beluv'd amang t' sons. Ah sat dahn under hiz shada wi' greet deleet, an hiz frewt wor sweet ta ma taste.

4. He browt ma ta t' banquetin' hahce, an' hiz banner ower ma wor luve.

5. Stay ma wi' flagons, cumfat ma wi' apples; for ah'm sick a' luve.

6. Hiz left hand's under my heäd, an' hiz reight hand embraces ma.

7. Ah charge ya, O yo dowters a' Jerusalem, bў t' roes, an' bў t' hinds a' t' field, 'at yo stur not up, nor wăken my luve, till he pleäze.

8. T' voice a' my beluv'd! behowd he cumes laupin' upa' t' mahntans, skippin' upa t' hills.

9. My beluv'd 's like a roe, or a young hart; behowd, he stands behint ahr wall, he looks foorth at t' windas, shewin' hizsen thro' t' lattice.

Craven (Henry Anthony Littledale).

Chapter II.

1. I is 't rocaz o' Sharun, an' 't lilly o' 't gills.

2. As 't lilly amang 't wicks, evven soaa is mah luv amang 't dowghters.

3. As 't apple-tree amang 't trees o' 't wud, evven sooa is mah luv amang 't sons. A sat mah daan unner as shadow wi' girt delaight, an as frewt wur sweeat to mah teast.

4. A browght mah till 't banquetin'-heouse, an' as flag ower mah wur luv.

5. Stay mah wi' pots, comfort mah wi' apples; fur a is fair daan wi' luv.

6. As leaft han' is unner mah heead, an' as reet han' cuddles mah.

7. A charge yah, O yah dowghters o' Jerusalem, by 't roes, an' by 't hinds o' 't field, 'at yah rog nut, nother wakken mah luv till that a chews.

8. 'T voice o' mah luv! sithah, a cums lopeing upo' 't fells, skipping upo' 't hills.

9. Mah luv is laike until a roe, or a yung stag: sithah, a stanns ahint wir wa', a keeks foorth eouet o' 't winder, showin' hissel throwgh 't casement.

Sheffield (Abel Bywater).

Chapter II.

1. O'm t' rooaz a' Sharon, an t' lilli a' t' valliz.

2. As t' lilli amang thoarns, sooa is mo luv amang t' dowters.

3. As t' apple-tree amang a' trees a' t' wood, sooa is mo beluvved amang t' suns. O sat dahn under his shaddo we gret deloight, an his fruit wer sweet tummi tast.

4. He browt ma to t' banquittin hahse, an his banner ore ma wer luv.

5. Stay ma we flaggons, comfort ma we apples, for o 'm sick a' luv.

6. His left hand 's under mo' heead, an his reit hand huddles ma.

7. O charge ya, O ye dowters a' Jeruslem, be t' roes an be t' hoinds i' t' field, that yo stur not up nor wakken mo luv till he pl-eaz.

8. T' voice a' mo beluvved! behold, he cometh lopin uppa t' mahntins, skippin uppa t' hills.

9. Mo beluvved 's loik a roe or a young hart: behold, he stans beheent ahr wall, he looks fooarth at t' winders, sho'in his-sen throo t' lattice.

The plural in *-s* of the Present Indicative, which Dr. Morris has chosen as the most convenient characteristic of the Northumbrian (where indeed the *s* is found, in the singular as well), is an exception to the comparative unimportance of the remaining inflections of the northern dialects. It is still retained in some of them. The mixture of the two numbers, and the compromise indicated by the use of the Auxiliar and Infinitive, are shown in the following extracts.

Northumberland—Song of Solomon.

Chapter I.

3. It 's a' be the fine smell o' thaw oils, it thaw neam 's like oil teem'd oot, an' for this the lasses *luves* the'.—*Robson.*

Chapter VIII.

13. Thoo thit leeves i' the gardins, thaw freens *lissens* te thaw talk; let me bud heer 't!

So it is in the Newcastle sub-dialect—*the maidins luves the' — the marrows lissens te thaw voice* (Robson).

Also, in Central Cumberland—*that 's what t' lasses likes tha for—t' cronies lissens to thy voice.*—(Dickinson).

In Westmorland we find—*t' virgins luv the'*—as in the present English; also, in the other passage—*hearken.*

In North Cumberland it is *do love* and *lissan.* In the North Riding, *do* and *lizzen.*

In all the others it is *do love* and *hearken.*

§ 104. *Dialects of the Northumbrian of Scotland.*—These are arranged by Dr. Murray as follows:—

1. *The Southern Group.*—Simple and small; falling into varieties rather than sub-dialects. Spoken in the counties of Berwick, Roxburgh, Selkirk, Peebles, and Dumfries; in Teviotdale, Tweeddale, Ettrickdale, Annandale, and Eskdale; but changing in Nithsdale. This means that, so long as there is a frontier between Scotland and England, they are spoken along, and indeed beyond, it; but that they cease where the division between the two kingdoms is the Solway Firth. Neither is it spoken on the *Lower* Tweed; where the English county of Northumberland runs northward and comes in contact with the dialects of the next group. The parts about Coldstream and

Kelso form the north-eastern boundary. On the west, however, where the Scotch runs southwards, it passes into the English of *North* Cumberland—changing in the central parts of the county. Here, in the eastern and middle districts, at least, the original language was British rather than Gaelic.

2. *The Central Group.*—Separated from the Northumbrian of Northumberland (or the Northumbrian of England) by the Lower Tweed. To this belongs the *Merse* (i.e. *March*) district.

a. Haddington, Linlithgow, and Edinburgh, i.e. the Lothians. The literary language of the fifteenth and sixteenth centuries. Like the dialects of the southern counties, it is spoken on ground originally British rather than Gaelic. Fife, on or within the Gaelic boundary, is Lothian in dialect.

b. Galloway and Carrick. Spoken on ground originally British; upon which Gaelic was subsequently introduced. The ethnology is further complicated by this having been the district in which the Picts for the last time are assigned in trustworthy history—Kirkcudbright, Wigton, and part of Dumfriesshire.

c. Clydesdale = Ayr, Renfrew, and Lanarkshire, and part of Dumbartonshire, i.e. beyond the Clyde, and beyond the Northern Wall. Here, like the Lothian in Fife, it must be supposed to have encroached on the *Gaelic* frontier.

The last divisions of this group lie wholly within the Gaelic, as opposed to the British, area.

d. The Highland Border—western parts of Perth and Stirlingshire. For this see not only Dr. Murray's Map, but his Appendix on *The Present Limits of the Gaelic in Scotland*—pp. 231–239.

e. The North-eastern Group.—This falls into two divisions:—

(*a.*) *The Southern.*—Murray, Banff, Elgin, Aberdeenshire, Angus.

(*b.*) *The Northern.*—Caithness; the intervening districts between the Murray Firth, and the parts between Lybster and Ubster (Scandinavian names) being classed with the purely Gaelic districts. Here there has been an intervening element, viz. the Scandinavian or Norse.

For Orkney and Shetland, in which there are no traces of the Gaelic, the speech is English on a substratum of Norse. The following is, I believe, the only specimen* of the *Norns*, or Norse, of Orkney and Shetland.

Fa vor i ir i Chrimrie, Helleur ir i nam thite, gilla cosdum thite cumma, veya there mota vara gort o yurn sinna gort i chimrie, ga vus da on da dalight brow vora, Firgive vus sinna vora sin vee firgive sindara muttra vus, lyv vus ye i tumtation, min delivera vus fro olt ilt, Amen. *Or* on sa meteteth vera.

§ 105. *Effect of Contact with the Original Gaelic.*—Dr. Murray has shown that, in the Phonesis, at least, this must not be overlooked.

The prominent distinction of the north-eastern dialects is the use of *f* for *wh*, and of *v* for *w*, as in '*fat 's vrang*' for '*what 's wrong?*' This peculiarity is current from Pentland Firth to the Firth of Tay, and the dialect is most typically represented in Aberdeenshire, and the district to the N.W. toward the Murray Firth (*Dialect of the Southern Counties, p.* 237). See also p. 118 of this work.

§ 106. *Analytic Character of the Northumbrian.*—The analytic character of the Northumbrian is less than that of the Westsaxon. We must remember, however, that its original Synthetic character was less also.

* For the translation and interpretation, see Appendix.

CHAPTER XI.

THE MERCIAN OR MIDLAND DIALECT.—THE WEST-MIDLAND DISTRICT.—'*HOO*' AND '*SHE*.'

§ 107. *The Mercian or Midland Dialect.*—The third of our main dialects is eminently deficient in positive characters; so much so, that the answer to any question about the limits of its area would be to the effect that they depended upon those of the Westsaxon and Northumbrian dialects; or that everything which could not be assigned to one of these two divisions was, on the principle of exclusion, Mercian or Midland—simply because there is no other place for it. However, with this indefinite character, much of the importance of the Mercian or Midland area is connected. It is the district wherein provincialism is at its minimum.

There is a rough way of forming an opinion upon this point. The literature of the dialects of the English language is considerable, and our provincial and local Glossaries are numerous; from which we may infer that where a county, or a group of counties, has no work upon its dialects, or only short ones, there is but little to be said about them. Now the counties for which we have this minimum of information are Middlesex, Herts, Buckinghamshire, Bedfordshire, Huntingdonshire, and Rutland; and this is because, in these, the ordinary literary, written, or standard language of the island is spoken with comparative purity. Something abnormal is, of course, to be found in each; but it amounts to very little in all.

The same applies to Kent; but in Kent we know that the dialect which the current English has superseded was the Westsaxon; this being not only more than what we know about the dialects north of the

Thames, but also contrary to what we believe was the actual fact.

In the Midland districts it is reasonably held that the spoken language of even the most uneducated approaches the written language of the educated classes because it was originally the most like it; in other words, it was the dialect out of which the present literary English was developed. Nevertheless between the non-provincial English of a district, the mother dialect of the cultivated language of the present time, and the English of one wherein the cultivated tongue has displaced a dialect of a different class, it is hard to decide. We can do so in the case of Kent and Surrey; partly from their geographical position, and more fully by special evidence as to the earlier forms of speech. But where the boundary is indefinite, and there are no records of the earlier speech, we can only come to approximate conclusions; and it is needless to say that the Mercian or Midland district is both irregular in outline and wide in extent.

Northampton is the county which has the best claim to represent the Midland, or Mercian. It has long had the credit of giving us the best *average* English; and, for some parts of it, not undeservedly. But like Buckinghamshire and Nottinghamshire it is a long county, and the dialect varies with its frontier. It is probable that, taking into consideration both its size and its outline, we should place Bedford, Huntingdon, and Hertfordshire somewhat higher. In Warwickshire and Oxfordshire it is certain that anyone who looks closely and sharply for Westsaxon characteristics may find them; and that in respect to Norfolk, Suffolk, and Essex, a case may be made out for treating the dialects, as East Anglian, in a class by themselves.

This they may be. Their position, however, prevents them from being, like Warwickshire and Oxfordshire, transitional.

§ 108. *The West Mercian.*—The sub-division of the Midland dialects, called the *West* Mercian, has a better claim to an independent rank. But it is probably a transitional, ambiguous or equivalent group, with affinities on both sides—Northumbrian and Westsaxon—rather than truly Mercian. South Worcester is about as far as we can trace the Westsaxon; and North Lancashire about as far as we can trace the Northumbrian southwards and westwards. The division is recognised. Sometimes it is the Wyre, sometimes the Ribble; the difference being inconsiderable. On the Mercian side there is no boundary even so good as these. Mr. Garnett held that the parts about Sheffield were Mercian; and every Lancashire man knows that the famous work of Tim Bobbin (Collier) is only good for the parts about Bolton, Oldham, and Bury; certainly not for Furness and Ribblesdale. This makes Shropshire, Cheshire, South Lancashire (whatever may be its boundary), Staffordshire, and North Derby, East Mercian—South Derby, Nottinghamshire, and Leicester being grouped with Northamptonshire; which we have seen has a different aspect for each of its frontiers. What this most especially shows is the difficulty of determining classes by single characters, and with definite lines of demarcation. It must be by type rather than definition that classes must be framed; and ambiguous affinities, when two well-marked groups come into contact, must be the rule rather than the exception. Nevertheless, so long as the investigation is going on, single characters must be invested with an undue importance. There is no harm in this so long as each enquirer names the character he trusts to, and lets the

common-sense of those who come after him determine its value.

That the dialects of the districts just enumerated are equally difficult to divide into two classes, or to assign, as a single class, to either the Westsaxon or the Northumbrian, is certain. But they are not Mercian in the way that South Lincolnshire and Huntingdonshire, or even Norfolk and Suffolk are so. Certain, too, it is that, unlike the Westsaxon, the Northumbrian, and the Mercian proper, they are not represented by a literature of anything like national dimensions.

During the times before the Conquest we know nothing about them. But this is the case with Mercia in mass. About the middle of the fourteenth century they appear for the first time. Dr. Morris takes as his leading character the personal signs of the Singular number of the Present tense which give *hope*, opposed to the Northumbrian *hopes*; the other two persons being Northumbrian.

	West Midland.	*Northern.*
First Person . . .	hop*e*	hop*es*.
Second „ . . .	hop*es*	hop*es*.
Third „ . . .	hop*es*	hop*es*.

More important, however, is the statement that when the second and third persons vary their form, they take the southern (Westsaxon) forms *-est*, and *-eth*; and that these forms in *-e*, *-est*, and *-eth*, are West Midland also. But this is not all. Like the Westsaxon, and unlike the Northumbrian, they use the plurals of *he* for *their* and *them*; and prefix the *ge* (or its equivalent) to the past participle. Again, unlike the Northumbrian, but like the Westsaxon, they add *-en* to the plural of the preterit, as *loved-en = we, ye, they, loved.* This is found in poems ascribed to both Shropshire and Lancashire, i.e. the two extreme

districts. On the other hand, the vowel of the present participle is *a* rather than *-e* or *-i*; though the other forms are found.

In comparing the East and West Mercian, the physical outlines of our island must be borne in mind. Norfolk and Suffolk project into the sea, and have nothing but Mercia on the frontier. West Mercia is on the Welsh frontier, and to the north of the Dee, in that part of England where Mercia runs furthest westward.

§ 109. '*Hoo*' and '*She.*'—The present leading characteristic of these dialects is the use of *hoo* for *she.* It is conspicuously present in the old and middle West-saxon. It is obsolete or obsolescent in the present provincial dialects which represent it; or those of Devon, Dorset, &c.

The following are; (1) the districts in which *hoo* certainly holds its ground at the present moment; and (2) the districts of the frontier where *she* prevails:—

(1.)

DERBYSHIRE.

Farmer B. What did Misses Boord za or do to Hester, then?

Tummus L. Why, Hester may be wor summut to blame to; for *hoo* wor on 'em, de ye zee, that jaw'd Skimmerton, the mak gam that frunted zum o' the gentlefolk.

Dialogue between Farmer Bennett and Thomas Lede.

Owd Sammy Twitcher's Visit tu't Gret Exibishun e Darby.

It'll ne'er dow ta stey at whom wen ivveryboddy els has bin tu't Exibishun. Or meens ta goo, sed ah ta mysen won neight, wen ah get whom aftur a hard deys wok i't feelds. Soo ah meyd hup me moind ta goo i't marnin, an tae aar owd wummun wey me, az *how* rimembus t'fust Exibishun ther wor e Darby a monny yere sin, and *how* thinks they conna bete that'n. * * * *How* went on till wee'd getten neer tu't plaise weer *how* thowt ta foind hit, but they'n pow'd it aw daan na, an's meyin a grond new streight, wi sich foine bildins az ah ne'er seyd afoar. * * * At last wee get inter Hiron Yate, weer theer wor a lot moor

grond bildins, an wee fun a heatin haase kep be a mon o't neym a Simmons an theer wee get a gud tuck aat, t'owd wummun hevin a kup a tee, az *how* sed it wor moor refreshin tu't inner mon. * * * * * Molly sed *how* thowt if t'yung men an wimmin wor theer at t'saim toime theer wudna be much wok gooin on. So ah sed ah thowt t'men bilt it, an t'wimmin fun theer shair o't brass for't; but ony how it's a foine peece a wok an woth gooin a long wey ta sey. Aftur wee'd seyn this, ah sed, Nah, Molly, wee'l goo tu't Exibishun, an follerin a craad a foaks we soun fun aarsens in frunt a't Bildin, wen ah sed, Naw, Molly, kom on—an went bowdly in an peyd me bob at t'whirlegig, an get hadmittered. Wen ah tunned raand fur Molly *how* cudna get throw, *how's* soo fat, an theer wor t'foaks loffin at her. At last t'mon as towk t'munny hoppened a side yate an let her in.

(2.)

STAFFORDSHIRE.

A. Dun you know solden-mouth Summy?

B. Ees, an' a neation good feller he is tew.

A. A desput quoiet mon! but he loves a sup o' drink. Dun you know his woif?

B. Know her, ay. *Hoo's* the very devil when her spirit's up.

A. Hoo is. *Hoo* uses that mon sheamful; *hoo* rags him every neet o' her loif.

B. Hoo does. Oive known her come into the public, and call him al' the names *hoo* could lay her tongue tew afore all the company. *Hoo* oughts to stay till *hoo's* got him i' the boat, and then *hoo* mit say wha *hoo'd* a moind. But *hoo* taks aiter her feyther.

(3.)

CHESHIRE.

So tightly houdin on by th' yed, I hits th' owd mare a whop,
Hoo plumps into the middle o' the wheatfield neck and crop;
An, when *hoo* floundered out on it, I catched another spin:
And, missus, that's the cagion of the blood upo' my chin.

A Day with the Cheshire Fox Dogs.

(4.)

LANCASHIRE.

Eawr Marget declares had *hoo* cloas to put on,
Hoo'd go up to Lunnon ar' talk to th' great mon;
An' if things were na awtered when there *hoo* had been,
Hoo's fully resolved t' sew up meawth an' eend;
Hoo's neawt to say again t' king,
But *hoo* loikes a fair thing,
And *hoo* says *hoo* can tell when *hoo's* hurt.

The Oldham Weaver.

(*a.*)

And as *hoo* was restin one day in her rowm,
Hoo spyd't the mon ridin th' mare into the town;
Then bounce go's her hart, and *hoo* wur so gloppen,
That out o' th' winder *hoo'd* like for to loppen.

(*b.*)

Hoo stampt and *hoo* stardt, and down th' stairs *hoo* run,
Wi her hart in hur hondt, and hur wind welly gone;
Hur headgear flew off, and so did hur snowd,
Hoo stampt and *hoo* stardt as if *hoo'd* been wod.

Warrikin Fair.

8. We'n a little sister, un *hoo's* beawt paps: wot mun we do for eawr sister ith' day when *hoo* 'll be spoken for?

9. If *hoo* be a waw, we'll build on her a pallus o silver; un if *hoo* be a dur, we'll close hur in wi' seedar booarts.

Th' Sung o' Solomon, ch. viii., 8–9.—*Lancashire* (*parts about Bolton*).—J. T. Staton.

In the South of Yorkshire and in the *North* of Lancashire we find '*she*.'

When yo goa ta meet Miss May (the month), mind an be aware ov hur at t' varry furst seet, for *shooaze* az full ov her joakes, ivvery bit, as hur bruther April iz; an glories if *shoo* can nobbat mack a May geslin ov onnyboddy. Still, *shoo* means no harm in it, it's a lively way *shoo* hez, &c.

T' Bairnsla Foaks' Annual, &c., 1856, pp. 10–11.

8. Ween a little sister, an *shoo's* nooa brests: wot shall we do for ahr sister i' t' day when *shoo* shall be spokken for?

9. If *shoo* be a wall, weel bild on her a palace a' silver; and if *shoo* be a door, weel inclose her we booards a' cedar.

T' Song A' Solomon, viii., 8–9.—*Sheffield* (*A. Bywater*).

8. Wee 've geet a laile sister, an' *shu* hesn't onny breeas: wativver sall wee dew fur wir sister, i' 't day 'at *shu* 'll be sparred for?

9. An *shu* be a waw, wee 'll big upov hir a pallis o' silver; an' an *shu* be a dooar, wee 'll clooas hir up wi' booards o' cedar.

'T Sang o' Solomon, viii., 8–9.—*Craven* (*H. A. Littledale*).

8. We have a lile sister, an *shoo* hez naä brusts: what shall we due for our sister e t' day when *shoo* shall be spoken for?

9. If *shoo* be a woe, we'll build on her a palace a silver; an if *shoo* be a dŭer, we'll fence her we baärds a cedar.

T' Sang A Solomon, viii., 8–9.—*North Lancashire, i.e. Lancashire North of the Wyre* (*T. Phizackerley*).

But, besides this, the form in *h-* is a scarce one anywhere; in other words, the nominative feminine of *he* (as a *word*) is limited to two groups (and to two only) of the German class of languages—viz., the *Anglo-saxon* and the Frisian. In the latter we find *heo* in the old East Frisian and in the present North Frisian; whilst in the Middle Frisian of the present Dutch province the word is *she*.

Ne se dat *hio* et seld habbe jef seth, jef wixled truch dera tria haudneda eer, deer *hio* dis kindes des leves mede hulp. **See page 55, lines 1 and 29.**

'Ofke' *sei* sei, 'elk jier in bern.'
'Ofke,' she said, 'each year a bairn.'

Jŭ seed Min Seen, fortüne wat.
She said, 'Mine son, earn somewhat.'

Jü nöodight höm en sin hinghst in.
She forced him and his horse in.

Meanwhile—

In Old Saxon the nom. fem. is *siu*; the plural *siâ*, *siâ*, *siû*.

In Old High German, *siu*; plural, *siê*, *siô*, *siû*.

In the present German, fem., *sie*; plural, *sie*.

In Mœsogothic, nom. fem., *si*.

It is found, however, in the Northumbrian; i.e. that of the Glosses.

But the form *hoo* or *heo* does not stand by itself. Its use, or disuse, involves that of the Feminine Definite Article, which is in Westsaxon *se* = ὁ; *seo* (*she*) = ἡ = *þæt* (*that*) = το: the demonstrative pronoun proper, and the pronoun of the third person (which is much the same), being *he*, *heo*, *hit* = *it*. There is, then, a mixture of

two fundamental words, when we look to the demonstrative and personal pronoun alone, and of *three* when we take in the article. For the article, however, masculine and feminine, the root *s-* is the oldest form, i.e. it is the form in Mœsogothic, Icelandic, and Anglosaxon. If it does not exclude the masculine and feminine of *that* (i.e. the inflections of the root *th* = þ), it preponderates. The Mœsogothic we know in its oldest stage only; but in Anglosaxon and Norse it disappears early. In Frisian and in the Modern German it is superseded by the root *th-* (*thju*, *die*). In Westsaxon, however, it is displaced without taking a substitute; i.e. *þe* serves for all the three genders; as it does now. When *seo* is thus (so to say) liberated from its function as a definite article, it displaces *heo*, the feminine of the personal pronoun. Hence, *heo*, or *hoo*, seems to hold its ground only so long as either *seo* or *theo* (*thiu*, *theo*) are not feminine demonstratives (definite articles), or until the common form *þe* (*the*) has superseded them both. *Se* drops out altogether, at an early period. In the Northumbrian neither is found from first to last.

This applies to the value of *heo*, or *hoo*, as a characteristic form; showing that it stands for something more than itself. The application of the bearing of the correlation is general. Its exact history, however, in the present case cannot be given in detail. But this is for want of materials. All we can say is that if, in the dialects of the above-named districts, *hoo* wholly exclude *she* as the feminine of the third person, the latter word has fallen out of the language altogether; for it has not yet been found as a definite article. More than this, in the known specimens of the West Midland dialects in their older stages, *she* and *hoo* do not occur.

In the truly Mercian English *she* is, to say the

least, a commoner form than *heo*. It has wholly superseded *heo*, and survives *se*, which is wholly lost.

All that can be said about the use of the word *hoo* in Staffordshire, &c., is that it points in the direction of Wessex rather than in that of Northumbria.

§ 110. *Preponderating Affinities of the Mercian.* —This use of *hoo* for *she* points, as we have already said, to the Westsaxon; but it only does so in the first instance—only when we compare the Mercian with the Northumbrian of the Middle period. In the *oldest* Northumbrian we find *heo;* nor must we fail to remember that, in the present Westsaxon, it is obsolescent.

In respect to its characters in the way of name and geographical area, the external evidence, though of less value than that of language, deserves notice. *Mercia*, as a name, is an indifferent one; i.e. it points neither to Saxon Wessex nor to English Northumberland; for it is a geographical rather than an ethnological term, and, so far as it characterizes a population, means nothing. But it is not a continuous one. On the contrary, for the districts south of the Humber, and south even of the Ouse, the names *East-Engle* and *Middel-Engle* appear in the Anglosaxon Chronicle, and that as translations of the *Orientales Angli*, and *Mediterranei Angli* of Beda; specially connected in origin with the Mercians, with the Northumbrians, and with the Angle denomination in general.

De Anglis * * Orientales *Angli*, Mediterranei *Angli*, Mercii, et tota Northumbrorum progenies.—*Beda*, *Hist. Eccl.* I. XV. 36.

Of Angle comon * * Eást-*Engle*, Middel *Engle*, Mearce, and ealle Northymbra.—A. S. Chron., A.D. 499.

It is safe, then, to say that the evidence of Beda, who specially gives us the distribution of the conquering Germans, makes Mercia Angle rather than Saxon.

And it is equally safe to say that, in Germany, we find no district so definitely assigned to the men of Mercia, as Westphalia is to the Saxons, and the Lower Elbe to the Angles.

This is as much as can well be said at present. Nor is the question one that presses; for whether the Mercian be modified Angle or modified Saxon, an independent dialect or a mixed one, is, probably, incapable of being positively either affirmed or denied. Still, it belongs to a large district, and if we call it mixed, something more than the mere influence of a dialect on its frontier is required.

§ 111. Of the analytic character of the Mercian we can only repeat what was said about the Northumbrian. If few old inflections have been replaced by analytic forms, it is because they were, comparatively, but few to begin with. Still there has been change.

CHAPTER XII.

EXISTING OLD SAXON OF GERMANY.—ITS CHARACTERISTICS AND AREA IN THE EXISTING DIALECTS OF GERMANY.

§ 112. Between the *Westsaxon* character of the Heliand, and the Essex and Frekkenhorst specimens from the parts about Münster in Westphalia, we got, from the evidence of the language, an approximate locality for the *Old*saxon of Germany as compared with the *Anglo*saxon of Wessex; but without any corresponding historical indications.

For the parts about Altmark we get an incomplete series of historical notices of the approximate locality

in Germany of the mother-country of the *Angle* denomination in England; but without any corresponding specimens of the language. Nor are the later provincial dialects sufficiently characteristic to make up for the deficiency.

Still, for two definite and distant points in England we have got two definite and distant points in Germany; though the evidence of their correspondence is not of a uniform character.

And in Germany, as in England, we find a third district in which we find no correspondence with the midland parts of England sufficiently definite to enable us, either from internal or external evidence, to assign to it the third division of our dialects.

The distinction, then (or dualism, if we choose to call it so), between the Angle and Saxon element in England is real (and not nominal) in both countries.

But the evidence of it is different. On the Saxon side it is both more direct than on the Angle, and there is much more of it. On the Angle side it is wholly a matter of inference.

In the following extracts we get a language of which the very least that can be said is that it is as like the Oldsaxon of Westphalia as the dialects of Wilts, Dorset, Somerset, and Devon are like the Westsaxon; and it may be seen, if we note the localities, that some of them lie far beyond the boundaries of Westphalia. It is in the plural of substantives in *-s* and the plural of verbs in *-t* (= *th*) that they most decidedly disagree with the High German. They are italicized accordingly.

Parts about Essen.

Tuck, tuck, tuck, mien Hähneken,
Wult deiste in mienen Hoff?
Plücks mi alle Blaumkes aff,
Dat mäk te vol te groff.

Tuck, tuck, my chicken,
What dost thou in my yard?
Pluckest (for) me all flowers off,
That dost thou much too rough.

Dual of the Personal Pronoun.

Frau, frau wat spinn i so flietig?	Dame! dame! what spin you so busy?
For miene Mann 'n golden Rink.	For my husband a golden ring.
Wo ess u Mann?	Where is your husband?
Inne Schüür.	In the barn.
Wat dat hä do?	What does he there?
Eck segg et *ink* nich.	I won't tell you.
O segget het mi all.	O tell us all.
Hä is op dä Schüür un fourt dä Küüskes.	He is in the barn and fothers two cows.
Git mögget sä mi awer jou nich jagen.	You may now not hunt me.

Parts about Frekkenhorst.—The Prefix of Past Participle dropped.

Laiw Häär, laiw Häär, so blitz' doch äs!
Jans Schrôkamp was ut 't Wäätshus *kyuemen*,
Wö he all nacht satt bäs te lasz,
He harre Djoarst fjöer fiif of säsz
Auk woll en Hälfken to vjiel *njuemen*.

'Dear Lord! Dear Lord! how it lightens!'
Jack Schrokamp was come from the inn;
Where he all night sat till the last;
He had thirst for five or six.
But he would take a half-glass too much.

Parts about Warendorf (near Frekkenhorst).

Sié de tied hawwe*t* ålle nachtegallen twee augen, un blinnerslangen kiénne augen.

Since that time have all nightingales two eyes, and blindworms no eyes.

Dialect of Osnaburgh.

Dar ginten, dar kiket de Strauten henup,
Dar stahe*t* wat aule Wywer in 'n Trupp;
De Annke, de Hildke, de Geske, de Siltke,
De Trintke, de Äultke, de Elsbeen, de Täultke;
Wann de sick entmö*tet*, dat schnaatert sau sehr
Liefhaftig as wenn't in 'n Gausestall wör.

In English.

There yonder, there look up the street,
There stand the old women in a troop;
The Annke,* the Hildke, the Geske, the Siltke,
The Trintke, the Aultke, the Elsbeen, the Taultke.
When they meet† each other, it cackles so sore,
Laughable (?) as if it were in a goose-stall.

Parts about Münster.

(1.)

Vat kiekt as de Stärnkes so fröndlich an?
O saih, wu se spielet un lachelt us an!

Why look the stars so friendly on?
O see, how they play and laugh on us.

(2.)

Aowens wen ick in min Bettken triäde
Triäd ick in Maria's Schaut.
Twiälf Engelkes gaoht met mi.
Twee Engelkes an den Kopp-End,
Twee Engelkes an den Föten-End,
Twee de mi mi deckel,
Twee de mi wecket.

Evening's, when I in my bed step (tread),
Step I in Mary's bosom;
Twelf Angels go with me.
Two Angels on the head-end,
Two Angels on the foot-end,
Two that cover (deck) me,
Two that wake me.

Town of Osnaburgh.

Een'n Ossen willt wi vör Di föhren,
  Dat sülvst Du süst wo groot se sind:
Dock kann sick saken et geboren,
  Dat man se noch väl gröter find.

An ox will we before thee bring,
  That self thou seest how big they are;

---

* Annie, Hilda, Jessie, Sibyll, Catherine, —— (?) Elizabeth, Adelaide.

† As in full *sore = much*.

Still, it may, perhaps, happen
That one may find them *still bigger.

Ammerland.

Ic weet wol, ick weet wol, wo goot wahnen is;
To Hollwege, to Hollwege, wenn't sommer is.
De Halstruppers, de hewwet de fetten Swien;
De Moorborgers, de driewt se henin;
De Halsbecker he wet de hogen Schoh;
De Eggeloger snöret se to, &c.

The poem runs on in similar couplets; giving the characteristics of the different villages. This calls for a free use of the plural, so that within the remaining stanzas we find as many as seven of them—*et't*, *hewwt* (twice), *gaht*, *staht* (twice), *stickt*, *geiht*, *streiht*.

Jever.

Dat is te Banter Karkhof;
De liggt buten dieks up d'Groo;
De Tuten de roopt, un d'Seekobb kritt,
De Dooden de höört to.

That is the Banter churchyard;
That lies out up in the deep;
The sand-pipers cry, and the sea-mews shriek,
They belong to the dead.

Dialect of Butjahde.	*In English.*
Hee schull by siens glyken blyven;	He should remain with his equals;
Wy kahmt also wyt as hee;	We have come as far as he:
Ick kann lesen, reknen, schrieven:	I can read, reckon, write,
Dat is nok woll gar vär dree.	That is enough for three.

Parts about Vechta.

Ik stah nech up, late di der nech in,
Bett datt mine Oolen na'n Bedde sünt.
Gah du nu hen in den grönen Wald,
Denn mine Oolen schlapet bolle?

---

* For *viel* (? *well* = *wohl*).

The same in the Frisian of Saterland.

Ihk stoende nit ap, lete di dir nit in,
Bett dett min Oolden etter Bedde sünt.
Gounge du nu fout in den grenen Wold,
Denn mine Oolden schlepe bald.

I stand not up, let thee there not in,
Till that my parents after bed be;
Go now forth in the green wood,
For my parents sleep soon.

Saterland.

German.	*Frisian.*
Ick un min Kamerad,	Ihk un min Kamerad,
Wy beyde, wy sint Soldat;	Wi be, wi sünt Soldat;
Wy gaht morgen weg.	Wi gounge meden fout.

I and my comrade,
We both, we be soldiers;
We go, to-morrow, away.

The Valley of the Diemel. (Here Saxonia is divided from Hesse.)

De Wüörpelthären.

(1.)

Se had dre graute Stene utehågget, osse de Wüörpel siet, un had se se eliegt up, de üngerste Müre vannen Thären, un darup siet ewiest to seëne achtein Augen. De allen Lüē, de nau liewet, had den Thären, un de Wüörpele, de darup wören nau eseen, un daavan heed de Thären eheiten: de Wüörpelthären.

They had three great stones cut out as if they were dice, and had them laid upon the topmost wall of the tower, and there are to be seen there eighteen eyes. De old people, who now are alive, had now seen the tower and the dice which were on it, and, thence, had called the tower Wüörpelthären.

Da siet ree de Buffen, de Stangen, de Prangen;
Se kommet und willt de Schandarmen uphangen.
Se staht inn 'em Glieddo, de Scheten im arm,
Dat jiet 'ne Geskichte, dat Good siek erbarm.

There are ready the clubs, the poles, the forks;
They come and will hang-up the Gendarmes.
They stand in a row, the guns in arm;
There gives a story, God have mercy.

Sunne Martin, hilges Mann
Dei us wat vertellen kann.
Van Appeln un van Biërn,
Dei Niöte fall*t* van der Miërn.
Sie*t* sou gout un giëwet us wat?
Lât 't us nech to lange stan!
Wi miöt*t* nâ 'n Husken födder gân
Van hier bätt nä Kaölen;
Dâ miot*t* wi auk krajolen,
Un Kaölen es nâ faren.

Saint Martin, holy man;
Who us (some)what tell can;
Of apples and of pears—
The nuts fall from the walls.
Be so good and give us (some)what.
Let ús not too long stand;
We must back to house a-foot go
From here to Cologne;
There must we also carol,
And Cologne is still far.

Parts about Hildesheim.

Wi Kome*t* woll vor eines riken Manns Döör
Tau düssen Marten-Abend!
Wi wünsche*t* dem Heeren einen goldenen Disch;
Wi wünsche*t* der Fruen 'n goldenen Wagen.
Tau düssen Marten-Abend!

We come well before a rich man's door,
To (at) this (St.) Martin's eve.
We wish to the master a golden dish,
We wish to the mistress a golden carriage.
For this Martin's eve.

Wi köhn*t* nich verdragen
Da du us wutt fegen.

We cannot bear it;
We have already masters,
That we must honour.
We cannot tolerate
That thou wilt sweep us.

Such are the dialects and sub-dialects which most especially give us the characteristic *-t* as the sign of the Plural Number. Any other Anglosaxon characteristic would have given like results; but the Plural *-t* is the best. After this, perhaps, the absence of the final *-r* in *we*, *he*, &c., where the High German has *wir*, *er*, &c. The plural in *-s* is not so important, inasmuch as, though absent in the literary German, it is, along with *-en*, the ordinary Plural in Dutch.

All the extracts are taken from Firmenich (*Germaniens Völkerstimme*).

§ 113. *The Analytic or Synthetic Character of the Existing Representatives of the Old Saxon.*—That the dialects of the German in Britain changed more

rapidly than those in Germany is well known; and it is, also, known that the present German, so far as its inflections go, is, at least, on a level with the oldest Westsaxon. To this we may add that what applies to the literary languages of both Germany and the Netherlands applies to the provincial dialects as well. Even among the scanty specimens of the present chapter we find in the provincial Westphalian what we fail to find in the cultivated language—viz., the Dual of the Personal Pronoun.

CHAPTER XIII.

RETROSPECT.—AFFINITIES OF THE NORSE WITH THE MŒSO-GOTHIC.—AFFINITIES OF THE NORTHUMBRIAN WITH THE NORSE.

§ 114. *Indefinite and Negative Character of the Mercian.*—The indefinite and negative character of the Mercian, as compared with that of either the West-saxon or the Northumbrian, has commanded our attention. To some extent, it is nothing more than what we expect from its place on the map of England. Two extreme dialects, as a matter of course, are more easily distinguished from one another than either of them is distinguished from an intermediate form of speech. Hence, we find nothing in Germany which corresponds with the Mercian as the Westphalian corresponds with the Westsaxon. The correspondence between the Northumbrian and the probable dialects of the Lower Elbe is less direct. But even for the Old Angle of the Continent, as the parent tongue of the Northumbrian, we can make out a much stronger case than we can for

any third form of speech in Germany having been the parent of the Mercian; and, as the words *Mercian* and *Midland* are geographical rather than ethnological or national terms, this is nothing more than what we expect.

§ 115. *Frisians of Procopius.*—In Procopius the three nations of Britain are (1) the native Britons; (2) the Frisians; and (3) Angles.

What we have to notice on this point is not so much the *presence* of the name '*Frisian*' as the absence of the name '*Saxon.*' The preference of the one to the other is, probably, referable to the mixed character of the Embassy; which, when we go into the details of its composition, is partly Frank, partly Angle. The ambassadors of the Frank king were, as their master, Franks; but there were sent with them certain Angles (presumptively of the Elbe) in order that the Frank king might pass with the Emperor as a ruler over the *Angles* of Britain. What basis there may have been for the claim does not here interest us. What seems likely, however, is this—that it was *not* from the Angle part of the Embassy that the word *Frisian* reached Procopius; for the Angles, if our view of the origin of the name be accurate, would have applied Saxons not only to the Saxons, but, probably, to the Frisians as well; whereas, the Franks are likely not only to have called the Frisians by their old name, but to have extended it to the Saxons; for we must remember that, though the time when the name '*Saxon*' is first met with as applied to the occupants of Northern Germany is approaching, it has not actually arrived.

§ 116. *Goths of Procopius.*—The same unwillingness on the part of the ordinary historians to impugn the authority of Beda, which has shown itself so conspicuously in their neglect of the notice of Prosper

Tiro, shows itself a second time (as it shows itself over and over again) in their neglect of an important notice of Goths in connection with Britain, by Procopius. In his History of the Gothic War he gives us a conference between certain Gothic legates and Belisarius. The former make a merit of having made over to the Romans the valuable island of Sicily. To this Belisarius replies that the Romans, on their part, had made over to them the larger island of Britain. Nothing is more unlikely than that this answer should not have been given; though Procopius is a cotemporary witness for the conference only. The cession must have been made earlier: nor is the approximate date difficult to make out. It must have been when the Goths were at the height of their power in Gaul, and before the rise of the Franks: a date which comes very close to the times of Hengist, Vortigern, and Vortimer, i.e. the middle of the Fifth * Century.

§ 117. *Danes of Procopius.*—Procopius is the first writer who mentions the Danes; and he mentions them in connection with the Heruli and the Warni. This, along with the account of Jornandes, has already been noticed. So have the kings of the Warni and the relations between the Warni and the Angles. So, too, has an association of the Heruli with the Saxons of Gaul.

Procopius's is the first notice of the Danes. The next is that of Gregory of Tours; but it is only

* This alone is held to stand good against the authority of Beda; whose *Jutes* are deduced from *Jutland*. The influence of either the *Jutes* of Beda or the *Goths* of Procopius on our language is so insignificant that no more is here said about them. Other reasons, however, in favour of the present view, may be found in my larger work, '*The English Language*,' p. 151–155 (Edit. 1862). For another incidental remark upon the confusion of the names Goth and Jute (of Jutland) see note on next section.

because Gregory is the later writer that Procopius takes precedence of him as an authority. As such, he is earlier by about forty years. But the death of Chochilaicus, which is related by the Frank historian as having taken place after a defeat in the Netherlands, is assigned to the year 516; not too early, however, for the time of Theodebert, who, during the lifetime of his father Theodoric (Thierry), defeated the Danes. The *third* notice of the Danes is in the 'Anglosaxon Chronicle,' A.D. 787.

That these were the *first* Danes that invaded England is expressly stated in the notices referred to; far more so than it is in any part of Beda referring to the Saxons as being the first of *their* denomination. At present, however, it is not interpreted so strictly; indeed, it is probable that the most influential authorities admit the likelihood of there having been Danes in England as soon as there were Angles; and this without counting the Norwegians of Scotland.*

§ 118. *Saxony, Hesse, and Thuringia.—Saxony*, as compared with the other two, is a new name; and, at first, it is an ethnological, rather than a geographical, one. When it becomes geographical it is so indefinite as to lose its import in ethnology. All that here need be done with it is to indicate the extent of the area within which the philological characters

* This by no means militates against the doctrine that the Jutes of Beda were *Goths* rather than *Jutlanders*. In the Letter of Venantius we find the words *Geta* and *Euthio* in the same line; from which we may infer that they apply to different populations; and as *Geta* meant the *Goth*, *Euthio* meant the *Jute*. Moreover the name *Danus* is associated with them. All, however, that comes from this is the fact that the names *Dane* and *Jute* were known to the Franks of the sixth century, and that an indefinite claim of supremacy over them was asserted. Nothing is more likely than this; for we have seen Theodebert affected a similar authority in England. But there is nothing in the two terms that sanctions the notion of Jutlanders in Kent.

of the Saxon, as a form of speech, present themselves. And here we must introduce a new factor, viz., the letter *-r* as the sign of certain cases of the pronoun. It characterises the present Literary German; where *wir* = we. The older Mœsogothic gives us *-s—veis*, of which the German *wir* and the Icelandic *ver* are later forms. The importance of the change will soon show itself.

Between the verbs in *-th*, and the pronouns in *-e* or *-i* (i.e. without the *-r*), we trace, in the present provincial dialects of Germany, signs of Saxonism as far as Waldeck, and the parts about Weimar, Erfurt, Gotha, and Rudolstadt, in Thuringian Saxony; a name which indicates a borderland, and that on the side of both Thuringia and Hesse.

On the west we find them as far as the Angrarian frontier, and on the coast as far as the Jahde (Butjahde) and the parts beyond it, i.e. the narrow angle between the mouths of the Weser and the Elbe, where the Frisian ends; reappearing, however, on the north side of the Elbe, and being continuous on the islands.

For the northern frontier of Hesse we find one definite boundary, but (in my mind) only a political one, viz., the *Pagus Hessi Saxonicus*, and the *Pagus Hessi Francicus*. This, along with the present dialect, makes *Waldeck* Saxon. But in Northern, and to a less extent in Central Hesse, we find Saxon characteristics. Along the Rhine the Old Saxon changes character till, in the Alsatian of the Krist, we get a preponderance of *High* German characters—characters, however, which are nearly of one kind, i.e., the change from *d* to *t*, *b* to *p*, *g* to *k*, and *t* to *z*. The distinction in these districts between Saxon and Frank has been treated as political rather than ethnological (see § 42). That between Saxon and Alemannic is more decidedly ethnological.

Hesse is by no means a district with a special dialect of its own; but one which shows Saxon, Alemannic, and Thuringian characters according to the frontier.

Thuringia, on the other hand, has as definite a Thuringian form of speech (dialect or language, as the case may be) as any in Germany.

§ 119. *Dialect of the District of Anglen.*—The only two specimens I have seen of the district of Anglen, which Beda especially assigns to the Angles, have nothing that specially points to either the Saxon or the Angle of England. They are the ordinary Platt Deutsch of Northern Germany, with older *Danish* elements.

§ 120. *The Angle of the Continent—Where must we look for it?*—I submit that it must be looked for in Denmark; not, however, within the boundaries of the present kingdom so called, nor yet within the kingdoms of either Norway or Sweden, but rather in the district from which both the German that became the language of Central Britain, and the language that is known by the name of Norse, or Scandinavian, originated. The particular time at which the two languages were sufficiently alike one another to pass for the same, or for closely allied dialects of a common mother-tongue, is not determined; though it is believed that until after the eighth century the two forms of speech were mutually intelligible, if not over the whole of their respective areas, at least in Britain, and in the parts between the Elbe and the Eyder. Such a form of speech must have been sufficiently unlike the Saxon of Westphalia and the Westsaxon of Southern Britain to account for the acknowledged differences between the Westsaxon and the Northumbrian, and, at the same time, sufficiently like it to have left the Saxon and

Angle forms of speech in Britain as two different varieties of one and the same language rather than as two mutually unintelligible languages; in other words, to have left them as they are represented in the Northumbrian Glosses and the more regular compositions of the Westsaxon literature.

The geographical relations of the district that has been assigned to the Angles of Germany are the basis of this view. Of their language we have no specimens; but if it can be shown that the Danish of the parts north of the Angle area agrees in the necessary characters with the German on the south, the result is a presumption, at the very least, in favour of the Angle having belonged to the same class. This means that the character of the Angle, which cannot be determined by actual specimens from the soil of Germany, may be, in the first instance, presumed from that of the languages of its northern and southern frontiers—provided, of course, that there are no conflicting reasons in favour of connecting it with the languages, or dialects, of either the West or East. Concerning the West we may say that, though German, it is other than Saxon, for the Saxon characteristics extend but a short way into Ostphalia. On the east the frontier is not even German; for when we cross the Elbe the whole language is Slavonic.

That the direction of the Non-Saxon dialects ran from south to north rather than from west to east, that it ran in approximate parallelism with the Saale and Elbe rather than across the head-waters of the Weser, was stated in a previous chapter. But, within the area then under consideration, no specimens of the language were brought in. This was because, for the *middle* districts, there were none, of adequate antiquity, producible. And this, again, was because we limited our-

selves to the earlier periods of the Christian era in place, and to the date (or a moderate approximation to it) of the Old Saxon remains in time. The Danes were only named as a people; a people without any definitely assigned language or locality. When the Danish language, however, comes under consideration, the horizon enlarges itself; and to this change of condition we now advert; for the Danish (or Norse) *is* now brought in from the north, and two other forms of speech from the south; so that when we find the Danish language on the north (as far north as Iceland and as late in time as the present century) and the German of Western Thuringia and South-eastern Hesse agreeing with one another in certain points wherein they differ from the Saxon, the same difference (though to a less extent) being found in the Westsaxon and Northumbrian of Britain, the *primâ facie* evidence of the Norse and Thuringian affinities of the Middle district speaks for itself. Unless then, there are reasons for the contrary, the intervening district agrees in character with that of parts beyond it, and between which it lies.

§ 121. Such is the main reason for looking to Denmark, or the Danish language, in the first instance. What we find depends upon its relations to the languages of the Southern extremity. But there is a minor point which deserves notice. The *Frisian* is the language which is generally referred to in the first instance when the differences between the Westsaxon and the Northumbrian are investigated. This is because the Frisians are generally considered to have been the earlier settlers. It is not, however, so much a question of date as one of likeness and difference between the three forms of speech.

But there are reasons why the question is important. If, in addition to supposing that the Frisians were either Saxons under another name, or an allied population that took part in the invasions of the fifth century, we, also, hold that the Danes were strangers to Britain until the eighth, it is clear that the characters of the earliest Northumbrian specimens, when they are other than Westsaxon, must be Frisian rather than Norse; and that criticism of this character has been applied

to the '*Psalter*' we have already stated (§ 98). The doctrine that the Norse is as old as the Saxon, of course. leads to nothing of the kind; but it is not the prevailing one. This, then, is one of the circumstances that invest the Frisian with somewhat more importance than is universally admitted; in other words, the Frisian owes its position to the accident of its date rather than to its own intrinsic claims; and to these its prerogative over the Norse, rather than to any abnormal oversight on the part of English investigators, has to be ascribed. The Frisian was sufficiently (and more than sufficiently) like the Westsaxon to pass for a mutually intelligible form of speech; and, as it bore a separate name, it was sufficiently unlike to pass for a second factor in the consideration of the differences between our dialects. Moreover, where it differed with the Westsaxon, it agreed, to a certain extent, with the Northumbrian. It does this, most especially, when it gives us the termination *-a* for *-an* in the infinitive mood, as *bærna* = *bærnan* = *burn*.

It must be remembered, however, that the Frisian and Westsaxon records that give us this difference are, by no means, contemporaneous; indeed they belong to different stages of the two languages. The Westsaxon that forms its infinitives in *-an* is the Westsaxon of the ninth, tenth, and eleventh centuries. During the middle period of its history the *-n* disappears.

Now it is with the Westsaxon of the *middle* period that the oldest specimens of the Frisian coincide in date; so that, although, as compared with the later forms of speech, the Frisian of the Asega-bog, &c., is called *Old* Frisian, it is anything but *old* after the manner of the Old Westsaxon. On the contrary, so far as date goes, the *Old* Frisian is the parallel of the *Middle* Westsaxon; and with this it agrees rather than differs; for in the fourteenth century both languages (or dialects) are without the final *-n* of the infinitive. This greatly abates the supposed difference; indeed, when we take date for date, we have no evidence that, in the time of the Westsaxon literature and the Northumbrian Glosses, the *-n* was obsolete in the Frisian.

§ 122. *Mœsogothic and Old Norse.*—The Mœsogothic is the oldest of any of the German languages both in date and in situation; for the translation of the Gospels by which it is best represented is as old as the last quarter of the fourth century. In respect to its inflections, it has nearly all that are found in all the other German languages put together; and it has them in a fuller form, and in an older phonesis, especially in

the use of *-s* for *-r*. Indeed, the Mœsogothic may be said to be characterised by its *Sigmatism*.

The Old Norse, in respect to the time of its oldest known compositions with assignable dates, is fully six hundred years later than the Mœsogothic. In respect to the form of its inflections, and its phonesis, in some respects it is the newer, or more modern, of the two. But in the actual numbers and amount of their inflections there is not much difference between them; while the *general* phonesis of the two is the same.

About half way between the two, the first compositions of the *Old High German* present themselves. The import of the term *High*, and the points in which the High and Low divisions of the German family differ from one another, will command notice as we proceed. At present the reader is referred to the extracts and remarks in §§ 39–42.

§ 123. *Mœsogothic, Old Norse, and Old High German Inflections.*—It is from these that the points of agreement as between the three forms of speech under notice, and of difference as between the Angle and the Saxon, will be selected.

The Article will be considered in the sequel.

The Noun in general means the Substantive, the Adjective, the Pronoun, and the Participle. Everything that is about to be noticed under these several heads will be found in the Old High German, the present Literary German (which is *High*), and the Old Norse, in some shape or other, and to some degree. It will always appear in the same shape, viz., that of *-r* instead of *-s*, except in a few instances referable to the transitional period. But it will not always appear to the same extent; i.e. in an equal number of individual words, belonging to the same divisions. In the Pronouns it will be most characteristic.

(1.) *The Nominative Case of the Noun.*—This is the -*s* in the Latin words like *lupus*, *bonus*, *dens*, *habens*, *mortuus*, *gradus*, *is* (*ea*, *id*), &c., which in every similar case is wanting, except in fragments, in the Saxon dialects: as *wolf*, *good*, *tooth*, *having*, *dead*, *step*, *son*, &c.—and in the substantive is now wanting in the Literary German. But in this shape it will occur, more or less, throughout the three groups.

In both the Old High German and the Icelandic this -*s* becomes *r*.

In both the modern H. G. and the Swedish and Danish it is dropped altogether.

(2.) *The Nominative and Accusative Cases of Weak Substantives.*—In Anglosaxon and Old Saxon these end in -*n*; or, if not in the vowel, changed or unchanged, which preceded it—as *heortan* = *hearts*.

Except in the genitive plural, nothing in Saxon *follows* the *n*. The plural itself is *blindane*. In the Mœsogothic, however, the nominative is *ns*; i.e. *tungons* = *tongues* = *ling*. In Old Norse it is *tungur*; the -*n*- being, as usual, ejected, and the *r*, as usual, substituted for -*s*.

(3.) *The Neuter of the Adjective.*—The sign of the neuter in M. G. is -*t*-, followed by -*a*—M. *blinds*; N. *blindata*. In the O. H. G. it is *z* (*ts*). In the present Literary German -*s*; as *blindes*. In the Swedish and Danish it is, at the present moment, -*t*, and, *à fortiori*, -*t* in the Old Norse.

(4.) *The -S and -R of the Pronouns.*—Between the true personal, the demonstrative, and the relative pronouns we find three forms in either -*s* or -*r*, in M. G. and O. N., which are wanting, or very rare, in the Saxon.

1. The Nominative *Singular* of the *Demonstra-*

tive, &c. This, in M. G., ends in -*s*, as *is* = Latin *is* = A. S. *he*; or *hvas* = Latin *quis* (*interrogative*), and High German *wer*.

2. The Nominative *Plural* of the True Personals, i.e. those of the first and second persons.—M. G. *weis* = *we* = Latin *nos*, *jus* = *ye* = Latin = *vos*; High German, *win*; Old Norse, *ver*; H. G. *ihr*; O. N. *þer*.

3. The Dative Singular of the True Personals and the Reflective.—M. G. *mis*, *þis*, *sis* = Latin *mihi*, *tibi*, *sibi*; Old Norse, *mer*, *þer*, *ser*; High German, *mir*, *dir*.

(5.) *The Duals and Plurals of the Personal Pronouns.*—Engl., *our two* = M. G. *ugkara*, *us two*; and *to us two*, *ugkis*. O. N. *okkar*, *okkr*.

Engl., *your*, *you* = M. G. *izvara*, *izvis*; O. N. *yðar*, *yðr*.

Engl., *your two*, *you two* = M. G. *igqara*, *igqis*. O. N. *ykkar*, *ykkr*. Here the *s* is retained as -*r*.

(6.) The M. G. present runs thus—

Indicative.		Conjunctive.	
Singular.	*Plural.*	*Singular.*	*Plural.*
1. *nasja*	*nasjam.*	1. *nasjau*	*nasjaima.*
2. *nasjis*	*nasjiþ.*	2. *nasjais*	*nasjaiþ.*
3. *nasjiþ*	*nasjand.*	3. *nasjai*	*nasjaina.*

In O. N.—

Indicative.		Conjunctive.	
Singular.	*Plural.*	*Singular.*	*Plural.*
1. *kallar.*	1. *köllum.*	1. *kalla*	*kallen.*
2. *kallar.*	2. *köllu*þ.	2. *kalla*	*kallen.*
3. *kallar.*	3. *köllu.*	3. *kalla*	*kallen.*

The -*n* of the Conjunctive is still presented in the Swedish *Imperative*. See § 139.

(7.) *The Numerals* 3 *and* 4.—There are in M. G.

threis, fidvor; in O. N. *thrir, fiörir*; in A. S., O. S., and English *three*, without the *s* at all; and *feower*, *four*, without any second *r*.

(8.) For the forms corresponding with *there, thither*, and *thence*, see § 159.

§ 124. *Phonesis of the High German.*—From one point of view the foregoing remarks are unnecessary; inasmuch as, in a classification based upon the *older* structure of the two languages, the closeness of the affinity between the Mœsogothic and Old Norse is partially recognised; and so is the affinity between both and the Old High German.

When we come, however, to a *tabular* view, and to a classification made for the purpose of showing the affinities as determined by the characteristics of the present time, some of which are certainly of comparatively recent origin, the classification by no means places the M. G. and O. N. so near one another as they appear in a genealogical *tree*, and in the present work. The Old *High* German it removes to a still greater distance from both.

In the conflict between these two classes of characteristics lies the justification of the previous details, which, from the first point of view, are, probably, superfluous. Practically, i.e. as a matter of opinion and teaching, the difference is an important one.

§ 125. *Distribution of the Surds and Sonants.*—It is on this distribution of the Surds and Sonants that the practical objection to the connection of the High German languages with either the Norse or the Mœsogothic is founded. Under different names, such as *flat* and *sharp*, *soft* or *hard*, *voice* sounds or *breath* sounds, *vocal* sounds or *whispers*, and, to some extent, as *media* and *tenues*, the difference of the two series, *p*, *t*, and *k* on one side, and *b*, *d*, and *g* (as in *gun*), has long been recognised and acted on in details of grammar. For reasons which will be given in the chapter on Phonesis, the first series is called *Surd*, the second *Sonant*, as they are in Sanskrit.

That the High German uses the former where all the other dialects use the latter is a simple fact, and it is one of no small importance. It does not use them to the exclusion of the others, but it uses them largely. It does not use them to the same extent with each of the letters of the series, but it uses them, to some extent, in all. When it does this, it also substitutes *s* for *t*, though not at the beginning of words. At the beginning of words there is a change; viz., into *z* (=*ts*). Thus —*water, wasser; hot, heiss; better, besser; sweeter, süsser*—*tongue, zunge; tear* (*lacrima*), *zahr; ten, zehn; two, zwei; tooth, zahn; tin, zinn*, &c.

But the fundamental change is between the six mutes of the

double series, surd and sonant, sharp and flat, hard and soft, according to the names we prefer. Thus—

From *b* to *p*.

English.	*Mœsogothic.*	(*Old*) *High German.*
Break	brikan	prëchan.
(*I*) *bear*	baira	piru.
Berg	bairg-s	pereg (*hill*).
Beam	bagm-s	paum (*tree*).
Blood	blôds	pluot.
Brother	brôthar	pruoder, &c., &c.;

some of which may be found in the extracts from Muspilli and the Weissenbrun Hymn, §§ 40, 41, as *pediu* = *both*, *beide*; *prinnit* = *burns*; *pi* = *by*. Hence, it is only for the *Old* High German that *p*, in the place of *b*, is characteristic.

From *d* to *t*.

English.	*Mœsogothic.*	*High German.*
Day	dags	tag, takh.
Do (*facio*)	don	thun.
Do (*valeo*)	dugan	taugen.
Deer	djur-s	thier.
Door	duru-s	thur.
Duck (*cloth*)	—	tuch.

From *g to k*.

English.	*Mœsogothic.*	(*Old*) *High German.*
Goose	—	kans.
Yard (*gard-en*)	—	karto.

Throughout these three series, as a whole, we may remark the irregularity of the amount of the change; for though not one of the lists makes any approach to completeness, the three fairly represent the *proportions* of the change; and, in detail, each division has its peculiarities. The first gives us the most instances; but it is the one in which the present High German least coincides with the language of the older stage. In every one of the examples of the preceding list the present Literary German agrees not with the O. H. G., but with the Mœsogothic and the other members of the family—*brechen*, *berg*, *baum*, *blut*, *bruder*, &c. The fact is that *p* is an exceptional sound throughout the whole family, and few, if any words of German origin begin with it. In the Bavarian dialect, however, it almost excludes *b*; the Bavarian himself calling his country *Peyern*, *Paiern*. Nevertheless, we must not explain the change by reference to Bavaria alone. All we can say of *p* is that, though limited to the High German, it is not co-extensive with it.

From *th* (þ, or ð) to *d*.

The part that *d* plays in the phonesis of the High German is a notable one. So far, however, as it is superseded by *t* it plays no part at all. As a substitute for another sound it plays a great one.

The sound of the *th* in *thin* and *thine* (Greek Theta) is not a common one. Many languages (the Latin for instance) are without it. But it is found in their older stages in all the languages of the German family; with the exception of the *High* German. There we miss it. Now the High German substitute for this is *d*—the *d* which, in its own original function, has been displaced by *t*.

English.	*German.*	*English.*	*German.*
Thou	du.	*Through*	durch.
This	diese.	*Thatch*	dach.
That	das.	*Think*	denken.
Thin	dünn.	*Three*	drei.
Thick	dick.	*Thumb*	daum.

This, however, is not a letter-change after the manner of the other three; a change from sonant to surd or *vice versâ*. It is rather a change from one of the so-called *aspirates* to the so-called *lenes* of its class. Neither is it a change for which we can see no definite reason. It is a substitute for a lost, or non-existing sound, rather than a change made, without any ostensible reason, from one sound to another. There is a reason why a substitute should be resorted to when the sound of *th* (þ or ð) is lost. There is no reason why *p*, *t*, or *k* should have been preferred to *b*, *d*, or *g*, when all six are at hand.

From *g* to *k*.

This is, at one and the same time, the sound in which the change is the least in amount, and the one in which the present High German least agrees with the Old; for we have seen that where we say *goose* and *garden*, the present Germans say *gans* and *garden*. Moreover the words wherein *both* use the *k* are more numerous than their analogues in other two divisions; as *knee*, *knife*, *know*, *kiss*, *kettle*, &c.—*knie*, *knif*, *kennen*, *küssen*, *kessel*, &c. In the Old High German we find the change at its *maximum*, *i.e.* we find it just where we find that of *b* into *p*. See *Muspilli*, and *Weissenbrun Hymn*, §§ 40 and 41.

Again, what applies to the change between *th* and *d* applies to that between *t* and *ss*. It is not a change between sounds of different degrees of sonancy. It is not even a change between two letters of the same division. It is rather a change of the sound of *t* itself; which, at the beginning of words, makes part of a compound sibilant (*ts*), and in the middle drops out—*tongue*, *zunge* (*tsunge*), &c., *water*, *wasser*, &c. The sound which is now simply that of *-s*, is often found in the older stages of both the High and Low divisions spelt with a *z* (*ts*)—as *gelegitaz* = *gelegetes* = *laid*.

The other changes which are generally given in the tables which illustrate the preceding are of no importance in the classifications of the German languages and dialects *one with another*. Thus the change from *b* to *f* or *v* is found between dialects so nearly allied as the O. Saxon and the Anglosaxon; e.g. *obar*, O. S.; *over*, A. S. That the O. S. *aba* and the A. S. *of* belong to a system; and that that system gives the Latin *ab*, with which the O. S. agrees, while the Greek *ἀπὸ* differs from both, are facts that indicate regularity and system in a department where it was long either overlooked or undervalued.

So, also, does the identity of the English *h* in *heart* and *head* (in German *herz* and *haupt*) with the Latin *caput* and the Latin and Greek *cord-(is)* and *καρδία*; while the *k* in *know*, *knot*, *kin*, *knee* is in Latin and Greek *γνόω*, *(g)nodus*, *genus*, *γένος*, *genu*, *γόνυ*.

All these are instances of order and system. But they are not facts which touch the present enquiry. It is necessary, however, to notice them because, in the opinion of the present writer, they have invested the fact of regularity to a certain degree in letter-changes with an importance which is sometimes overrated—especially in matters of classification.

§ 126. *The History of the Mœsogothic, or the German of the Goths of Mœsia.*—Though we have hitherto seen but little of the Mœsogothic, we have seen enough to show that it is a language which speaks for itself. On the archaic character of its structure alone we may assert the prerogative of the Mœsogothic in respect to antiquity. What it is we know. But it is by no means so easy to say whence it came. The men who spoke it were, so far as they did so, Germans; but it is not on the soil of Germany that we find them when it first occurs, nor to the soil of Germany has its origin ever been definitely and directly traced. That a German language originated, in some form or

other, in Germany is implied in the very name. But the Germany of the present time is not the Germany of the seventh and tenth centuries; nor is the Germany of the seventh and tenth centuries, with the Elbe and Saale (beyond which everything was Slavonic) for its boundary, the '*Germania*' of Tacitus. The language of the Goths, however, was not only German, but the representative of the German language in its oldest form; and that to such an extent that there is no language in the German family which can be explained in some of its important details in the way of inflection without a reference to it.

The Mœsogothic is German; but in what part of Germany it originated no one knows; indeed, the historian, or ethnologist, who believes that, in the way of language, the parts of the '*Germania*' of Tacitus which lay beyond the Oder (and even beyond the Vistula) were German in its present sense, may hesitate to assign it to what is now called *Germany* at all. It is difficult to say how opinions are divided and distributed on this point. It is only certain that there is no unanimity.

What we know of its external history is as follows:—

At the beginning of the third century a German population was known on the northern side of the Lower Danube, in what was then called the Province of Dacia; now the Danubian Principalities, or Wallachia, Moldavia, and Bessarabia. The Goths became formidable to the Romans. They crossed the Danube, and invaded the north-eastern provinces of the empire. They defeated the Emperor Decius in a great battle. They ravaged the coasts of Greece and Asia Minor. They continued formidable; and the Province of Dacia, to the North of the Danube, was surrendered by the Emperor Aurelian to the so-called barbarians. Here

the Goths establish a kingdom; and we know, in respect to its geography, that the valley of the river Dniester belonged to it—that it was probably the central part of it. They break up into two divisions, each with three names. They were called Ostrogoths or Visigoths from their geographical positions; Amalungs or Baltungs from the name of the royal dynasty; and Grutungs or Thervings from the names by which they seem to have designated themselves. However, collectively, they are called by the Romans Goths.

In the last quarter of the fourth century they cross the Danube; nominally by permission of the Romans, but actually as a nation of warriors going forth to conquer. By A.D. 400 they have sacked Rome under Alaric; and thence form one kingdom in France, and another in Spain. This division is that of the *Visi*goths.

In the latter half of the century the Ostrogoths, under *Theodoric*, make themselves masters of Italy.

But, though conquerors in three countries, they lose their language in all. It is smothered (so to say) by the Latin of the three conquered countries.

They are never heard of, from first to last, in Germany.

By the end of the fourth century these Goths were converted to Christianity—the Christianity of the Greek Church and of the Arian heresy.

This conversion was accompanied by a translation of the Scriptures: the Alphabet being founded on the *Greek*.

Of the translation, dating from the last quarter of the fourth century, we have remains, viz., the greater part of the Four Gospels.

The particular division of these Goths who seem by their conversion to have been transformed from warriors into peaceful villagers, settled in a district

near Philippopolis, in the Roman Province of *Mœsia*. The translation of their Scriptures is attributed to their Bishop, Ulphilas.

Hence, *Mœsogothic*, or the language of the *Ulphiline Gospels*, is the ordinary name for the chief fragment (the most important, though not the only one) of the language of these great Gothic conquerors.

§ 127. *Its Uncertain Character.*—The result is that the first locality to which we can assign the Mœsogothic is the distant province of Mœsia; then, less definitely, to Italy; and then to Gaul and Spain; but never to the soil of Germany. Yet, unless we believe that it represents the language of that part of a '*Germania*' which lay beyond the Vistula, we can scarcely suppose that it was foreign from the very first to the historical Germany. All this, however, is a matter of inference rather than of testimony. The Ostrogoths called themselves *Thervingi*. This points to *Thuringia*. So early a writer as Michaelis (and I have no reason to suppose that he was the first who did so) suggests, on the evidence of the present dialect of that district, that *Thuringia* was the original home of the Mœsogoths when they were occupants of German soil; and those who investigate the relations of southern Thuringia to the line of the Danube, and the history of the Marcomanni, may easily believe that, under another name, they worked their way along the March till they reached the Dnieper, and in the country of the *Getæ* became called *Goths*. But this is only inference; and, in the eyes of the upholder of the Germanism of the '*Germania*,' is (in the face of the text of Tacitus) inference of a wholly unnecessary character. That the Old German is, in some, at least, of its forms, Thuringian, few are likely to deny. But, then, it is *High* German, and the conflict of characters again comes in

to perplex us. I believe this is a fair statement of the difficulties of the question in general.

That they subtract from the value of the previous evidence as to the affinities between the northern and the southern extremities of the area to which the Angle district belongs is clear, inasmuch as the language which agrees with the Old Norse in its Low German character, is just the one which we cannot absolutely assign to the parts to which we assign the Old High German; whilst the German which we can so assign is not Low, but *High*.

To objections on this score I can only say that, for the present argument, I hold that the Mœsogothic affinity is sufficient—amply sufficient. It is better, of course, if by subordinating the difference of High and Low to that of the evidence supplied by the inflections, we can correct the three forms of speech. But it is held to be sufficient if it is good for the connection between two of them. Upon the value of the two classes of characters, as determined by their intrinsic merits, more will be said in the sequel.

§ 129.

Icelandic.—From Snorro's Heimskringla.

3.

Y'nglinga Saga.—Kap. 1.

Svá er sagt, at kringla heimsins, sú er mannfólkit byggir, er mjök vagskorin: gánga höf stór úr útsjánum inn í jordina. Er þat kunnight, at haf gengr af Njorvasundum, ok allt út til Jórsala-lands. Af

hafinu gengr lángr hafsbotn til landnordrs, er heitir Svartahaf: sa skilr heims þridjúngana: heitir fyrin austan Asia, en fyrir vestan kalla sumir Evrópa, en sumir Enea. En nordan at Svartahafi gengr Sviþjod in mikla eda in kalda. Sviþjod ena miklu kalla sumir menn ecki minni enn Serkland hit mikla; sumir jafna henni vid Bláland hit mikla. Hinn neyrdri lutr Svíþjódar liggr óbygdr af frosti ok kulda, swa sem hinn sydri lutr Blálands er audr af sólarbruna. I Svíþjód eru stór hérut mörg: þar eru ok margskonar þjodir undarligar, ok margar túngur: þar eru risar, ok þar eru dvergar: þar eru ok blámenn; þar eru dýr ok drekar furdulega stórin. Ur Nordri frá fjöllum þeim, er fyrir utan eru bygd alla, fellr á um Sviþjód, sú er at rettu heitir Tanais; hún var fordum köllut Tanaqvísl edr Vanaquisl; hún kémur til sjávar inu i Svarta-haf. I Vanaqvíslum var þa kallat Vanaland, edr Vanheimr; sú á skiir heimsþridjúngana; heitir fyrir austan Asia, en fyrir vestan Evrópa.

Fyrir austan Tanaqvísl í Asía, var kallat Asa-land edr Asaheimr; en höfutborgina, er í var landinu, kölludu þeir Asgard. En í borginni var höfdíngi sá er Odinn var kalladr, þar var blótstadr mikill. Þar var þar sidr at 12 hafgodar vóru æztir; skyldu þeir ráda fyrir blótum ok dómum manna í milli; þat eru Diar kalladir edr drottnar: þeim skyldi þjónustu veita allr folk ok lotníng. Odinn var hermadr mikill ok mjök vidförull, ok eignadiz mörg riki: han var sva Sigrfæll, at í hvörri orustu feck hann gagn. Ok sva kom at hans menn trúdu því, at hann ætti heimilann sigr í hverri orustu. Þat var háttr hans ef ann sendi menn sína til orustu, edr adrar sendifrarar, at hann lagdi adr hendur í höfut þeim, ok gaf þeim bjanak; trúdu þeir at þá mundi vel farasc. Sva var ok um hans mann, hvar sem þeir urdu í naudum staddir á sjá edr á landi, þa kölludu þeir á nafn hans, ok þóttuz jafnan fá áf því fro; þar þottuz þeir ega allt traust er hann var. Hann fór opt sva lángt í brot, at hann dvaldiz í ferdinni mörg misseri.

In English.

So is it said that the earth's circle which the human race inhabits is torn across into many bights, so that great seas run into the land from the out-ocean. Thus it is known that a great sea goes in at Niorvasund, and up to the land of Jerusalem. From the same sea a long sea-bight stretches towards the north-east, and is called the Black Sea, and divides the three parts of the earth; of which the eastern part is called Asia, and the western is called by some Europa, by some Enea. Northward of the Black Sea lies Swithiod the Great, or the Cold. The Great Sweden is reckoned by some not less than the Saracens' land; others compare it to the Great Blueland. The northern part of Swithiod lies uninhabited on account of frost and cold, as likewise the southern parts of Blueland are waste from the burning of the sun. In Swithiod are many great domains, and many wonderful races of men, and many

kinds of languages. There are giants, and there are dwarfs, and there are also blue men. There are wild beasts, and dreadfully large dragons. On the north side of the mountains which lie outside of all inhabited lands runs a river through Swithiod, which is properly called by the name of Tanais, but was formerly called Tanaquisl, or Vanaquisl, and which falls into the ocean at the Black Sea. The country of the people on the Vanaquisl was called Vanaland, or Vanaheim; and the river separates the three parts of the world, of which the eastermost part is called Asia, and the westermost Europe.

The country east of the Tanaquisl in Asia was called Asaland, or Asaheim, and the chief city in that land was called Asgaard. In that city was a chief called Odin, and it was a great place for sacrifice. It was the custom there that twelve temple godars should both direct the sacrifices, and also judge the people. They were called Diars, or Drotners, and all the people served and obeyed them. Odin was a great and very far-travelled warrior, who conquered many kingdoms, and so successful was he that in every battle the victory was on his side. It was the belief of his people that victory belonged to him in every battle. It was his custom when he sent his men into battle, or on any expedition, that he first laid his hand upon their heads, and called down a blessing upon them; and then they believed their undertaking would be successful. His people also were accustomed, whenever they fell into danger by land or sea, to call upon his name; and they thought that always they got comfort and aid by it, for where he was they thought help was near. Often he went away so long that he passed many seasons on his journeys.

§ 130. Those who are not above betaking themselves to mechanical contrivances may bring the Old Norse into something like its older form by substituting, in the preceding specimen, *-s* for *-r* wherever it is inflectional. In doing this he will not go wrong more than once or twice in a dozen instances; so regular is the change. If this help him in the appreciation of the influence of the single change from Sigmatismus to Rhotacismus, he may continue the illustration by attaching *-n* to the inflections in *-a*; the infinitive moods, and the definite (weak) inflections more especially. Between the two he may learn the extent to which the eschewal of Nunnation, though a single change, affects the general aspect of a language.

In both of them, though not to the same extent, the Frisian agrees with the Norse. And this is the main likeness upon which the recognized affinity between the two has been founded; and that legitimately—so far as it goes; but we have seen that, as a rule, the other details of the Frisian are Westsaxon. In the substitution of the *-r* for *-s* the High German, like the Frisian, is Norse. The old nominative case ends in *-r*; but the sign is soon abandoned. In the High German, however, the plurals of nouns end in *-r* rather than in *-s*. The nunnation the High German dialects retain; and, with the exception of the Frisian, the Low German do the same. The Northumbrian is the first to drop it. The Dutch of Holland still retains it.

Nevertheless, the tendency to change, in some degree or other, is found throughout the whole German family. The Saxon dialects have not only held (we may say pertinaciously) to the *-s*, but have extended its application to the genitive of feminines; and we know that at the present time it is nearly the only sign of inflection we have. But even, as such, so far as the distinction of one form from another is concerned, it is scarcely an inflection at all. It is only to the *eye* that the genitive singular is distinguished from the nominative plural; as *father's = patris*, *fathers = patres*; whilst it is only the nature of the main word or the context (one or both) that distinguishes the third person of the verb from the noun—as *he walks a long way*, *he takes long walks*. Yet in words like *our*, and *were*, with others of less importance, the older form was not only in *-s*, but has left traces of its having been so—*e.g.* in Old Anglosaxon *use* and *usse*; and *was* in the present English.

The mere change, then, is, by itself, no characteristic of much value; since it is found, more or less, in

different forms of speech. Its value is determined by (1) the *extent* of its operation, and (2) the period at which it sets in; which is nearly, though not quite, the same thing as its *rate*.

§ 131. *Rate of Change, &c.*—Upon the question of *extent* little need be said; inasmuch as it has already been illustrated, to some degree, explicitly and in detail; while more has been suggested by implication; since it was because they operated very decidedly on the languages under notice that certain changes were used as characteristics. That of *rate*, however, commands our best attention; especially under the particular aspect just indicated, viz., the period at which such or such a change began to operate. This, independent of the amount of its action, is of primary importance. Otherwise, we may in our comparison of languages which, at one period, were little more than dialects of a single form of speech, find them so altered by changes subsequent to their separation from the parent tongue as to be placed in different classes when compared (or rather contrasted) with one another, in their later stages. Reasons will be given in the sequel, for believing that, in two notable instances, this has been the case with the Northumbrian (or Angle) and the Norse.

§ 132. As the question thus presents itself we have three epochs.

1. The last quarter of the fourth century (say A.D. 375) when we first get the Mœsogothic; destined for more than three centuries to be the representative of the German family.

2. The eighth and ninth centuries, when we get in the Anglosaxon (both Westsaxon and Northumbrian), the Old Saxon, and the Old High German, the first of the remaining languages of the family that can be

compared with either the Mœsogothic or with one another.

3. The eleventh century is the time when we first get an adequate amount of *data* for the Old Norse. That, what with the Runic inscriptions, and what with the fragments assigned by the earliest Norse writers to the older poets (Scalds), we may get an inkling of something older is not denied. For an adequate literature, however, the eleventh century is as early a date as can be given.

The intervals implied by these dates are, by no means, inconsiderable; but this is not the only difficulty. Two others must be added. The two forms of speech which most especially interest us are the Mœsogothic and the Northumbrian; and of each the history is incomplete. The Mœsogothic, as we have seen, is mainly represented by a single composition; whilst, to the soil of Germany, either in its own proper form, or by any generally recognised *directly* descended dialect, it has never been traced. The Northumbrian, on the other hand, though known by something like a literature in the ninth and tenth centuries, has no continuity in its history; for we have already spoken about the great break, or blank, during the eleventh, twelfth, and thirteenth centuries. Between the latest of the Glosses and the last quarter of the thirteenth century we have only a few lines to represent it.

§ 133. It is now necessary to state, or perhaps repeat, the exact points towards which the present investigation is directed. It has nothing to do with the differences of dialect between the northern and southern forms of speech in our island. These are not only already recognised, but have been admirably elucidated by enquirers who have done much and promise to do more. What is attempted is an historical

and geographical elucidation of their import. Nor does this mean the setting up of any wide lines of demarcation between them. It does not make them alien and opposing forms of speech. It goes no further than the assignment of definite and special parts of Germany from which the Angle on one side and the Westsaxon on the other originated. But it *does* mean that those are precise and natural; that each coincides with the origin of the name under consideration, and that each gives a difference of dialect coinciding with recognized differences of south and north in Great Britain; and that the two points are in Germany, and in Great Britain, north and south to one another.

Nor does it mean that a connection, on the one side with Denmark, and on the other with Gaul, implies much difference in respect to the descent of the Westsaxon and the Northumbrian from a common parent; or that Scandinavian elements exclude German. Any great difference made in this respect, on the strength of the division into High and Low German, is not one of my making, though it is, certainly, one which I am prepared to consider in the sequel.

§ 134. On the other hand, it is not to the effect that the Danish and Angle were one and the same dialect of the same language. They were rather dialects with subdialects; the *minimum* difference between them being found on the common frontier. There is no reason, however, to believe that, in the sixth century, they bore different names. It is in the sixth century when the name *Dane* appears for the first time; but only to the effect that in 516 a Dane named Chochilaicus was killed in the Netherlands. Denmark, as a country, is not heard of for more than two centuries afterwards.

There was likeness and there was difference; and

of each we may give the measure so far as it bears on the present doctrine. The Danish in the time of Beda may easily have been as like the Northumbrian as the Westsaxon was; i.e. a mutually intelligible language; so that just as Beda made no distinction between the Angle and the Saxon (preferring English as the common name), he may have made none between the Angle and the Danish. Liker than this the two languages need not have been. *Unlike* we suppose them to have been so far as it is necessary to account for the difference between the Northumbrian of the Glosses and the Norse when we first get an adequate representation of it in the eleventh century, or (even if we say the tenth) three hundred years after the death of Beda, and about two hundred after the last of the Glosses. In investigating this we must remember that it is not the Danish of England that is compared with the Northumbrian, but rather the Danish, or Norse, of the Continent; and that after it had reached a point so far from the Old Angle district as Iceland.

Nor does the connection of the Danish (Norse of the Angle frontier, as we may call it) imply any inordinate difference from the Westsaxon. Both go back to either the Mœsogothic, or some closely allied form of speech; and both differ from it merely in a variation of the details of their change. The Frisian, however much we may hesitate to refer to it in preference to the Norse, is, to some extent, a transitional form of speech; though only one between the Saxon and the Angle; the Angle itself coming between the Norse and the Frisian.

This means that, in the sixth century, the distinctive characters of what is now the representative language of the Scandinavian division of the German class had not become sufficient to separate the

two classes; and with this I leave the exposition of the nature of the suggested affinities. The differences are considerable now; but they were inconsiderable twelve hundred years ago. The changes during this interval by which they were brought about, so far as they are capable of investigation, along with their approximate dates, will be noticed as we proceed.

§ 135. The two great breaks in the continuity of the three languages under notice—the Mœsogothic, the Norse, and the Northumbrian—have already been indicated.

The little I can do towards filling them up consists in the following three notices; two of which bear on the change from the *Sigmatismus of the Mœsogothic to the *Rhotacismus of the later forms of speech, and the third upon the remnants of the *Nunnation.

The first applies to the Mœsogothic itself: the other two to the Norse.

§ 136. '*Asting*' *and* '*Garding*' *in the Gothic.*—These are, word for word, the same; inasmuch as both forms are Gothic; the form in *-s* being the older one. The word in either form is a rare one. So far, however, as it goes it is an instructive one. The proper name Ἀστιγγοι, as applied to a population of Dacia, first occurs in Dio Cassius; Jornandes, who is an *Ostro*goth, uses the same form; Cassiodorus does the same, he also being an *Ostro*goth. Lydus, referring to an event during the reign of Justinian, tells us that the word was a title of honour; his form being *Astingi*, with the *-s*. But, in a Spanish, or *Visi*goth, record referring to the same period, it is *Gardingi*, and this

* I find it convenient to use these somewhat scholastic terms for the difference between the languages under consideration in respect to their adoption or avoidance of the sounds of S, R, and N, in inflections. The Sigmatismus is characteristic of the Mœsogothic.

it is wherever it is found (and it is found more than once) in the *Visi*goth Code; and that with the secondary meaning of *Noble* which it has under the form *Asting* in *Lydus.

§ 137. '*Is*' *for* '*Er*,' *the Old Norse Pronoun.*—The older Runes give us the older form *is* for *er*; the former being the Mœsogothic demonstrative. 'It is found,' writes Munch, 'oftenest in the old old (*æld-gamle*) forms *is* and *ias*, oftener compounded (contracted) into *sas*, *sar*.'—*Kortfallet Fremstilling*, &c., p. 32.

§ 138. '*Is*' for '*er*,' *the Auxiliary Verb.*—From the same writer—'The auxiliary verb *vera* gives generally, or, at least, a majority of forms in *-s*—viz., in the present indicative *ist* (*est*), *is* (*ias*, *es*); infinitive *visa* (*vesa*); participle *visandi* (*vesandi*); preterit indicative singular *vas*, *vast*, *vas*.'—*Ibid.*, p. 29.

§ 139. *Remains of the Nunnation in O. N.*—In the M. G. the third person plural for both the present and the past tenses of the subjunctive mood ended in *-na*; as *nasjaina* = *sanent*; *nasidêdeina* = *sanarent*. This *-n*, concurrently with newer forms in *-i*, is found in the Old Swedish of the Runic period. It is also found in the *imperative* of the present Swedish. See *Ibid.*, p. 29.

§ 140. *The Post-positive Article and the so-called Passive Voice.*—But the two points in the structure of the Scandinavian languages upon which the most stress has been laid are (1) the post-positive article, and (2) the so-called passive voice.

§ 141. *The Post-positive Article.*—In M. G. the definite article is as follows:—

---

* This is from Zeuss, pp. 461, 462, and note. The foregoing references tell us all that is known about the *Astings*. Their history seems to have been merged in that of the Goths in general.

SINGULAR.

	Masculine.	*Feminine.*	*Neuter.*
Nom.	*sa.*	*sô.*	*thata.*
Gen.	*this.*	*thizês.*	*this.*
Dat.	*thamma.*	*thizai.*	*thamma.*
Acc.	*thana.*	*thô.*	*thata.*
Abl.	*thê.*	—	*thê.*

PLURAL.

Nom.	*thai.*	*thôs.*	*thô.*
Gen.	*thizê.*	*thizo.*	*thizê.*
Dat.	*thaim.*	*thaim.*	*thaim.*
Acc.	*thans.*	*thôs.*	*thô.*

Except that this gives us the characteristic *s* of the old language, as opposed to forms like *there*, *thera*, and *their*, which take *-r*, this is little more than the definite article both in the Old Saxon and the Westsaxon; in neither of which is there anything remarkable. *Sa* and *so*, or *se* and *seo*, differ from *þæt*, just as in Greek ὁ and ἡ differ from τό; and in the three languages they all precede their noun, and stand apart from it as separable words. And this is what articles do in general.

In Norse, however, the equivalents of *sa*, *so*, *thata*, and ὁ, ἡ, τὸ, are *hin*, *hinn*, and *hit;* and these, instead of preceding their noun, *follow* it; and instead of standing apart from it as separate words, coalesce with it. In the present Danish the *i* has become *e;* and, as in the present Danish, the *in*definite article is *en* for the masculine, and *-et* for the neuter genders. Then the *h* of the *definite* article is dropped, the two articles, form for form, become confluent, and it is only by their position that they are distinguished; *e.g. en mand* = *a man*, *et bord* = *a table*, while *manden* = *the man*, and *bordet* = *the table.*

Hence, in both Danish and Swedish, i.e. the modern descendants of the Old Norse, the forms from the

root *s* have disappeared, and the substitution of the derivatives of *hin* for those of *se* and *þæt* is complete. Both the Mœsogothic roots are excluded, and a *post*-position in the garb of inflection is substituted for the familiar separable and independent prefixes of the German and the Greek languages.

With all this difference, however, there is a great amount of likeness. The M. G. *sa* and *sô*, though lost to the *Danish* and the *Swedish*, are preserved in the *Icelandic* from the time of the earliest Runes to the present day; the only difference being that they are classed as demonstrative pronouns rather than as definite articles. Between the two, the difference is of the slightest; indeed, in most languages where both occur, either one may be used where we expect the other, or equivocal constructions may present themselves. Such a one is the combination that one Englishman would translate by *the* and another by *that*.

If we take this as a convenient test, and apply it to the *old* forms of the Norse, we shall find something very like *two* articles, one of old and one of recent origin; the two for a time destined to be used concurrently, but the older, at length, destined to be superseded.

Hin is the form that is most decidedly articular. In extreme cases like *Frederic the Second*, *George the First*, &c., where *that* is out of the question, it predominates—*Ari hin Froða = Ari the Wise*; *Froðe hin Frökne = Frode the Active*, &c.

On the other hand, in contexts like

The man that has not music in his soul,

where there is a relative to follow (so that the article belongs to the noun of the antecedent), and where *that*, though not incompatible with the text, is rarely used,

the Norse pronoun is not *hin*, but *sá*, or *sú*, according to the gender. And *er* follows.

Thus, from a single division of a single poem in the Metrical Edda we have—

Vafthnidnir.

Segðu þat, Gagnráðr,
hve *sá* völlr heitir;
Er finnask vigi at
Surtr ok *in* svasu goð?

Say-thou Gangrad,
how *the* plain is called;
Where is found (the) war between
Surtur and *the* sweet god?

Vafthnidnir.

Segðu þat Gangráðr,
hve *sú* á heitir;
Er deilir med jötna sonum
grund ok með goðum?

Say-thou Gangrad,
How *the* river is called;
Which divides between the Jotun's sons
(the) land and between (the) gods?

Edda Sæmundi, Vafþrúdnismál, 17–15.

Here *sá* and *su* are, at least, as good for articles, as they are for demonstratives; while *in precedes* its noun; is separated from it; and has, moreover, dropped the initial *h*-.

This is, certainly, something like the present post-positive article in the process of formation, the date being the eleventh century. However, if it were carried back to the ninth it would still be three hundred years subsequent to the latest recognised date for the Angle invasions of Britain.

To this we may add that in one notable case, at least, the phenomenon of a post-positive definite article is manifestly of late origin. In the Italian, French, and Spanish derivatives from the Latin the

definite article is a simple and secondary form of the demonstrative *ille*, in its ordinary independent form, and in its usual place as a prefix to its noun. But in the Wallachian and Moldavian of the Danubian Principalities it is, as in Icelandic, a *post*-position, more like an inflectional case-ending than a separate word, and, as such, wholly in contrast to its congeners of Italy, France, and the Iberian Peninsula. In Wallachian and Moldavian *il uomo, el hombre, l'homme* is *ómul* = *homo ille*; *óameni-i* = *homines-illi*; *ómului* = *hominis illius*; *óameni-lor* = *hominum illorum*. Feminine—*kas-a* = *casa-illa*; *kase-le* = *casæ illæ*; *kase-lor* = *casarum-illarum*—*muer-ea* = *mulier illa*; *muere-i* = *mulieris illius*; *muer-ile* = *mulieres illæ*; *muer-ilor* = *mulierum illarum*. To forms like these it is impossible to assign any considerable antiquity; for the Roman conquest of Dacia was little more than four hundred years earlier than the German conquest of England.

The actual absence of this Postpositive Article in the Danish of South Jutland will be noticed in the sequel. At present it is sufficient to draw attention to it.

§ 142. *The (so-called) Passive Voice.*—*Passive* is the term applied to the second voice in the Scandinavian languages; where, so far as the fact of its power being indicated by an inflection goes, it is a true voice; and, as such, a very prominent characteristic. But it is, to a great extent, *Deponent*; perhaps as largely so as in Latin. Again, it is certainly *Middle* rather than Passive; certainly, too, as far as its construction goes, *Reflective*; and, in respect to its meaning, to a great extent, *Reciprocal*. Historically, however, it is so evidently a compound that it is only in its latest forms that it differs from such an evident combination of different words as the French *se frap-*

or the German *sich schlagen* = *to beat his* (*one's*)

This means that it is no Inflection at all.

The present or latest form of this so-called Passive ; the penultimate form, *-st* ; the next oldest form, or *-sk* ; the original form, *sik* = (*him*)-*self* in Eng- ; *sich* in German ; and *se* in Latin and French ; simply the Reflective Pronoun. It is used, how- , for all the three persons, and for both numbers.

DANISH.

Active.

(1)

1. Jeg elsker	=	*I love.*
2. Du elsker	=	*Thou lovest.*
3. Han elsker	=	*He loves.*
1. Vi elske	=	*We love.*
2. I elske	=	*Ye love.*
3. De elske	=	*They love.*

(2)

1. Jeg elskede	=	*I loved.*
2. Du elskede	=	*Thou lovedst.*
3. Han elskede	=	*He loved.*
1. Vi elskede	=	*We loved.*
2. I elskede	=	*Ye loved.*
3. De elskede	=	*They loved.*

Passive.

(1)

1. Jeg elskes	=	*I am loved.*
2. Du elskes	=	*Thou art loved.*
3. Han elskes	=	*He is loved.*
1. Vi elskes	=	*We are loved.*
2. I elskes	=	*Ye are loved.*
3. De elskes	=	*They are loved.*

(2)

1. Jeg elskedes	=	*I was loved.*
2. Du elskedes	=	*Thou wast loved.*
3. Han elskedes	=	*He was loved.*
1. Vi elskedes	=	*We were loved.*
2. I elskedes	=	*Ye were loved.*
3. De elskedes	=	*They were loved.*

Now the actual process of this contraction of *mik* =*me*, and *sik*=*se*, is found going on (we might almost say beginning) so late as the tenth century, i.e. in the very oldest Norse known to us. In other words, the combination of the Verb with the Reflective Pronoun is so loose that it scarcely justifies us in assigning a Reflective, Middle, or Reciprocal Voice to the Old Norse, unless we also assign one to the French, the Italian, and the German as well. As time, however, goes on, the case alters, for *sik* soon serves for all the three Persons, and no longer corresponds with the Nominative Case of its Verb, when it is either the speaker or the person spoken to—the result being combinations like *je se lave*, *nous s'aiment*, &c., in French, and *nos se lavamus*, *vos se amatis* in Latin. Then the *k* becomes *t*, and *-st* is the sign of the Passive Voice. Finally, as, in the present Danish and Swedish, the *-t* itself is dropped; so that words that began as *elska sik*, and proceeded as *elskask*, *elskast*, become, in Swedish, *elskas*, and in Danish, *elskes*, i.e. Passives after the manner of *amor* and *τύπτομαι*, rather than Reflective constructions like *je suis aimé*, and *ich bin geliebt*.

§ 143. Now it is clear that inflections like the two under notice are not, necessarily, of any great antiquity. As a general rule, indeed, it is true that inflections are oftener lost than developed; in other words, that combinations like *I have written* take the place of single words like *γέγραφα*, oftener than single words like *γέγραφα* take the place of combinations. That this is a rule of great generality and importance is beyond doubt. But its generality is easily exaggerated. The Futures in both the French and the *Italian are

* In the French *parlerai*, and the Italian *parlero* (where the *-ai* and *-o* have long been admitted to represent the verb *habeo*), the change is, manifestly, a late one.

undoubted instances to the contrary; and it is submitted that both the Post-positive Article and the Passive Voice in Norse are instances of the same kind. Indeed, it is only in a general way that the rule as to the change from Synthetic to Analytic, and not *vice versâ*, can be applied.

§ 144. It is not pretended that the evidence upon either of these points is conclusive; and it is not denied that they are weighty ones in the present argument. I don't think that, if it were certain that, in the time of Beda, these two inflections were as fully developed as they are in the Norse of the tenth century, the doctrine of the Angle and the Danish being sufficiently alike to pass for the same language would be tenable.

The uncertainty, too, as to the original geographical position of the Mœsogothic has much to do with this inconclusiveness; for, if the Mœsogothic, as a matter of certainty, could be shown to have been spoken on, or within, the Angle frontier in the fourth or fifth century, the descent of the Old Norse would be undoubted; and the later origin of forms like *bordet* and *elskes*, &c., would be recognised as a matter of course. The question, however, is not so simple as this; so that we can only take it as it presents itself, and press it only so far as it will go.

§ 145. The affinities between the Northumbrian and Norse which will now be brought under notice are, of course, those wherein both the Norse and the Northumbrian differ from the Westsaxon. It is not apprehended that any of the instances will either be objected to, or treated as accidental. The only point upon which there may be any question refers to their origin. Are they due to contact with Norse settlers during a time when the Norse and English languages were as distinct (or nearly so) as they were in the tenth

century; in other words, to what is usually called '*Norse influences*;' or are they due to an original affinity as close (there or thereabouts) as that between the Northumbrian and the Westsaxon, and anterior to the differentiation and divergence of the Angle and Danish languages? It is not likely that all the forthcoming instances will be of equal value in this respect. Those, however, that bear most especially on the question will be treated at length. A notice under each of the Frisian affinities will be added; and they will show clearly that they are Westsaxon rather than Northumbrian.

§ 146. The two important exceptions to the rule that the Frisian agrees with the Westsaxon rather than with the Northumbrian are the two connected with its Phonesis; in respect to (1) its Nunnation and (2) its Sigmatismus. It has less of both than the Westsaxon; though the absence of neither is quite so conspicuous as it is in the Norse.

§ 147. *Eschewal of the Nunnation; Change from -an to -a.*—This we find in three inflections:

a. In the Weak (or Simple) Substantive—A. S.; *eágan* = *eye's* and *eyes*, &c.; *tungan* = *tongue's* and *tongues*, &c.; *naman* = *name's* and *names*, &c.—in Frisian *ága*, *tunga*, *nama*, &c.

b. In the Definite Adjective—A. S. *gódan* = *boni*, *bonæ*, *bono*, in the Singular; and *boni*, *bonæ*, *bona*, *bonos*, &c., in the Plural. In Frisian the form is *góda*.

c. In the Infinitive Mood of Verbs—A. S. *deman* = *judicare*, *bærnan* = *urere*, &c.; in Frisian, *dema*, *berna*, &c.

In all these the Northumbrian agrees with the Frisian, and both with the Norse.

§ 148. *Rhotacismus.*—The substitution of *-r* for *-s*

is found in Frisian only as the sign of the Plural of Substantives—A. S. *cyningas* = *kings*; in Frisian, *kening-an*. In this it agrees with the Norse, and with the *Non*-Saxon dialects of Germany; whilst it differs from *all* the dialects of England.

§ 149. Between these two processes we get in Old Norse the forms *tungur* = *tongues*, where in A. S. we find *tungan*, and in Frisian *tunga*. This is because in Mœsogothic the *-n* was followed by an *-s*, and the full form *tuggôns* = *linguæ* and *linguas* was the result.

The Norse drops the *n*, but changes the *-s* into *-r*; herein following the Mœsogothic and standing alone in doing so; since all the other members of the German family drop the inflection altogether; none retaining either the *s* or any representative of it.

§ 150. *The Extension of -s to the Feminine Genitives.*—The *s* in the present English is common to both the Masculine and the Feminine Genders. In Westsaxon it was limited to the Masculine and the Neuter; and traces of the distinction are found in the fourteenth century. In the Northumbrian the change begins earlier. In the Modern Danish and Swedish this identification of the two inflections has led to another Scandinavian character, which is manifestly of recent origin. The Icelandic has the usual three Genders. The Danish and Swedish have only two. But these two are (in contrast with those of the languages of Latin origin) not the Masculine and Feminine, but the Common and the Neuter.

§ 151. *The Defective Inflection of 'He.'*—In the Glosses we find the Pronoun of the Third Person declined as in the Westsaxon; i.e. with all its present forms (*he*, *him*, *her*), and with four others now lost. These are the Singular Accusative *hine*, and the Plural forms *hi* = *they*; *heora* = *their*; and *heom* = *them*.

Now the total abandonment of the form in *-n*, or the *Accusative* Singular, is nothing more than what we have at the present time; where it is superseded by *him*, originally a *Dative*. And the same applies to the displacement of all the plural forms of *he* by *they*, &c. The peculiarity of the Northumbrian, however, is the early date at which these inflections of *he* disappear. Though found, as we have already stated, in the Glosses, they are not found in the Northumbrian of the thirteenth century; i.e. the earliest *Middle* Northumbrian known.

This displacement of the Plural of *he* by that of *the*, along with the loss of the true Accusative in *-n*, leads us to the notice of the relations of both *the* and *he* with *se*.

§ 152. '*He*,' '*The*,' *and* '*Se*.'—For the Definite Article in Mœsogothic see § 141. Except that it uses *s* or *z* where the other two dialects use *r*, it is the same as the Old Saxon and the Westsaxon; in other words, they all agree in giving it a full inflection, in which, with the exception of the Nominative Singular, of the Masculine and Feminine Genders, the radical form is *th-*, or the root of *that*, *they*, *their*, *then*, and *them*, all of which are, in the present English, Demonstrative, or (so-called) Personal Pronouns rather than Articles. As Personal Pronouns they have, *in the Plural Number*, displaced and superseded the old plurals of *he*, as shown in the preceding section.

Meanwhile, the Nominatives Singular, Masculine and Feminine, are *sa*, *sô*=*se*, *seo*; of which the first has entirely dropped out of our language; while the latter with a change of both forms and meaning has displaced the older *heo*, and is retained as *she*.

The same inflection, with the same retention of the forms *sa* and *su* (compare the Greek *ὁ*, *ἡ*, *τό*), charac-

terises the Old Norse; with the difference (as we have seen) of the power of the forms being those of the Demonstrative Pronoun rather than those of the Definite Article. In all this and much more, the Middle, and, to some extent, the older Northumbrian differs very widely.

It gives us þ- for *s*-, in the Glosses.

It has got rid of the Accusative Masculine Singular, and all the plural forms of *he* before the fourteenth century.

For these it has substituted the plurals of *th*-; the result being that in the Middle Northumbrian, the Definite Article is simply that of the present language —just as simple and just as destitute of inflection. *Se* has disappeared altogether; and *she* represents *heo*.

But the *maximum* of contrast is that between the Northumbrian and Norse; as may be seen by comparing such a simple form as *the* with the complex and exceptional Postpositives of the Scandinavian system.

It is possible, however, that through this very notable difference, and, to some extent, in spite of it, may not only the affinities between the Norse and the Northumbrian, of which we have already said so much, be maintained, but, from one point, may be strengthened: inasmuch as reasons will be given for treating the whole series of changes in respect to the roots *h*-, *th*-, and *s*-, whether as Definite Articles or Demonstrative Pronouns, as parts of a system; in which case the evidence in favour of the recognised points of likeness between the two languages being due to original affinity rather than to subsequent contact would be greatly strengthened.

§ 153. *The -n- in the Ordinal Numbers.*—In the Westsaxon the ordinals for 7, 8, 9, 10, 13—19 end in *-otha*; as *seofotha, eahtotha, nigotha, teotha, thretheo-*

tha, *feowerteotha*—*nigonteotha*, i.e. without any *n*, as in *seventh*, *tenth*, &c.

In the thirteenth and fourteenth centuries these were—

sevethe, *nethe*, and *tethe* (in the Southern dialects).
sevende, *neghende*, *tende* (in the Northern dialects).
seventhe, *ninthe*, *tenthe* (in the Midland dialects).

The Midland forms are formed from the Northern ones, and made their appearance in the fourteenth century; and the latter are of Scandinavian origin. In the Northumbrian Gospels we find *seofunda*—Cp. O. N., 7, *siöundi*; 9, *niundi*; 10, *tiundi*; 13, *threttandi*; 15, *fimtandi*, &c.—Morris, *Historical Outlines*, p. 114 and note.

§ 154. *The eschewal of the form sind*, &c.—These are conspicuous in the Westsaxon; *We are*, *Ye are*, *They are*, being specially Northumbrian. The Icelandic runs: 1. *em*; 2. *ert*, *er*; *erum*, *eruþ*; 3. *eru*. In this the Frisian agrees with the Westsaxon.

Old Frisian.—*Wi*, *I*, *hja send* = *we*, &c., *are*.
East Frisian.—*Wi be*, *we süint Soldat* = *we two* (*both*), *we are soldiers*.
Frisian of Heligoland.—*Wann wi to freden sen* = *when we contented are*.
———————.—*Wi sen ja lick van stann* = *we are likes of condition*.
North Frisian.—*Wü sen jit di jest fuurtein Juar* = *we are yet* (*now*) *just fourteen years*.

§ 155. No form in *-inne*, a Gerundial or Dative Case of the Infinitive.—In Westsaxon *lufian* = *amare*, *to lufianne* = *ad amandum*.

This is not a pure case of Nunnation, or retention of the final *-n*—not, at least, in the first instance.

In not having the form at all, the M. G. agrees with the Norse. The Frisian, however, which agrees with the Norse in dropping the *-n* of the Infinitive, retains it, *without* the final *-e*, in the Gerundial, or Dative

form; though the exact origin is uncertain; inasmuch as in the Old Frisian we find such forms as *to demande, to delande=to judge, to doom.*

(1)

Man wat wejr jer to *dōn*!

But what was here to do?

(2)

Help ūūs! lūr ūūs sa dat wū
Wellig sen, de wei tō *gungen*.

Help us, learn us, so that we
Willing be the way to go.

(3)

Skuld en Kemmer of en Lek
Ūūs wat fuul tō *dreien* maake—

Should a trouble or a sport
Us (some)what foul to try make—

(4)

Din es Hoogheid, Din es maght!
Dü heest alles aur tō *reeden!*
Din es wisheid! Fol Bedaght,
Weest Du alles bääst to *reeden*.

Thine is Highness, thine is might!
Thou hast all to advise (*rede*)!
Thine is wisdom! full thought,
Thou knowest all best to advise.

§ 156. *No Participial Prefix*, as *ge-nered, ge-lufod =healed, loved.*—This prefix is preserved in the Frisian, and found in the Mercian of England. In the Westsaxon it is very common during the Middle period, universal in the older, and predominant in both the High and Low German of the Continent, throughout all, or almost all, of its latest dialects. In short, its absence is characteristic of the Norse and the Northumbrian.

'The retention of the *Affix*, or the final *-en*, of the Perfect Participle, which in the Middle Westsaxon is often ejected (*y-broke=gebroecen*),

but which, *except when there is an -n- in the verb itself*, is universal at the present time, is also Norse. But it is not a point of any characteristic importance; inasmuch as it prevails in all the other German forms of speech. The real peculiarity, in this respect, lies with the Westsaxon and the modern English.

'The Strong Verbs form the Past Tense by strengthening or modifying the stem vowel. The Past Participle ends in *-en*, but this termination is dropped whenever a nasal (*m*, *n*, or *ng*) is found in the preceding syllable. Thus *beyte*, *bait*, *bytten*; but *clym*, *clam*, *clum* (for *clumben*); *fynd*, *fand*, *fund* (for *funden*); *ryng*, *rang*, *rung* (for *rungen*). In *drynk* we may thus drop the *-en* and make *drunk*, or we may expel the *n* of the stem, and retain the termination, *drukk-en* (compare the Norse *drukken*). In *cum-en*, after dropping the *-en*, *d* is added to distinguish the past participle from the present tense: "thay're *cum'd*," Eng. *come*, Old Northern dialect *cum-en*. This rule is of course unwritten, but it is invariable; I have not observed the same regularity in the dialect of any other district or of any period. No rule can be given for the dropping or retention of *-en* in the Book-English.'—*Murray; The Dialect of the Southern Counties of Scotland*, p. 201.

§ 157. *Absence of the Signs of Person in the Preterits.*—This is what we have in the present English; but the Southern forms were—

A. S.		*Middle English (A. S. and Mercian).*	
1. *lufode.*	1. *lufoden.*	1. *lovede.*	1. *loveden.*
2. *lufodest.*	2. *lufoden.*	2. *lovedest.*	2. *loveden.*
3. *lufode.*	3. *lufoden.*	3. *lovede.*	3. *loveden.*

The Old Northumbrian anticipates the present English; and has the simple form in *-d* throughout. The Old Norse retains the inflections nearly as they are in Mœsogothic—*talde*, *talde*, *talde*, *töldum*, *töldu*þ, *töldu*.

§ 158. *Persons in the Present Indicative in -s.*—This is so characteristic of the Northumbrian, and, indeed, of the other two dialects, that Dr. Morris has taken it as a test.

These dialects are distinguished from each other by the *uniform* employment of certain grammatical inflexions.

A convenient test is to be found in the inflexion of the *plural* number, *present* tense, *indicative* mood.

The Northern dialect employs -*es*, the Midland -*en*, and the Southern -*eth*, as the inflexion for all persons of the plural present indicative.

	Northern.	*Midland.*	*Southern.*	
1st pers.	hop-*es*,	hop-*en*,	hop-*eth*,	we hope.
2nd „	hop-*es*,	hop-*en*,	hop-*eth*,	ye hope.
3rd „	hop-*es*,	hop-*en*,	hop-*eth*,	they hope.

The inflexions of the singular number, though no absolute test of dialect, are of value in enabling us to separate the West-Midland from the East-Midland.

The West-Midland conjugated its verb, in the singular number and present tense, almost like the Northern dialect.

	West-Midland.	*Northern.*
1st pers.	hope	hope*s*.
2nd „	hope*s*	hope*s*.
3rd „	hope*s*	hope*s*.

The West-Midland of Shropshire seems to have employed the Southern inflexion -*est*, and -*eth* as well as -*es* in the second and third persons singular indicative.

The East-Midland dialect, like the Southern, conjugated the verb in the sing. pres. indic. as follows.

1st pers.	hope.
2nd „	hope*st*.
3rd „	hope*th*.

Some of the East-Midland dialects geographically connected with the Northern seem to have occasionally employed the inflexion -*es* in the 2nd and 3rd pers. as well as -*est* and -*eth*. It is mostly found in poetical writers, who used it for the sake of obtaining an extra syllable riming with some nouns plur. and adverbs in -*s*.

The West-Midland is further distinguished from the East-Midland dialect, in employing the inflexion -*es* for -*est* in the 2nd pers. sing. of regular verbs.—*Specimens of Early English*, § 7.

Those who are satisfied with treating -*s* as a mere softening of the Westsaxon -*th*, and then supposing that the sign of one person is extended to others, will see nothing in all this that bears upon any connection with the Norse. But, if we look to the Scandinavian

languages in general and to the Mœsogothic, the case takes a widely different form.

The Mœsogothic Present runs—

Singular.	*Plural.*
1. nas*ja*	nasj*aima.*
2. nasj*is*	nasj*aþ.*
3. nasj*iþ*	nasj*and.*

and the same fulness and distinctness of inflection we find in the Old High German.

In Icelandic we find—

Singular.	*Plural.*
1. kall*ar.*	1. köll*um.*
2. kall*ar.*	2. köll*uþ.*
3. kall*ar.*	3. köll*u.*

In Danish—

Singular.	*Plural.*
1. kall*er*	kall*e.*
2. kall*er*	kall*e.*
3. kall*er*	kall*e.*

In Swedish—

Singular.	*Plural.*
1. kall*ar.*	1. kall*a.*
2. kall*ar.*	2. kall*a.*
3. kall*ar.*	3. kall*a.*

§ 159. Here the Old Icelandic has a near approximation to the Mœsogothic and the Old High German; and it retains it to the present day.

The Danish and Swedish, doing just a little more than we do in English, retain a distinction for the number, but make no distinction for the persons, of the Plural.

But as, with the exception of the Genitive Singular, every Mœsogothic inflection in *-s* becomes an *-r* in Scandinavian, the *-r* of the Singular may be held to represent the original *-s*. Hence, it has its proper place, like the Northumbrian *-s*, in the second Singular

only. But it is extended to the other two. It is just the same with the Northumbrian -*s*. Considering that this extension is common to the two languages, it is reasonable to suppose that the same process is in operation in both, and that the -*s* in Northumbrian agrees in its origin as well as in its application with the -*r* of the Danish and Swedish; the one preserving the original -*s*, the other changing it into -*r*.

§ 160. *The Absence of Genitives Plural* in -*ne*.—These are those of the Substantives of the *Weak* Declension:—Masc., *hanena*; Fem., *tungena*; Neut., *heortena* in A. S.—*hananê*; *tuggônô*; *hairtenê*, in M. G. In English, *cocks'*; *tongues'*; *hearts'*. It is not difficult to see that the early loss of these Genitives in the Northumbrian is part of a system; the system which eliminates the -*n* from the Infinitive Mood of Verbs. The same avoidance of the Nunnation presents itself in the Old Norse; where, for Masculines which end in -*i* (i.e., *not* in *a*, the termination of the Feminine and Neuter Substantives), the Genitive Plural is simply -*a*; as *geisl-i* = *geisl-a*. Where the Nominative case, however, ends in -*a*, the -*n* is either retained or inserted—*ob differentiam*. Such, at least, is the suggestion of Rask.

§ 161. *Here, Hither, Hence, &c.*—The best evidence, however, of the affinities of the Norse and Northumbrian being due to a common influence is found in the following table:—

Mœsogothic.—þar, þaþ, þaþro—*there, thither, thence.*
hêr, hiþ, hidrô—*here, hither, hence.*

Old High German.—huâr, huara, huanana—*where, whither, whence.*
dâr, dara, danana—*there, thither, thence.*
hêr, hêra, hinana—*here, hither, hence.*

Old Saxon.—huar, huar, huanan—*where, whither, whence.*
thar, thar, thanan—*here, hither, hence.*
hêr, hêr, hênan—*there, thither, thence.*

Anglosaxon.—þar, þider, þonan—*there, thither, thence.*
hvan, hvider, hvonan—*where, whither, whence.*
her, hider, henan—*here, hither, hence.*

Middle High German.—dâ, dan, dannen—*there, &c., &c.*
wâ, war, wannen—*there, &c., &c.*
hie, hër, hennen—*there, thither, thence.*

Modern High German.—da, dar, dannen—*there, &c., &c.*
wo, wohen, wannen—*there, &c., &c.*
hier, her, hinnen—*here, &c., &c.*

Old Norse.—þar, þaðra, þaðan—*there, thither, thence.*
hvar, hvert, hvaðan—*there, &c., &c.*
hêr, hëðra, hëðan—*here, &c., &c.*

So far as this goes it is only in the M. G. and the O. N. that the þ appears in the *third* series: where it appears with a difference. It may be added, however, that it also appears in the Northumbrian, and that *without* a difference.

§ 162. The preceding table is from Grimm. The following extract is from Dr. Morris:—

Northern.	Southern.
23. Absence of the pronouns *ha* or *a* = *he*; *hine* = *him* (acc.); *wan* = whom, which (acc.); *his* (*hise, is*) = them; *his* (*is*) = *her*.	Use of the pronouns *ha* (*a*), *hine*, *wan*, his (*hise, is*), *his* (*is*).
24. Use of *hethen* = hence; *thethen* = thence; *whethen* = whence.	Unknown in Southern Dialects.

Specimens of Early English, Part II. Introduction, xxii., § 8.

The whole list of Dr. Morris's Grammatical Differences between the Northern and Southern dialects may be read with advantage; but the two under notice are selected and compared because, to some extent, they seem to stand to one another in the relation of cause and effect; and, if such be the case, it implies that the remarkable use of such forms as *hethen, thethen,* and *whethen* belongs to a system common to the Norse and

Northumbrian forms of speech rather than to the accident of mere geographical contact.

The Southern and modern forms in *-ce* are manifestly founded on an earlier form in *-es*; as is shown by the words *hennes*, *whennes*, *thennes*; the change of *-es* to *-ce* being a mere point of spelling. But these forms in *-n* are by no means of regular occurrence in the Northumbrian; whilst, in the Norse, the whole system to which they belong is deranged. This derangement, or *fault*, as we might call it in geological phraseology, has already been suggested; one of its results being the Definite Article *hin*. That the *h-* is the *h-* in *he* is certain. But what is the import of the *-n*? In the A. S. and O. S. *hine*, and in the German *ihn*, it is the sign of the *Accusative* Case; being as different from *he*, or *er*, as *eum*, in Latin, is from *is*. Then there is, for the Pronoun of the Third Person, a series of forms of a very peculiar kind.

The root is *h*, followed by a vowel; but not the vowel *i*, as in *hin*. In the Masculine Gender it is *a*; in the Feminine, *o* or *u*. Meanwhile, the *-n* is treated as a part of the fundamental word, and *hans* = *his* = *ejus* is the Genitive Case of *han*, while *hennar* = *her* = *ejus*, as applied to a female, is Genitive of *hun* = *ea*. The Objective is formed by adding *-m*; as *honom* = *-him*.

This treatment of *-n* as a part of the theme rather than as a sign of case, along with the process of distinguishing the Personal Pronoun from the Definite Article, and the Genders of the Personal Pronoun itself by changes of the vowel, is of far more importance as a characteristic of the Norse than either the Post-position of the Article or the so-called Passive Voice; and it certainly has had the effect of limiting the use of *-n* as a sign of the Accusative, in the other two roots of

the series under notice. The Norse equivalent (word for word) for *then* or *than* is *den*; but it stands, not for *illum*, but for *ille*; in other words, it is Nominative. Of the A. S. *hvœne*, Middle English *wan*, German *wen*, there is, in the present Danish, no equivalent at all—not even (as we expect from the analogies of *hen* and *den*) as a Nominative Case. The Danish for *who*, *qui*, or τις, is *hvem*—just as if we said *him* for *he*—whilst the Adverb of time (= *when* in English) is a wholly different word—*naar*.

§ 163. There is no disturbance to this extent in the Northumbrian. But, in a lesser degree, there is something of the same kind. *Hine*=*eum*, and *wan*=*quem* are excluded from the Northumbrian of the Middle Period by Dr. Morris. At the present time the use of *than* as an Adverb of Comparison is, comparatively, rare; and, perhaps, in Scotland, is an Anglicism. That *hethen*, *thethen*, and *whethen* are unknown in the Southern Dialects is the statement of Dr. Morris. The present notice shows us that they are known in Norse, and, what is more important, known nowhere else.

That the use of *-n* is a deviation from its original import is clear; and, being so, it may be called '*Abusive*' or '*Catachrestic*,' according to the language from which we choose to derive our term. As a characteristic of language in which it presents itself this '*Catachresis of -n*' is of sufficient importance to claim a definite name; and so it will be called when, in conjunction with the Post-position of the Article and the (so-called) Passive Voice, it is alluded to as one of the three peculiarities of the Norse.

§ 164. This is the evidence afforded by grammatical forms. That which is derived from the similarity or identity of particular words is of less importance; though it is well known that words common to the

Danish and English are more conspicuous in the Northern dialects than the Southern. They are generally referred to geographical contact rather than to the original affinity of dialect. '*Danish*,' '*Scandinavian*,' or '*Norse*,' however, in these cases means, of course, something more than the occurrence of the same word in Britain and Scandinavia. It means '*peculiar to Scandinavia*' as opposed to Germany; inasmuch as words common to the *three* divisions of the family are no more Scandinavian than German, and *vice versa*. Words of this kind may be counted by the thousand. But unless they are shown to be non-existent in the German they are of no value: and what with the proverbial difficulty of proving a negative, what with the extent of the German literature, and what with the number of the German Dialects, it is dangerous for anyone to assign a word exclusively to Scandinavia; and those who, like the present writer, have done so at one period of their life generally retract their opinion as their experience increases.

The only words in Scandinavian that can safely be treated as other than German, are those derivatives from non-German languages, such as the Lap, the Fin, the Slavonic, the Lithuanic, or the Keltic. But these are, themselves, scarcely Scandinavian. Nor are they numerous. Moreover, whether numerous or not, none of them have hitherto presented themselves in English.

§ 165. Still, there are certain words which have a better claim to be considered Scandinavian than others; i.e. those that are current and conspicuous in the Danish, Swedish, and Icelandic; whereas, if they are found in German at all, they are found either in the provincial dialects or in writers of an earlier period.

Of these there are two divisions; the recognition of which is, in the philology and ethnology of the

Norse parts of Britain, of great and exceptional importance.

The distinction between *Proper* names and *Common* names is an instrument of criticism; and, of *Proper* names, those of geographical objects and localities have most especially commanded notice.

The particular word that has done the most service in this way is the word *by=town*, in compounds like Grims*by*, Spils*by*, and some hundred others. It is preeminently a Danish word. *Caster*, too, in the place of *Chester* is a Danish *form*, and *Skip-*, *Carl*, *Orm-*, and *Kirk*, imply Danish occupancy. Hence, where the English parts of Britain give us Charl*ton*, Dor*chester*, *Ship*ton, and *Worms*head, the Danish forms are *Carlby*, An*caster*, *Skipton*, *Ormshead*, and *Ormskirk*. Any ordinary map supplies the list of these. They are the most numerous in Yorkshire, especially in the East and North Ridings; but Yorkshire is an inordinately large county. For its size, Lincolnshire gives us the most. Then, at a great distance, Leicester, Nottingham, Derby, and Northampton. We lose the word *by* in the south at Rug*by*, and on the north in Durham—Ra*by*. It is to be found, in patches, in Norfolk and Suffolk. Elsewhere, on the eastern side of England, they are either undiscovered or undiscoverable. From Yorkshire, however, they follow the western feeders of the Ouse to its watershed, which they cross, and then reappear in Cumberland, Westmoreland, Lancashire, Cheshire, the Isle of Man, and North Wales; at least in such names as *Orm's* Head. In Ireland, we have a new instrument of criticism. In Carling*ford*, Strang*ford*, and Wex*ford*, the final syllable has not its ordinary import. It means an arm of the sea; in short, is the Norwegian *Fjord*. And so it is in the *Firth* of *Forth* in Scotland. In this country the distribution of

the *bys* is remarkable. We have it at Duncans*by* Head in the extreme north, and we have it in Eskdale and Annandale in the south-west. Otherwise the *bys* are exceptional. As *proper* names, these give us a long list. But they are not *common* names. They are all proper names, the names of geographical localities.

It may be expected that where we find these, we shall find *common* names also. But such is not the case. If true Danish *common* names exist in one part of Great Britain more than another, it is in Scotland; but that is just where the local names give us the fewest signs of Danish occupancy. This anomaly, however, has been, to some extent, explained. Mr. Worsaae, in his 'Danes and Northmen,' has shown that it is only the Danes of Denmark proper that exhibit this inordinate partiality for villages ending in *-by*, and that in Norway they are rare. In Iceland, pre-eminently a Norwegian colony, they are not to be found. The admitted inference is that it was Norwegians who assailed and circumnavigated *Scot*land, but Danes who assailed *Eng*land; and, from the parts about Kirk*by* Lonsdale, &c., crossed the watershed, and gave us the numerous *-bys* of Cumberland and Selkirkshire.

§ 166. It is doubtful whether, though true in the main, this explanation is complete. The Norse of the Orcades, as represented by the Shetland Paternoster, is undoubtedly Norwegian as opposed to Danish, and the Norse of Lincolnshire, &c., as represented by numerous local names in *-by*, is as undoubtedly Danish as opposed to Norwegian. But, if the present view be right, there are for both Norway and Denmark two kinds of Danish and Norwegian. There is, for each, the Norse of the earlier period, when the difference between what afterwards became the Danish and the Northumbrian English, was little more than

that between two mutually intelligible dialects; and there is Norse which, at a later period, has become a distinct language from the English. The Norse of the north of Scotland was not only the Norse of Norway, or Norwegian, but it was the Norwegian of the period when the difference between the two languages was complete. The Norse of Lincolnshire and Yorkshire was the Norse of Denmark, and, probably, that of the later period. But the Norse of the parts between the Tees and Forth, of Durham, Northumberland, and the Lowlands of Scotland, is in a different category from both. It differs from the Orcadian in not constituting a separate language; and in this it agrees with the Norse of Yorkshire and Lincolnshire; and it leads the investigator to the perplexing fact that, contrary to expectation, the distribution of the *Common* names in Norse by no means coincides with that of the *Proper* ones. There are no local names in *-by* between *Raby* on the Tees and *Duncansby Head* on the northern extremity of Scotland; none in Northumberland, none in Berwickshire, none in the Lothians; the Norse elements being numerous. In Lincolnshire the local names are numerous, the other Norse elements being inconsiderable.

There are three forms, then, in which, according to the present treatise, we find the Norse language in Britain: (1) The Norwegian of the Orcades and Caithness; (2) The Danish of the districts where the termination of *-by* predominates; and (3) The Norse, which, by hypothesis, is as much Angle as Danish, or in other words, a form of the German, of no later date than the sixth century, out of which the present Danish, Swedish, and Icelandic were subsequently developed. This last is the only one upon which more need be said.

§ 167. *Retrospect.—Internal Evidence.*—The evidence as to the original connection between the North-

umbrian and Danish, rather than the mere contact of two dialects which afterwards diverged from one another so far as to constitute different languages, being the true cause of the acknowledged points of similarity between the two forms of speech, so far as it has been submitted to the reader, has hitherto consisted solely and wholly of their relations in the way of grammatical structure; and so much so that no cognizance has been taken of individual words; and it is believed that evidence of this kind is sufficient.

In respect to the details themselves there is little or nothing which has not been recognized. Neither is the notion that it is from a common origin rather than from Norse influences of the ninth, tenth, and eleventh centuries a new one. I think it safe to say that thirty years ago the original affinity, or approximate identity of the Angle and Danish was considered the sounder doctrine of the two; and that words quoted as *Danish* due to contact with historical Danes were looked upon suspiciously; nor am I sure that such is not the prevalent doctrine at the present time. That there were Norsemen in Britain as early as ever there were Angles is certainly a view which has numerous supporters. Neither is the advent of the first Angles so definitely fixed for the sixth century as that of the first Saxons is fixed for the fifth; for those who think themselves constrained to believe that Hengist was the earliest of the Saxon conquerors, are by no means tied down to think the same of Ida the Angle, who may have had predecessors. The little that runs contrary to doctrines more or less received is really a matter for the Scandinavian scholar rather than the English. It touches the history of the Norse language more than that of our own. And in respect to this the leading points are of the simplest. The great characters that at present

distinguish the Norse languages from the English and German are, as we have seen; (1) The Postpositive Article; (2) the Passive Voice; (3) the Catachresis of the *-n*, three in all. Whether these are characters that could be developed between the Angle invasion of England and the date of the earliest specimens of the Norse (say A.D. 550 and 950—there or thereabouts) is the leading question for consideration. Subtract these from the Norse as it is known to us in the earliest compositions; compare the language as we may suppose it to have been without them with the Northumbrian; deduce the latter from that part of Germany which the name *Angle*, or *English*, suggests; bear in mind its geographical relation to Denmark; and, finally, compare both with the Mœsogothic.

The result will be that the language from which we get the Durham Glosses and the Northumbrian of Scotland was, in the sixth and seventh centuries, little more than a variety of the German of the parts between the Weser and the Eyder, which, on the continent, developed itself into what are now the Icelandic, the Swedish, and the Danish.

§ 168. *Retrospect.—External Evidence.*—We may now safely say that if we can get this from the internal evidence of the structure of the two languages themselves, we shall not find much (if anything) in the way of external evidence to oppose to it. It is not as if in the sixth and seventh centuries the area of Denmark and the name *Danish* were what they are now, or even what they were in the ninth century. The only Danes that are mentioned during the fifth century (when the name appears for the first time) are those of Procopius, who seem to have been on the frontier of the Warni (the Warni themselves on the Angle frontier), and the '*Chochilaicus Danus*' of Gregory of Tours. From

Gregory we know only that this great Dane made a descent upon the Netherlands, and was killed. But where he came from no one can say. There is nothing that connects him with what we afterwards know as Denmark. Where the *Danish March* was, or whether there was any at all in the sixth century, we have no means of knowing. If it was the March of the *Marcomanni* of the ninth century, it was south of the Eyder, and close upon the Angle area.

This *Chochilaicus* may or may not have been *Havelok the Dane*. If so, he is enough of an Angle to be connected, by tradition, with England. That he was the *Higelac* of '*Beowulf*' has been generally admitted since the time of Outzen (A.D. 1816), and Higelac is enough of an Angle to be associated with Hengist.

The Danes themselves of the Anglosaxon Chronicle are as little traceable to the soil of Denmark as the Danes of Procopius, and as Chochilaicus. They came according to the notice from *Heretha-land*, a name which itself requires explanation. Those who place it in Denmark only do so because certain Danes are assigned to it.

That this is an insufficient reason is evident, but the bearings of it require a special notice. It is clear that if we invest the Denmark of the times of Ida and his Angles with the dimensions of the Denmark of our own times, the difficulty of conceiving its language as little more than a variety of the Angle increases with the magnitude of the area. The larger the extension of a form of speech the greater is the likelihood of its being a separate substantive language rather than a mere dialect, subdialect, or variety, or *vice versâ*; and if it were certain that when Northumbria was Anglicized by certain Germans from one side of the Elbe, Jutland and

the Danish Isles had already been Danecized by certain Germans from the other side, the doctrine that the difference between the Norse and the English is of later date than the seventh and eighth centuries would require more evidence than has been found for it. But we have no certainty that such is the case. We have no evidence that the Germanization of Jutland and the Islands is a day older than that of Northern England. We fail, however, to realize this because when we hear of Danes we refer them to what we subsequently know as Denmark; the real fact being that it is only in our habit of doing so that the evidence, if so it may be called, of a geographical Denmark anterior to the time of Charlemagne has any existence. The habit of thinking of the early Danes as if, in their character of pirates, they are easily traced to a definite district as the Algerines, is, no doubt, natural; but it is fraught with error when, instead of thinking about Denmark as we do of Algiers, on the strength of our knowledge of it as a country, we argue from our knowledge of it as it was in the time of Charlemagne, or even of Alfred. What has been said about its language applies to its geography. As the language must be held to have become differentiated subsequent to the Angle invasion, the area must be held to have extended itself. The Danes are known on foreign shores long before they are known on their own. That they are, in the first instance, Germans; that they are Germans of the northern known extremity of Germany; that they are Germans of the Angle frontier; that they lay to the north of that frontier; that their history is of the same character as that of the Angles—are fair inferences from the little we know about them. But there is nothing in all this that carries them beyond the Eyder, nothing that carries them into Jutland, nothing which makes them

old occupants of the present kingdom, any more than there is anything which makes the Angles old occupants of Britain. The Danes, who are specially said to have been the first of the denomination in our island, land in a part which is pre-eminently *Non*-Danish. They are recorded in the composition essentially belonging to the area of the *Non*-Danish dialect. The notice is at least a hundred years later than the event. The name after the time of Alfred is sufficiently familiar, but even then there is no notice of the country from which they came; and of their language no notice from first to last.

§ 169. Beda, though he enumerates the languages of Britain, makes no mention of the Danish. This, according to the view of those who hold that the notice of the Anglosaxon Chronicle excludes all Danes anterior to A.D. 787, is accounted for by the fact of there being none in the island. The present writer holds that Beda made no difference between the Danish and the Angle.

Again, the Anglosaxon Chronicle, though it lands its Danes in the Westsaxon parts of Britain, says that the land they made their descent on was *English*. But this only tells us that the name *England*, when the entry was made, was extended from the Northern and Middle districts to the Southern.

More important is the notice by Jornandes of Scandinavia, i.e. Norway and Sweden. It cannot be denied that he gives us Germans in Norway. The names *Finnaithae*, *Raumariciae*, and *Ragnaricii*, are not only the present names *Finheide*, *Romerige*, and *Ringerige*, but are compounds of the German word *heide* = *heath*, and *-ric* = *kingdom*, *domain*. Moreover the king's name was Rodulf, who left his own kingdom to put himself under the protection of Theodoric the king of Goths. The blood of some of these men of German race (the general population was Fin) was the same as that of the Danes of Procopius. Now the most that can be got from the statement is that, a little earlier than the recorded invasion of the Angles under Ida, but not earlier than the earliest inferential invasions of the Saxons, there was a German invasion of Norway nearly simultaneous with one of England; the name of the invaders being '*Danes*' in one case, and *Angles* in the other.

Upon two of these three points, the only ones in which I see the elements of an objection in the way of history, as I do not care to explain

them away, I submit them to the judgment of the reader without comment. The text, however, of Jornandes requires a fuller notice.

After giving several names of less importance, that writer continues: 'Sunt et his exteriores *Ostrogothæ*, *Raumaricii*, *Ragnaricii*. Finni mitissimi, Scandziæ cultoribus omnibus mitiores, necnon et pares eorum Vinoviloth. Suithidi, cogeni (al. cogniti) in hac gente reliquis corporibus eminentiores, *quamvis et Dani ex ipsorum stirpe progressi* [*qui*] *Herulos* propriis sedibus expulerunt. Qui inter omnes Scandziæ nationes nomen sibi ob nimiam proceritatem affectant præcipuum. Sunt quanquam et illorum positura Grannii, Agandziæ, Uuixæ, Ethelrugi, Arochiranni, quibus non ante multos annos Rodulf rex fuit: qui contemto proprio regno ad Theoderici Gothorum regis gremium confugit, et, ut desiderabat, invenit. Hæ itaque gentes Romanis corpore et animo grandiores, infestæ sævitia pugnæ.'—*De Rebus Geticis*, c. 3. (*Zeuss*, p. 502, p. 503.)

§ 170. Rodolf's retreat to the bosom of Theodoric is earlier than the time of Ida in Northumberland; but not much. The contact of the Heruli with the Danes is found in Procopius as well as Jornandes; and Procopius is the better authority. His account is that the Heruli fled to the Warni, and *skirted* (? the Greek is *παρέδραμον*) the nations of the Danes. Jornandes, somewhat differently, makes the Danes expel the Heruli. The conflict between the two texts is of less importance than the place it gives to the Danes. They are on the frontier of the Warni, in Mecklenburg; who are, themselves, on that of the Angle in Altmark. The Angle district is a *March*. The Danish the same. The Angle district abutted on the German Ocean rather than on the Baltic: the Danish on the Baltic rather than the German Ocean. One pointed more especially towards Britain; the other towards the Danish Isles: but, at the neck of the Cimbric Chersonese the two divisions would touch each other; and each might join in the expeditions of its neighbour. On the one side the one name, on the other the other, might predominate. And this seems to have been the case. Where, in the Twelfth Century, we get the early accounts of Denmark,

though much in them is mythic, one point seems real, viz., that the Danish kingdom began not in Holstein, Sleswick, or Jutland, but in the Islands, and extended itself to Skaane, the most Southern part of the Scandinavian Peninsula, at least as early as it did to Jutland. This means that it spread not Northwards, but North-east. *Dan*, the brother of *Angul*, is, of course, a mere Eponymus; but his brother is the Eponymus of England—and that in the eyes of the Danes. That Jutland was not Denmark, and that the kingdom of Dan consisted of the Islands before it embraced Jutland, is the unanimous statement of the earliest Danish logographers.

Again—as to the limitation of the original Denmark to a comparatively small district on the Angle frontier, we have the following evidence in favour of reducing its dimensions. When Holstein is first known in detail, the eastern half is Slavonic and the western is Frisian; in other words, there is no continuous extension of the Danish language in the central Peninsula. There is a Danish March, or boundary; but it was not so called because it was the frontier of a kingdom behind it, but a March which extended its name to a kingdom subsequently established.

Taking this and the dates, we find it difficult to believe that, in the fifth and sixth centuries, the difference between the Angle districts and the Danish was either that of two great national areas, or that of two languages which differed from one another as the Scandinavian class of languages now differ from the German.

§ 171. The exact details of the language we assign to this district are of minor importance, and, if they were not so, they would lie beyond our means of investigation. The name, too, or names, is unknown. The

speech itself may have been absolutely uniform; may have fallen into two dialects; or may have fallen into more than two. For the present inquiry, however, the following conditions are all that is needful:—

(1) That it should be common to the two denominations, *Angle* and *Dane*.

(2) That it should contain the elements out of which two languages as unlike as the Northumbrian and the Old Norse of the Twelfth Century (the time when they can, for the first time, be compared) could be developed, when separated from one another by the German Ocean, and with (say) five centuries allowed for the changes on each side to be effected.

(3) That, though more akin to the Angle than to the Westsaxon, it should be intelligible to both the Westsaxons and the Mercians. This is because, at no time in English history, is the Danish treated as a separate language, any more than, in spite of certain differences of dialect, the Westsaxon and Angle are so treated.

§ 172. *Corollary*.—From this last condition the corollary in respect to the dialects and sub-dialects of the German both of England and the Continent is that, though the differences between them were appreciable, they lay within a small compass; for when forms of speech like those of the northern and southern frontiers of Germany are found to be mutually intelligible, and (as such) little more than dialects of a single language, the presumption is that the intermediate dialects are the same. It need not be so; but such is the presumption. This applies to the districts on the western half of Germany rather than to those of the south-east, of which, in the way of language, less is known.

CHAPTER XIV.

STAGES OF THE ENGLISH LANGUAGE.—OF LESS IMPORTANCE THAN FORMERLY.—THE DIVISIONS.—THE NAMES OF THEM—ANGLOSAXON, OLD ENGLISH, ETC.

§ 173. It is usual to divide the English language into what is called its several *stages*; and the word is a convenient one. The English of Henry VIII.'s time is older, or earlier, than that of the present day—not only in date, but in structure. And, in like manner, the English of the reign of King John is newer, more modern, or later, than that of the time of Alfred; and here we have, as we expect, a similar antiquity of structure. We have not only words which are now obsolete, but inflections which have now disappeared.

It is by these internal and structural characters rather than by the mere number of years that the age of a language must be measured; and it is a great gain if we can divide its history into clear and definite stages of growth or development. However, we cannot, from the very nature of the process of either growth or decay, expect that any very definite lines of demarcation can be drawn; though we know what terms are likely to present themselves. There will be an Older English, and a Newer, or Modern, English; perhaps a Middle, an Intermediate, or a Transitional English—perhaps much more of the same kind. But, whatever may be the name, the relations of the divisions to one another will be the same.

§ 174. The classification, and nomenclature, which satisfied the scholars of the last generation, are as follows:—

(1) The Period; extending from the first introduction of our language into Britain to the Battle of

Hastings. Practically, this begins with the times of Beda, A.D. 725 (*ca.*)

(2) From the Norman Conquest to the Middle of the Thirteenth Century—A.D. 1258. This is a very artificial division. However, a Proclamation to the people of Huntingdon of Henry III., for this year, has the credit of being the first example of what may be called the *English* to which the present language belongs rather than the English of the *Anglosaxon* period. This division is, we repeat, wholly artificial; but as it is generally known to be so, it has been allowed to keep its place; though with some limitations on its strict import.

(3) From the Middle of the Thirteenth Century to the time of Chaucer; which means the latter part of the reign of Henry III., that of Edward I., Edward II., and (partly) that of Edward III. This, again, is mainly determined by the importance of the name of Chaucer. Still it is, to a great extent, natural.

(4) From Chaucer to Sir Thomas More. With Thomas More the present literature of England is, somewhat loosely, said to begin. Nevertheless, the name is sufficiently conspicuous to make the division convenient.

(5) From the time of Henry III. to the present.

§ 175. Such are the *dimensions* of the five stages of the English language as generally understood. The *names* of them are as follows:—(1) *Anglo*saxon, (2) *Semi*saxon, (3) *Old* English, (4) *Middle* English, (5) *Newer*, *Recent*, or *Modern* English.

Partly on the strength of the divisions themselves, and partly on account of the names, there is, at present, a good deal of criticism afloat, which is by no means favourable to the preceding nomenclature.

§ 176. In respect to the names the chief objections

lie against the first two—the compounds of the word *Saxon*. The history of the English language is continuous; and as the word *Saxon* seems to indicate a different language, rather than the same language in a different stage, it is charged with disguising the continuity. Perhaps with some persons it may do so. But then the substitute for it does something, perhaps, as bad. Old *English*, for that is the proposed name, disguises the continuity between the *Old* Saxon of the Continent and the insular Saxon of what is now England, but what was originally Britain.

§ 177. Those who object to '*Anglosaxon*' object also to '*Semisaxon;*' as is natural. It is not likely, however, that the question of names will be determined on any *a priori* notions of propriety. The name that turns out to be the most convenient will be the one which eventually prevails, and of this common-sense test those who make the most use of it in their investigations are the best judges. A name that is good in one department of learning may be exceptionable in another. '*Old English*' may be a good term for the historian, though an inconvenient one in philology. Of this the historian and the philologue are the best judges, and each, as a workman in a different department, has a right to name his tools. This is as much as need be said upon a point which, just at present, is invested with more importance than it deserves.

§ 178. One of the reasons for the present objections to older classification and its corresponding nomenclature is the importance which within the last thirty years has been attached to the study of our *Dialects*; and when it comes to be generally recognized that each of the leading ones is represented by a corresponding literature, limited to its own proper period, there is so

little continuity in their history that the impropriety of massing them together and treating them as one and indivisible is manifest.

Another reason is the extent to which the history of the Middle English has been cultivated. The more we know of it the more we see how one period graduates into another, and how difficult it is to draw definite lines of demarcation.

Nevertheless, there is something akin to the stages of a language in general, or certain epochs at which the language in mass of the whole island was, or might be, affected.

Such a one is the time from the reign of Diocletian, at the end of the third century, to the middle of the fifth, when we know that some Germans of some sort or other had set foot in our island.

Such a one is the time from the middle of the fifth century to the beginning of the seventh, when the history of our language was a blank. But we know that it was to a great extent German.

Such a one was the time from A.D. 600 to the death of Beda; for which we have a few lines in English, and these we know belong to the *northern* rather than to the *southern* form of speech.

Such a one is the time from the death of Beda to that of Alfred, where we know that the northern literature is declining. Under Alfred and his successors the classical *Westsaxon* literature was formed. But a fresh influence was introduced by the Norman Conquest.

From the Norman Conquest to the death of Richard II. there is a period out of which many subordinate stages may be made. There are the reigns of the two Williams, Stephen, Henry II., Richard, and John, in which the Westsaxon still is the predomina-

ting dialect; but there is very little of it. Then, under Henry III., there are compositions other than Westsaxon. Those that are Northumbrian are representatives of an old, though diminished literature, in a new shape after a long arrest. Hence we have the Northumbrian form of speech re-appearing, but with no continuity in its history.

There are, also, Midland dialects, which are represented in this century, but they have no anterior history.

Meanwhile the Westsaxon declines.

For this period there is no continuity for any one of the forms of speech of which the English language consists; nor can we expect one of the language in general.

§ 179. As early as 1852 a writer (Professor Stephens of Copenhagen) in the 'Gentleman's Magazine' for April and May proposed the following change: viz. that—

1. From A.D. 550 to 1150 the Language should be called *Old* English.
2. From A.D. 1150 to 1350 the Language should be called *Early* English.
3. From A.D. 1350 to 1550 the Language should be called *Middle* English.

§ 180. Of this arrangement, with its corresponding system of terms, it is only certain that it is now on its trial; also that from the time of its first introduction to the present it has had good authorities in its favour. Nor can it be denied that to a looker-on it has much to recommend it. It is invested with a certain patriotic or national halo of what we may call *Anglehood*; and it favours, to a certain extent, the notion that if the history of language, or, indeed, of anything else is *continuous*, no term that has the slightest tendency to

disguise that great fact of continuity should be tolerated. I have no means of ascertaining how far the word *Anglosaxon* does this; but I can easily imagine that many a person who has heard of it as the name of one language, and of *English* as that of another, may get exaggerated views as to the nature of their difference. But unless he know that there is such a thing as a language with certain stages, periods, or consecutive divisions in its history, the words *Old*, *Middle*, and *New*, as qualifying additions to the word *English* in the newer vocabulary, teach him but little; and when he knows this a change is unimportant. Moreover, whatever may be said against the term *Semi*saxon, the word *Anglo*saxon is anything but a new one.

As for the continuity which it is supposed to conceal, it is one of a very partial, or sectional, character; for it extends no farther than the Angle conquest of Britain. The continuity of the Old *English* of England with the Old *Saxon* of Germany is as real as that of the English of Alfred's time with that of the Conqueror, and as well worth being made unmistakeable. But, in the opinion of the present writer, the extent to which either is misunderstood is over-rated. However, as has been already stated, one word may be the best for the historian, the other for the philologue; and each is the judge in his own department.

Meanwhile it is well to know that such evil as the use of the compound '*Anglosaxon*' is supposed to have done, is not involved in the term itself, and that the charge against it is not so much that it is a bad word in itself, but that *English* is a better.

§ 181. Still it is a word that needs explanation; for it is *not* a new one, and it *is* one which has several senses.

(1.) The sense in which it is not only unexception-

able, but almost necessary, is that with which we find it in the Lombard historian of the ninth century—Paulus Diaconus. He is not the author who gives us the earliest instance of its use; but the import he attaches to it is the most definite. With him it means the *English of Britain*, or the Island, as opposed to the *English of Germany*, or the mother-country of the Continent. For a Continental writer such a compound was excellent.

(2) With Beda, an earlier writer, it has the same want of precision as it has now. Few who use it at the present time are able to say at once whether they mean by it *Angle* and *Saxon*, or *Angle* or *Saxon*. With the exact sense of Paulus Diaconus, Beda would have no great occasion to use it; for with him, as an Anglosaxon, there would, in general, be nothing exceptional in the term. Whether it meant *Angle* rather than *Saxon*, or *Saxon* rather than *Angle*, it would, as a matter of course, be *English*. Beda used all three terms—*Angle*, *Saxon*, and *Anglosaxon*. He also uses *Old Saxon*=*Antiqui Saxones* translated *Eald-seaxan*.

§ 182. In neither of these senses can the compound be abandoned.

As opposed to the *Old Saxon* of the Continent, the *Anglosaxon* is the Anglosaxon of Paulus Diaconus.

This is the compound in its most precise and unexceptionable form. But it is wanted with a second sense. Though there was a unity between the *Angles*, *Saxons*, or *Anglosaxons* of Britain, there was also a difference, and not an unimportant one. At times we can analyse this, and show what was Angle and what was Saxon. But, at times, the separation is either beyond our means of analysis, or not requiring it. In this case, *Anglosaxon*, meaning neither *Angle* or

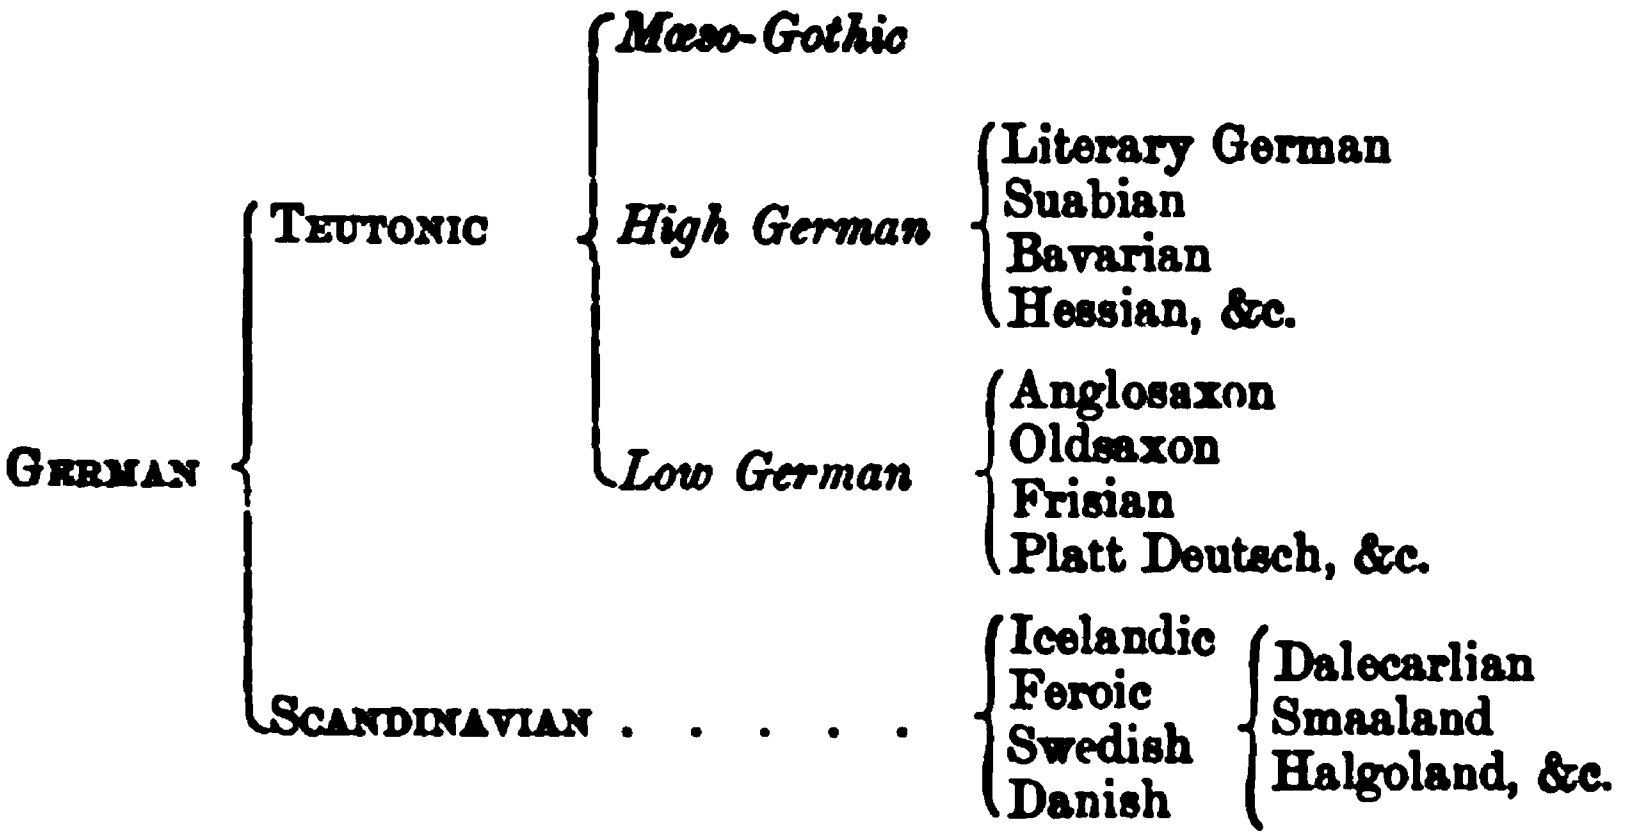
Saxon in particular, but both in general, is, to say the least, a convenient term. In the matter, however, of language or dialect, *Westsaxon* has become a recognized term.

But it is only a geographical one; and as such applies to a particular dialect of our language rather than to the stages of the language in general. For the period anterior to the Norman I have found *Anglosaxon* the most convenient name.

CHAPTER XV.

CLASSIFICATION.—PLACE OF THE ENGLISH AS A MEMBER OF THE GERMAN FAMILY.—PLACE OF THE GERMAN FAMILY AS A MEMBER OF THE INDO-GERMANIC, INDO-EUROPEAN, OR ARYAN CLASS.

§ 183. It is conspicuously clear from what has preceded that just as the Westsaxon, the Northumbrian, and the Mercian are divisions of the English, so is the English a division of some larger group; a group which some call *Gothic*, some *German*. There is no doubt as to its contents. The languages or Dialects which are here stated to belong to it are universally admitted to do so. Upon their relations, however, to each other, or the divisions and subdivisions which they form within the class at large, there is no unanimity of opinion. The Table of Affinities which satisfied the generation of Grimm and Rask was as follows:—



The English Language, p. 213.

Here the Mœsogothic stands by itself.

The classification of the last work of importance and authority, Dr. Morris's '*Historical Outlines of English Accidence*,' runs thus :—

The Teutonic languages may be arranged in three groups as subdivisions—

(1) The Low German. (2) The Scandinavian. (3) The High German.

I. To the Low German belong the following languages—

(1) Gothic, &c.
(2) Frisian, &c.
(3) Dutch, &c.
(4) Flemish, &c.
(5) Old Saxon, &c.
(6) English. (*a*) Old English; (*b*) Modern English; (*c*) Provincial English; (*d*) Lowland Scotch.

II. To the Scandinavian division belong the following languages: (1) Icelandic; (2) Norwegian; (3) Swedish; (4) Danish.

III. To the High German division belongs Modern German, the literary dialect of Germany, properly the speech of the south-east of Germany, Bavaria, Austria, and some adjacent districts.

It is divided into three stages—

(*a*) Old High German, comprising a number of dialects (the Thuringian, Franconian, Swabian, Alsacian, Swiss, and Bavarian), spoken in Upper or South Germany, from the beginning of the eighth to the middle of the eleventh century.

(*b*) Middle High German, spoken in Upper Germany from the

beginning of the twelfth to the end of the fifteenth century.

(*c*) Modern High German, from the end of the fifteenth century to the present time.

Luther ennobled the dialect he used in his beautiful translation of the Bible, and made the High German the literary language of all German-speaking people. The Low German dialects of the Continent are yielding to its influence, and, in course of time, will be wholly displaced by it.

10. If we compare English and Modern German we find them very clearly distinguished from each other by regular phonetic changes: thus a *d* in English corresponds to a *t* in German, as *dance* and *tanz*; *day* and *tag*; *deep* and *tief*; *drink* and *trinken*. A *t* in English agrees with an *s* or *z* in German, as is shown by *foot* and *fuss*; *tin* and *zinn*; *to* and *zu*; *two* and *zwei*; *water* and *wasser*. A German *d* is equivalent to our *th*, as *die* and *the*; *dein* and *thine*; *bad* and *bath*, &c.

Not only English, but all the remaining members of the Low German family, as well as the Scandinavian dialects, are thus distinguished from High German.—Pp. 4–6, 1872.

Here the Mœsogothic is made *Low* German; thereby isolating the High German, and making it exceptional to the general character of the Family. The principle upon which this is done is explained in the last four sentences. It is founded on the letter-changes indicated, and, to some extent, illustrated, in §§ 124, 125, viz., the change of the Sonant Mutes to the Surd. That it is not general has been shown. Still it is a change of a regular and systematic character, and as such must be taken as we find it. But only so far as it goes; that is, so far as there are no signs of affinity elsewhere.

That there actually are such that connect the Mœsogothic with the *High* German is beyond doubt; so that the result is the paradox or see-saw, that though the changes under notice may associate a given form of speech with the Low German dialects, it may not separate them from the High ones; and this is only another way of saying that between the value of *High* and *Low* as divisions, and the value of the change of *Sonant* to *Surd* as a criterion, the value of the characteristic which makes a cross-division of the kind before us is

questionable. In fact, the change under consideration is a *single character*, and single characters are proverbially suspicious. To be of any value they must come under one of two conditions. They must either be of such importance of themselves as to outweigh a mass of minor differences, and no one has shown that the change from Sonant to Surd does this, or they must, so to say, carry with them, imply, or represent other differences with which they are connected in the way of cause and effect, or as parts of a systematic series of changes, in which case they are not single characters.

The difference between the change from Surd to Sonant was not a matter of such importance in the eyes of the older philologues as it is with us. With us it is important because in the particular case of the High and Low German forms of speech it admirably exemplifies what is called Grimm's Law. But it does not follow that because it did this, it should be a good measure of the nearness or distantness of the relationship between one language and another. The change may and does exist between closely allied forms of speech. But it drew attention to a change which the older scholars had either overlooked or undervalued.

When *High* and *Low*, however, became precise, technical, important, and generally current terms, the Low German character of the Mœsogothic Phonesis commanded attention; and more than thirty years ago Kemble drew attention to it. Still it was kept separate in the systems of classification. At present it is not only classed as *Low* German, but specially, sometimes ostentatiously, separated from the *High*.

The real question in all this is the merit of the terms *High* and *Low* as names of classes, and the value of the change from *Surd* to *Sonant* as a test.

As for the Mœsogothic, so far as its Phonesis goes,

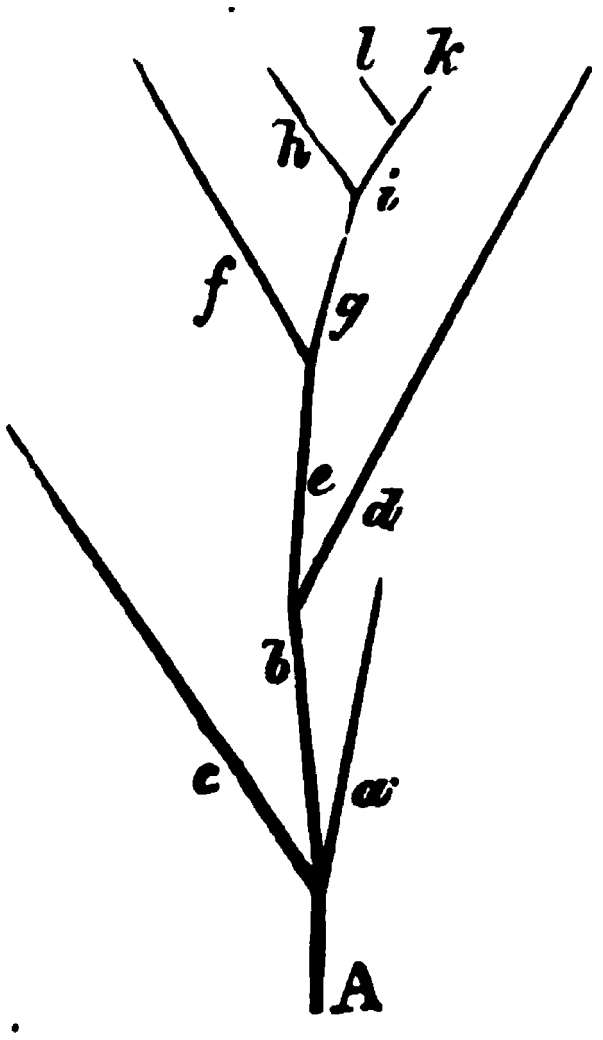
it is, *quoad hoc*, Low German. It may be so in other matters; but until it is not only shown to be so, but shown to be so in more points, or more important ones than those wherein it agrees with the High German, the unattached condition in which the older scholars left it should be upheld; and the proof that the Mœsogothic and High German are in different and distant divisions proves too much.

§ 184. But the tabular arrangement is not the only one. In the only other English grammar of importance, that of Mr. March, we have a Genealogical Tree. After mentioning the Anglosaxon and the Danish the author writes:—

'The other languages sprung from the languages of Low German tribes are Friesic, Old Saxon, and, later, Dutch (and Flemish), and Platt Deutsch . . . These Low German languages are akin to the High German on one side, and to Scandinavian on the other. These with the Mœsogothic constitute the Teutonic class of languages.'

This leaves the Mœsogothic by itself.

'The following stem shows the manner in which the Teutonic languages branch after separating from the Teutonic. The Gothic (Mœsogothic) died without issue. The Gothic (Mœsogothic) is nearer akin to it than the High German is. The branches of the Scandinavian (Swedish, Danish, and Norwegian) are not represented.



A Teutonic. Theoretic
a Gothic. 4th Century
b Germanic. Theoretic
c Scandinavian. 13th Century
d High German. 8th Century
e Low German. Theoretic
f Frisian. 14th Century
g Saxon. Theoretic
h Anglosaxon. 8th Century
i Old Saxon. 9th Century
k Platt Deutsch. 14th Century
l Dutch. 13th Century.'

A Comparative Grammar of the Anglosaxon Language. 1871.

Here the Mœsogothic, though not classed as either *High* or *Low*, is said to be more '*like*' the latter than the former. But it branches off from the main stem at a nearer point than the Old Saxon does; while the continuation of the stem, though marked as '*Low* German,' is also marked as *Theoretic*.

This shows that an arrangement which classes languages, at a late period of their growth, may conflict with one that shows them in their earlier relations to a common stock. Both are incomplete. Provided, however, that we know this, and take each system for what it is intended, and for no more than it is worth, the evils are not very serious; for one checks the other, and classifications of such an absolute nature as to allow each of their characteristics to be driven to its extreme results are rarely attainable. It is one thing to make the Mœsogothic *Low* in respect to its Phonesis, another to make it, when its other characteristics are brought in on the other side, more Westsaxon than High German.

§ 185. *The Indo-Germanic, &c., Class of Language.*—But, as the English was only a single member in the German family, so was the German itself but a single member of a higher group, viz., Indo-Germanic, Indo-European, or Aryan. In a systematic work on Philology it would be necessary to discuss the relative merits of these three names; and to ascertain the dimensions of the class; but this is not necessary here. Such members of it as will be used for the illustration of the details of English Philology—these and these only—will be here mentioned.

I. Nearest in geography, but not so much used as the others in illustration, is the Slavonic. This contains:—

a. The Polish, with outlying fragments in other

parts of Germany dating from a time when Slavonia extended to and beyond the Elbe. These are:—

b. The Linonian of Luneburgh, in which the original Slavonic was preached during the last century. Known only by a Paternoster.

c. The Kassubic; still spoken by a fragmentary population in Pomerania.

d. The Sorabian, a remnant of the Slavonian of Lusatia and Brandenburg.

e. The Bohemian, called Czekh (Tshekh) in Bohemia; Moravian in Moravia; and Slovack in Upper Hungary.

f. The Russian.

g. The Bulgarian.

h. The Servian: where this ends it is difficult to say. It is well separated from the Bulgarian in the East; but where it ceases in the direction of Croatia, Carniola, and Dalmatia, is indefinite.

II. The Lithuanic; comprising the Lithuanic of Lithuania, and parts of East Prussia; the Old Prussian; the Lett, or Lettish, of Courland, Livonia, and Estonia.

III. The Latin; with its old dialects Umbrian and Oscan, and its modern derivatives, the Italian, the Spanish and Portuguese; the French, both Northern and Southern (or Provençal); the Romain of the Danubian Principalities; Bukhovinia; part of Transylvania; and Bessarabia; and, lastly, the Romance of the Swiss Grisons (Graubünten).

IV. The Greek, Ancient and Modern.

V. The Sanskrit, with its congeners and derivatives, whatever they may be; for upon this point there is no complete agreement of opinion.

That there are other languages assigned to the class under notice has been already indicated; more especially

the Celtic and the Albanian. In a work upon Comparative Philology it would be necessary to go into this question; but, in the present, the main reason for saying about them the little that has been said is the fact that they are continually referred to as languages illustrative of the structure of our own. That the Celtic, Albanian, and others may do the same is true; but they don't do it to the same extent. Hence they may be Indo-Germanic, Indo-European, or Aryan, but they are not so in respect to their application in English Philology.

§ 186. *Synthesis and Analysis.*—The general character of our dialects in respect to their change of structure from Synthetic to Analytic is a point of more importance. One and all, they are more Synthetic in their older stages than in the newer ones. There is always change of some kind, though it goes on in the different languages at different rates; but whether the changes be quick and frequent, or few and far between, the general direction is the same throughout, viz., from Synthesis to Analysis, and not *vice versâ*.

PART II.

PHONESIS.

CHAPTER I.

SPEAKING AND SPELLING.—NUMBER, NATURE, AND CLASSIFICATION OF THE ELEMENTARY SOUNDS.—VOWELS—LIQUIDS — SEMIVOWELS — MUTES — *NG* — *H* — DIPHTHONGS.

§ 187. In most languages there is a difference between the actual pronunciation of words in *speaking* and the representation of them, by written signs or letters, in *spelling*; and in English this difference is inordinately great.

Hence, when we investigate the nature of the elementary articulate sounds of our language, the eye misleads the ear. Thus—

(*a*) The sounds of the *Ph*, as in *Philip*, and the *f* as in *fillip*, differ to the *eye*; while, to the ear they are the same. Here, then, a real likeness is concealed, and an artificial difference suggested.

(*b*) The sound of the *th*, as in *thin*, differs from that of the *th* in *thine*. Yet to the eye the two sounds are alike. Here a fictitious likeness is suggested, and a real difference is concealed.

Besides this, the Names of the Letters as we find them in the Alphabet, for the most part, mislead us; the only exceptions being *Bee* and *Pee*, *Dee* and *Tee*.

These, though they fail to give us the exact relations of *b* and *p*, or *d* and *t*, as sounds, do not altogether conceal it, as names like *ka* and *gee*, *eff* and *vee* do. If we wish, however, to thoroughly understand the matter, we must trust nothing to the *names* of the *letters*, but everything to the *sounds* themselves, and to nothing else. This means that even from names so simple as *Bee*, *Pee*, *Dee*, or *Tee*, we must cut off the vowel, and accustom ourselves to pronounce the simple uncombined sounds of the consonant. We must do this in spite of their consonantal character, and in spite of the statement that a consonant cannot be sounded without a vowel to support it. Without a vowel consonants will not readily combine into syllables; but, without a vowel they can be pronounced separately; and so every one who wishes to make a study of the mechanism of speech must bring himself to pronounce them. It is easy to see that *p* and *b* are allied sounds; easy, too, that *t* and *d* are allied; and not difficult to see that *t* is to *p* as *b* to *d*, and *vice versâ*. *K* and *b* when similarly examined are in the same condition. This is a point upon which any one who chooses to convince himself may do so; for the machinery is not only always at hand, but every ordinary Englishman has the full command of it. When, however, we take to the *names*, we find that though words like *pee* or *bee* may not do much towards concealing an affinity, words like *kay* and *gee* may do it most effectively.

§ 188. In counting the *number* of our elementary sounds it is necessary to have clear views as to the principle upon which we treat such varieties as the *a* in f*a*ther, f*a*te, f*a*t, &c. Are they to be counted as three distinct elements or as so many modifications of a single sound; in other words, are there in English three *a*'s, or one *a* with three powers?

It is found convenient to count them as *three separate* sounds.

If so, the number of the elementary Articulate Sounds, of the literary, standard, or classical English, amounts to *thirty-four*; and if we add to these the Diphthongs and the sounds of *ch* and *j*, to *forty*.

Simple Sounds.

§ 189. *The Vowels.*—1–12. These are the vowels in *father, fate, fat; bed, feet, tin; cool, fall; bawl, note, not; but.* Whoever isolates these, pronounces them slowly, and pays attention to the condition of his tongue, teeth, and cheeks, during the utterance of them, will find that the passage of air from the lungs to the outer atmosphere is permanently free or open, there being no point where either the tongue touches the palate, or where the lips close on one another. They are farthest apart in the *a* in *father*; and they are nearest to one another in the *oo* in *cool*; but the column of air which forms them, though narrowed, is never arrested, the sound being capable of prolongation, or *Continuous.*

The sounds thus formed constitute the class of *Vowels*—twelve in number.

§ 190. *The Liquids.*—13–16. The sounds of *l, m, n,* and *r*, as in *low, mow, no, row.*

Here the tongue and lips play a part. The tongue is either applied to the palate, or vibrates upon it, or else the lips are closed. In either case, however, there is contact between the upper and under parts of the mouth so that the sound is checked, arrested, or diverted. With *m* the lips are closed, and the column of air escapes, not through the mouth, but through the nostrils. The sound of *n* also escapes through the nostrils; but, instead of the passage through the mouth,

being closed by the *lips*, it is closed by the *tongue*, which is pressed against the fore part of the palate. With *r* the tongue vibrates on the palate; and with *l* it touches the palate on one side so as to divert the stream of air to the other. All these sounds, like the Vowels, can be prolonged; or, in other words, are Continuous. They constitute the class of *Liquids*—four in number.

§ 191. *The Semivowels.*—17–18. The sounds of the *y* in *yet*, and *w* in *well*. These are treated as single sounds; though they are more properly Diphthongs, since *yet* is little more than *e-et*; and *well* little more than *oo-el*, the prefixes *e* and *u* being pronounced so quickly as to coalesce with the vowel that follows. It is convenient, however, to treat them as single. They constitute the class of *Semivowels*—two in number.

§ 192. *The Sibilants.*—19–22. The sounds of the *s* in *seal*, and the *z* in *zeal*, the *sh* in *shin*, and the *z* (*zh*) in *azure*. Here the passage of air is diverted by the contact of the tip of the tongue with the palate. All these sounds can be prolonged or continued, like the hissing of a serpent, with which the sound of *s* has been compared. They form the class of *Sibilants*—four in number.

These sounds are the easiest of all the Consonantal ones, to be isolated. In words like *hiss*, *hush*, *buzz*, *whizz*, &c., they constitute the characteristic part of the word, or that element through which the sound in certain words becomes a sort of 'echo to the sense.'

This makes the difference between the sounds of *s* and *z* intelligible. The sound of *z* is that of a *whizz*, or *buzz*, rather than that of a *hiss*.

This last, however, is not the ordinary pitch or tone of the human voice in common conversation, but rather that of a conversation in *whispers*; the pitch of *z*, on the other hand, being that of conversation in general.

As all the sounds hitherto enumerated have been of this latter kind, the sounds of *s* and *sh* introduce a new term, or, rather, a new pair of terms; the distinction upon which they are founded being that between *hiss* and a *buzz*, or ordinary *voice* and *whispers*, or *sharpness* and *flatness*.

Now when *s* and *z* are thus contrasted it is clear that the sound of *sh* stands to that of *s* as that of *zh* (the *z* in *azure*, *glazier*, &c., and the French *j*) does to that of *z*, and *vice versâ*. Hence arises a pair of pairs, or a *quaternion*.

The *Liquids* are, also, four in number; but they neither fall into the divisions that have just been indicated, nor are they so, decidedly, varieties of a single fundamental form. For it is clear that we may if we like call *z* a vocalized *s*, or *s* a *z* reduced to a whisper.

§ 193. The Sibilants, as has been already stated, are Continuous; and, in being this, they agree with *all* the sounds that have preceded them.

The next group, however, will contain sounds other than continuous, viz., a *p*, *b*, *t*, *d*, and *k*.

All these, so to say, *explode*. With everyone of them, either by the closure of the lips, or by the close contact of the tongue with the palate, the passage of the air is completely barred. With the Vowels it has been merely narrowed. With the Liquids and Sibilants it has been only partially closed; for even when with *m* and *n* the closure of the front part of the mouth was complete, the vocalised column of air escaped by way of the nostrils, and the pair of *Nasal* Liquids was the result. The same diversion of the voice takes place with the Sibilants. But with *p*, *b*, *t*, &c., the posterior nares as well as the outlet through the mouth are closed; and the air is pent up, as it were, behind a barrier formed by either the lips or tongue; and as long as this lasts there is no sound at all. When, however, it is removed a sound escapes. But it escapes at once, and after the fashion of an explosion. Such is the case with the sounds of *p*, *b*, *t*, *d*, *k*, *g*, as contrasted with those of *f*, *v*, and *th*, which are as easily prolonged, or made continuous, as those of *s*, *sh*, *z*, *zh*, or even as the Vowels themselves.

§ 194. 23–32.—(*a*) The sounds of *p*, *b*, *f*, and *v*, in *pane*, *bane*, *fane*, and *vane*.—*Four* in number, and called *Labials* from the Latin *labium*=*lip*; the organ most engaged in the formation of them.

(*b*) The sounds of *t*, *d*, *th*, as in *thin*, and *th* (sounded *dh*), as in *thine* (pronounced *dhine*)—*Four* in number and called *Dentals*, from the Latin *dens*=*tooth*, the dental region, or front of the palate, being the part upon which the tongue is more especially pressed in the formation of the valve, behind which the air is first confined, and through which it afterwards escapes.

In each of these two quaternions there are the elements of a double arrangement, i.e.

Explosive		*or*	*Continuous.*	
Surd.	*Sonant.*		*Surd.*	*Sonant.*
p.	*b.*	|	*f.*	*v.*
t.	*d.*	|	*th.*	*dh.*

Surd		*or*	*Sonant.*	
Explosive.	*Continuous.*		*Explosive.*	*Continuous.*
p.	*f.*	|	*b.*	*v.*
t.	*th.*	|	*d.*	*dh.*

The Sibilant series has no *double* arrangement.

(*c*) The sounds of the *k* in *kill* and the *g* in *gun*.—These are called *Palatals*, the arch, or back of the palate being the most characteristic part of it. Still, the Dentals are, in a degree, palatal.

(*a*) In the formation of the Dentals the tongue touches, or approaches the teeth, in the front of the palate, and this it does with its tip.

In the formation of the more special Palatals (*k* and *g*) the tip of the tongue is depressed, the *middle* part of it being curved upwards, so as to touch the *soft* or back palate, rather than the parts about the teeth and gums.

(*b*) The Palatal, or Palatal Mutes, are, here, only *two* in number. This is simple, because the sounds which stand in the relation to *k* and *g*, as *f* and *v*, *th* and *dh*, to *p* and *b*, *t* and *d* are wanting in our language, just as the sounds of *th* and *dh* are wanting in the French and German; and indeed in the majority of languages. Unless we remember this, the true character of the division under notice escapes us.

(*c*) The three groups of Labials, Dentals, and Palatals constitute the higher division of *Mutes*; from which the Liquids and Semivowels have always been separated, and with which it is time to leave off associating the Sibilants.

Of the Sibilants, however, as we have seen, *all* are Continuous. Of the Mutes *one half* only is Continuous, the other half being Explosive.

§ 195. The Semivowels are connected with the Vowels, through *i* (*ee*) and *u*, the Consonants, by *g* and *v*—*i*, *y*, *g*, and *u*, *w*, *v*. However, between *g* and *y* the series is broken in English, because the

Continuants of *k* and *g* are wanting. Still *g* is the nearest congener to *y*.

The Liquids are connected with the Sibilants and Mutes through—*r* to *z* and *s*; *l* to *g* and *k*; *n* to *d* and *t*; *m* to *b* and *p*. So far as the Liquids, like the Vowels, are Sonant, the closest to the Liquids of the several pairs are *z*, *g*, *d*, and *b*—i.e. the Sonant, Sibilant, and the Sonant Mutes.

§ 196. The mechanism of the system of the Mutes is the most complex part of Phonesis; but it is easily learnt. Anyone, in any country, who has a well-formed mouth and an average ear can teach himself —*if he will*. If he will not, no one else can teach him. By so doing he anticipates the operation of the so-called Rules of Euphony which are casually and occasionally inserted, and repeated, in the parts which treat of Etymology. The details themselves are important: but the fact that there is not only a system at all, but one of remarkable symmetry, is more so.

It is, however, those details only which have an especial bearing upon our language that are noticed here. So far as a system is exhibited it is only exhibited as a means of giving unity to the details—on the principle that 'The whole is easier than the part.'

§ 197. (33) *The sound of the letters -ng*, as *in king*, *song*, &c.—This is, by no means, the sound of *ng*, but an indecomposable elementary articulation.

Ng is a *Nasal*. *N* is a Nasal also; but it is a Nasal Liquid. So is *m*.

With *m* the exit of the vocalized air is closed by the lips; with *n* by the extremity of the tongue and the forepart of the palate; with *ng* by the middle part of the tongue and the *velum palate ng*. Hence, *ng* is, in a certain sense, a Liquid; and, in a certain sense, *ng*, *n*, and *m* are Vowels. The passage for all three is through the nostrils, and the closure of the mouth, or the passages within it, is merely subordinate to the diverting of the column of vocalized air towards the nostrils. Within the Nasal cavities its passage is as unbroken as is the passage of the true Vowel through the mouth. The *-en*, *-in*, *-on*, and *-un*, in French, is more of a Vowel than a Consonant; and so is the *ão* in Portuguese.

Ng in English never begins a syllable. We say *-ing* and *-ong*, but not *ngi* and *ngo*; though the latter form is, in some languages, initial as well as final. This shows that sounds are not so much pronounceable or the contrary by themselves, but are pronounceable or unpronounceable according to their relation to other sounds.

§ 198. (34) *The sound of the letter H.*—This is a Breathing, rather than an Articulated Element of Speech. It passes through the mouth simply as Breath; or without being acted upon by any of the organs of Speech. Neither is it Sonant, but Surd. But *p*, *f*, *t*, &c., are Surd also: yet, still, articulations. This is because the tongue and lips act on them; which with *h* are perfectly passive.

§ 199.

Compound Sounds.

These are six in number—

35. The sound of the letters *ou* in *house.*
36. „ „ *ew* „ *new.*
37. „ letter *i* „ *pine.*
38. „ letters *oi* „ *voice.*
39. „ „ *ch* „ *chest* (i.e. *tsh*).
40. „ „ *j* „ *jest* (i.e. *dzh*).

These are, one and all, *etymologically* Diphthongs; the only difference being that the first four are made up of Vowels, the last two out of Consonants. The latter, however, will be called '*Compound Sibilants*,' and the former '*Diphthongs*' as usual.

§ 200. *The Organ of Vocalization.*—This brings us to a point which has apparently been neglected.

All that has hitherto been indicated can be made out by the student himself from the mere observation of the condition of the different parts of the mouth and nostrils, during the formation of the elementary sounds; and though it is not quite so easy to know the relative position of the tongue, lips, and soft palate in ordinary speaking as it is to see the position of the fingers and thumb when we talk 'on our fingers,' it is not much harder. One point of the vocal organization, however, lies beyond, and below, the mouth, viz., the

mechanism by which we form the Sonants as opposed to the Surds.

This is done by the larynx (or Adam's apple), of which all that can be said in a work like the present is that it is an organ provided with elastic membranes, which can be made lax or tense by a system of small muscles by which they can be either tightened, relaxed, or left in a state of quiescence. When they are left quiescent the sound comes out as that of ordinary breath; when they are tightened their vibration gives us Vocal, or Sonant, articulations. Something even of the larynx can be seen by means of the Laryngoscope; but for the generality it is only the parts within the mouth that can be brought under direct observation.

CHAPTER II.

ELEMENTARY SOUNDS CONTINUED—THEIR CHIEF PECULIARITIES—THEIR INFLUENCE IN ETYMOLOGY—THE *A* IN *FATHER*, AND THE *-AR* IN *FARTHER*—BROAD AND SLENDER VOWELS—*R* AFTER A LIQUID—THE COMBINATION OF *SURD* AND *SONANT*—NO TRUE *ASPIRATES* OR DOUBLED CONSONANTS IN ENGLISH—UNSTABLE COMBINATIONS—ASSIBILATION—THE GENERATION OF THE COMPOUND SIBILANTS.

§ 201. *The -a in father and the -ar in farther.*—These are generally sounded alike; the process being generally, that the *-ar* is sounded like the *-a*, rather than the *-a* like the *-ar*. When the converse takes place, and when *Maria*, or *idea*, is sounded *Mariar*, or *idear* (a recognised inelegancy), the mispronunciation is either due to early contact with persons who what is called

'*thrill the -r*,' or to some early imperfection of speech which has been to a great extent, but not wholly, surmounted. In the first case they do it unconsciously; in the latter with a slightly misdirected effort. It has left its mark in our language. *Daughter* is found in Old English spelt *dortor*. The words *near* and *hoarse* are thus transformed; for the true roots are *hás*, or *hoase*. Cockney rhymes, like *morning* and *dawning*, are common; and, if the sounds are really identical, may by excused if not defended.

If we consider how prevalent the open sound of the *a* is in other languages, the comparative rarity of it in English may surprise. But it is only the true open *-a* that is rare. The abusive, or catachrestic, form is common. Not to mention the cases like *-a*, and *-aw*, as in *bawl*, how many of us, when beginning German, are perplexed with the difference between *meine* and *meiner!* The single *-e* in English is, as a rule, mute; but in German we have to sound it; and sometimes we do so. But in many cases we sound the two words alike, i.e. *meiner* as *meine*, and not *vice versâ*.

The fact is that, when *r follows* a vowel, most of us never pronounce it at all. We may fancy we do, but we don't. We fancy we do because we find the *-r* appears in the written language.

I do not say that this *softening* or *slurring* of the *-r* is universal. It is certainly general. But it is South British, rather than Northumbrian.

In the way of evidence on this point I give the following *selected* statement from a writer who is not only a North Briton familiar with the language of the South, but one who, as a philologist, well knows what the sound of the *-r* really is, both in its attenuation and its exaggeration.

'R is in Scotch always a consonant, and in all positions trilled sharply with the point of the tongue, and never smoothly *buzzed* or burred, or converted into a mere glide as in English, nor *rolled* with the

whole length of the tongue as in Irish, nor roughly *burred* with the pharynx as in Northumberland, in France and Germany. Even the initial English *r*, in *road*, *rung*, is softer and more gliding than the Scotch, which is used with equal sharpness before or after a vowel, as in *rare*, *roar*, *raythe*r, *roarer*. In the south of England its subsidence after a vowel into a more glide renders it impossible to distinguish, in the utterance of some speakers, between *law*, *lore*; *lord*, *laud*; *gutta*, *gutter*; *Emma*, *hemmer*. Hence, when these words are used with a following vowel, a hiatus is avoided by saying draw-*r*-ing, Sarah-*r*-Anne, Maida-*r*-'ill, idea-*r* of things, law-*r* of England, phrases which even educated men are not ashamed, or not conscious, of uttering. No such liberties are allowable with the Scotch *r*, which is always truly consonantal.'—*Murray: Dialect of the Southern Counties of Scotland*, p. 120.

§ 202. *The Slender vowels e and i as opposed to the Broad ones, a, o, and u.*—The bearing of this difference is twofold; (1) in respect to its influence on the double power of the letters *c* and *g*; and (2) upon its determination of the *Umlaut*.

(*a*) *A small vowel preceded by either C or G.*—*C* before *e* or *i* is sounded as *s*; before *a*, *o*, or *u* as *k*. We know this from our first lessons in spelling, and this alone is sufficient to show the importance of the distinction.

G before *e* or *i* is sounded as *J*. We know this also from the Spelling-book.

We may put this in a more general form and say that when $c=s$, $g=j$.

We must add, however, that though the principle of the change is the same, the details of the result are different. In both cases the Palatal is changed into a Sibilant or Assibilated. But with *C* the Sibilant is Simple; with *G* Compound.

(*b*) *The Umlaut.*—When, in either a Compound or a Derivative word, a syllable containing a slender vowel is either prefixed or appended to one containing a broad one, the broad one may be modified, and may become, if not actually slender, slenderer.

Of this change, in some shape or other, most languages give us examples. There is less of it in English than elsewhere. The words *elder* and *eldest* as the Comparative and Superlative forms of *old*, are examples.

§ 203. *R after a Liquid.*—When any one of the other three Liquids is immediately followed by *-r*, or *vice versâ*, when *-r* is immediately preceded by a Liquid, the combination is *Unstable*. It is, beyond all doubt, pronounceable. But it rarely lasts long without something being interposed, and so that the immediate contact of the two liquids is avoided. This interposed sound varies with the liquid which it follows.

Between *l* and *r* it is *g—pilgrim* from *pelerin*.
„ *m* and *r* „ *b—number* „ *numerus*.
„ *n* and *r* „ *d—kindred* „ *kinred*.

In the word *lamb*, the *b*, which is no part of the original, has thus been introduced. The plural was in *-r*, as in *childer*, from *child*. The termination was dropped, the *l* retained, so that now it looks like a part of the fundamental word.

§ 204. *The combination of 'Surd' and 'Sonant.'*—Two Mutes of different degrees of Sonancy cannot immediately succeed one another in the same syllable; a fact which makes the thorough comprehension of the system of mutes indispensable.

It is not a matter of mere understanding. We may understand that 9 and 8 make 17; or we may know the Multiplication Table by heart; but if sums are to be done quickly, safely, and easily, we must be thoroughly familiar with the working of it. We must remember without an effort that *t* is to *d*, as *p* to *b*, and *k* to *g*, and *f* to *v*, &c.; and we can only do this when we have taught ourselves their relations. When we have done this, the Rules of Euphony are known beforehand; and deductions from them either anticipated or taken as a matter of course.

Moreover, for the English language we must take the English arrangement. The classical groups of *Tenues*, *Mediæ*, and *Aspiratæ*, if they don't perplex us, carry us but half way.

Unless we do this we must pick them up as we find them in their special applications, and, so doing, pick them up laboriously and incompletely. A little practice and a little conversation to ourselves give us the requisite familiarity with them.

This especially touches the formation of our Plural Numbers and Preterit Tenses. Words like *slabs*, *lives*, *pluckd* (*plucked*), *stoppd* (*stopped*), may be *written*, but not *pronounced*. The *sounds* are *slabz*, *līvz*, *pluckt*, *stopt*, &c. The rule, however, is simple. When such conjunctions occur, one accommodates itself to the other, i.e. takes its degree of Sonancy.

That the second adapts itself to the first, rather than the first to the second, or, changing the expression, that it is the first that determines the change, is due, in English, to the practice of the language. There is nothing to preclude the opposite process; and there are instances of it in English. The first *s* in *houses*, &c., is sounded as *z* (*houzez*). This is because the final, or appended Sonant acts upon the Surd of the fundamental word; i.e. acts backwards. In Scotland the form is *housez*.

§ 205. *No true Aspirates in English.*—The Aspirate never follows a consonant in the same syllable: such combinations as *ph*, *th*, and *sh*, and *ch* being mere points of spelling; and, by no means, the sounds of $p+h$, $t+h$, &c.

The only words wherein we find a real sound of *h* preceded by a consonant are those *compounds* whereof the second element *begins* with -h—as *hap-hazard*, *nut-hook*, *ink-horn*.

This limitation is not connected with the structure of language in general. The true sound of a Consonant and an Aspirate is pronounceable; and, in some languages, is common. The English, however, is not one of them; though, from our spelling, it looks as if it were.

§ 206. *No true Doubled Consonants in the same Syllable.* — Identical consonants never follow one another immediately in the same syllable; in other

words, are never *doubled*; such combinations as *mass*, *buzz*, &c., being mere points of spelling. Generally, they show that the vowel which precedes is short. The only words wherein we find a real doubling of the consonant are (as with *h*) certain *compounds*—e.g. *un-natural*, *in-nate*, *soul-less*, *book-case*, &c.

This limitation is not connected with the structure of language in general. Two consecutive identical Consonants are, as we have seen, pronounceable. They are rare, however, in English; though, from our spelling, it looks as if they were common.

A mute is changed into its corresponding Surd or Sonant (as the case may be) of the same organ, i.e. Labial into the correspondent Labial, a Dental into the correspondent Dental, and a Palatal into the correspondent Palatal. Whether the first act upon the second or the second upon the first depends on the habit of the language. In English it is the *last* that is modified, and we say *slabs*, *livez*, *ladz*, *bagz*; though we might (only we do not) say *slaps*, *lifs*, *lats*, *baks*. That there must be an accommodation of some sort is a matter of necessity.

§ 207. *Unstable Combinations.*—The Diphthong *iw* or *ew* is one of the best instances in our language of an *Unstable* combination. We can pronounce it, and we can combine it with other sounds. But, with all this, it rarely keeps its place over the whole of a language. We find it at the beginning of a word in *ewer*; and many pronounce it so. But it is certain that many sound it like *yŏur*. *Hew*, as in 'Sir *Hew* Dalrymple,' is probably sounded according to the spelling; but *Hugh* is often *You*. How many *Humes* are called *Hewm*, and how many *Yume*, is unknown, but the pronunciation is certainly divided. So, likewise, with *ewer* and *your*.

We may now take the question from another point of view; and attend only to the sounds of the vowel *u*. In most words, when long, it is sounded as a diphthong; for whether we pronounce the word *tune* as *tyoon* or as *tewn*, we don't sound it as *toon*. Yet this last is the way in which we spell it when it is a long vowel. As for the short *u*, it is sounded, with few exceptions, such as *full*, *pull*, and others, like the *u* in *but*—an allied, but different, form. The name of the letter itself is *yoo*.

§ 208. *The Slender Vowel, &c.*—So much for the changes of the vowel, or diphthong. In many, perhaps in most, cases the series of further changes begins in a diphthong; or can, at least, be traced to one. Let us suppose that between a consonant and a broad vowel a slender one intervenes, and that instead of *sa*, *so*, or *su*, the word is *sea*, *seo*, or *seu* (or *sea*, *sia*, *sui*). Or let it be *y* alone; giving *sya*, *sya*, *sui*. Or let it be the vowel alone which changes into *y*—the semivowel. The details are of minor

importance. The general character of the change is all that is here indicated. It is a matter of general experience that such combinations as *sya*, &c., are Unstable. Their notorious tendency is to run into the sound of *sh*; in which case the semivowel disappears, and the consonant changes its character. Words, in our own language, like *sugar* and *sure* (*shuggar* and *shure*) teach us this.

§ 209. But what is the tendency when the consonant is *t*-? Words like *nature*, *picture*, and others inform us. Here the sound of *u* has become that of *yoo*, and a semivowel stands between the vowel and the consonant that precedes it. We pronounce them *natshŭr* and *pictshŭr* (sometimes *pikshŭr*). In other words, the influence of the diphthongalised vowel has been the same in kind as that which changed *sia* into *sha*. The vowel element disappears. The consonant changes. But the change is a different one. *S* was a Sibilant (a simple one) already; and it changes into another simple one—one closely allied to it, or, rather, a mere variety of itself. *T* was no Sibilant at all, but a Dental. Yet it becomes a Sibilant. Not, however, a simple but a compound one. In other words, the combination *tya* is, like *sya*, Unstable, and has a tendency towards Assibilation. We can understand this by pronouncing the word rapidly, and seeing how naturally the sound of *sh* introduces itself.

Mutatis mutandis, the same occurs with *dy*, *di*, or *de*, followed by a vowel. It becomes *dzh*, or *j*—i.e. Compound Sibilant, which is to *tsh* as *zh* is to *sh*, and *d* to *t*—*ordure*, *verdure*; and, more exceptionally, *dew* pronounced as *jew*, and *duke* as *juke* (*dzhew* and *dzhook*).

Thirdly,—what is the tendency when *k* precedes a vowel, semivowel, or diphthong of the kind under notice? The comparison of words like *Chester* and *Castra* suggests a similar process. The Latin word *castra* in Anglosaxon is *ceaster*.

But this gives the sound of *ksh*; and no such Compound Sibilant exists in English. We may, however, suppose that, at some time or other in the history of the word *ceaster*, it existed; but, as it was Unstable, it was not long before the *k* became *t*. Nor is there anything gratuitous in this assumption.

Farther than this we cannot see very clearly; i.e. we cannot see why words spelt with a *c* are sounded as if they were spelt with *s* when followed by a small vowel; for all that has just been said touches only the change from *s* to *sh*, and from *t* and *k* to *tsh*. The simple *s*, with no second element to affect it, is in a different predicament. Can we say that small vowels, as such, exert an influence on a Palatal when it precedes them akin to that of the more complex combinations which have just been noticed? We can—we can say so; and, when we say anything at all, *do* say so, and must say so. But it is saying very little. Forms like *sya* and *tya* we can test. We can pronounce them, and see

that, as a matter of fact, the changes just indicated take place. Words like *sa* and *so*, *ka* and *ko*, show no such tendencies.

But that the syllable *ka* may change into *se* (sound for sound) we see in forms like *Bicester*, *Cirencester*, &c., which are as true derivatives from *castra* as *-caster* and *-chester*. The change, however, from *k* to *s* is far more obscure than that from *s* to *sh*, or from *k* to *tsh*, though of the magnitude and extent of it there is no doubt. The Latin is the language in which the question is best investigated; for, in the Latin, by comparing it with the Greek, we can see when *k* was certainly invested with its own proper sound, and, in the Italian, see how it has undergone the same processes, resulting in the same Compound Sibilant *tsh* as it has in English and other tongues.

Lastly.—The presumptions are that when *g* is to *k* as *t* to *d*, &c., and *z* to *g* as *d* to *t*, and *zh* to *z* as *sh* is to *s*, the history of the two Palatals will run parallel. They do this, and they do not.

So far as the Compound Sibilant goes they agree, and *ge* and *gi* come out as *dzhe* and *dzhi* (*j*), where *te* and *ti*, or *ty*, become *tsh* (*ch*). Yet they do not present themselves as *ze* and *zi*, but (on the contrary) as *je* and *ji*, whereas *k* in a similar situation is sounded as *-s*. This is because the words by which the Surd Palatal (*g*) is represented, are, as a class, exotics—of French or Latin rather than of English origin; and the English *dzh* (*j*) is the French *zh* (also spelt *j*) strengthened. But in other languages the parallel is incomplete; *g*, when changed, being changed into *y* rather than assibilated. And this is the rule for the German languages in general; and, in the English itself, where in English words, when *g* is changed at all, it is the sound of *y* which it assumes.

But *ga* and *ka* start even, so to say, on the same career of Instability. There are many who talk of *kyards* (*cards*) and of their *kyind* (*kind*) friends. And as many call a *garden* a *gyarden*, and a *girl* a *gyirl*. Still, the histories of *g* and *k* diverge. Two cases may help to determine the difference. *Z** is a rarer sound in languages than *-s*; and *y* is a sound with which *g* is pre-eminently interchangeable; though *g* becomes *y* oftener than *y* becomes *g*. Be this as it may, the Assibilation of the Palatals—*k* and *g*—is a fact of great generality in language; and almost, if not equally, general is the divergence between the two during the history of the long and complex series of changes which both undergo. Of its special importance in English there is no doubt. The very complications it has introduced in our spelling are sufficient evidence of this.

---

* *Z* in English is common sound; but not as a part of the original word: for no English word begins with it. Where it occurs is in the Plural of Substantives, and the Third Person of Verbs, where the last Consonant is a Scnant; as *stags*, *moves*, *drags*, &c., &c. But here it is only a modified *-s*—an *-s* modified by having accommodated itself to the preceding sound.

CHAPTER III.

ACCENT.

§ 210. Accent plays a great part in all languages; and no inconsiderable one in the English.

It may fall on the last syllable of a word; as in *brigáde, preténce, superádd, cavalíer.* Most of these words are of foreign origin.

It may fall on the last but one; as in *ánchor, hásten, fáther, fóxes, bespátter, terrífic.*

Also on the last but two, or the third from the end of the word; as in *régular, fórtify, dífferent, orthógraphy.*

Sometimes it falls on the last syllable but three; as in *ábsolutely, lúminary, inévitable, órthodoxy.*

This is, perhaps, as far as it is ever carried *backwards;* for in treating of Accent we count from the end, rather than the beginning, and talk of *penultimate* and *antepenultimate,* rather than of *first* or *second* syllables.

§ 211. *Place of the Accent in English.*—The syllable on which we expect to find an accent is, of course, the most important. But the test of importance is neither evident nor very regular. The second *-o-* in *orthógraphy* is accented; but it is difficult to say in what respect it is the most important, leading, prominent, or characteristic syllable. In Composition it is the *first* of the elements of the compound which carries the accent: but of this more will be said in the sequel.

For the present it is safe to say that, in words of *English* origin, the *last* syllable is, as a rule, *un*accented; the exceptions being compounds like *mistake, before,* and others where the prefix is a word, or part

of one, which has no accent of its own. More, however, will be said on this point in the chapter on *Composition*.

§ 212. The exceptional character of final syllables with an accent is a part and parcel of the structure of the English language.

In the first instance it abounds with monosyllables: and in the second it forms its Derivatives by *af*fixes rather than by *pre*fixes: having dozens of words, whether compound or derivative, like *néedful*, *sínging*, *spóken*, *mánly*, &c., for one like *amíss* or *mistáke*. All this tends to throw the accent backwards.

§ 213. With the French—and the French element in English is important—the case is different. The French is a language of Latin origin, but from a great number of Latin words it has dropped the last syllable. Hence, words which in Latin ended in *-is*, *-i*, *-em*, &c., as signs of the Genitive, Dative, and Accusative Cases, in words like *nátio*, *rátio*, &c., and ran *natión-is*, *natión-i*, &c., when divested, as they are in French, of their inflection, have their accent, which was originally on the penultimate syllable, on the last.

§ 214. Every superadded syllable, when it is final, has a tendency to throw the accent back; e.g. *mánly*, *mánliness*; *sickness*, *sicknesses*. To adjectives in *-ic* (and indeed to other words) *three* additions may be made —*cómic*, *cómical*, *cómically*; and when we get to such a word as *comicálity*, the accent, which we can no longer throw back, has to be put forward.

§ 215. *Distinctive Accent.*—In each part of the following sentences the same word occurs twice, but with a difference. In the first use of the word the accent is on the first syllable, in the second on the last, the words with the first syllable accented being Nouns; those with the second so affected being Verbs.

1. The *éxports* and *ímports* are considerable. 2. They *impórt* cloth and *expórt* corn.

1. Honey is an *éxtract* from flowers. 2. You cannot *extráct* honey from all flowers.

1. I have *fréquent* opportunities of seeing him. 2. I *frequént* the theatre.

1. This is the *óbject*. 2. I *objéct* to this.

1. *Pérfumes* are agreeable. 2. The flowers *perfúme* the air.

These Accents may be called distinctive.

PART III.

ETYMOLOGY.

CHAPTER I.

ETYMOLOGY AND SYNTAX.—COMPOSITION AND DERIVATION.

§ 216. *Etymology and Syntax.—Composition and Derivation.*—Etymology and Syntax are the two principal parts of Grammar.

Etymology deals with *single* words, and the various forms they may take; Syntax with *two* words, or more, in Combination.

Combinations, by which two words are combined into one, give *Compounds.* Such a compound is *father-like.* It can be divided into two separate independent words. The result, however, is a single one.

With *fathers* and *likeness*, and a whole host of words beside, this is not the case. Subtract the *-ness* from *likeness* and *no* separate independent word remains; and in the *-s* in *fathers* there is not even an approach to a second word at all. The numerous class of words which *likeness* and *fathers* represent is that of *Derivatives.*

§ 217. *Composition.—Derivation. — Inflection.—Declension.—Conjugation.*—*Composition* takes place when two separate words are joined together so as to form a single word, as—

day-light	dog-star	Englishman
nut-brown	father-like	peacock.

§ 218. *Derivation* takes place when a word is either changed by the addition of some new elementary sound, or by the alteration of one previously existing.

hunt-*er*	drunk-*ard*	*be*-spoke
wood-*en*	spin-*ster*	chick-*en*.

Composition implies the addition of *whole words*; Derivation, the addition of *parts of words*.

Certain Derivatives are called *Inflections*. These present themselves in nouns and verbs only. They are the forms by which we determine Gender, Number, Case, Voice, Mood, Tense, and Person, and will be considered in detail in the sequel.

The Inflection of a noun is called its *Declension*. Nouns are *declined*.

The Inflection of a verb is called its *Conjugation*. Verbs are *conjugated*.

The two classes, however, are not always so easily separated as the preceding examples may lead us to suppose. Indeed, the doctrine that many Derivational elements were once separate words, but that through wear and tear, through time and use, they have lost their independent character, either by having become obsolete, or by loss of their more characteristic parts, is both probable in itself and well supported by facts. Whether it will account for *all* Derivational changes is another question. It applies to syllables of appreciable length more readily than to single letters like the *-s* in *fathers*, or the *-i* in *patri*: and it applies to single letters better than to internal changes like *spoke* from *speak*. Nevertheless, whatever may be the extent to which the doctrine may be driven, the difference between a Derivative form like *fathers* and a Compound like *fatherlike* is manifest. Whether *fathers* was ever

as divisible into two separate words, as *fatherlike*, may be doubtful; but there is no doubt as to what it is at present. It is a *single word modified*; and not a *pair of words* joined together as one. And this is sufficient for the present enquiry.

§ 219. *Compounds that may be mistaken for Derivatives.*—Composition simulates Derivation, when, after the union of two distinctly separate words, one of them either changes its form or becomes obsolete. Thus *manly* looks more like a derivative than a compound. But it is only a shortened form of *manlike*. Again, the *ric* in *bishop-ric* is no longer current as an ordinary term in English. Yet, when it was first attached to the word *bishop*, it was as truly a separate word as *kingdom*, *domain*, or *jurisdiction*, or any other substantive.

When we look to the instances just given, the process of reducing derivation to composition is an easy matter. All that is required is a certain amount of knowledge of the language in its earlier stages. This is wanted for *bishopric*. But in the word *manly* less than this will be enough. We have only to *consider* a little, and its connection with *manlike* strikes us at once. The words *gentlemanly* and *gentlemanlike* are still more to the purpose. With a little knowledge and a little consideration we can do much—so long as the word is a *dis*syllable; for we can separate its component parts, even if we do no more.

So long, then, as a compound has two syllables, out of the second of which we can get a second word, combinations that, in the first instance, look like Derivatives, may, under many circumstances, be put in their proper place.

But *Mono*syllables may also, in respect to their origin, be Compound; and, when this is the case, the

analysis is more perplexing. Words like *not*, *such*, and *which* are not easily picked to pieces. Yet, common words as they are, and monosyllables as they are, they are *compounds*. *Not* is a compound of the negative element *n'*, and *whit* (as in *not a whit*). It is *n' aught*, which is again compounded of a prefix *i-* or *ye*. *Which* is, in Scotch, *whilk;* in German, *welch;* and *such* is, in Scotch, *swilk;* in which the *-l-* represents the *-l-* in *like;* which, as we have seen, has been already reduced to *-ly;* and which thus early has lost its character as an independent and entire word.

Manifest, unequivocal, and self-evident Compounds belong to Syntax; manifest Derivatives to Etymology.

That some, perhaps the most important portion of them, is separated from the rest, under the name of Inflection, has already been stated. For the remainder there is no definite name—which is inconvenient. The Derivatives of the more indefinite divisions will be considered first: but not exhaustively. Those only which form clear and important subdivisions will be noticed. Nor will any great sacrifice be made to systematic arrangement. On the contrary, some of these, in compliance with the ordinary form of our grammars, will be taken along with the inflections, and considered as they refer to the different '*Parts of Speech;*' i.e. under the heads of Noun, Pronoun, or Verb, as the case may be. What the names of these parts of speech mean is assumed to be known; and such refinements upon the definitions of them as are held to be necessary, will be found under '*Syntax.*' For '*Etymology*' they can be taken as we find them in the ordinary grammars.

§ 220. The division of Derivatives with which it is best to begin is that in which a word belonging to one part of speech, by a change of form (generally, though not always, an *addition* of some kind)

becomes connected with another; i.e. becomes an Adverb or a Substantive instead of an Adjective, or a Verb instead of a Noun.

Instances of the first kind are *wisely*, *bravely*, *slowly*, from *wise*, *brave*, and *slow*.

This, *historically*, is a case of Composition; but, practically, it is one of Derivation.

Instances of the second kind are *wooden*, *truthful*, *sheepish*, &c.

Instances of the third kind are *to grease*, *to use*, and some others; where the sense is that of a Verb, and the *s* is sounded as *z*. In *grease* and *use*, the Substantives, it is sounded as it is spelt, or rather as if it were spelt *greace*, *uce*. Here the change from Surd to the Sonant changes the word from a Substantive to a Verb. In *raise* from *rise*, and *fell* from *fall*, &c., the *Vowel* is changed.

This is an instance where the transforming element consists of an internal change rather than of an addition *aliunde*.

A still better example of this internal change is found in words like *súṛvey*, *éxport*, &c., which are Substantives, as compared with *survéy* and *expórt*, which are Verbs. Here, nothing is changed but the accent.

But these are only selected instances from many of the same kind.

§ 221. *Hybridism.*—In *lambkin* and *lancet*, the final syllables (*-kin* and *-et*) have much the same power. They both express the idea of smallness or diminutiveness. These words are but two out of a multitude, the one (*lamb*) being of English, the other (*lance*) of Norman origin. The same is the case with the superadded syllables: *-kin* being English, *-et* Norman. Now, to add an English termination to a Norman word, or *vice versâ*, is to corrupt the language; as may be seen by saying either *lance-kin*, or *lamb-et*.

Such words are *hybrid:* which means *mongrel*.

Words like *penetra-ble* and *penetra-bility* are not only possible, but actual Latin words; viz., *penetrabilis*, *penetrabilitas*. So are *possible*

and *possibility*. So are *legible* and *legibility*. But *readable* and *bearable*, with their opposites, *un-readable* and *un-bearable*, are *hybrid*, and (to say the least) exceptionable.

The terminations *-ize*, *-ist*, and *-ism* are *Greek*, and in words like *ostracize* and *ostracism* they find a fit and proper place. In words of *English* origin they are exceptionable.

Individually (to repeat what has been already stated), I consider that *hybridism* is a *malum per se*. It is often difficult, however, to avoid it. Many scientific terms err in this respect; sometimes exhibiting the heterogeneous juxta-position of *more* than one language. Nor is this, in all cases, an accident. Occasionally it occurs through inadvertency: yet, occasionally, it is defended. In a few cases it is the lesser of two evils. It is least blameworthy in words like the ones just quoted—words ending in *-ize*. It would be difficult to dispense with such words as *moralize*, *civilize*, and some others: however much the former part may be Latin, and however much the latter part may be Greek. Again—to words like *botanic*, where the *-ic* (like the *botan-*) is Greek, we may add the Latin *-al*. As such a word was possible in the Lower Empire, where such words as *πρωτονοτάριος* were common, we may call these (after the fashion of the architects) Byzantine formations. But this is only naming our tools.

§ 222. *Roots and Themes* (*Crude Forms*).—If we take a word like *father*, and by adding *-s*, make it either a Genitive (Possessive) Case Singular, or a Nominative, or Genitive Plural, the sound of *-s*, which we add to it, is an *Inflection*. In this case *father* is what is sometimes called a *theme* (or *basis*), sometimes a *crude form*. It is the stem on which we engraft the Inflections. So far as we know, it is the *original* form; from which *fathers'* is a Derivative, and *fatherlike*, or *fatherly*, a Compound. But this alone will not make it so. When we compare it with mo-*ther* and bro-*ther* (and we may add sis-*ter*), the second syllable looks so like a Derivational element, that the notion that the true fundamental, basic, primitive (or whatever we may call it), word is *fath*, or *fat*, suggests itself. If it be, it is a *Root*; the root being that which remains when every superadded element has been taken away. Roots, however, go back to a period of language which belongs to General, or Comparative, rather than to special Philology. *Vocit-* is the *theme* of the Latin Frequentative Verb, *vocit-o*, *vocit-as*, *vocit-avi*, &c.; but, as *voc-*, the theme of *voc-o*, *voc-as*, *voc-avi*, exists also, we know that *-it-* is no part of the *Root*.

CHAPTER II.

DERIVATION.—FORMATIVE AFFIXES, ETC., OF THE FIRST CLASS.—FORMS IN *-LY*—IN *-NESS* AND *-TH*; ABSTRACT—IN *-ER* AND *-ING*; VERBAL—IN *-EN*; MISCELLANEOUS—CHANGE OF CONSONANT; *BREATH*, *BREATHE*.

§ 223. The first division of the derivational processes contains those by which a word is changed as a Part of Speech, and the form with which it is convenient to begin is the affix *-ly*. Whatever it may have been at one time, it is not now a separate word. So we take it as we find it, and treat it as derivational.

In *manly* it has undergone one change; and in the Scotch *whilk* and *swilk*, and the German *solch*, and *welch*, another; while in the English *which* and *such* (the Frisian *sok*) it has left its mark only so far as it has changed the form of the word in which we know that it once presented itself.

In the first instance, it gives us Adjectives like *manly=manlike*; and here it keeps its original import. A *manly person* is a person *like a man*.

But in words like *wisely*, *bravely*, *hotly*, &c., where it is added to an *Adjective*, it is the sign of an *Adverb*.

§ 224. *The Affixes -ness and -th.*—These convert Adjectives into Substantives; for (to begin with the first) by the addition of *-ness* every Adjective becomes a Substantive; the result being an *Abstract* name for the attribute implied, or suggested, by the Adjective itself. *Red-ness*, *weak-ness*, &c., are the attributes implied or suggested by *red* and *weak*, &c. This is only another way of saying that for every adjective

there is a corresponding Substantive, either actual or possible; and such is the case. Practically, however, there is a limit to their formation. When the Adjective, either by Composition or Derivation, exceeds two syllables, an additional one becomes cumbersome. Nevertheless trisyllabic Abstracts are common, and quadrisyllables not uncommon. Even such a word as *pusillanimousness* must be tolerated if necessary. From the mixed character, however, of the English vocabulary there is no want of substitutes; for the Latin terminations *-ty* and *-bility*, as in *piety* and *penetrability*, along with the French *-ment*, as in *contentment*, give us, if not actual, approximate equivalents.

But these are not all. Besides these there are the forms in *-th*. As *-th* is a single consonant, it creates no new syllable; but attaches itself directly to the main word. Doing so, it generally creates some slight euphonic modifications. Thus—in *strong*, *long*, and *broad*, the vowel changes, giving *strength*, *length*, *breadth* (*brĕdth*). In *height* the *th* is often sounded as *t*. In *depth* the *p* has a tendency to become *f*. Compare *τυφθεὶς* for *τυπθείς*.

The Abstract names thus formed are limited in number, and constitute a peculiar class. When we talk of the *longness* or *shortness* of anything, we imply that the object to which the terms apply is either *long* or *short*. But with forms in *-th* we may talk of the *length of a very short walk*, the *height of a very low wall*, or the *depth of a very shallow stream*; in which cases we merely mean that the *walk*, the *wall*, and the *water* have a certain amount of extension in a certain direction. Whether it be much or little is another matter. We mention it generally, and the conception we connect with our abstraction is not so much that of any particular kind of dimension, but of the dimension

itself. If we suggest that the quality under notice is either below or above this indefinite kind of average, we have recourse to the affix *-ness*, and say *short-ness*, *low-ness*, and *shallow-ness* in the one case, *long-ness*, *high-ness*, or *deep-ness* in the other.

§ 225. *The Affixes -er and -ing.*—Every verb can be converted into a Substantive by the addition of either *-er* or *-ing* ; the result being, in the first case, a name for the *agent*, in the second a name for the *action* implied in, or suggested by, the Verb. *Hunt-er*, the name of any one who *hunts* ; *hunt-ing*, the simple act of any one that *hunts*. This is only another way of saying that every Verbal Substantive (for that is what these forms in *-er* and *-ing* are called) has its corresponding Verb ; and every Verb its *two* corresponding Verbals. This is a repetition of what has been said about the Affix *-ness* ; and it is made in order to say how absolute and extensive the three forms are, and how they multiply the *possible* words in our English ; since, *possibly* and *potentially*, they double the number of our Adjectives, and treble that of our Verbs.

The older form of *-ing* was *-ung*. Out of the Objective Case of this form in *-ung* or *-ing* come the Adverbs in *-ing*—as *darkling*, &c. More on this point will be found as we proceed.

§ 226. *Affixes in -en.*—These are numerous. Two only belong to the present division—

(*a*) The *-en* in *whit-en*, *soft-en*, &c., where the main word is an Adjective ; and the meaning is '*make white* ;' and that in *length-en*, *strength-en*, &c., where the main word is an Abstract Substantive, and the meaning is '*invest with the character of length*, or *strength*'—

(*b*) The *-en* in *wood-en*.—This shows that the Substantives to which the termination applies are the names

of the *material* of which something is made—*golden* = *made of gold.*

§ 227. *Change of Consonant between Noun and Verb.*—In *breath* and *breathe*, *cloth* and *clothe*, the Surd changes to the Sonant, and the Noun becomes a Verb. *Use* and *grease* are of foreign origin. The sound of the Verb, in all three cases, is *brēadhe*, *clōdhe*, *uze*, *greaze.*

CHAPTER III.

DERIVATION CONTINUED.—FORMATIVE AFFIXES, ETC., OF THE SECOND CLASS.—FORMS IN *-KIN*, *-OCK*, *-ING*, *-LING*, ETC.; DIMINUTIVES.—AUGMENTATIVES AND PATRONYMICS—IN *-ER*—IN *-MA* AND *-ST*; DEGREES OF COMPARISON—IN *-TH*; ORDINAL NUMERALS—IN *-IN*, *-STER*, ETC.; GENDER.—COLLECTIVES.—*RISE* AND *RAISE*, ETC.—AFFIXES IN *-ND.* IN *-ED.* IN *-EN.* MISCELLANEOUS AND UNCLASSED FORMATIVES.

§ 228. The second division of the derivational processes contains those by which two words belonging to the same group as Parts of Speech are changed from one section of it to another.

§ 229. The Affixes *-kin*, *-ock*, *-ing*, *-ling*, &c.—*Diminutives.*—The Diminutives are a convenient class to begin with.

Compared with *lamb*, *man*, and *hill*, the words *lambkin*, *manikin*, and *hillock*, convey the idea of smallness or diminution. In *hillock* there is the simple expression of comparative smallness in size. In *doggie* and *lassie* the addition of the *-ie* makes the word not so much a Diminutive as a term of tenderness. The idea of smallness, accompanied, perhaps, with that of

neatness, generally carries with it that of approbation. *Clean* in English, means, in German, *little=kleine.* The feeling of protection, which is extended to small objects, engenders the notion of endearment.* Sometimes, a Diminutive is a term of disparagement; as *lordling* and *hireling.*

Next to knowing that in some Diminutive Nouns there is *something more*, it is useful to know that in others there is something *less*, than the simple notion of smallness. This means that, in many cases, the Diminutive displaces the original word, and takes its power; but without being accompanied by the idea of diminution. Thus *sol*, in Latin=*sun.* But the Slavonic for *sun* is *slunce=little sun*, originally; now simply *sun.* The only word for *star* in Latin is *stella = ster-ula = little star.* The French for *sun* is *sol-eil = sol-illus = little sun.* In Italian *frat-ello* and *sor-ella = brother* and *sister = frater, soror*, without any idea of size. In the Lithuanic, where the Diminutives attain their *maximum*, we may meet such expressions as *the big little sun.*

§ 230. *The Augmentatives.*—The opposite to Diminutive is *Augmentative*, from the Latin *augmentum=increase*; Augmentatives being words by which the notion of excessive size is suggested. They are, by no means, so widely diffused over the domain of language as Diminutives; and where they occur, they are less numerous. The Italian is, probably, the language which has the most of them. In the Italian, however, the Diminutives (as has already been stated) are numerous also: so that there is no reason for believing that the two classes are in any inverse ratio to each other. Like the Diminutives, the Augmentatives

* As *klein* is to *clean* in German and English, so is *petitus* (*sought, desired*) to *petit* (*small*) in Latin and French.

have secondary meanings; and, as a general rule, the idea conveyed by them is anything but complimentary. Many of them are terms of disparagement, though some are quite indifferent.

§ 231. *Patronymics.*—In Anglosaxon the termination *-ing* was as patronymic as *-ιδης* is in Greek. In the Bible-translation the son of Elisha is called *Elising*. In the Anglosaxon Chronicle occur such genealogies as the following:—*Ida wæs Eopping, Eoppa Êsing, Êsa Inging, Inga Angenwiting, Angenwit Alocing, Aloc Beonocing, Beonoc Branding, Brand Bældæging, Bældæg Wódening, Wóden Friðowulfing, Friðowulf Finning, Finn Godwulfing, Godwulf Geating*=Ida was the son of Eoppa, Eoppa of Esa, Esa of Inga, Inga of Angenwit, Angenwit of Aloc, Aloc of Beonoc, Beonoc of Brand, Brand of Bældag, Bæeldag of Woden, Woden of Friðowulf, Friðowulf of Finn, Finn of Godwulf, Godwulf of Geat.—In Greek this would be Ἴδα ἦν Ἐοππείδης, Ἔοππα Ἠσείδης, Ἦσα Ἰγγείδης, Ἴγγα Ἀγγενφιτείδης, &c. In like manner, Edgar *Atheling* means *Edgar* of the *family of the nobles.*

§ 232. *Details.*—Diminutives are commoner in Scotch than in English.

Forms in *-ock.*—*Hillock* in English; *lassock, laddock, wifock*, and others in Scotch. In *laddick, lassick*, in the same language, the *-o-* is changed into *-i-*. In *emmet*=*little ant*, the *k* has become *-t*. So it has in *gobbet*=piece, *mouthful*; which is in Scotch *gappock*; *mammet* from *mammock*; *gimlet* from *gemlick*, from *gaffet*=*fork*. Key, from whom these and other details are taken, adds *cricket, hornet, limpet, locket, mallet, packet, pocket, sippit, smicket* (from *smock*), *tippet, wevet* (Somersetshire for *spider's web*), *ballot, spigot*. Here, however, the origin of the *-t* is uncertain. The local term *fitchet* = *polecat* has a better

claim, inasmuch as there is another form *fitchew*, in which the origin of the *w* out of a *k* is nearly certain. *Brisket* and *maggot* are transpositions from *bristeck* (from *breast*), and the A. S. *maƿu*, where a *k* or *g* precedes (as in *smock*).

Form in -ing.—*lord-ing*, *bird-ing*.

Form in -l.—*nozzle* (*nose*), *speckle* (*speck*), *spittle* (*spit*), *throstle* (*thrush*), *thimble* (*thumb*), *girdle*, *griddle* (*grid-iron*), *kernel* (*corn*), *gristle*, *knuckle*, *stubble*, *sparkle*.

Kantle=*small corner*, from *cant*=*corner*.

Hurdle; in Dutch *horde*; German *hurde*. *Hoarding*, without the *-l*, is used in an allied sense by builders in England.

Form in -ie.—*Scotch*—*wifie*, *daddie*, *lassie*, *lambie*, *boatie*. English—*daddy*, *baby*.

Double Derivatives.—Forms of which the basis is *k*—

K+*ie.*—Scotch—*Lassockie*, *lassickie*, *wifockie*.

K+*in.*—This gives us the termination *-kin*, the commonest of our Diminutives, though by no means general. The following list is from a paper on English Diminutives in the Philological Museum (vol. i. pp. 679–686). *Manikin*, *lambkin*, *pipkin* (=*little pipe*). *Gerk-in* is from the *root of gourd* rather than from *gourd* itself; German, *gurke*; Norse, *gurka*.

Jerkin = *frock*. In Dutch, *jurk*.

Pumpkin.—Dutch, *pomp*. Obsolete in English.

Griskin=Little pig. *Gris* or *grice*. Obsolete.

Bumpkin.—Root *b-m*; Dutch, *boom*=*tree*, *beam*; in German *baum*=*tree*; in English *beam* (generally= the Latin *trabs*, but preserved in horn-*beam*, with the power of *arbor*). The notion of *woodiness*, connected with *stupidity*, or extreme simplicity, is shown in the word *blockhead*.

Firkin=*Little fourth*=Latin *quadrantulus*.

Lastly, we have in *lad-i-k-in*, *man-i-k-in*, the combination *-i+k+n*.

The form with -l+ing.—*Bant-l-ing*, *dar-l-ing*, *chitter-l-ing*, *duck-l-ing*, *first-l-ing*, *fond-l-ing*, *found-l-ing*, *kit-l-ing*, *nest-l-ing*, *star-l-ing* (*stare*), *sap-l-ing*, *seed-l-ing*, *strip-l-ing*, *suck-l-ing*, *wit-l-ing*, *year-l-ing*, and a few others. In *change-l-ing* and *nurse-l-ing*, the root is other than English. In *hire-l-ing*, *lord-l-ing*, and *wit-l-ing* the idea of Diminution is accompanied by that of contempt.

The form in l+ock.—In Professor Key's list I find, from Jamieson, and (as such) Scotch—*hump-l-ock=a small heap*, *knub-l-ock=a little knob*.

The combination let=l+et.—Here the Affix *-l-* is German—common in the Swiss and Bavarian forms of speech—whilst the *-t-* is either English or French, as the case may be. When English, it is *-t* in *emmet*; i.e. a *t=k*; when French, the *-t* in *lancet*. When the latter, it gives us an instance of hybridism. In *gim-let* the affix seems to be English. In *ham-let*, *stream-let*, and *ring-let*, it is, probably, French.

§ 233. *Form in -art.*—These are not so much simple Augmentatives as words conveying the sense of disparagement—*drunkard*, *stinkard*, *laggard*, *coward*, *braggart*.

§ 234. Except in the proper name Edgar Athe*ling* =*Edgar of the noble blood*, the termination *-ing* as a Patronymic is rare. As a termination, however, of a long series of the names of towns and villages in England it has commanded attention as an instrument of historical and ethnological criticism. In—

Barlings	in	Lincolnshire.	Hastings	in	Sussex.
Bealings	—	Suffolk.	Lillings	—	Yorkshire.

of which the full forms, as found in the Anglosaxon

Charters, are in -*as*, it is held by Kemble and others that we have the names of the men and women who occupied certain districts rather than the names of the districts themselves.

Kent	25	Hunts	3
Norfolk	24	Northumberland	3
Sussex	24	Notts	3
Essex	21	Cambridge	2
Suffolk	15	Derby	2
York	13	Dorset	2
Lincoln	7	Gloucester	2
Southampton	6	Oxon	2
Berks	5	Bucks	1
Surrey	5	Devon	1
Beds	4	Salop	1
Norths	4	Leicester	1
Lancashire	4	Somerset	1
Middlesex	4	Warwick	1
Herts	3	Wilts	1

Word for word *Wales* is *Wealhas* = *strangers*, *foreigners*, *aliens*; but it is only one word out of many; the transfer of the name of the inhabitants to the land inhabited being common both in A. S. and Old English.

In *Cornwall*, the √ *w-l* is singular; as it also is in the following passage:—

> Þis tiþing com him how *Wale* him betrayed
> Þerfor is Gascoÿn left and er at werre delayed.
>
> *Rob. Br.* 263.

The older name for England is *Engle* = *Angles*, rather than *Anglia*.

> The Denes adde the maÿstre, tho al was ÿdo:
> And by *Est Angle* and Lyndeseÿe hii wende vorþ atte laste,
> And so hamward al bÿ Kent and slow and barnde vaste.
>
> *Rob. Glou.* 160.

Again, in Lithuanic—

Szvëdai, *Swedes*	from	Szvëdas, *a Swede*	=	*Sweden*.
Prúsai, *Prussians*	—	Prúsas, *a Prussian*	=	*Prussia*.
Lénkai, *Poles*		Lénkas, *a Pole*	=	*Poland*.

§ 235. *The Affix -er, in under, wiser*, &c.—The Affix *-er* attached to an Adjective is the well-known sign of the Comparative Degree. But it is found in words which are neither Adjectival nor Comparative, such as (1) *whether, o-th-er*; (2) certain prepositions and adverbs, as *ov-er, und-er, af-t-er*; (3) Adjectives of the Comparative Degree, as *wis-er, strong-er, bett-er*, &c.; (4) Adjectives, with the form of the Comparative, but the power of the Positive Degree, as *upp-er, und-er, inn-er, out-er, hind-er*.

What is the idea common to all these words? Bopp, who has best generalized the view of the form, considers the fundamental idea to be that of *duality*. In the Comparative Degree we have a relation between one object and *some* other object like it, or a relation between two single elements of comparison: as *A is wiser than B*. In the Superlative Degree we have a relation between one object and *all* others like it, or a relation between one single and one complex element of comparison: *A is wiser than B, C, D*, &c. Over and above, however, the idea of simple comparison, there is that of (1) contrariety; as in *inner, outer, under, upper, over*; and (2) choice in the way of an alternative; as *either, neither, other*, and *whether*, a word which, as a pronoun, is nearly obsolete. No one at present says *whether of the two will you have?* or *whether of the two is this?* but, on the contrary, *which of the two*, &c. In Lithuanic, the converse takes place, and *whether* (at least its *equivalent katras*) applies to more than two, *e.g.*:—

Trỳs bernýczei szẽno pióve;
Katràs búsit màno mẽlas?
Katràs plauksit vainikẽlio?

i.e. *Three* young men mow hay;
Whether (*which*) will be my love?
Whether (*which*) will swim for the wreath?

The word *whether*, as is suggested by this quotation, is an old one; being the Latin *uter* (*c-uter*, whence *n-euter* = *n-either*) and the Greek *κότερος* (=*πότερος*).

That the *-er* in all these applications is invested, in its general sense, with the notion of Duality, is simply a matter of fact. Its exact import, however, in the Comparative Degree, is not so simple as it seems to be. This is because the oldest form, in the German languages, of the affix was not *-er*, but *-iz*.

§ 236. *The Affixes -ma and -st.*—The *-ma* here indicated is, in the present language, disguised; because it looks as if words like *upmost* were simply compounds formed by the addition of *-most*.

On the contrary, they are (some of them at least) remarkable instances of an accumulation of *derivational* elements taking the guise of a full and complete word; and, as such, passing for ordinary instances of *Composition*.

The Anglosaxon language presents us with the following forms; which show that the *m* has nothing to do with the word *most*.

Anglosaxon.	*English.*
innema (inn-ema)	inmost
ûtema (ût-ema)	outmost
siðema (sið-ema)	latest
lætema (læt-ema)	latest
niðema (nið-ma)	nethermost
forma (for-ma)	foremost
æftema (aft-ema)	aftermost
yfema (uf-ema)	upmost
hindema (hind-ema)	hindmost
medema (mid-ema)	midmost.

From the words in question there was formed, in Anglosaxon, a regular superlative in the usual manner; viz., by the addition of *-st*; as *æfte-m-est*, *fyr-m-est*, *læte-m-est*, *sið-m-est*, *yfe-m-est*, *ute-m-est*, *inne-m-est*.

Hence the *m* is the *m* in the words *innema*, &c.; whilst the *-st* is the sign of the superlative. Hence, we should write—

mid-m-ost	*not*	mid-most	fore-m-ost	*not*	fore-most
ut-m-ost	„	ut-most	in-m-ost	„	in-most
up-m-ost	„	up-most	hind-m-ost	„	hind-most

In *neth-er-most*, &c., there is a superlative superadded to a comparative.

§ 237. *The Affix th, and the Reflected Ordinal.*—This is the affix by which all the ordinals from *three* to *twelve*, inclusive, are distinguished from their Cardinals. The Ordinals of *one* and *two* are formed on a different principle.

It is not without a reason that the formative of the Ordinals is noticed next in order to those of the Degrees of Comparison. Either rightly or wrongly the ideas of Ordinality and Superlativity have been held by so influential an authority as Bopp to be allied. The train of reasoning, which is not given in the words of the author, but which, I hope, does full justice to his argument, is as follows:—

The older form for *first* was *forma;* evidently one of the Superlatives in *-m*. This *m* is not only the *-m-* of the Lithuanic *permas* and the Latin *primus*, but of *intimus*, *extimus*, and other similar words in Latin. In the Greek *πρῶτος* this *m* is replaced by *-t;* and in the *-tim-* of *septimus* and *extimus* we have *both* sounds. Hence, form for form, the Latin *decimus* is the *-tim-* of *sep-tim-us*—the *t*, while the *t* in *πρῶτος* and in *sextus* is the same *minus* the *-m*. In *octavus* this *-m-* is represented, as it is also in *novimus;* of which *nonus* is a contraction.

The *-m-* that in *octavus* and *novimus* is reasonably held to have passed into a *-v-*, is, with equal reason, held to have become an *-n;* especially the *-n* in *nine* and *ten*. But these, like the *m* in *novem* and *decem*, to which they answer, are not *Ordinals*, but *Cardinals;* though in the Greek *ἔννεα* and *δέκα*, *ἔνναtος* and *δέκατος*, there is neither *m* nor *n*. But, with *ἕβδομος*, as compared with *septimus*, the Greek shows that it does not wholly ignore the *m* (*μ*). That there is much curious detail in all this, and much to think about, is certain; the result being that what we may call a Reflection of the Ordinal formatives upon the Cardinals must be recognised as an instrument of criticism; so that the Latin *decem* differs from the Greek *δέκα* because it has had the *-m* of the Ordinal thrown back upon, and incorporated with, it; and the English *ten* differs from the Latin *decem* because the radical *k* has been first softened into *h* and then ejected, and because, moreover, the *-m* has

become *-n*. In all this there is nothing open to objection; and what we may call the Reflection of the Formative of the Ordinal upon the Cardinal is not only a legitimate instrument of criticism, but a necessary one.

For *-t-* as a Reflected Ordinal Formative the evidence is not so good as that which applies to *-m-*; for in the Greek we find ὄκτω and ἕπτα, where we fail in finding *-m-* (or *-n-*). But we find in English *seven*, without the *t*, and in the Scandinavian languages we find the forms *sjù*, and *syv*, Swedish and Danish, wherein we fail in finding *either*. If these last forms be those of the original Cardinal, there are *two* Reflected Ordinal Formatives. But the Greek Superlative, which, as we have seen, is connected with the Ordinal, is *-τατ-*, as in κακός, κακό-τερος, κακό-τατ-ος. If so, there are *two* sounds of *-t-* to be dealt with.

This leads us to a new series of facts. The Greek Comparative is *-τερ-*. This is held to be the *tr-* in *trans = beyond*. The train of thought here—to take it from the logical point of view, or that which contemplates the connection and association of ideas—is that the Comparative Degree is something that *trans*cends the Positive, the Superlative something that *trans*cends the Comparative.

The result of all this is that, between the Latin *-tim-* and the Greek *-ταr-*, we are brought to the doctrine that some such form as *-tamt-* gives us the true and original Superlative. Whether right or wrong as a fact, the doctrine is one which is recognised, and should be known to be so; in other words it is a fact in the history of philological criticism, whatever it may as a fact in the real history of language.

Here, for the present, the exposition ends. It will be continued under the article on *Numerals*.

§ 238. *Forms in -in.*—The chief affix by which the name of a male is converted into that of a female, is in German *-in*; so that from *freund = friend* we get *freund-inn = female-friend*; in A. S. *munec = monk*, *municen = nun*.

It is a termination which is not only German, but Sarmatian also; the Lithuanic giving—

Bajóras	nobleman	bajor-*ënė*.
Kùnigs	parson	kunig-*ënė*.
Kùrpius	shoemaker	kurpiur-*ënė*.
Avýnas	mother's brother	avýn-*ënė* (*his wife*).
Ásilas	ass	asil-*ënė*.
Gándras	stork	gandr-*ënė*, &c., &c.

This being the case, its absence in English is remarkable. The only word in which it is believed to exist at the present moment is *vixen* = *female fox* = *füchsinn*, in German.

§ 239. *Forms in -ster.*—These were, originally, Female, or Feminine, forms. The old Glossaries give us—

(1.)

Textor	webba	|	Citharedus	hearpere
Textrix	webb*estre*	|	Citharista	hearp*estre*

(2.)

Cantor	sangere	|	Fidicen	fiðelere
Cantrix	sang*estre*	|	Fidicina	fiþel *stre*
Lector	rædere	|	Sartor	seamere
Lectrix	rædi*stre*	|	Sartrix	seam*estre*

(3.)

Hec pectrix,	a kemp*ster*	|	Hec siccatrix,	a dry*ster*
— textrix,	a web*ster*	|	— palmaria,	a brawd*ster*
— pistrix,	a bax*ter*	|	— salinaria,	a sal*ster*
— pandoxatrix,	a brow*ster*	|	— auxiatrix,	a huk*ster*

On the other hand, such entries as

Hic pis*tor*,	a back*stare*	|	Hic tex*tor*,	a web*ster*

are very rare.

At present, however, *spinster* is the only representative of what was originally a large class.

§ 240. *Collective forms.*—The so-called Plurals which, like *oxen* and *feet*, are said to be formed from the Singular by either the addition of *-en*, or a change of Vowel, are Collectives rather than true Plurals.

Forms in -ery.—A *fishery* is not a collection of *fishers*, or fishermen, but one of *fishes*. A *rookery* is a collection of *rooks*; and there is no such word as *rooker*. The power, then, of the affix *-ry* is Collective. Besides *yeomanry* and *Jewry*, we have the rarer ones *Englishry*, *Danishry*, and *Welshery*, as the

names of political or ethnological districts. *Eyrie*, generally said to mean the nest of an eagle, is an *eggery* = *place for eggs*, or *collection of eggs*. In the following words the *-r* is a true sign of the Plural Number.

Hus-ir,	*houses.*	Lemp-ir,	*lambs.*
Chalp-ir,	*calfs.*	Plet-ir,	*blades.*
Eigir,	*eggs.*		

Indeed, in one word it occurs in provincial and archaic English, viz., *childer* = *children*. All these are of the Neuter Gender.

In other words, such as *foolery*, *prudery*, *bravery*, *slavery*, *witchery*, *stitchery* (*needlework*), &c., however, this origin is inadmissible, and the idea of collection or assemblage is either obscure or non-existent, the *-ry* having originated out of a false analogy, suggested by the affinity of meaning of Collection and Abstraction.

Frisian.	*German.*	*Danish.*
Shriwwerâi	Schreiberei	Skriverie.
Swênnerâi	Schweinerei	Svinerie.
Thiewerâi	Dieberei	Tyverie.

meaning *writing*, *swinishness*, and *theft*, respectively.

§ 241. *Change of Vowel between Transitive and Intransitive Verbs.*—The following are Transitive Verbs derived from Intransitives by a change of the Vowel of the root:—

(*a*)

Intrans.		*Trans.*	
Liegan	*lie.*	Lecgan	*lay.*
Sittan	*sit.*	Settan	*set.*
Drîfan	*drift.*	Dræfan	*drive.*
Fëallan	*fall.*	Fyllan	*fell.*
Wëallan	*boil.*	Wyllan	*make to boil.*
Flëogan	*fly.*	A-fligan	*put to flight.*
Bëogan	*bow.*	Bigan	*bend.*
Faran	*go.*	Feran	*convey.*
Wacan	*wake.*	Weccan	*awaken.*

		(*b*)		
Rise	Raise.	|	Sit	Set.
Lie	Lay.	|	Fall	Fell.
	Drink		Drench.	

In Anglosaxon these words were more numerous than they are at present.

Intrans.		*Trans.*	
Yrnan	*run.*	Ærnan	*make to run.*
Byrnan	*burn.*	Bærnan	*make to burn.*
Drincan	*drink.*	Drencan	*drench.*
Sincan	*sink.*	Sencan	*make to sink.*

§ 242. *Affixes in -nd.*—This in the older stages of our language was the termination of the Active, or Present, Participle of Verbs; i.e. words like *living* from *live*, *speaking* from *speak*, &c., &c.; all of which *now* end in *-ing*. The vowel that preceded the *-n*, in the Middle English, varied with the dialect; the West-saxon affix being *-ind*, the Mercian *-end*, the North-umbrian *-and*.

With this change of form we must compare that of the Verbal Substantive in *-ung*; wherein the *-u-* has become *-i-*, and the two forms become Confluent. *Hunt-ing* from the A. S. *huntand*, with the meaning of the Latin Participle *venans*, and *hunting* from the A. S. *huntung*, with the meaning of the Latin *venatio*, are now, in respect to their form, one and the same word.

§ 243. *The Affix -ed.*—This, though one of the most important of the English Affixes, is one of the most obscure. It characterises both the Preterit Tense and the Past, or Passive, Participle, of words like *love*, which form them by the addition of *-d*, or *-t*, as opposed to those which form them by a change of Vowel, with (for the Participle) the addition of *-en*, or *-n*—*love*, *loved*, *loved*; *speak*, *spoke*, *spoken*; *know*, *knew*, *known*.

(*a*) *The -d in loved = amavi; i.e. as a Preterit Tense.* This is held to be an abbreviated form of the word *did*, the Perfect of *do;* in other words, the *did* in the combination *I did love*, modified in form, and transposed in place; or made to *follow* the verb (with which it coalesces) instead of *preceding* it.

(*b*) *The -d in loved = amatus; i.e. as a Past, or Passive, Participle.*—This is held to be the -τ in the Greek verbals ending in -τεος, and -τος; as ποιητός, ποιήτεος.

More upon this point will be found in § 363, on the formation of the Preterit.

CHAPTER IV.

AFFIXES OF THE THIRD CLASS — *SHADE, SHADOW; MAID, MAIDEN.*

§ 244. The Affixes of the Third Class are those in which no definite, or notable difference in *meaning* can be assigned to the words which they distinguish in *form*. Those only will be given in which, when the affix is taken away, an actual word remains; as *maid, maiden; mead, meadow; shade, shadow.* That there is absolutely no change of sense is not asserted; for it is certain that the words in each pair are not used indifferently and with equal propriety in every case. Still it is the change that exists between words like *rise* and *raise*, *man* and *manikin;* and still less that between words like *hunt* and *hunter*, or *strong, strength*, and *strengthen.*

Subject to the preceding limitation this class is confined, or nearly confined, to the three words just

quoted. But it cannot be denied that there are many words like them where, although the fundamental element cannot be found, in English, as a separate word, the inference that it has existed as such is legitimate.

The following table well illustrates the forms in *-ow* :—

'The suffix *-ow* represents, in some few substantives, an older suffix, (1) *u*, (2) *wa*.

(1)	*shadow* . .	O. E.	*sceadu*, in Goth. *skathu-s*.
	meadow . .	O. E.	*meodu*, *medu*.
(2)	*callow* . .	O. E.	*calu*. Lat. *calvus*.
	fallow . .	O. E.	*fealu*, *fealwe*. Lat. *fulvus*.
	mallow . .	O. E.	*mal-u*. Lat. *malva*.
	narrow . .	O. E.	*nearu*.
	sallow . .	O. E.	*salu*. O. H. G. *salaw*.
	yellow . .	O. E.	*geolu*. Lat. *gilvus*.
	swallow . .	O. E.	*swalewe*. O. H. G. *swal-awa*. Ger. *schwalbe*.
	sinew . .	O. E.	*sinewe*, *seonu*. O. H. G. *senawa*.'

Morris: Outlines, &c., p. 212.

In the following examples the *w* seems to have grown out of a *-g-* :—

English.	*Frisian.*	*English.*	*Frisian.*
Barr-*ow*	bäir-*ig*	Swall-*ow*	swāll-*ig*
Gall-*ow-s*	gul-*ig*	Fall-*ow*	fall-*ig*
Furr-*ow*	furr-*ig*	Marr-*ow*	mar-*ig*
Sparr-*ow*	spārr-*ig*	Tall-*ow*	tul-*ig*

To a great extent this form in *w* (=*v*) is Danish; e.g. in Danish *marv*=*marrow*, though, in Swedish, the word is *merg*. In the Danish *furre* and *spurre*=*furrow* and *sparrow* the change is carried further.

The present list of Derivational Formatives is, by no means, exhaustive; and the reader is referred to Morris's Outlines (p. 212, &c.) for additions to it. The examples of the present and two preceding chapters have been mainly meant to indicate the principle of their arrangement.

CHAPTER V.

INFLECTION.—DECLENSION—OF PRONOUNS.—THE NUMERALS.—THE DECLENSION OF SUBSTANTIVES.—ADJECTIVES (THEIR DEGREES OF COMPARISON).—ADVERBS.

§ 245. *Inflection* now comes under notice. It is a eculiar kind of Derivation; of Derivation rather than omposition. But it is by no means certain that a efinition could be framed so as to exclude all com-ounds without inconvenience. The word *father-s*, hether taken as a Possessive Case or as a Nominative lural, is a good sample of Inflection. The addition o the main word is the sound expressed by the single etter -*s*. That this is not a whole word is evident. y going back, however, to the Anglosaxon period we nd that it was preceded by a vowel—*e* or *a*, as the ase might be. Now, though this gives us a syllable, he affix is as far from being a separate and indepen-ent word as ever: and, hence, it belongs to deriva-ion rather than composition. But what if it be both ossible and probable that *all* derivation was once com-osition, just as all composition was, originally, the ixtaposition of separate words? The doctrine that uch is the case has already been alluded to. Neverthe-ess, for most purposes Derivation may be separated rom Composition, and Inflection treated as a peculiar nd important part of Derivation.

Inflection falls into (1) Declension and (2) Conju-ation. Declension applies to (1) Gender, (2) Number, 3) Case; Conjugation to (1) Voice, (2) Mood, (3) 'ense, (4) Number, (5) Person.

Nouns are declined; Verbs conjugated. Nouns re (1) Pronouns, (2) Substantives, (3) Adjectives.

Participles are, in some respects, Adjectives, in others Verbs.

To give precedence to the Pronouns over the Substantives, and to put them first in order in the class of Nouns, is unusual. The prerogative, however, with which this invests them is justifiable.

§ 246. *The Personal Pronouns.—The Name of the person speaking.*—First come the Personal Pronouns, and the first of these is the name for the speaker. When N. or M., no matter what his *permanent* name may be, speaks of himself as either *I* or *me*, *I* or *me* is a name *for the time being;* the person to whom it applies, or the temporary bearer of it, being, at the same time, the person who applies it. When applied strictly, it is limited to the Singular Number. But as a speaker may consider that what he says or does is said or done by others, so that, to some extent, he represents more speakers than his single self, a Plural form of the First Personal Pronoun is rarely, if ever, wanting. No sign of Gender is required.

§ 247. *Name of the Person spoken to.*—Then comes the name of the person spoken to. Here, also, the sign of Gender is superfluous. But here the Plural Number is no longer exceptional, or, in some degree, non-natural; but, on the contrary, almost a matter of necessity, since a speaker may address either a single individual or a multitude. The import of the words *we* and *us* requires, when the speaker is a single individual, some explanation: that of *ye* and *you*, when more individuals than one are spoken to, is self-evident.

§ 248. To these two the *true* Personal Pronouns are limited. They are those of the First and the Second Person. They stand alone, and apart from *the* so-called Pronoun, or Pronouns, of the Third Per-

sons,—*he*, *she*, *it* (*hit*), and *they*—in which we have *Three* Genders, and which are, historically, or in origin, *Demonstratives*. The true Personals have no Gender; and they need none.

§ 249. *I and Me, Thou and Ye.*—In each of the true Personal Pronouns there are, at least, either two distinct roots, or two forms sufficiently unlike another to look like such. For the First Person there are the roots represented by *I* and *me*; for the second those represented by *you* and *thee*.

I is found only in the Nominative Case, and has no Oblique Cases to correspond with it; and, *vice versâ*, the Oblique Cases have no Nominative. *I* is no Nominative Case of *me*; nor *me* of *I*; no more (to use a well-worn illustration) than *Puss* is the Vocative Case of *cat*.

Of the Declension of *I*, then, there is nothing at present more to say; except that there is no Declension at all. The forms in *m-*, such as *me*, *my*, and *mine*, whether Cases or derived Adjectives, are *not* cases or derivatives of the words *Ego*, *Ich*, *I*, or any of the numerous forms in which the Pronoun of the First Person Singular appears; and, *vice versâ*, *I* is no Nominative of *me*.

§ 250. *Personal Pronouns in A. S.*—In A. S. the Declension of the true Personal Pronouns is as follows:—

(*a*)

I—found only in the Nominative Case.

(*b*)

Singular.			*Plural.*
Nom.	—	—	we.
Acc.	me	mec	us (usic).
Dat.	me	—	us.
(?) *Gen.*	min	—	user (ure).

(*c*)

Singular.			*Plural.*
Nom.	þu	—	ge.
Acc.	þe	þec	eow (eowic).
Dat.	þe	—	eow.
(?) *Gen.*	þin	—	eower.

The so-called Genitives are *Adjectives*; and this is the reason for the Note of Interrogation (?).

Reasons for treating the *c* in *mec* and *þec* as anything but a true sign of case are found in the familiar declension of *hic, hœc, hoc* in Latin; wherein the *c* is a sign neither of case or gender; nor yet of number. It is this *-c* that is not only the *-c* in *mec* and þec, but the *y* in *my* and *thy*.

§ 251. *I and We; Thou and Ye.*—In both Persons the Plurals are sufficiently different from the Singular to look like derivatives from different stems. This is the case with *we, our, us*, whether we compare them with *I* or *me;* and with *ye* and *you*, as compared with *thou* and *thee*.

Neither are the Cases of the Plural itself cases which stand to *we* in the same definite and unequivocal way that *their* and *them* stand to *they*, *his* and *her* to *he*, or *fathers* to *father*.

This is specially the case in the *First* Person; for, whatever may be their relation to *thou, thy*, and *thee*, *you* and *yours* are evidently from the same root as *ye*.

§ 252. *We, Our, Us.*—These, as different cases of the plural number, though, certainly, not so closely connected with one another as *they*, *their*, and *them*, are universally admitted to be forms of the same word. A difference, however, of some kind is found throughout all the German languages. In the present High German *wir* = *we*, *unser* = *our*, *uns* = *us*. In Danish the difference is at its *minimum*. In Danish *vi* = *we*, *vor* = *our*, *os* = *us*.

§ 253. *We and Me, Ye and Thou.*—The difference between the forms of the Singular and Plural Numbers is more perplexing; in other words it is easier to connect *our* and *us* with *we*, than *we*, &c., with *me*, and *ye* with *thou*.

In spite, however, of their external differences, it is safe to say that the prevalent opinion is in favour of their being, one and all, derivatives from the same root; though, of course, greatly altered.

§ 254. And this leads us to ask why (supposing that they *are* all from one root) the difference should be so great; and that not only in English, but in other languages; for we shall see that, throughout the whole Indo-European class, these same Personal Pronouns are, at least, as abnormal and multiform as they are in English; and we shall, also, see that throughout the whole class the fundamental roots are the same.

This, however, is only another way of saying that, as a class, the Personal Pronouns are among the oldest words of the languages to which they belong; and, as such, have undergone more than usual wear and tear.

§ 255. But this is not all. Many of their alterations can be accounted for; indeed, are deducible from the nature of the class.

The Dual Number in this matter helps a little, but the Dual Number is not exclusively Pronominal. The more important characteristic is the difference between the Exclusive and the Inclusive Plurals.

§ 256. *The Dual Number.*—The Dual Number, as a rule, is found in the older stages of the language. As time goes on it is dropped. But, though dropped as a Dual, it may be retained as a Plural, or *vice versâ*. If so, certain Plurals may be Duals disguised.

This is no mere possibility. If it were, it would not have been brought forward. The Latin Plurals *Nos* and

Vos are, word for word, the Greek Duals Νῶϊ and Σφῶϊ. The Slavonian Plural agrees with the Latin. The Tshekh, for instance, has like the English *gá*=*I*, *mé* and *me*=*me* and *my*, and the Plural *my*=*we*.

The Plural, however, is Latin throughout—Latin or Greek according as we compare it with *Vos* or with Σφῶϊ.

1. my	=	*we.*
2. nás	=	*our*=*nostrum* in Latin.
3. nám	=	*to us*=*nobis* „
4. nás	=	*us*=*nos* „
5. ó my	=	*we!*
6. w nás	=	*in us.*
7. s námi	=	*with us.*
1. wy	=	*vos* or σφῶϊ.
2. wás	=	*vestrum* or σφῶϊν.
3. wám	=	*vobis.*
4. wás	=	*vos.*
5. ó wy	=	*vos!*
6. w wás	=	*in nobis.*
7. s wámi	=	*cum nobis.*

§ 257. There was a Dual in Anglosaxon *wit*=we two; and in the English of the present time there is the word *both* (closely akin to the Numerals)=*ba two*; German *beide zwei*; Danish *begge to.*

This gives a second element; for these last two words were Compounds. But Compounds may be so closely connected as to lose their compound character; and further changes may eject one or the other of the original elements. If this be the original one, the whole character of the resulting word is changed. The word, in short, is transformed. This process must, from its very nature, be less evident than the previous ones. But it has been recognised as a matter of inference. At any rate it accounts for the phenomena. At present, however, it is merely given as an instrument of criticism.

§ 258. *Exclusive and Inclusive Plurals.*—The compound character of the Plural is even more intelli-

gible than that of the Dual; but it is one which is only partially illustrated by the languages with which we have much familiarity. The Greek and Latin, along with the Slavonic, have sufficed for the illustration of the Dual. For the Plural we must go to the Sanskrit. But the Sanskrit itself will need illustration. For this we must go to some of the rudest and most undeveloped languages in the world: for the compound Plural in its most visible forms, even the formation of the Plural itself, belongs to the very infancy of speech.

There are two sorts of Plurals; the *Inclusive* and the *Exclusive*. A speaker may address his hearer on a matter in which both take a part; which is much like saying *you* and *I*, or *I* and *you*. Or he may address him on a matter from which one of the two is specially excluded; in which case the import of his speech is '*I* but not *you*,' or '*you* but not *I*.' The Exclusive and Inclusive elements are plain enough here. But which is which? Upon which of the two does the speaker start with the notion of Inclusion or Exclusion? Is it *I*+*you*, and *I*+*you*, or *I*−*you*, and *you*−*I*? The primary unit is convertible according to the state of his mind. Still the difference between Inclusive and Exclusive Plurals is manifest. So is the likelihood of the term being a compound. So, too, the likelihood of its parts being dismembered, and the result being the absolute transformation of the original word.

It is the languages in the low stages of development that best illustrate this class of Plurals. They are, (1) compounds of the name of the speaker, or the person spoken to, *plus* the name of some one else, after the fashion of a sum in addition; and (2) when the compound becomes cumbrously long, the processes of amalgamation and rejection may result in an absolute transformation of the word.

Comparative Table.

§ 259. The mode of growth from the radicles in the Indo-European family may be studied in the following :—

SINGULAR—

	Sanskrit.	*Greek.*	*Latin.*	*Gothic.*	*O. Saxon.*	*O. H. G.*	*O. Norse.*
Nom.	ahám	ἐγώ	egô	ik	ic	ih(ihha)	ek

§ 260. The preceding Comparative Table is from Professor March's '*Comparative Grammar of the Anglosaxon Language.*' I have not accompanied it with the author's explanation; because it is given, to a great extent, in symbols: which, though explained in the work, would take up too much room in this. The point, however, which it is intended to illustrate is the extent to which the compound character of the Plural forms disguises the simpler and more original ones: the adjuncts sometimes reducing the fundamental syllable to a *minimum*, and sometimes wholly eliminating it. He continues—

'*We.*—The present High German is *wir*. In Old Norse it was *ver*. In Mœsogothic *weis*. This *-s* represents the *-sm-* in the Sanskrit *-sma*, and the Greek *-μεῖς* in *ἡμεῖς* and *ὑμεῖς* = *we* and *ye*. It was originally a Demonstrative Pronoun = *he*, *that*, or *this*. Here *we* = *wir* = *weis* = *asmê* = I + *he*, *that*, or *this*. The *w* is *v* in the Sanskrit *vayam*.'

'*Us.*—In High German *-uns*. This *-ns* also represents the Sanskrit *-sma*.'

'*Thee.*—Gothic *thas*. The *th-* has become *y*. The *-s* is, again, the Sanskrit *-sma*.'

It is only in illustration of the line of criticism applied to the Personal Pronouns that these notices have been given. For more on the subject the '*Comparative Grammar*' and Dr. Morris's '*Outlines*,' &c., are referred to.

§ 261. *The Declensions of Pronoun.*—There are three kinds of Declension for the Pronouns now coming under notice.

1. The first is that of the Demonstratives and Interrogatives; which is specially and typically *Pronominals*.

2. The second is *Substantival*.

3. The third is *Adjectival*; i.e. is wholly negative, or, in other words, is no Declension at all.

§ 262. *The Declension of the Demonstratives and*

Interrogatives (*Relatives*).—The key to both the Declension and the Conjugation of the present English is the clear appreciation of their remarkably small dimensions, and the knowledge that such inflections as occur are the fragments of a larger system. Ours is the study of what has been lost, of what has been kept, and of what has been changed. It applies to every part of the reduced system of Inflection that we still retain; and to no part is it so applicable as to the Demonstrative Pronouns.

This applies to not only *this* and *that*, but to the Definite Article *the*, and the so-called Third Personal Pronouns *he*, *she*, and *they*; every one of which has come from a different root; every one of which has had a complete Declension of its own at some time, in some language or another; and every one of which is now found in a changed condition. With this breaking-up, the import of one of the roots has been altered. Nor, when we consider how closely allied in import they all are, should this surprise us.

He was, originally, what it is now—a Pronoun of the Third Person rather than a Demonstrative.

The was a Demonstrative Pronoun rather than a Pronoun of the Third Person; but it was also the Definite Article, and that throughout its whole Declension.

Se, so far as it was anything, was the Definite Article; but in Anglosaxon it existed in only two forms—*se* and *seo*; corresponding to the Greek ὁ and ἡ. The Neuter Article was *þat*; and all the other cases, in both numbers, were forms of *þe*. But it was used, even in its two forms, regularly. It was Westsaxon, Old Saxon, Mœsogothic, and Old Norse. Elsewhere *the* and *theo* (*thju* in Frisian) were the equivalents to ὁ and ἡ. But whether the Masculine and Feminine of the Nominative Singular were *se* and *seo*, or *þe* and *þeo*, the

remainder of the Declension was always founded on the root *th-*: just as it is in Greek, where we begin with ὁ and ἡ, and continue with τὸ, τοῦ, τῆς, τῷ, τῇ, &c.

With this as a preliminary, the following tables lead us to the rest.

Saving that in the Westsaxon *se* and *seo* take the place of *þe* and *þeo* (as they do in the Old Saxon, Mœsogothic, and Norse *si*, *siu*—*sa*, *su*—*sa*, *so*) the several declensions were as follows:—

	Singular.			*Plural.*
	Masc.	*Fem.*	*Neut.*	*All Genders.*
Nom.	he	heo	hit	hi.
Acc.	hine	heo	hit	hi.
Dat.	him	hire	him	him.
Gen.	his	hire	his	heora.

	Singular.			*Plural.*
	Masc.	*Fem.*	*Neut.*	*All Genders.*
Nom.	(þe)	(þeo)	þæt	þá.
Acc.	þane	þa	þæt	þá.
Dat.	þam	þam	þam	þám.
Gen.	þæs	þære	þæs	þara.
Abl.	þi	?	þi	

	Singular.			*Plural.*
	Masc.	*Fem.*	*Neut.*	*All Genders.*
Nom.	þes	þeós	þis	þás.
Acc.	þisne	þás	þis	þás.
Dat.	þissum	þisse	þissum	þissum.
Gen.	þisses	þisse	þisses	þissa.

For *se*.

Nominative Singular Masculine *se*.
„ „ Feminine *seo*.

The Lithuanic is the only language which gives us the Declension of this word in full.

Nom.	szis	szi.
Acc.	szi	szié.
Loc.	sziamè	sziojè.
Dat.	sziam	szèi.
Inst.	szium	sziè.
Gen.	szió	sziós.
Nom.	sziudu	szedoi.
Acc.	sziudu	szëdoi.
Dat.	szëmdvëm	sziódvem.
Inst.	szëmdvem	szeódvem.
Gen.	sziudvëjü	sziudvëjá.
Nom.	sze	sziós.
Acc.	szius	szies.
Loc.	sziusè	szïosè.
Dat.	szems	sziómis.
Inst.	szeis	sziomis.
Gen.	sziu	sziú.

The rest is read by what we know of the language in its present state.

§ 263. *He and Heo.*—The Feminine of *he* has become obsolete; and *seo* in the shape of *she* has replaced it. *Se* is wholly extinct. All the Plural forms of *he* have shared its fate, and been replaced by the Plural of *the*—*they*, *there*, *their*.

§ 264. *The*, &c.—The Masculine Nominative Singular is retained as the *uninflected* Definite Article. *Than* and *there* exist only as Adverbs: the first under the form *then* as an Adverb of Time, and under that of *than* as the adjunct to the Adjective in its Comparative Degree. *There* is an Adverb of Place. The Ablative *þi* is preserved in such combinations as *all the better*, *so much the more*, &c.=*eo melius*, *eo magis*. The Feminine Nominative *þeo*, and the Genitive *þæs*, are extinct. The Plural has replaced the extinct Plural forms of *he*; a Pronoun of the Third Person rather than either an Article or a true Demonstrative. *That* alone remains

as a Demonstrative; and, except so far as we can call *those* its Plural, is (like the Definite Article) uninflected.

§ 265. *They—These—Those.*—But *those* is *not* the true Plural of *þe*. The true Plural of *þe* was *þá*: and, when *þá* was the Plural of *þe*, *þás* was the Plural of *þes* (*this*); or rather *þes* (*this*) was the true Singular of *þás* (*those*); and no such Plural as *these* then existed.

(*a*) *Thá and Thei, &c.*—So long as *þá* is the plural of *þat*, and *þat* itself is a Definite Article, we have no reason to treat *á* as anything but a pure vowel; but when we find it spelt with a *-y*, as in *they*, or as anything out of which a *-y* could find its way into the spelling, a presumption against its pure vocalic character suggests itself. Now, in the Twelfth Century, we find the secondary forms *þei*, *þa*, *þe*, and later, in the Northumbrian, *thae*; for during the long blank in the early Northumbrian period, the plural of *he* in that dialect has disappeared, though retained in the West-saxon.

This new element in the Ormulum is written ȝ (which, as the vowel that precedes it is short, is, according to the peculiar spelling of that work, doubled); and points either to the sound of *g* itself or to some of its varieties—*gh*, *h*, *kh*, or *y*. At any rate, in words like *þeȝ-ȝ* and *þeȝ-ȝre* = *they* and *their*, it gives us an element which, whether we call it consonantal, diphthongal, or semi-vocalic, is never found in the older *þá*.

(*b*) The power of the older form *þá* is, as it was before, that of either *the* or *those*. The power of the newer form *þeȝ-ȝ*, *thei*, or *they* is that of the obsolete *hi*; which is the Plural of *he*, which is a Personal Pronoun rather than either a Demonstrative or a Definite Article.

§ 266. *Þás, Þeos, Þues, Þes, Þese, Þise, these.*—These are later forms: generally recognised as transformations of the older *Þás.*

We now know two forms of *Þás*, of which the original in *-á-* (*Þás*) and the present in *-e-* are the extremes—just as we had two extremes of *Þá*—viz., *Þá* itself and *Þeȝȝ* (*thei, they*). They make *four* in all.

(1) The old *Þás* has given us *these*; the plural of *this*, the Demonstrative indicating comparative nearness. But the development of these secondary forms out of *Þás*, by no means involves the abolition of the original form. It may, of course, be wholly supplanted by the later and smaller, or more slender forms; i.e. be lost to the language. But it may, also, keep its ground; either as a synonym, or with a modification of import.

It *does* keep its ground; and hence out of the original pair, *Þá* and *Þás*, we have now *two* pairs—*they*, *Þá*, and *these*, *Þás*.

Out of these four words there are only three for which there is a use.

(1) *They* (*Þeȝȝ*, *thei*) becomes the Plural of the Pronoun of the Third Person = Latin *illi*: and we know the reason for its becoming so. It replaces the lost plural of *he*.

(2) *These* serves as the Plural of *this*.

(3) The only two remaining relations that now stand over are those expressed by the Definite Article, and the Demonstrative which indicates comparative distance; and these are sufficiently akin to one another to be expressed by the same word, and, at the same time, sufficiently distinct to be expressed by two—*those* and *these*.

But for the true and undoubted Definite Article *the*, since *se* became obsolete, has always been the ordinary form; and that both in the Northern and the

Southern Dialects. Meanwhile for the Plural of the Demonstrative of distance (the Plural of *that*) there was the original Northumbrian *þá*, *þo*, or *thae*, according to the dialect.

There is no place, then, for *þás*.

But what if *þá*, *þó*, *thai*, or *thae* become obsolete? If such be the case, there *is* a place for *þás* (*those*).

Now in the Southern and Midland Dialects *þá* or *þo* *did* become obsolete, and a place was left for *þás*. What this is we know. It is that of the present *those*, the plural of *that*, and the opposite of *these*.

§ 267. Such is the exposition of the differences of form, and import, connected with the strange transfer of import on the part of the old *þás*, and the evolution of the newer form *these*, concerning which there is no reasonable doubt, and, I believe, no difference of opinion. That the change of vowel from *þás* to *these*, and the obsolescence of the true plural of *that* (*þá*, *þo*) are connected, to some extent, as cause and effect, is probable. But on which side the influence began, and upon other details equally obscure, it is unnecessary to speculate.

§ 268. The import, however, of the sound of *-s*, is more susceptible of investigation. The following explanation is got from two quarters: (1) the use of the French *-ci* in *-ce-ci*; and (2) the Norse of the Runic period.

(*a*) The French *ce*, when it stands alone, is neither an Article like *the*, nor a definite Demonstrative like *this* and *that*. But it can be made equivalent to either of the latter by the addition of *-ci* or *la* as a determinant; and such is, very nearly, the relation of *þá* to the affix *-s*—provided, of course, that sufficient reason can be given for considering *-s* to represent some separate word with the power of the *-ci* in *ce-ci* = *this*.

(*b*) Upon this point I adopt the opinion of that eminent Scandinavian scholar, the late Professor Munch. In his short but valuable work on the *Runes*, after stating that the Compound Pronoun *þessi* is (with certain exceptions which are not needed here) inflected in the ordinary manner, or as follows:—

The *i* in the majority of cases, except the Nominative and Genitive Singular (*i de fleste Casus uden for Nom. og Gen. Sing.*) of the Pronoun *sá* is declined, and the first part of the undeclined ending *si* or *sa* is added-on in the following manner:—

Singular.

	Masc.	*Fem.*	*Neut.*
Dative	*þaimsi*	*þasi*	*þvisa.*
Accusative	*þansi*	*þinsa*	*þansi.*
	þinasi	*þinasa*	*þinsi.*
Neuter	*þatsi.*	—	—

Plural.

	Masc.	*Fem.*	*Neut.*
Nominative	*þaisi* (ɔ : *þairsi*)	*þasi* (ɔ : *þársi*)	*þausi* (*þusi*).
Dative	*þaimsi.*	—	—
Accusative	*þasi* (ɔ : *þási*)	*þasi þasi* (ɔ : *þarsi*).	—
Neuter	*þausi* (*þusi*).*	—	—

Here, after noticing *þessi* as a compound of the Demonstrative *se*, upon which the writer seems to have no doubt whatever, he gives us his examples. More than half of them are forms of *þat*, and *þa*, with the broad vowel, rather than of *þissi* with the slender one. About their import, however, there is not the slightest doubt. They both point equally to the same degree of nearness or distance; and that is, we may say, *this-ness*.

The Accusatives *þansi* and *þinsi* mean exactly the same: and both mean *this*. There are some contexts

* *Kortfattet Fremstilling af den ældste Nordiske Runeskrift.* 1848.

in which there might be a doubt on this point; but when we find on a gravestone such a sentence as—

RAGNHILDR SVSTIr VLFS SATI STAIN *ÞANSI* AVK GAR DI HAUG *ÞANSI* AVFT GVNVLF VAR SIN.

Ragnild, sister of Ulf, set *this* stone, and made *this* barrow after Gunulf her man.

there is no doubt *thansi* means the gravestone on which it is engraven, and no other.

§ 269. It is not maintained that the comparison between *ce-ci* and *tho-s* holds good on all points. But identity of principle with difference in details is the rule rather than the exception in Philology.

The French *-ci* we can trace to its origin. It is the *-ci* in *ici=here*. In like manner, though the fact is not so conspicuously clear, the prevalent opinion is in favour of the root *-se*, being suggestive of nearness rather than of distance.

In French this *-ci* has its correlative *-la*; denoting comparative distance. The French used both forms; the English only one. But though two are not superfluous, *one* is sufficient. On the other hand, we expect, *à priori*, that when one only is used, it will be the one that indicates distance. But in English, where there is only one, the determinant falls on the pronoun expressive of nearness; or the one that might have best stood without. *Pro tanto* this is an objection to the present view—but only at first sight.

It is only in the Plural of the English forms that the *single* Determinant *-s* presents itself. And this is only natural, because precision is more needed for Plural and Collective than for Singular forms. The former are naturally more indefinite.

Moreover, it is only in the Nominative and Accusative that the form in *á* for *þis* is found. All the other

cases have an *-i-*; a small, or slender, vowel. In the declension of *that* the broad *a* runs throughout. Naturally, then, the form in *a* would seem to belong to the cases where the vowel was broad. If so, the determinant would be most wanted for those which, except in the Nominative and Accusative, had -ĭ-.

§ 270. *Tha retained in the Northumbrian -þir.*—It has been stated above that after the *four* forms *they* (*thez z*, *thei*), *these* (*þues*, &c.), and *þás* (*those*), and *þá* (*tho*, *thae*) existed concurrently in the Middle English of the three dialects, there were three senses in which they could be used; that the chance lay between *þás* and *þá*; and the latter went to the wall. It is now necessary to add that this applied only to the Southern and Midland dialects. The Northumbrian preferred *thae* to *those*; and, moreover, used *thir* for these.

'Of the two plurals for *that*, which now (13th & 14th centuries) existed in the Northern and Midland dialects, only one was eventually retained by each. In the Northern dialect the surviving form was *þa* (*tha*, *thae*), the other form *þas*, *thas*, being absent from the Scottish writers, and totally unknown to the living Scottish dialects (and I believe also to those parts of the North of England which still retain the true Northern speech). In the Midland dialect, on the other hand, *þos* (those) was triumphant, *þo*, *tho* being gradually eliminated, perhaps because the former was more distinctly *plural*, and more distinct from the third personal pronoun *thai* and article *the*.

The literary English being, in its main features, of Midland origin, acknowledges the Midland Demonstratives *þise and þos*, these, those . . . *These* and *those* have not, however, been cordially welcomed by the popular speech either in the North or South; the Dorsetshire peasant does not say 'I think those houses better than these,' but 'I think *them* housen better than *theäsem*,' from Ags. *þǽm* and *þisum*, dat. plurals. In the Northern dialect the Scotch has retained *thir* and *tha*, *thae*, as its plural demonstratives. In the North of England, although the influence of the Standard English has been gradually driving the old dialect northward, so that *thir* and *tha* are not now, as in Richard the Hermit's time, heard in the neighbourhood of Doncaster, we meet with them as *thor* and *theea* in the dialect of Cleveland in the North Riding, and in Cumberland and Westmoreland, th*ur* (sound of *u* in f*u*ll), th*or*, are in regular use as the plural of *this*. But *tha*, *thae* is not now used in the two Western counties, which supply its place by *them*: 'I'll gie-tha thur (in my hand) for *them* (in yourn);' 'Th*ur*'s mi aan, them's mi fadther's an' yon's laal Jacup's.' In South Lancashire we find these forms displaced by the Midland *these*, *thooas*; and in the Barnsley dialect of Yorkshire *thease* seems also to replace the Northern thir. In

Scotland *thir* and *thae* have, curiously enough, not penetrated beyond the Grampians, the North-eastern Scotch using *thys* and *that* in the plural as well as the singular: 'thys beuks an' that pens.'—*Dr. Murray: Dialect of the Southern Counties of Scotland*, p. 184.

§ 271. In the relations between *she*, *he*, *they*, *these*, and *those*, lie nine-tenths of the details of the Declension of the Demonstrative Pronouns. What remains may be treated briefly.

She, in A.S. *seo* or *sio*, as has already been noticed, as the last fragment of declension of which the Lithuanic alone gives us something like the original dimensions. Upon its connection with the Reflective more will be said hereafter.

In *it*, we have the old Neuter after the loss of its initial *h*.

In *its* we have greater change. The initial *h* is dropped, and the *-t* inserted. This makes *its* a transformation of *his*; the A.S. form for the Neuter as well as the Masculine. The *-t* is the *-t-* in *hit*; which is, of course, out of place in the Genitive. It was not until the end of the sixteenth century that this exceptionable form took root.

Him and *hine*.—The A.S. Accusative ended in *-n* —*hine*; the *Dative* ending in *-m*.

Hi-m (acc.) This was originally a dative form, which in the twelfth century (in Lagamon and Orm) began to replace the Accusative.

Hi-ne.—The old Accusative was sometimes shortened to -in, and still exists in the South of England under the form *en*.—*Morris's Outlines*, &c. p. 120.

þisne and *þessum*.—The first is a common provincial, as *thesn*. The second, as *theasem*, is still current in Dorsetshire.

Em, as in 'give it 'em.'—By some this is considered as a shortened form of *them*; by others, as the A.S. Accusative *heom*, or *hem*.

§ 272. *The Interrogative and Relative.*—These, in the essentials of their Declension, agree with the Demonstratives, and belong to the same, or the true Pronominal, system. Except, however, in the Dative Singular (*hwære, where*) they have no Feminine forms. Like the Demonstratives, they retain the true Neuter sign *-t*; the same as the *-d* in the Latin *quod, id,* and *illud.*

What, and not *which,* is the real Neuter.

Which is a compound — *hve-lik,* Scotch *whi-lk,* German *we-lch=what-like.*

Whose=in A.S. *hwæs,* is an ordinary Possessive in *-s* —*whoes* or *who's.* The spelling which makes it end in *-e,* disguises its true nature.

Whom.—Like *him* originally Dative.

When.—The Accusative Masculine, preserved as the Adverb *when.*

Where.—The Dative Feminine, preserved as the Adverb *where.*

To these add *then, there,* and *here,* which are in the same relation to *the* and *he* as *when* and *where* to *who.*

Why=for what reason. From *hwi,* the Ablative, or Instrumental, of *hwa* (*who*).

How, a variation from the same case.

§ 273. *Pronouns with a Substantival Declension.* These are (1) *self, selfs', selves, selves'*; (2) *one, one's, ones, ones',* as in *one does not like to see one's property wasted—my wife and little ones are well*; (3) *other, other's, others, others'.*

One and *other* are declined like ordinary Substantives. *Self,* like *shelf,* forms its plural in *-v, selves, shelves.*

§ 274. *Pronouns with an Adjectival Declension.*—This means all those that have not been already enumerated. They are declined like Adjectives. But Adjectives are not declined at all. Though this is so like

—

saying nothing, that, without an explanation, it had better have been left unsaid, such is far from being the case. It is merely because the Adjectives have *lost* a very characteristic declension that they are, at present, wholly without one. What this declension was may be seen in § 81. It may, also, be seen that it was of two kinds, a Definite and Indefinite one. The former the Pronouns never had. The latter they had, and this, with the exception of the Demonstratives and the Interrogatives (also Relatives), like the Adjectives, they have lost. This is one point which connects the Pronoun with the Adjective in respect to their Inflections.

Another and a more important one is that the declension was the same for the two, i.e. the Pronominal Inflection, in its integrity, followed that of the Adjectives and not that of the Substantives. It is only in the German family that this is the case. In Latin, *bonus, bona, bonum*, are declined like *dominus, domina, regnum*; and so elsewhere. In the German languages they are declined like *he, the*, or *who*; or, *vice versâ*, the Pronominal forms are adjectival.

§ 275. *The Numerals.*—The difference between the Ordinals and Cardinals is *not* a matter of Declension or Inflection. Still it is, generally, in conjunction with the Inflections that the Numerals are considered. For the practical purposes of tracing a language they are among the first words that command notice.

Moreover, in Comparative Philology they are words which characterize the whole Indo-European class. Indeed, in the Celtic they are the chief words which, as a class, are Indo-European. This means that they are among the oldest words in the group.

Being such, they have been more subjected to the wear and tear of time and place than any others; as may be seen by some of the extraordinary letter-changes they present.

The following list is intended to show this; but it should be read with special reference to the Reflected Ordinal.

	Cardinal.	*Cardinal.*	*Cardinal.*
English	one	two	three
Mœsogothic	áin-*s*	tvai	þrei-*s*
Icelandic	ein-*n*	tvei-*r*	þrí-*r*
Swedish	en	to	tre
Danish	en	to	tre
Welsh	un	do	tri
Gaelic	aon	daoi	tri
Latin	unu-*s*	duo	tre-*s*
Greek	εἷς (ἑ ν σ)	δύο	τρεῖ-*s* (τρί-*α*)
Polish	jeden	dwa	trzy
Russian	odin	dva	tri
Lithuanic	vĕna-*s*	dù	try-*s*
Sanskrit	eka	dvi	tri

	Cardinal.	*Cardinal.*	*Cardinal.*
English	four	five	six
Mœsogothic	fidvor	fimf	sáihs
Icelandic	fiór-*ir*	fimm	sex
Swedish	fire	fem	sex
Danish	fire	fem	sex
Welsh	pedwar	pump	chwech
Gaelic	ceathar	cuig	sé
Latin	quatuor	quinque	sex
Greek	τεττάρτετ-ες	πέντε	ξξ
—	τεσσάρτορ-ες	πέμπε	—
—	πίσυρ-ες	—	—
Polish	cztery	pięć	sześć
Russian	tshetëre	pat	shest
Lithuanic	kęturi	perki	szeszi
Sanskrit	chátur	páńchan	shásh

	Cardinal.	*Cardinal.*	*Cardinal.*
English	seven	eight	nine
Mœsogothic	sibun	ahtáu	niun
Old Norse	siau	átta	níu
Swedish	sju	otte	nio
Danish	syu	otte	ni
Welsh	saith	wyth	nau
Gaelic	seacht	ocht	naoi
Latin	septem	octo	novem
Greek	ἑπτά	ὀκτώ	ἐννέα
Polish	siedm	ośm	dziewięć
Russian	sęm	vocem	dévat
Lithuanic	septyni	asztüni	devyni
Sanskrit	sáptan	cishtan	návan

	Cardinal.		*Cardinal.*
English	ten	*Latin*	decem
Mœsogothic	tâíhun	*Gaelic*	deich
Old Norse	túi	*Greek*	δέκα
Swedish	tio	*Polish*	dziesięć
Danish	ty	*Russian*	désat
Welsh	deg	*Lithuanic*	dęśimpt
		Sanskrit	dáçan

1. Here the Sanskrit *eka* is the most exceptional. It is supposed to represent the same root as *ἐγω*, *ego*, *ich*, and *I*; or, as Donaldson (? Key) has put it, it means '*Number One*.' It is also held to represent the Greek *ἑκα-στος* = *each* or *each one*—a Superlative form like *μέγιστος*, &c. The

-d in the Slavonic is more likely to represent an abnormal pronunciation of *-n* than a true radical sound of *-d*. We miss it in the other languages. The Ordinal is no modification of the Cardinal; but the Superlative form of a wholly different word. So it is generally—Latin *primus*; Greek *πρῶτος*; German *erste*; Lithuanic *pirmas*. The Aspirate *εἷς* in Greek, and the *v* in *vënas* in Lithuanic, suggest that the initial vowel was not wholly pure. In Greek it is remarkable for taking a wholly new word for the Feminine. Contrast *εἷς, μία, ἕν*, with *unus, una, unum* in Latin.

2, 3.—These are very regular. The *-r* in the Mœsogothic *þveir* and the Old Norse *þreir*, seems to have been a sign of the Plural Number; retained in the first Numeral that *was* Plural. Like *first* as compared to *one*, *second* as compared to *two*, gives us a wholly different word for the *Ordinal*. In Greek it is *δεύτερος*, a Comparative form. The English *second* is the Latin *secundus*, from *sequor* = *I follow*. In Danish we have *anden* = *other*. The German, however, gives *zweite* from *zwei*. In respect, then, to its Ordinal, the second Numeral follows the same principle as the first, though not to the same extent.

4, 5. Here the *-v* in the English *five* represents an *-m-* or *-n-*, softened. The *ęedilla* in the Polish *pięc* does the same. In the Lithuanic *penki* we have it in full; though in Lithuanic it is generally reduced to a nasalized vowel. The *-que*, *-τε*, *-πε*, *-ć*, *-t*, *-k-*, and *-ch* (*tsh*) in the Latin, &c., is certainly non-radical; and, *à fortiori*, the *-n* in the Sanskrit *panchan*.

That, in the English and Icelandic *four* (A.S. *fëower*) and *fiorir*, a Medial Dental, *t* or *d*, has been dropped is manifest; for the Mœsogothic *fidvor*, and the Latin *quatuor*, with the exception of the initial consonants, are nearly identical in form. The double *-ττ* and *-σσ* in *τέττăρα* and *τέσσăρες*, with the *single* *σ* and the *long* vowel in *πίσυρες*, suggests that the Medial Dental has undergone much change.

But the perplexing element in this pair of words is the difference between the initial consonants, which are *k*, *t*, *cz*, *tsh*, *ch* (the *ch* in *chest*), *f-*, and *qu-*, which, in Latin, presents itself in *quinque* as well as in *quatuor*. It is mainly a Latin combination, and is the *qu-* in *quercus*. which is, word for word, *fir*, *furh*, and in Swedish *furu* or *furuh*. In the English *quick* the *q-* represents the Latin *v* in *vivus*, in the first letter, which in the second *v* becomes *k*. In like manner the *w* in *s-now* represents the *φ* of *νίφας* in Greek, and the *k* of *nix* (*ni-k-s*) in Latin. The history of the letter-changes suggested by the Latin *quatuor* and *quinque*, as contrasted with *four* and *five*, is very obscure.

6. The most remarkable part about the word *six* is that it ends with the same letter with which it begins; and, so doing, suggests the notion of a reduplication of its half. Nothing is more likely, *à priori*. But the *tr* in *tres*, *τρία*, and the *thr* in *three*, are not the names for 3 that the doctrine suggests. The doctrine, however, of Reduplication, in the

lower languages, is a very rational one; indeed it is, in many cases, without doubt, the true one.

7, 8, 9, 10.—The elimination of a consonant in the middle of a word we have seen in the history of *four*; and the presence, or absence, of an affix we have seen in the *-que*, *-τε*, and *-t*, in the names for *five*. But for the last four Units we have a new factor, viz. the doctrine of the *Reflected Ordinal*. That *nine* and *ten* represent an earlier *nigun* and *taihun* we can not only believe, but prove; because the words *nigun* and *taihun* have been found within limits of the German family; but in the Greek ἐννέα, and δέκα there is neither an *-n* nor an *-s*, and in the Norse languages there is no *-t*. Hence has arisen the doctrine that where we have either one or both we have a sign of the *Reflected Ordinal*.

§ 276. *Ordinality and Superlativity*.—Upon the connexion, real or supposed, between the ideas of Ordinality and Superlativity we may now form an opinion. That 1*st* and 2*nd* are Superlative and Comparative in *sense*, and that, in Greek at least, δεύτερος is Comparative in *form*, is beyond doubt. But it is equally indubitable that they are thus *in their relations to one another, and to the rest of the numerals*; and that they are *not* the Superlative and Comparative of *one* and *two*.

The great difference between these and the other dualisms with which the Comparative is associated is the direction of the comparison. In *bright*, *brighter*, *brightest* we compare *upwards*; in *first* and *second*, (the *following* or *next*) we compare *downwards*. After this 3*rd* becomes the *following* or *next* to 2nd; while 4*th* bears the same relation to 3rd; and so on throughout. This is the true Ordinality, in which there is manifestly the prerogative of Superlativity with 1st, and a Comparative subordination of 2nd. Then, when we remember that every number is what it is solely through its relation to its predecessor, there is a sense of comparison through the whole series of Ordinals. But this, we must remember, is founded on their relations to one another, and *not on their relations to their corresponding Cardinals*. What this relation may be forms no part of the present enquiry. At present we know that in some form or other there are certain elements, both logical and formal, common to our conceptions of Ordinality in Numerals, and Degree in Adjectives, and that some of the most complicated investigations in the history of the names for the first ten digits are involved in the connexion. In the case of 1st and 2nd, we see its nature at once. With the rest of the Numerals we have to be reminded of it; but when in the word *sep-tim-us* we believe that the *t* is the τ in πρῶτος, and the *m* the *m* in *primus*, *pirmas* (Lithuanic) and *forma* (A. S.), and that the *m* in *septem* and *decem* is the same *m* transferred to, or reflected back upon, the Cardinal, the double character of the class must be thoroughly understood. The relation of 3rd to 2nd and 4th is one thing; its relation to 3 another.

All that has hitherto been done in the way of criticism has been done on the recognition and the affinity with the Degrees of Comparison only. In this respect the doctrine of the Reflected Ordinal is a safe instrument of criticism, and here we leave it.

§ 277. *Eleven* and *Twelve*.—Until within the last twenty years the current opinion as to the import of the combinations *-leven* and *-lv* in these two numerals was that it was the *l* + *v* in *leave*, which in this case meant *over* or *in excess*. Hence, *e-leven* = *one*, and *twelve* = *two*, *over*, or *left*. This principle of numeration is at variance with that of the Latin, Greek, and many other languages—where the formula is *un* + *decem* = 1 + 10, and *duo* + *decem* = 2 + 10.

But, of late, it has been held that, by a legitimate series of letter-changes, this *l-f* may be deduced from the *d-k* in δέκα, *decem*, &c.; in which case there is, in the German names for 11 and 12, nothing exceptional.

This doctrine has, certainly, found favour. I have never, however, seen it fairly and fully exhibited, not even by Schleicher himself, who, as a Lithuanic scholar, well knew the elements of an objection to it. That the syllable *lik* has ever been found, clearly and positively, as a form of *dek* has never been pretended. All that can be said for it is (1) that, in giving us the sound of *k* where the English compounds give that of *v*, it brings the forms *lev* and *dek* closer together: (2) that it is used not only for 11 and 12, but for 13, 14, &c., to 19 inclusive—*e.g.* 11 *wienolika*, 12 *dwalika*, 13 *trylika*; 19 *devinyalika*. If there were nothing beyond this, the decision might be left to the judgment of the critic.

But there is a serious objection beyond it; and this I have never seen recognised. Whether *-lev* be reducible to *-lik*, and *-lik* to *-dek*, is a question of some depth and complexity as a matter of *form*. But that, in respect to its *meaning*, the Lithuanic *lik-* is simply the English word *leave* is a matter of certainty. In short, *lik-ti* (the *-ti* being the sign of the infinitive mood) is simply the Latin *linq-uere*.

Whether this wholly demolish the doctrine to which it is opposed is another question. This power of *lik-* is certainly an objection that should not be kept back in the promulgation of it.

§ 278. *The 'ty' in twenty, &c.*—In Mœso-Gothic we find the root *-tig* used as a true substantive, equivalent in form as well as power to the Greek δεκ-άς—*tváim tigum þusandjom* = *duobus decadibus myriadum* (Luke xiv. 31); *jêrê þrijê tigivê* = *annorum duarum decadum* (Luke iii. 23); *þrins tiguns silubrinaize* = *tres decadas argenteorum* (Matthew xxvii. 3, 9).

In Icelandic, the numbers from 20 to 100 are formed by means of *tig-r*, declined like *viðr*, and naturally taking the word which it numerically determines in the genitive case.

Nom.	Fjórir tigir manna	=	*four tens of men.*
Gen.	Fjögurra tiga manna	=	*of four tens of men.*
Dat.	Fjórum tigum manna	=	*to four tens of men.*
Acc.	Fjóra tiga manna	=	*four tens of men.*

This is the form of the inflection in the best and oldest MSS. A little later was adopted the *indeclinable* form *tigi*, which was used adjectivally.*

§ 279. The Declension of the *Substantives* consists of the signs of (1) Number; (2) Case.

There are two Numbers, the Singular and the Plural. In A. S. there was a Dual; but only for the Pronouns of the true Personals. This was *wit*=*we two*, *git*=*two*. But as this was only an abbreviation of *we-two* and *ye-two*, it was a Compound rather than a true Inflection. The Plural, however, has its proper sign.

The only Case that has a *sign* is the Possessive. It has this, to some extent, for both Numbers. All the other Cases are alike in form, and agree in the negative character of having no affix whatever. They are only known as Nominatives or Objectives by the context. In A. S., as we have seen, the Declension was less limited. There was, at least, a sign for the Dative; and, in some instances, for the Ablative (Instrumental). The Mœsogothic, like the Latin and Greek, had a special sign for the Nominative; and so had the Norse; and so, to some extent, the High German.

The sign of the Plural is *-s*, or *-es*, as *father*, *fathers*, *horse*, *horses*.

The sign of the Possessive Singular is also *-s*, *as father's*, *horse's*.

The sign of the Possessive Plural is also *-s*, *as fathers'*, *horses'*.

The apostrophes by which these three forms are

* *Det Oldnorske Sprogs Grammatik*, af P. A. Munch, og C. B. Unger, Christiania, 1847.

distinguished are no part of the spoken, i.e. the actual language. They are mere expedients for making an artificial difference to the reader; in other words, for creating for the *eye* a distinction which to the *ear* has no existence.

Such is the case. The three signs are identical, and so far as they separate one case from another can scarcely be called Inflections—certainly not if we make it the part of an inflection to be *distinctive* between case and case. But this is only an accident of the present state of our language. Originally, they *were* distinct. The Genitive Singular was *-es*; the Nominative Plural *-as*; the Possessive Plural *-a*—a totally different affix.

But in the first two the vowel was dropped; and the two endings became identical, or Confluent.

To the Possessive Plural the *-s* of the Singular was extended.

Originally, then, the inflections in *-s* were *distinctive* between Case and Case, as well as between Number and Number. *Now* they require an artificial mark to distinguish them. But this is a point of spelling rather than of speech.

In the Possessive Plural there is *to the ear*, a sign only for those few words in our language that do not end in *-s*. These are *oxen*, *men*, *women*, *teeth*, *feet*, *children*, *brethren*, and *kyn*. We can, and do, say the *oxen's horns*, *the men's wives*, and the like; but we do not say the *fox-es-es tails*, or the *fatherses children*; though we might if we thought proper to do. But we do not. We eschew the accumulation of *-s*^{es}. In Scotland there is no such strong objection to it.

In A. S. though *-es* was the sign of the Possessive Case, it was only this in Masculine and Neuter Nouns. The *Feminine* sign of the Possessive was *-e*. For this extension of the *-s* to the Feminine, see pp. 315, 316.

§ 280. The Substantive has, in way of Declension, *no signs of Gender*: nothing that corresponds to the Masculine sign *-s*, as in *his*; the Feminine *-r*, as in *her*; or the Neuter *-t*, as in *what*, among the Pronouns.

This, at first sight, seems a sweeping assertion: for, so far as Gender goes, we have abundant means of distinguishing it. We have pairs of wholly different words; as *horse* and *mare*, *boy* and *girl*, *brother* and *sister*, and the like.

We have pairs of Compounds; like *he-goat* and *she-goat*, *man-servant* and *maid-servant*, &c.

Of ordinary Derivatives the commonest is that in *-ess*; as *peer*, *peeress*, *duke*, *duchess*, and others. But as these words are of foreign rather than of English origin, they are only noticed to show that they have not been overlooked. In the *-en* of *vix-en* (German *füchsinn*), and in the *ster* of *spinster*, we have native forms. Still, these are not signs of Declension. Their Plural and Possessive forms are simply those of *peer*, *duke*, *fox*, and *spinner*. They are not distinctive terminations like *-s* in *his*, and *-r* in *her*.

The Declension in the way of Gender is so fragmentary in the present English that the difference is best illustrated by languages where the inflection is fuller. Thus—in the Latin pairs of words which express difference of sex not only by the same process, but by the same syllables that we find in *duch-ess* and *peer-ess*, and which we may illustrate by the examples *genitrix* = *a mother*, and *genitor* = *a father*, the Declension is as follows:—

Sing.	*Nom.*	Genitor	Genitrix.
	Gen.	Genitor-*is*	Genitric-*is*.
	Dat.	Genitor-*i*	Genitric-*i*.
	Acc.	Genitor-*em*	Genitric-*em*.
	Voc.	Genitor	Genitrix.

Plur.	*Nom.*	Genitor-*es*	Genitric-*es*.
	Gen.	Genitor-*um*	Genitric-*um*.
	Dat.	Genitor-*ibus*	Genitric-*ibus*.
	Acc.	Genitor-*es*	Genitric-*es*.
	Voc.	Genitor-*es*	Genitric-*es*.

The syllables in italics are the signs of the cases and numbers; and these signs are the same in each word, the difference of sex not affecting them. Contrast them, however, with *domina* = *a mistress*, and *dominus* = *a master*.

Sing.	*Nom.*	Domin-*a*	Domin-*us*.
	Gen.	Domin-*æ*	Domin-*i*.
	Dat.	Domin-*æ*	Domin-*o*.
	Acc.	Domin-*am*	Domin-*um*.
	Voc.	Domin-*a*	Domin-*e*,
Plur.	*Nom.*	Domin-*æ*	Domin-*i*.
	Gen.	Domin-*arum*	Domin-*orum*.
	Dat.	Domin-*is*	Domin-*is*.
	Acc.	Domin-*as*	Domin-*os*.
	Voc.	Domin-*æ*	Domin-*os*.

Here the process of distinguishing the Gender, though not extended to every case, is widely different. In *Genitrix* and *Genitor* the sign of sex is found in the unchanging part of the theme (or crude form). In *Domina* and *Dominus* it is found on the affixes which indicate Case and Number.

The bearing of this difference for the *history* of languages, and the changes they undergo between one stage and another, is important. The *-ix* in *genitrix* is preserved up to the present time in the French *-esse*; while the inflections of words like *dame* (*domina*) are dropped throughout the whole Declension. There is a reason for this, of course; and one which readily suggests itself. But this is the very fact which makes the distinction important. If we are to talk of the difference between the Synthetic and Analytic stages of

anguages; of the *inflections* that are dropped during he passage from the one to the other; of the law, or omething akin to one, which impresses these changes with the character of order and regularity; of the substitutions in the way of prepositions for the case-ndings, and of auxiliary verbs for the signs of tense, nood, and voice; and of other similar concomitants—f we are to do this, the least we can do is to guard gainst confounding those parts of a word which are nost specially involved in these changes with those which, comparatively speaking, have but little to do with them.

Such words as *vixen* and *spinster* are words like *genitrix*; and not words like *domina*. Nor are there, at the present time, among the English *Substantives*, any words whatever like *domina*. During the earlier stages, however, of our language there were a few; e.g. *maga* = *cognatus*, *socius*; *mage* = *cognata*, *socia*; *widuwa* = *widuus*; *widuwe* = *vidua*. Of the oblique cases the most characteristic was the Possessive, which ended in *-e*, and not in *-s*.

The suffix *-ës* originally belonged to the genitive singular of some masculine and neuter substantives; it was not the genitive sign of the feminine until the thirteenth century, and then for the most part only in the Northern dialect (cp. *Lady-day* with *Lord's day*).—*Morris, Outlines, &c.*, § 98, p. 102.

Again, in respect to the Possessive Plural—

Late in the fourteenth century we find traces of the old plural ending in *-ene*, *-en* (*-ena*), as *king-en* = *of kings* (*Piers Plowman*).

Probably before the thirteenth century *-es* began to take its place:—Alre *louerdes louerd*; and alre *kingene* king.—*Old English Homilies*. Second Series—*Ibid.*

Again, in respect to the distinction of Gender in general—

'Traces of grammatical gender were preserved much longer in some dialects than in others. The Northern dialects were the first to discard the older distinctions, which, however, survived in the Southern dialect of Kent as late at least as 1340.

* * *

Therthe schok, the sonne dym becom
In *thare tyde*.'—*Shoreham.*

Here the inflection of the demonstrative shows that *tyde* is feminine.

'Be there virtue the guode overcomth alle his vyendes *thare* dyevel, the wordle, and *thet* vless.—*Ayenbite.*

Dyevel is masculine; *wordle* feminine; and *vless* neuter.'

Id.: Outlines, &c.

§ 281. *The termination in* -*s*.—We have seen that, though the three existing signs of Declension were originally distinct, they have since become Confluent, and are now identical. All, or nearly all, that still remains for consideration are the principles and details that the sound and form of this affix in -*s* exhibit; for the question henceforth will be not so much the import of -*s* in its character of a sign of Case, as the changes it undergoes as a sound according to the conditions under which it is attached to its theme. For these we are, to a great extent, prepared by what we know concerning the incompatibility of Surds and Sonants in immediate contact with each other; and also concerning the difficulty of pronouncing two identical consonants consecutively. This enables us to anticipate certain changes. Some of these are absolutely necessary, as parts of a general law of Euphony or Phonesis. Some are not necessary; but deduced from the practice of the particular language. This we shall see as we proceed.

§ 282. *The* -*s of the Possessive Plural*.—This -*s*, in the *present* English of *England*, with the exception of a few words like *men*, *teeth*, &c., where there is not,

already, an -*s* in the Nominative, is a fiction rather than a reality; in other words, it is a sign of declension which addresses itself to the ear rather than to the eye, and, so doing, is no sign of declension at all; for though we use such forms as *mens'*, *brethrens'*, *childrens'*, we avoid such as *the fatherses children*, *the sisterses brethren*, *the masterses men*. The difference, however, we indicate in *writing*.

The father's children means *the children of one father*;
The sister's brethren, the brethren of one sister;

The master's men, the men of one master;
The owner's oxen, the oxen of one owner.

But—

The fathers' children means *the children of different fathers*;
The sisters' brethren, the brethren of different sisters;

The masters' men, the men of different masters;
The owners' oxen, the oxen of different owners.

This avoidance, however, of the accumulation of *esses* is English rather than Scotch. In Scotland the practice is as follows:—

The *Possessive Plural* in Ags. ended in -a, -ra, -na, but this termination has disappeared in the modern dialects, which have replaced it by a new form in *'s*, after the analogy of the singular. In the literary English this appears in full only where *s* is not already the plural ending, as in *men*, *sheep*, *mice*, poss. *men's*, *sheep's*, *mice's*; when the plural ends in *s*, euphony requires the second *s* to be omitted and its place indicated by the apostrophe alone: thus, *boys'* for *boys's*. But in our dialect this euphonic contraction does not take place, and thus the possessive plural, as well as the singular, is regularly formed by adding *'s* to the nominative. Thus, the *kye's huorns*, cow's horns, *the meyce's huoles*, mice's holes, *the bairns's clease*, the children's clothes, *the færmers's kye*, farmers' cows, *the doags's lugs*, dogs' ears. As in the singular the apostrophe must be pronounced as a connecting vowel after *s* sounds; men's, kye's = (msenz, kaiz), but bairns's, doags's, meyce's = (bernziz, doogziz, meisiz).—*Murray, Dialect of the Southern Counties of Scotland*, p. 164.

§ 283. *The sound of -s as Surd or Sonant.*—

General as is the use of the letter *-s* as a sign of the Possessive Singular and the Nominative Plural, it is a sign in the way of spelling rather than of speaking. We *spell* as if it were *s*; but, in the great majority of cases, we sound it as *z*.

In some cases we are obliged to do so—

1. Thus: *slabs*, *slaves*, *lads*, *blades*, *dogs*, &c., are words which we can spell, but which we cannot pronounce. We pronounce them *slabz*, *slāvz*, *ladz*, *blādz*, *dogz*, &c.

2. Words like *hills*, *drums*, *hens*, *bars*, *days*, *fleas*, *bows*, &c. we *can* pronounce as they are spelt; but we do not. The *s*, in all these words, and in all words like them (i.e. all words ending a liquid or a vowel), is sounded as a *z*.

3. If the last sound of the singular be that of *s*, *z*, the *sh* in *shine*, or the *z* in *azure*, the addition is that of the sound of the syllable *-ez* (spelt *-es*); as *loss-ez*, *kiss-ez*, *blaz-ez*, *haz-ez*, *blush-ez*, *lash-ez*, spelt *loss-es*, *kiss-es*, *blaz-es*, *haz-es*, *blush-es*, *lash-es*.

The true rule, then, for the Inflections of the Substantive is that it consists of the addition of the *sound of s modified according to the termination of the root.*

Such is the rule as one of Phonesis in general. The exceptions to it, or the words wherein the final sound of the fundamental word is accommodated to that of the affix, form a small, though somewhat obscure class. The change in this final consonant of the main word is, from Surd to Sonant, and the Surd thus changed is always one of the *Continuous* divisions; i.e. the change is either from *th* to *dh*, or from *f* to *v*.

(1) From *th* to *dh*.—This division contains the words *oath*, *youth*, *bath*, *path*, and others; but the evi-

dence as to the extent to which each individual word is changed is obscure; inasmuch as, whatever may be the sound, the spelling is the same. There are, certainly, some speakers who pronounce the plural forms *baths*, *mouths*, *oaths*, *paths*, *truths*, &c., as if they were spelt *bathce*, *mouthce*, *oathce*, *pathce*, *truthçe*, &c.; i.e. with the *s* sounded as in *seal*. But it is equally certain that others pronounce it as if the words were spelt *badhz*, *moudhz*, *oadhz*, *pathz*, *trudhz*, i.e. with -*s* sounded as the *z* in *zeal*.

(2) *From f to v.*—Here we limit ourselves, in the first instance, to words of English, such as *loaf*, *knife*, &c., as compared with words like *chief* and *brief* of foreign origin.

(*a*) Final -*f* preceded by a long vowel—*leaf*, *sheaf*, *thief*, *loaf*; in the Plural *leaves*, *sheaves*, *thieves*, *loaves*. Exceptions: *reef*, *reefs*; *oaf*, *oafs*; *hoof*, *hoofs*; *roof*, *roofs*.

(*b*) Final -*f* preceded by -*l*—*calf*, *half*—*elf*, *self*, *shelf*—*wolf*; in the Plural *calves*, *halves*—*elves*, *selves*, *shelves*—*wolves*.

(*c*) Final *f* preceded by -*r*—*scarf*; in the Plural *scarves*. That this is thus spelt and sounded is certain. With *dwarves* and *wharves* from *dwarf* and *wharf* the spelling is exceptional, and, in all probability, the pronunciation more so.

(*d*) Final *f* preceded by *ī* sounded as the -*igh*- in *night*—*knife*, *life*; in the Plural *knives*, *lives*. Exceptions: *fife*, *fifes*; *strife*, *strifes*.

In all these words the Possessive Singular keeps to the original -*f*-; and that both in speaking and spell-

the loaf's weight; the knife's edge; the leaf's

4. *Plural of words ending in a vowel or a*

g.—Here we have the addition of -*s*, as usual:

and, as usual, it has the sound of *-z*, inasmuch as the vowels and diphthongs, in English, affect the sibilant which follows them just as it is affected by a Sonant Mute. In this there is nothing particular. The particular question which presents itself concerns the character of the vowel. It may be either *long* or *short*. It may be long like the *-ōēs* in *cargōēs*, and *embargōēs*, or like the *-ēē* in *-bēēs*, and the *-ēā* in *flēās*; or it may be short like the *-ĕe-* in *ladĕes*, *citĕes*, *vallĕys*, &c., which are sounded *ladĕz*, *citĕz*, *vallĕz*, rather than *ladeēz*, *citeēz*, *valleēz*, &c.

This depends upon two points: (1) the character of the vowel as Broad or Slender; and (2) the nature of the syllable as Accented and Unaccented: the rules being as follows:—

(a) When the syllable is accented, the Vowel, whether Broad or Slender, is *long*; as *days*, *ways*, *blows*, *snows*, *hoes*, *pews*, *flews*, *flies*, *sighs*, *boys*, *hoys*, *teas*, *seas*, *fleas*.

(b) When the Vowel is *un*accented, the vowel, if broad, is *long*; if slender, *short*; as *caraways*, *runaways*, *holidays*, *cargoes*, *embargoes*, *heroes*, *echoes*, *grottoes*, *folios*, *cuckoos*; but words like *lady*, *baby*, *valley*, *money*, &c., give *ladies*, *babies*, *valleys*, *moneys*, &c., sounded *ladĭz*, *babĭz*, *vallĭz*, *monĭz*, &c.

This is the rule when we consider the language as it is *spoken*: the distinction between the Broad and Slender, and the Long and Short Vowels, being the basis of the distinction in *speech*. The exposition of details is generally founded on the *spelling*.

It cannot be said that there is much difference in the result. It matters very little, in practice, whether we say the slender vowels are long '*when the syllable is accented*,' or '*when the word is a monosyllable*;' inasmuch as it is only in monosyllables that the final syllable (which is also the first) is accented at all. And there are other cases where the practice is equally indifferent. Still, in language we must look to the speaking rather than to the writing. Moreover, if it were not so, the artificial character of our orthography would condemn it; and in this part of our

etymology it is more than usually artificial. Everything conceals the true nature of the words which, in *speaking*, end in vowels.

It is probable that at least four-fifths of the words connected with the spelling of them, end in either *-e*, as *made*, &c., or *-y*, as *quantity*, &c. But as the *-e* is mute, the true ending of the words in which it appears is consonantal. Then *-y*, when *un*accented, is sounded as the *e* in *be*; when accented as *y* in *by*. Finally, come the words like *shadow*, *thorough*, *through*, &c., where the vowel was originally followed by a consonant; in other words was anything but final: the fact being that true vowel endings are very rare in the older English.

§ 285. *The -s- in 'houses.'*—In *house* the *-s* is sounded as in *seal*; in *houses* as *-z* in *zeal* (*houziz*). The change may be due to the influence of the final *-s*; which, as following a vowel, is changed into its corresponding sonant.

Of the * * * change of *s* and *th* into their voice sounds, *z* and *dh*, in the plural, recognised in the English pronunciation of houses, mouths, truths, etc. (houz*yz*, moudhz, truudhz), I do not find any traces in the Scottish dialects.—*Murray, &c.*, p. 158.

To this class of exceptions belong the words *pence* and *dice*. In both the form is collective rather than plural. *Sixpence* means not six separate *pennies*, but a single coin equivalent to them, while *dice* means a pair of *dies* for the purpose of gaming rather than a number of *dies* for the purpose of stamping. This tells us why the *s* is sounded as in *seal* rather than as it is sounded in *zeal*.

Why the words are spelt with a *-ce* is a matter of Orthography. If spelt with *-s* they would run the risk of being sounded as *pens* and *dies* (*penz*, *diez*), and if there were no mute *e* to follow the *c*, the result would be the forms *penc* and *diec*, which would run the risk of being sounded *dyke* and *penk*.

§ 286. *Eaves—peas*, &c.—Up to this time the *-s* under consideration, whatever may have been its sound or its import, has always been the sign of either a

Possessive Case or a Plural Number. It is clear, however, that it may present itself under another character, and, what is more, may create ambiguities by doing so. It may be no sign of either Number or Case; no affix at all; but, on the contrary, a part of the fundamental word or theme. Should such a singular have a *collective* sense, the *-s* may make it take the guise of a Plural. Such words are—

(*a*) *Eaves*; in A. S. *yfes*, *efese*=*edge*; a purely German word.

Pox=*pock-s*.—The *-s* is no part of the original word—*pockmark*, *pockmarked*.

Alms; in A. S. *ælmesse*; and, as such, an old word in our language; though not a German one; but, on the contrary, from the Greek *ἐλεημοσύνη*.

Summons.—From the French *semonse*, *somons*. Plural *summons-es*.—*Morris*, § 91.

Riches.—Word for word the French *richesse*, but doubly disguised; (1) by the change of accent, and (2) by the change of the sound of *-ss* to that of *z*.

Pains, *means*, *amends*.—From the French *peine*, *moyen*, and *amende*. *Substantives*.

News.—From the French *nouvelles*, Anglicised in form, and, as an English word, an Adjective with a Substantival Plural.

(*c*) *Peas*.—Derived from the Latin *pisum*. Hence, the *-s* is, in origin, no sign of Number, but the *-s* of the theme, or fundamental word. *Pisa*, *peases*, and *peasen*, all found in the early stage of our language, are better forms. The most irregular form, however, is the singular itself, i.e. *pea* deprived of its final consonant. The principle of the confusion is clear. *Peas* passes for a Plural; and *pea* is deduced from it as its Singular.

(*d*) *Physics*, *Optics*, *Politics*, *Ethics*, *Pneuma-*

tics, *Hydraulics*, *Mechanics*, *Dynamics*, *Statics*, &c. —All these are of Greek origin, and all derived from Adjectives of the Plural Number and the Neuter Gender. This for *φύσικος* = *connected with*, or *relating to* *φύσις* = *nature*, was *φύσικα*. The Feminine Singular of the same word was *φυσίκη*. From this feminine and singular form are derived the words like *Physic*, and the corresponding series of scientific terms in French, which end in *-ique*, and are all, in form, *singular*. From the neuter and plural are derived those like *Physics*, &c., in English.

§ 287. *Signs of Number not ending in* -s.—Besides the usual plural forms in *s*, there are four other methods in English of expressing a *number* of objects.

(1) *Change of vowel.*—This class consists in the present English of the following words—

1, 2. *Man*, singular; *men*, plural. The vowel *a* changed into the vowel *e*. The plural of *woman* is, to the ear, *wimmen*, i.e. it has the vowel changed.

3. *Foot*, sing.; *feet*, pl. The vowel *oo* (sounded as the *u* in *could*) changed to the vowel *ee*. The *Old* Saxon has *fôti*. This suggests the notion that the present *-ee* (in A. S. *fêt*) is the result of *Umlaut*; the change from *-o-* to *-ee-* being retained after the affix *-i*, which initiated it, has been lost. How far the process explains all the cases of a similar change is another question. The words in which this real, or apparent, Umlaut occurs are Collectives rather than true Plurals; indeed, *feet* is such to a certain extent, though not so decidedly as *mice*, *lice*, and *geese*, and still less so than *teeth*; which is as much Singular as Plural. Now, in Welsh, and other languages, we get the apparent paradox of a Singular formed from a Plural; which is not quite the case, the real fact being that the older form

is a *Collective*; from which is formed a Singular. This is a caution against referring too much to the sole action of Umlaut.

4. *Tooth*, sing.; *teeth*, pl.: *goose*, sing.; *geese*, pl. The vowel *oo* (as in *food*) changed to *ee* as in *feet*.

5, 6. *Mouse*, *louse*, sing.; *mice*, *lice*, pl. The diphthongal sound of *ou* is changed to that of *i* (as in *night*). The combination *ce* used instead of *se*, for the same reason as in *pence* and in *dice*, i.e. lest, if written *mise*, *lise*, the words should be pronounced *mize*, *lize*.

(2) *Addition of* -en *or* -n.—In the present English the word *oxen* is the only specimen of this form in current use. In the older stages of our language the number of words in *-en* was much greater than at present.

hos-en	=	*hose or stockings*	*scher-en*	=	*shire-s*
shoo-n	=	*shoe-s*	*doghtr-en*	=	*daughter-s*
ey-ne	=	*eye-s*	*sustr-en*	=	*sister-s*
bischop-en	=	*bishop-s*	*uncl-en*	=	*uncle-s*
eldr-en	=	*elder-s*	*tre-en*	=	*tree-s*
arw-en	=	*arrows*	*souldr-en*	=	*soldier-s*.

The *-en* in *oxen* is the *-an* of the so-called *weak* Declension, for whatever may be the case with the other instances *ox* was certainly a weak substantive.

(3) *Children*.—Here the analysis is child-*er*-*en*, the *-en* being the *en* in ox-*en*, and the *er* or *-r* that of child-*er*, which is the ordinary Northumbrian form. In A. S. the *r* was followed by an *-u*, the sign of the nominative case in the original word: but when *lam-*, after becoming *lam-(er)-u*, undergoes contraction, the euphonic insertion of *b* between the *m* and the *r* takes place; and then, because the letter presents itself in the plural, it passes for a part of the simpler singular form.

(4) *Combination of two of the preceding methods.*—Three words occur in this class.

1. *Kyne=cows;* a plural formed from a plural by the addition of *-n*; as *cow, kye, ky-ne. Kye* is found in provincial English, and *cý* in Anglosaxon.

2. *Children*; a plural formed from a plural by the addition of *-en*; as *child, child-er, child-er-en= children.*

3. *Brethren*; a plural formed from a plural by the addition of *-en;* as *brother, brether* (?) or *brethre, breth-eren, brethren.*

§ 288. *Operative and Obsolete processes.*—By adding the sound of the *-s* in *seal* to the word *father*, we change it into *fathers.* Hence the addition of the sound in question is the process by which the Singular form becomes Plural.

The process by which *ox* is changed into *ox-en* is by a similar addition of the syllable *-en*, with a power sufficiently allied to that of the *-s* in *fathers*, to make both forms pass for Plural.

Now whether the meanings of these two affixes are, or are not, equally Plural, is another question. The fact which we now notice is that of the addition of *-s* being a process now in operation, and activity, which the addition of *-en* is not. If a hundred new substantives were introduced into our language next year, not one of them would form its plural after the fashion of *oxen*—nor yet after that of *teeth*, or *mice.* Indeed, they would, one and all, form it in *-s*; and in nothing else. This is a single instance of the difference between a living, vital, effective, active, practical, current, or operative (it matters little what we call it) process, and a dead or obsolete one. It is a single instance, however, out of many. Most of our Inflections are obsolete. There are two signs of Tense in our Verbs; one ending in *-d* or *-ed*, or *-t* (*call, called*), and the other formed by changing the vowel (*speak, spoke*). But no new Verb will ever form its past tense on the latter model. As for the Declension of the Pronouns, for all that we have said as to its historic importance, and the amount of old cases and genders that it has preserved, it is, from first to last, as an Operative system, wholly obsolete. This is the difference between Operative and Obsolete process on a large scale.

§ 289. *The Adjective.*—Of true signs of Inflection the Adjective, in the present English, has not one.

In the Anglosaxon stage of our language (as may be seen in § 81) it had an excess rather than a deficiency.

But though they are not true Inflections, the degrees of Comparison must be noticed.

§ 290. *The Comparative Degree.*—This can be formed from the simple adjective by the addition of *-er*, as *cold-er*, *rich-er*, *dry-er*, &c. The process is a remarkably regular one; and the forms that require special notice are few.

Near, *nearer.*—The first of these forms was in A.S. *neah*; with *nearre*, *near*, and *nyr* for its comparative. Hence, the present *-r* in *near* is no true *r* at all, but the *arr* in *idearr* and *Mariarr* noticed p. 250.

Farther.—This is the comparative of *far*; and means *more far*, or *more distant.*

Further.—This is the comparative of *fore*; and means *more forward*, *more in front.* In A.S. *fyrðre.* The dental (*th*, *d*) occurs in the O.H.G.

Former.—In A.S. *forma* was the *Superlative* of fore; the *-m-* being the *-m-* in the Latin *primus*, and the Lithuanic *pirmas.*

§ 291. *The Superlative Degree.*—So far as its form goes, the Superlative is derived from the Positive by the addition of *-est*; as *cold-est*, *rich-est*, *low-est*, *dry-est*, from *cold*, *rich*, *low*, *dry.*

The only forms that require special notice are those that look the simplest; viz. those in *-most*, as *midmost*, *foremost*, *&c.* But these we have already explained. To forms like the following, themselves Superlative—

Anglosaxon.	*English.*	*Anglosaxon.*	*English.*
innema	inmost	forma	foremost.
ûtema	outmost	æftema	aftermost.
siðema	latest	ufema	utmost.
lætema	latest	hindema	hindmost.
niðema	nethermost	midema	midmost.

was added a second sign of Superlativity, *-st.* This does not mean that no such compound has not been formed by the simple addition of *most* as a whole word. No absolute rule can be given in cases of this kind.

Hence, in the present English, the different parts of the syllable *most* come from different quarters. The *m* is the *m* in the Anglosaxon words *innema*, &c.; whilst the *-st* is the common sign of the superlative. In separating, then, such words as *midmost* into its component parts, we should write—

mid-m-ost	not	mid-most	fore-m-ost	not	fore-most
ut-m-ost	—	ut-most	in-m-ost	—	in-most
up-m-ost	—	up-most	hind-m-ost	—	hind-most

In certain words the syllable *m-ost* is added to a word already ending in *er*; that is, to a word already marked with the sign of the comparative degree.

neth-er-most	hind-er-most
utt-er-most	out-er-most
upp-er-most	inn-er-most

Here the addition is *most*, as a simple word; and the result is a *Compound*—not a *Derivative*.

Having accounted for the *m* in the words just mentioned, we can account for the *m* in the word *former*. The superlative was *forma*, and *former* was a comparative, catachrestically, derived from it.

§ 292. *Comparison of Adverbs.*—Adverbs, like adjectives, take degrees of comparison, though not to the same extent. In *the sun shines bright*, the word *bright* means *brightly*; and although the use of the latter word is better grammar, it is not better English.

The sun shines to-day brighter than it did yesterday, and to-morrow it will shine brightest.—Here the sense is adverbial.

In words like *oftener* and *seldomer* the adverbial comparison is beyond doubt.

Adverbs, then, take the degrees of comparison: and not only do they do this, but the history of their forms is important. In *Anglo-Saxon* there were *two* forms; one in *-re* and *-este*, the other in *-or* and *-ost*. Now the first of these was the form taken by adjectives; as *se scearpre sweord = the sharper sword*, and *se scearpeste sweord = the sharpest sword*: the second, the form taken by adverbs; as, *se sweord scyrð scearpor = the sword cuts sharper*, and *se sweord scyrð scearpost = the sword cuts sharpest.*

More than this—the adverbial form had a tendency to make the preceding vowel full: the adjectival, a tendency to make it small. Thus—

Positive.	*Comparative.*	*Superlative.*	
Lang,	Lengre,	Lengest,	*Long.*
Strang,	Strengre,	Strengest,	*Strong.*
Geong,	Gyngre,	Gyngest,	*Young.*
Sceort,	Scytre,	Scyrtest,	*Short.*
Heáh,	Hyrre,	Hyhst,	*High.*
Eald.	*Yldre,*	*Yldest,*	*Old.*

Of this change, the word last quoted is a still existing specimen, as

old, *elder*, and *older*, *eldest* and *oldest*. Between the two forms, however, there is a difference in meaning, *elder* being used as a substantive, and having a plural form, *elders*. A more important word is *rather*. Here, we pronounce the *a* like the *a* in *father*, or full. Nevertheless, the positive form is small, the *a* being pronounced as the *-a-* in *father*. *Rāthe* (*rāther*, *rāthest*) are Adjectival forms; (*rathe*) (pronounced as the *fath-* in *father*); *rather*, and (*rathest*) are Adverbial.

§ 293. *The Mœsogothic Comparative and Superlative in -s, or -z.*—The formulas which give us the difference between the Degrees of Comparison have been given as they are found in the generality of grammars; and, it may be added, that they are of remarkable simplicity and regularity. The doctrine, too, of the connexion between the Comparatives in *-er* and words like *under*, *over*, *whether*, *either*, &c. (for which see § 235), wherein there is a notion of dualism, or duality, in a more general sense, has been recognised. Finally, no explanation has been given of the words *worse* and *worst*.

There is a reason for this. The *-s-* in the words *worse* and *worst* is involved in an explanation which introduces a new element into our criticism, and one which, to some extent, invests the ordinary process with an artificial, or non-natural, character.

The Comparative Degree is formed from the Positive by the addition of *-er*, the Superlative by that of *-est*. Nothing is much simpler than this.

But the Superlative may also be formed from the comparative by changing the *r* of the comparative into *s*, and adding *t*; as *dark-er*, *dark-es*, *dark-es-t*, *cold-er*, *cold-es*, *cold-es-t*, &c. This is anything but simple.

We can understand, however, why it must be recognised when we ask what was the comparative of the Mœsogothic. It was *not* formed by the sound of *-r*, but by the sound of the sibilant *-s*, *ts*, or *z*: and words like *ald-iza*, *bat-iza*, *sut-iza*, were the original forms of what became in old High-German *alt-iro*, *bets-iro*, *suats-iro*, and in English, *old-er*, *bett-er*, *sweet-er*.

Vairsiza, then, in Mœsogothic was the form of the O. H. G. *wirsiro*. the M. G. G. *wirser*, the O. S. *versa*, the A. S. *vyrsa*, and the O. N. *vërri*, the Danish *værre*, the Swedish *värre*.

The Mœsogothic form in the sibilant introduces a serious complication in the doctrine of dualism; and I do not know that it has been successfully unravelled.

§ 294. *Defect and Complement.*—For *good*, as a positive form, there are now no such comparatives and superlatives as *gooder* and *goodest*. Hence, *good* may be called *defective*. For *better* and *best* there is, now, no such positive form as *bet*. This is *defect* again.

But what is wanting in the way of degrees of comparison between the two roots is made up by the other. And so it is in other cases.

This brings in the distinction *between a sequence in Logic and a sequence in Etymology.*

The ideas or notions of *thou*, *thy*, *thee*, are ideas between which there is a metaphysical or logical connection. The train of such ideas may be said to form a sequence, and such a sequence may be called a logical one. The forms *thou*, *thy*, *thee*, are forms or words between which there is a formal or an etymological connection. A train of such words may be called a sequence, and such a sequence may be called an etymological one. In the case of *thou*, *thy*, *thee*, the etymological sequence tallies with the logical one. In the case of *I*, *my*, *me*, the etymological sequence does *not* tally (or tallies imperfectly) with the logical one. Applying this to words like *good*, *better*, &c., we see at once, that, whilst some are deficient in their Comparative and Superlative, others are deficient in their Positive forms. The *defective* character, however, of this class of words is not all. It must be remarked that the forms which one word wants are made good by those which another possesses. Hence, there is not only *Defect*, but what may be called *Complement* also. The word *good* fills up what was wanting to the forms *better* and *best*.

These relations between defect and complement will meet us again and again. Simple *Defect* is common in language. Defect combined with *Complement* is not uncommon. *Irregularity*, with which they are often confounded, is a very different phenomenon, and, comparatively, at least, a rare one.

§ 295. *Retrospect, Amount of Declension.*—We have now gone through that part of Grammar which is

ordinarily assigned to the Noun, whether Pronoun or Noun Proper; and, in respect to Nouns Proper, we have considered both the Substantive and the Adjective (or the *Nouns* Substantive and the *Nouns* Adjective), as opposed to the *Pro*noun; which wrongly (as will be argued hereafter) is held to be something less than the Noun.

We have notified the manifest and undoubted difference between forms like *genetrix* and forms like *domina*; the latter only of which gives us *Declension* in the way of Gender, a true declension; and we have seen that, in the present English, no such feminine substantives as *domina* are to be found, though there are plenty like *genetrix*.

Among the Pronouns, in the *-t* of *it*, *that*, and *what*, we have found a true instance of Gender expressed by Declension; not, however, after the fashion of *domina*, but after that of *id*, *illud*, and *quod*. But the declension of the Pronouns is different from that of the Substantives.

That of the Adjective is also different from that of the Substantive, but identical with that of the Pronoun—different from what it is in the Latin and Greek.

Of this Pronominal Declension the Adjectives of the present time are wholly denuded.

Hence, if we wish to measure the extent of our Inflections in the way of Declension, or, in other words, the Inflection, of the Noun, we must take the Substantive and the Pronoun together, and ask what it amounts to. But before doing this we must recognise two limitations.

One of these has already been indicated. An Obsolete Inflection, though we cannot exactly say that it is not an inflection at all, is certainly one of an imper-

fect character. At any rate, there are degrees in what we call the efficiency of inflectional forms, as Operative or Obsolete.

There are, also, degrees in their efficiency in another respect. An affix, or any other characteristic, which is limited to a single function, and has only one import, is, certainly, more Distinctive than one which has several functions, and is common to a variety of words. Thus, while the Greek and Latin distinguish the Genitive Singular, the Nominative Plural, the Genitive Plural, and the Third Person Singular Indicative by inflections, as *-ου*, *-οι*, *-ων*, and *-ει* (*λόγου*, *λόγοι*, *λόγων*, *λέγει*), and as *-i*, *-a*, *-orum*, and *-at* (*regni*, *regna*, &c.), the single sign *-s*, in English, serves for all four.

The merest modicum of reflection tells us that this distinctive character is one of the most natural conditions of an inflection. But what is the case in English? In the *older* English it was much what it is in Latin and Greek. The old sign of the Genitive Singular was *-es*; that of the Nominative Plural, *-as*; that of the Third Person Present *-eth*. But the *e* has been lost in the first of these three forms, and the *a* in the second, whilst in the third there has been a double change; for not only has the *e* been dropped, but the *-þ* has become *-s*, and the signs of the three originally different parts of the Noun and Verb have become identical, so that the differences in function can only be inferred from the context.

In Greek and Latin, and in the older English, we might know by the mere inspection of an isolated word in *-ου*, *-οι*, or *-ει*—*i*, *a*, or *at*—*es*, *as*, or *-eth*, what the distinctive character of the last syllable was. In the *-s* of our Genitive Singulars, our Nominative Plurals, our Genitive Plurals (to a certain extent), and our Third Persons Singular of the Present Tense of the Indicative

Mood of the Verb, we have only one sign of Inflection; and when the fundamental word ends in *-s*, as in *alms*, &c., we do not know, except through information from another quarter, whether it is an Inflection or not. All this deprives our signs of Inflection—I had almost said our single sign—of the element of Distinctiveness. Not, indeed, wholly, but to a great extent; and the fact of its doing so deprives them of much of their import as Inflections. That this Indistinctiveness belongs rather to the present stage of our own particular language than to language in general, we have seen. But we must take our language as we find it, and value our Inflections accordingly. It is certain that they are not, now, such good inflections as they were at first, and this is just what we have seen to be the case with obsolete inflections like the *-t* in *that*, &c. So far, then, as Inflections, to fulfil their proper functions, are either Operative or Distinctive, we have but few of them.

What have we when we take in as many as we can? And what have we when we take them with what I hold to be their legitimate, and in certain cases, their necessary, limitations?

By going to the Pronouns we may get (1) the Neuter in *-t*; (2) the Feminine Genitive in *-r*; (3) the Masculine Accusative *when*, preserved as an Adverb of Time; (4) the Feminine Dative *where*, similarly preserved as an Adverb of Place; and (5) the instrumental *why*, and the *the* in *all the more*, &c.

All these are Distinctive. On the other hand, they are all Obsolete.

Whether we admit these drawbacks or not is a point upon which there may be differences of opinion. One thing, however, is certain, viz., that, if we do admit them, the whole Declension of the Noun consists in the

sound of the letter -*s* and its Sonant variety—in this and nothing more.

Nevertheless, this, with the limitations suggested, is the Declension of the Noun, and if more than usual has been said about it, there is a reason for saying it.

The same, *mutatis mutandis*, will be said when we have considered the Conjugation of the Verb.

The two will give us the amount of our *Inflection*, and when we have seen how small this is, we shall have a fair measure of the extent to which our language is Analytic rather than Synthetic. Indeed, it is the most Analytic language in the world; a fact of no slight importance.

CHAPTER VI.

VERBS OF TWO KINDS—THE INDETERMINATE—THEIR RELATION TO THE NOUN—THEIR DECLENSION—THE VERBALS—'*INDETERMINATE*' AND '*FINITE*,' AS NAMES.

§ 296. *Verbs of two kinds. Indeterminate and Finite.*—The Verb which will be considered in the present chapter will be called the *Indeterminate* Verb. Its opposite, the subject of the next chapter, will be called the *Finite* Verb. The meaning of the two words, and the value of the difference of their import, will be explained, or will explain itself, as we proceed.

The leading distinction between the two is their relation to the Noun.

We have seen that, from the accidents of their respective names, the *Noun* Substantive and the *Noun* Adjective, as Parts of Speech, have obtained a kind of prerogative over the *Pronoun*, which passes for less of

a *name* than it really is. We shall now see that the Verb has established something of the same kind as against the *Noun*. The Noun is the *Name*. The *Verb*, however, is the *word—par excellence*. It may be this, and more than this; but in the sense that is required for ordinary Grammar it is something less.

Both Verbs and Nouns are inflected; and there are, as already stated, two kinds of Inflection, viz., Declension and Conjugation. Nouns are declined, Verbs conjugated. Nouns are generally declined; rarely *conjugated. Verbs are both conjugated and declined. One term, therefore, does not exclude the other. Nouns have Gender, Verbs have not. But Verbs have both Case and Number; and, so far as they have this, are declined. On the other hand, they have Voice, Moods, and Tenses, which Nouns have not. Above all they have *Persons*. In this last inflection the distinction between the two Parts of Speech most especially lies.

§ 297. Nouns are Declined, Verbs are both Declined and Conjugated.

The declension of verbs is a fact which should never be overlooked; otherwise we run the risk of drawing a broader line between Verbs and Nouns than the structure of language warrants. Without doubt the difference is both important and striking, and the two classes are natural. This, however, is wholly insufficient to put them in anything like *contrast* to one another. Though the noun has no Moods and Tenses, it cannot be said that the verb has no Cases. More than this. If, on the strength of its decided verbal character, we connect the participle with the verb, the inflection of the verb gives us not only cases, but Genders as well; for, although, in the present stage of our language, the par-

* For *Conjugated* Substantives, see § 308, and note.

ticiples are uninflected, in Anglo-Saxon their inflection was as full as it was in the Greek and Latin, and as it is in many modern languages. But without having recourse to the Participle, which is generally, though not consistently, treated as a separate part of speech, the Infinitive Mood, along with the Gerunds and Supines, where they exist, is, for most purposes, a Substantive. In Old High-German we have *blasennes*=*flandi* and others. We may call this a Gerund if we choose. We may also, if we choose, call to *blasenne* a Supine; nevertheless, the result is a Noun in a Case. This is because the name of an action is an Abstract Noun. When we connect it with the idea of an agent we get something concrete. But this gives us Persons, or, at any rate, Agents. A horse may *run*, a man may *run*, a stream may *run*, time may *run* (or *fly*). But if I wish to have the conception of *running* alone, I must separate, or *draw off*, from the agent an action which is something which I can imagine, but which I cannot perceive through any of my senses. I can see a *man* in a *state of happiness*, and I can see a *horse* in the *act of running*. *Happiness*, however, without some happy object, or *the act of running* without some object that runs, I cannot perceive; though I can imagine it. Nevertheless, both are Substantives; one being the name of a Quality, the other that of an Action.

In English we have such lines as

To err is human, *to forgive* divine—
To be or not to be, that is the question—

in which a substantive in the nominative case is represented by a verb with a preposition before it. *To err* means *error*, and *to forgive* means *forgiveness*.

In Greek we find

τὸ φθονεῖν = *invidia*
τοῦ φθονεῖν = *invidiæ*
ἐν τῷ φθονεῖν = *in invidiâ*.

This is because the name of any action may be used without any mention of the agent. Thus, we may speak of the simple fact of *walking* or *moving*, independently of any specification of the *walker* or *mover*. When actions are spoken of thus indefinitely, the idea of person has no place in the conception; from which it follows that the so-called infinitive mood must be at once Impersonal. But the ideas of relation in time and space *have* a place in it. We can think of a person *being in the act of striking a blow*, of his *having been in the act of striking one*, or of his *being about to strike one*; and in like manner, we can think of a person who *is sleeping*, *is about to sleep*, or who *has slept*. In other words, can think of the act, or condition, of a *striker*, or a *sleeper*, as a simple act of *striking*, *sleeping*, as one alone in present, past, or future time; and, when we think of it apart from the particular agent, we think of it simply as an act, state, or condition; and of this act, state, or condition, the words *strike* and *sleep* are *names*, much in the same way that *redness* or *strength* are *names* for the attribute suggested by *red* and *strong*.

And as *redness* or *strength* can be Declined, so can *strike*, and *sleep*. In respect, then, to their Inflection, Verbs are (1) related to the Noun; and (2) characterised by certain peculiarities of their own.

§ 298. *Special relations of the Indeterminate Verb to the Noun.*—So far as the Verb is related to the Noun it is Declined. So far as it is characterised by peculiarities of its own it is Conjugated.

The relation of the *Indeterminate* Verb to the Noun is twofold.

With the Adjective it is related through the Participle; concerning which no more need be said; since the Participles are generally connected with the Verb,

and treated as a part of it. Their Declension, however, is Adjectival. Both were fully declined in Anglosaxon.

§ 299. *The Verbals.*—Those Substantives which stand in the same relation to the Verb as the Participles stand on the side of the Adjectives are the *Verbals.* These are (1) the name of the act, or state, itself, and (2) the name of the agent. The former ends in *-ing*; and may be called the Verbal in *-ing.* The latter ends in *-er*; and may be called the Verbal in *-er.* They are correlative to one another. *Hunting* is the act of one who *hunts.* *Hunter* is one who performs the act of *hunting.* The same is the case where, instead of an act, we have a state or condition. *Sleeping* is the act of one who *sleeps*; i.e. of one who in this respect is a *sleeper.*

§ 300. *The old Declension of the Verb.*—In the older stages of our language there was a true Infinitive Mood which ended in *-an*, as *bærnan=burn*, *lufian =love.* When this was preceded by *to*, *-an* became *-enne*; as *to lufienne = to love*, *to bærnenne = to burn.*

This A. S. form in *-nne* has been noticed already; but it will perplex no one who has gone through the elements of the Latin grammar, and knows what is meant by an Infinitive Mood or a Gerund. Such a reader will at once compare *lufian = love* with *amare*; and *bærnan=burn* with *urere*; whilst *to lufienne=to love* he will compare with *ad amandum*; and *to bærnenne=to burn* with *ad urendum.*

Both the Gerunds and the Supines in Latin are declined as Nouns.

The Latin, in words like *amari* and *audiri*, *moneri* and *regi*, shows that the Indeterminate Verb may approach the character of a Noun in both *Voices*; and the

Greek, which uses such combinations as *τοῦ τύπτεσθαι, τοῦ τύφθηναι*, does the same.

Here, then, we meet with an approach on the side of the Verb to the Noun, just as, in the Verbals, we met with an approach to the Noun on the side of the Verb.

In the Infinitive Moods, the Gerunds, and the Supines we have the name of the action only—not the name of any agent. Hence, it is with the forms in *-ing* that these Infinitive forms are most especially compared: and the Noun is the Noun Substantive.

§ 301. *'Indeterminate' and 'Finite' as names.*—In all these forms the name of an agent is conspicuous for its absence—conspicuous for its absence whether the Verb convey the notion of an act or a state. The Verbs, then, are essentially *Im*personal. As such they are Abstractions; but, as every act or state has some person or thing which makes it such, it is wholly indefinite, or indeterminate in this respect.

Unfortunately, however, we have no recognised name for them, or the division to which they belong. *'Impersonal'* is used in another sense, though, theoretically, it is by far the best name; inasmuch as the Verb of the other division, between which the whole class is divided, is characterised by having Persons. *'Infinitive'* is used in too limited a sense. If it were not so, it would be the second-best name; inasmuch as the opposite class is called *'Finite.'*

In comparing, and sometimes contrasting, these two classes, I call the second by its ordinary name, and call the former *'Indeterminate.'* This will include not only the *Infinitive* Mood, but the *Gerunds* and *Supines*; or their equivalents. The two great points of contrast are the absence or presence of the name of (or something suggestive of the name of) the agent;

nd, connected with this, their respective relations to he Noun.

§ 302. *The form in -ing and the Present Participle.*—The original Vowel of this Verbal Abstract was ıot *-i-* but *-u-*; as in *clœnsung*, *hwistlung*. Its oblique case when governed by *-on* was in *-e—on clœnsınge*, *on hwistlunge*, &c.; afterwards *a-cleansing*, *a-vhistling*, &c.

These in the present English both change the *-u-* nd drop the final *-e*; and *cleansing* and *whistling* are he result.

When, besides this, the prefix *a-* drops off, the result s *I was whistling*, *I was cleansing*, and the like.

But this *-ing* is the sign of the Present Participle, vhich began with the termination *-nd*, and ends in *ing*; as A. S. *lufiand*, now *loving*, &c., &c.

This is Confluence on a large scale, for the change is niversal.

More on this point will be said hereafter in '*Syntax*.'

CHAPTER VII.

ERBS OF TWO KINDS.—THE FINITE.—THE SIGNS OF PERSON.—GARNETT'S THEORY.

§ 303. Whoever, after duly noticing that nothing as been said about the Pronoun as one of those ranches of the Noun with which the Intermediate 'erb is connected in the way of affinity, and then, after onsidering such forms as *amare*, *amari*, *amandi*, *mando*, *amandum*, *amatum*, *amatu*, proceeds to the onjugation of *amo*, *amas*, *amat*, &c., or *amavi*, *amaisti*, *amavit*, will not be long in perceiving that the

Finite Verbs are as essentially and characteristically *Personal* as the Verbs of the preceding chapter are the contrary. He will see, too, that in these last there is something that implies, though it does not directly convey, the name of an agent; and he will see that, for the first two persons at least, that name must belong to the class of *Pronouns*. In *amo*, *amas*, &c., it manifestly lies in the affixes *-o* and *-as*, &c.; which, whatever they may have been originally, are now part and parcel of the Latin Verb; and when he translates these into English, and says *I love*, *thou lovedst*, the Pronominal character of the combination becomes unmistakeable.

From this point of view he may add symmetry and harmony to the relations of the Verb with the Noun. For in *-o* (or its equivalent *I*) and in *-as* (or its equivalent *thou*) he gets the name of the person who *loves*; and, as he can speak of the agent for the third person as *he*, *she*, or *it*, he gets a name like *hunt-er* (or the Verbal in *-er*), as that of the name of the Agent. Hence, as the Indeterminate Verb comes into connection with the Noun through one Verbal, the Personal comes into connection with it through the other; the Substantive through the Verbal in *-ing*; and the Pronoun through its equivalent to the Verbal in *-er*—each in their respective ways—connected with the Verb and Noun, or *vice versâ*.

§ 304. Still, the nature of the connection is by no means similar. The Substantive and Participle are, as Parts of Speech, akin to the Verb; and the Verb to them: and the act indicated by words like *hunting*, and the agency indicated by words like *hunter*, are correlative terms. But the Pronoun has no such elements of affinity. Such as it has it gets in its capacity of a substitute for a Substantive: and its connection with

the Verb is simply that of one word in combination with another. We infer this in compounds like *am-o*, *am-as*, &c. We see, and hear, it in combinations like *I love, you move.*

§ 305. How this can give us the three Persons of a Verb is not very difficult to see.

The logician, or metaphysician, divides the whole universe under two heads — himself, the sentient being, and everything else beside—the *ego* and the *non-ego.* The classes in the way of magnitude are incommensurable; but they exhaust the whole world of Thought.

The ordinary talker makes a third class. There is (1) the speaker, (2) the person spoken to, and (3) the person, or thing, spoken about. He calls one *I*; the other *thou*; the third *he*, *she*, or *it.* The first two explain themselves. The third is explained by the context. Every object that *hunts*, or *sleeps*, or does any action, or suffers from an action done by aught else, or is in any state whatever, comes under one of these three denominations. Countless, then, as is the multitude of known and conceivable actions, each one with its agents, the whole incalculable host of the latter can be reduced to *three* classes. Everything that has or will be done, or is capable of being imagined as a deed, is done by a doer belonging to one of them; and if each of them has a short and adaptable name, a coalition with the verb is a very natural result.

When such a coalition *has* taken place, the whole character of the verb is changed. It loses to a great extent its abstract and indefinite character. It becomes 'invested with circumstances;' for it is no longer the name of a bare action, but the name of an action *plus* that of the actor.

To this condition, however, Verbs arrive; and when

they have done so there is a great tendency to separate them from the noun; for they have thus become *personal*; and then the difference is a great one.

§ 306. The Finite Verbs, then, are Personal; and, as such, play a more conspicuous part in language than the Indeterminate. They do not, however, do this as simple, single-handed Verbs, but as Verbs with a superadded element.

What this is has been suggested; and it has long been admitted that it is a Personal Pronoun. Whether it is in the Nominative or in an Oblique case is a question of comparatively recent origin. It is chiefly with the name of the late Mr. Garnett, among whose numerous contributions to the higher departments of philology the present doctrine stands, perhaps, the first in value, that it is most especially connected. Mr. Garnett, however, with his usual justice towards his predecessors, has indicated a suggestion of the famous Keltic scholar E. Lhuyd.

The verb, according to Mr. Garnett (who henceforth will speak for himself), is not so much a finite verb as a verbal; the pronoun which invests it with personality being not in the Nominative case, or in Concord with the verb, but in the Possessive case, while the verb itself is in a state of Regimen or Government.

'Grammarians have not been able to divest themselves of the idea that the subject of the verb must necessarily be a *nominative*; and when it was ascertained that the distinctive terminations of the verb are in fact personal pronouns, they persisted in regarding those pronouns as *nominatives*, abbreviated indeed from the fuller forms, but still performing the same functions.'

'The personal terminations in Welsh are pronouns; but it is an important fact that they are evidently *in statu regiminis*, not in apposition or concord; in other words, they are not nominatives, but obliquo cases, precisely such as are affixed to various prepositions. For example, the second person plural does not end with the nominative *chwi*, but with *ech*, *wch*, *och*, *ych*, which last three forms are also found

coalescing with various prepositions, *iwch*, "to you," *ynoch*, "in you," *wrthych*, "through you."

'Now the roots of Welsh verbs are confessedly nouns, generally of abstract signification; as, for example, *dysg* is both *doctrina*, and the second person imperative *doce*. *Dysg-och*, or *-wch*, is not, therefore, *docetis* or *docebitis vos*; but *doctrina vestrum*, "teaching *of* or *by* you." This leads to the important conclusion that a verb is nothing but a *noun* combined with an oblique case of a personal pronoun, virtually including in it a connecting preposition. This is what constitutes the real *copula* between the subject and the attribute. *Doctrina ego* is a logical absurdity; but *doctrina mei*, "teaching of me," necessarily includes in it the proposition *ego doceo*, enunciated in a strictly logical and unequivocal form.'

The following table improves the evidence on this point.

Prepositional Forms.		*Verbal Forms.*	
er-ov	'for me.'	*car-ov*	'I will love.'
er-ot	'for thee.'	*car-ot*	'thou wilt love.'
er-o	'for him.'	*car-o*	'he will love.'
er-om	'for us.'	*car-om*	'we will love.'
er-och	'for you.'	*car-och*	'you will love.'
er-ynt	'for them.'	*car-ont* or *car-wynt*	'they will love.'

'No one capable of divesting his mind of preconceived systems, who compares the Welsh prepositional forms with the verbal forms, will deny the absolute formal identity of the respective sets of endings, or refuse to admit that the exhibition of parallel phenomena of languages of all classes, and in all parts of the world, furnishes a strong *primâ facie* ground for the belief of a general principle of analogy running through all.'—*Philological Essays*, pp. 289–342.

This is simply the truth. But the '*preconceived system*' is a very potent influence. An Englishman, who every day and hour is using, or making, such derivative forms as *running* and *runner*, from any or every verb in the language, is slow to become familiar with the notion that the Verbal and Verb are very different parts of speech, and that the Verb is not the older one of the two. That the two forms may be identical he can understand from words like *a run*, *a swim*, *a*

leap, and others; but he is in the habit of looking upon so many others with the addition of *-ing*, or *-er*, as the better representatives of the class of Verbals; and these he knows to be derivative. In languages where the derivational affixes are less conspicuous, the difficulty may be more easily abated. Where they are as numerous as they are in English, the adherence to preconceived system is more than usually natural. Be this, however, as it may, we have in the reduction of all the names of actual or possible agents to the three Personal Pronouns one of the most beautiful, harmonious, and exhaustive contrivances that the instincts of Language have contrived.

§ 307. It was no part of Garnett's theory to ask how far the Verb *plus* a Possessive rather than a simply Personal Pronoun, *excluded* the forms to which he opposed them; in other words, how far *doc-es*, as *doctrina mei=my teaching* excluded forms like *I teach=ego doc-(eo)*. The two may have been concurrent, and he nowhere says that they were not. All he had to do was to consider the import of the Signs of Person, as Inflections.

Neither was it within his subject to ask whether *tu doces* was *doctrina mei* rather than *doctrina mea*. The aim of his well-directed criticism was to show that the Personal endings were other than abbreviated *Nominatives*.

§ 308. The preceding extract told what the writer meant with transparent lucidity. The induction, by which he fortifies his doctrine, is less capable of being given *in extenso*. It is enough to say that from the Fin class of languages he adduces the only missing link in the chain of his argument. Here, the pure and proper *Substantives* coalesce with the word that implies Possession; i.e. take abbreviated forms of *my*,

thy, &c., as affixes incorporated with the main word—just like the Post-positive Article in Scandinavian.

pī (for *pi-i*)	filius	mei	*bera-i*	dixi
pi-ed	—	tui	*bera-d*	dixisti
pi-ez	—	ejus	*bera-z*	dixit
pi-my	—	nostri	*bera-my*	diximus
pi-dy	—	vestri	*bera-dy*	dixistis
pi-zy	—	eorum	*bera-zy*	*dixerunt

In the Iron or Ossete, a language of Caucasus, there is the same combination, except that the Pronoun *precedes* the Substantive.

s-ab	pater	mei	*s-nehoit*	oro
w-ab	—	tui	*u-nehoit*	oras
i-ab	—	ejus	*i-nehoit*	orat
h-ab	—	nostri	*pa-nehoit*	oramus
sh-ab	—	vestri	*sh-nehoit*	oratis
r-ab	—	eorum	*r-nehoit*	orant

§ 309. That the Finite Verb is Finite because it is Personal, and for no other reason, is hard to show in an uninflected language like the English; easy to show in an inflected language like the Greek.

(*a*) The Indeterminate *Verb* has Voice—*τυπτεῖν*, *τύπτεσθαι*.

(*b*) It has Tense—*τυπτεῖν*, *τετυφέναι*, *τυφθῆναι*.

(*c*, *d*) There is no reason why the Indeterminate Verb should not have both (*c*) Number, and (*d*) Gender. The combination *τὸ τυπτεῖν* = *verberare* = *act of beating*, so far as the article *το* is singular implies a single act. But of such acts there may be more than one; and, if necessary, combinations like *τὰ τυπτεῖν* may express them. But they are *not* necessary, inasmuch as words like *beating*, from their abstract character, rarely require a plural form. There is, however, no known language in which the Indeterminate Verb has a *sign* of Number.

(*e*) There is no reason why the Indeterminate Verb should not have *Genders*. In Greek it is preceded by the article *τὸ*. This in words like *τὸ τυπτεῖν*, is a sign of the Substantival character of the verb rather

---

* We may call this, if we choose, a *Conjugation of the Substantive*.

than a true sign of Gender. The Latin translation, however, of τὸ φθονεῖν is *invidia*, which is feminine, and there is no impossibility in conceiving a language in which the Infinitive Moods, when preceded by an article like ὁ, ἡ, τὸ, should take the gender of the corresponding substantive; as ὁ λέγειν. However, no language is known to do so.

(*f*) Whether the Indeterminate has *Mood* is chiefly a question of words. That it is called a Verb in the Infinitive Mood is notorious. But this conveys the notion that it *is* a Mood; rather than that it *has* Moods. It has, however, in the Gerunds and Supines a great deal beyond the purely Modal Infinitive; and these, if it were necessary to enlarge on the question, could be shown to be *mutatis mutandis*, in the same relation to the proper Infinitive, as the Imperative and Conjunctive to the Indicative.

§ 310. It is not for nothing these apparently irrelevant observations upon what the Indeterminate Verb *might* have, as opposed to what it really *has*, have been inserted. The object of the present criticism is to show that the limitation of the Finite Verb to the *Person* is the *only* characteristic which is not empirical. The reason for the class being natural is the fact of the distinguishing characteristic lying in the nature of Language itself rather than in the forms which mere observation supplies. Number and even Gender are *possible* forms of the Indeterminate Verb as a single word. But Persons are not. Persons imply a second element; i.e. the name of the Agent, and this involves a second name, from another Part of Speech, which the Indeterminate Verbs cannot supply when taken alone. In short, it takes us into questions of Combination and Composition.

But here mixture begins. As soon as Number and Mood are assigned to the Finite Verb, the forms by which they are represented become mixed-up, combined, and complicated with, or involved in, those of Person; and when this is the case the three must be considered together. Still, the other two are always subordinate to that of Person.

CHAPTER VIII.

THE FINITE VERB CONTINUED.—ITS MOODS, NUMBERS, AND PERSONS.

§ 311. *Mood and its signs.*—It is only to a very small amount that the Finite Verb, in the present English, has *Moods.*

There is a difference of Mood when we say '*if I were you*,' in preference to saying '*if I was you.*' We also say '*if I be the person you mean, I am ready to take the consequences.*' But *be*, here, is a different Verb, and, as such, Conjunctival on the strength of its own proper import as a *word*, rather than from anything it is as a *Mood.*

When anyone says '*if he start soon he will be in time*,' the chances are that he takes some pains to do so, that he is talking grammarian's grammar, rather than the grammar of the world at large. Be this, however, as it may, the instance of *start*, instead of *starts*, merely tells us of the *omission* of the characteristics of the Indicative; and is simply a Negation.

This negative sign of the Conjunctive Mood is all that the present English can show. But (to repeat and re-repeat the old statement) the existing system of Inflections is only the fragment of an older one. In Anglosaxon the Plural of the Indicative ended in *-aþ*; that of the Conjunctive in *-en*—*we*, *ye*, or *hi lufiaþ* = *we love*, &c.; *we*, *ye*, or *he lufien* = *if*—*we love*, &c. Here the signs, on both sides, are positive as to Number and Mood, though not distinctive as to the Persons. In the Present English, however, as the affixes, on each side, are dropped, the result is that, for the Plural, the two forms (*we love*, and *if we love*) are confluent and identical. Between *love* and *loves* as the respective signs of the two moods the difference is retained or ignored according to the speaker. The least that can be said in favour of the distinction is that it is obsolescent.

§ 312. *Signs of Number.* — In the words *am*,

speakest, and *speaketh* or *speaks*, there are three different inflections, *-m*, *-est*, and *-eth* (or *s*). But they are signs of *Person*; and only signs of *Number*, so far as they are signs at all. For of Number the present English has no proper *positive* sign whatever, except in two verbs.

Singular.	*Plural.*	*Singular.*	*Plural.*
I was	*we were*	*I am*	*we are*
Thou wast	*ye were*	*Thou art*	*ye are*
He was	*they were*	*He is*	*they are*

§ 313. In the present English the signs of Person are reduced to the *-st* in *lovest*, &c.; and the *-s* in *loves*. Of these the former is obsolete or obsolescent; the latter a secondary form from *lov-eth*. But the present system of Personal Inflection is one thing; the history of the Signs of Person another. This is best collected from a series of examples. The following give the forms for the Present Tense Indicative; those for the Singular in the first, those for the Plural in the second column. The Dual which is found in the Sanskrit, Greek, and Mœsogothic is omitted.

Sanskrit.	1. *sṛijami*	*sṛijamas*	(*create*)
	2. *sṛijasi*	*sṛijatha*	
	3. *sṛijati*	*sṛijanti*	
Greek.	1. λέγω	λέγομεν	(*say*)
	2. λέγεις	λέγετε	
	3. λέγει	λέγουσι	
Latin.	1. *lego*	*legimus*	(*read*)
	2. *legis*	*legitis*	
	3. *legit*	*legunt*	
Lithuanic.	1. *sukù*	*sùkame*	(*turn*)
	2. *suki*	*sùkate*	
	3. *suka*	*sùka*	

Bohemian.	1. *wolám*	*wolámе*	(*call*)
	2. *wolás*	*wolátе*	
	3. *wolá*	*wolági*	
Servian.	1. *tshitam*	*tshitame*	(*read*)
	2. *tshitash*	*tshitate*	
	3. *tshita*	*tshitahu*	
Illyrian.	1. *vidim*	*videme*	(*see*)
	2. *vidis*	*videte*	
	3. *vide*	*vide*	
Mœsogothic.	1. *nasja*	*nasjaima*	(*heal*)
	2. *nasjis*	*nasjaþ*	
	3. *nasjiþ*	*nasjand*	
Old High German.	1. *prennu*	*prennames*	(*burn*)
	2. *prennis*	*prennat*	
	3. *prennit*	*prennant*	
Icelandic.	1. *kalla*	*köllum*	(*call*)
	2. *kallar*	*kalleð*	
	3. *kallar*	*kalla*	
Swedish.	1. *kallar*	*kalla*	(*do*)
	2. *kallar*	*kallen*	
	3. *kallar*	*kallas*	
Danish.	1. *kaller*	*kalles*	(*do*)
	2. *kaller*	*kalles*	
	3. *kalder*	*kalles*	
Old Saxon.	1. *sokju*	*sokjað*	(*seek*)
	2. *sokis*	*sokjað*	
	3. *sokid*	*sokjað*	
Westsaxon.	1. *sece*	*secath*	(*seek*)
	2. *secest*	*secath*	
	3. *seceth*	*secath*	
resent High German.	1. *liëbe*	*liëben*	(*love*)
	2. *liebes*	*liebet*	
	3. *liebt*	*lieben*	
Dutch.	1. *denke*	*denker*	(*think*)
	2. *denkest*	*denket*	
	3. *denkt*	*denken*	

§ 314. To these we may add from the middle period of our own language the forms which we have already noticed for the three leading dialects.

Westsaxon.	1. *hope*	*hopeth*
	2. *hopest*	*hopeth*
	3. *hopeth*	*hopeth*
Mercian (East).	1. *hope*	*hopen*
	2. *hopes*	*hopen*
	3. *hopes*	*hopen*
Do. (West).	1. *hope*	*hopen*
	2. *hopest*	*hopen*
	3. *hopeth*	*hopen*
Northumbrian.	1. *hope* (*hopes*)	*hopes*
	2. *hopes*	*hopes*
	3. *hopes*	*hopes*

§ 315. This predominance of the single termination *-s* in the Northumbrian, must be compared not only with that of *-r* in the Scandinavian group, but also, for reasons which will be given in the sequel, with the forms of the so-called Passive.

Icelandic.	1. *kallast*	*köllunst*	Swedish.	1. *kallas*	*kallas*
	2. *kallast*	*kalliz t*		2. *kallas*	*kallers*
	3. *kallast*	*kalla*		3. *kallas*	*kallas*
Danish.	1. *kalles*	*kalles*			
	2. *kalles*	*kalles*			
	3. *kalles*	*kalles*			

§ 316. A mere inspection of this table shows the fragmentary character of the Inflection of the present literary English. It begins with the forms of the Greek Verbs in *-μι*, and ends with such negations as *I love* (*thou lovest*), *he loves*, *we*, *ye*, *they love*.

§ 317. In the *-s* of *love-s-t*, we still retain the old personal sign. But the *-t* is an extraneous addition; and the whole form is obsolescent. In all the other persons

there has been either loss or change—absolute loss throughout the whole Plural; and change (from *-th* to *-s*) in the Third Person Singular. But these are not the only processes. In the Old Saxon and the Anglo-saxon *all* the persons plural end like the second, i.e. in *-th*. Why? How? Has the second person extended its sign to the other two? Or has each of the other two undergone its own proper transformation? Has the *m* of the first person, along with the *-nt* of the third, *proprio motu*, and by an independent process, become *-th*? The German series *lieben, liebet, lieben* = *amamus, amatis, amant*, favour the view. But the Norse *-r*, which represents an older *-s*, can scarcely be thus explained. Thirdly, in the Middle Mercian (or Midland) English the termination is *-en*. But this *-en* in Westsaxon was the sign of the Conjunctive, rather than the Indicative, Mood. What is the nature of the change here? Have so many *-eths* become *-ens*? Or have the Conjunctive forms bodily and in mass, displaced or replaced the Indicative? These are the questions which the history of the Persons suggests. It happens, however, that the thoroughly negative character of our present Inflection makes minute criticism unnecessary—at least, in a work of moderate size. In the wider field of a more general philology the details are of great importance.

CHAPTER IX.

THE FINITE VERB CONTINUED—THE TENSES—THE PERFECT —THE PRETERIT—THE PARTICIPLES.

§ 318. *The Tenses—how many are there in English?* —If we look to their meanings, we have *two* Tenses. If we look to their forms and history, we have *three*. Thus—between the meaning of forms like *loved*, or *bent*, and forms like *spoke*, or *swum*, there is no difference in respect to the time to which the action is assigned. It is an action of *Past* time as opposed to *Present* (*love*, *bend*, *speak*, *swim*). But of Past time there are two sorts, *e.g. I loved*, *I bent*, *I spoke*, *I swum* as opposed to *I have loved*, *I have bent*, *I have spoken*, *I have swum*. Indeed, if we add combinations like *I had loved*, and *I shall have loved*, *I was loving*, we raise the varieties of past time to five. The last three, however, are not Tenses, in the proper sense of the word. They are not modifications of any single word. Neither do they belong to the domain of Etymology; but, on the contrary, to that of Syntax. This is because they are combinations of two, or more, separate words which convey the same import as that conveyed by a tense; and, so doing, are substitutes for a tense rather than the tense itself. In Greek and Latin, where we have single words like *ἔγραψα*, *γέγραφα*, *ἐγεγραφεῖν*, and *scripsi*, *scripsero*, *scribebam*, we have the exact converse; viz. single words as true Tenses, conveying the sense which, in English, is conveyed by a combination of separate ones. This means that for certain modifications of time there are two concurrent modes of expression; and the more clearly we understand the difference between them the more rational will be our grammar.

§ 319. The Tenses of the Present English as determined by their form and history are *Three*: (1) the Present; (2) the Perfect; and (3) the Preterit.

The Present has no special sign; the Perfect is formed by a change of Vowel; the Preterit by the addition of *-d*, *-t*, or *-ed*. Of the Present, as its characteristics are wholly negative, no further notice need be taken. In respect to its *Persons*, over and above the obsolete or obsolescent Second Singular in *-est*, it retains the Third (*loves* or *loveth*)—only, however, in the Singular Number and in the Indicative Mood. For the Plural and the Conjunctive we have only the negative form *love* throughout.

§ 320. The Mœsogothic, and the Mœsogothic alone, tells us, with unmistakeable clearness, the true nature of the forms like *spoke*, *swum*, and others—forms which are made by *changing* the vowel rather than by the *addition* of either a single sound or a syllable—forms which for this reason have, somewhat fancifully, been called *Strong*, or self-sufficing, as opposed to forms like *loved*, &c., where the super-added *-d* is a sign of *Weakness*, or dependence upon extraneous elements.

§ 321. These forms the Mœsogothic gives us in two divisions; one of which differs in detail only from the English, giving simply a change of vowel. The other (and in this lies its importance) gives us forms like *cucurri* or *momordi* in Latin, and *τέτυφα* or *γέγραφα* in Greek. In six out of the twelve classes over which the Mœsogothic Perfects are distributed, this reduplication of the initial consonant presents itself; and, in the last two, there is a change of vowel as well.

Present.	*Past.*
Salta	*sái-salt* (*spring*)
Háita	*hái-hait* (*call*)
Hláupa	*hlái-hláup* (*leap*)
Slépa	*sái-zlép* (*sleep*)
Láia	*lái-lô* (*laugh*)
Gréta	*gái-grôt* (*weep*)

In *stái-staut*, from *stautan* = we have a reduplication of *both* the initial consonants; and we have the same when the verb begins with either *sk-* or *sp-*. In *hlái-láup*, too, so far as the *h* is consonantal there is a similar reduplication. Elsewhere, however, it is only the *first* consonant that is doubled, *e.g. sái-zlêp*, *gái-grôt*. Herein the M. G. is nearer the Latin than the Greek; for the Latin gives us such forms as *spo-spondi*.

§ 322. But the point of the most importance wherein the M. G. agrees with the Latin is the difference of the treatment at the hands of grammarians between the Tenses like *mo-mordi*, *cu-curri*, and *spo-spondi*, which are formed by reduplication, and the Tenses like *scrip-si*, and *ama-vi*, which are formed by a syllabic affix.

In Greek, words like γέγραφα, ἔγραψα have always been treated as Verbs alike in respect to their Conjugation; as Verbs equally normal, and equally reducible to rule; and above all, as Verbs which had *two* Tenses for the two varieties of Past time; each with its appropriate function, each with its characteristic formative, and each with its recognised name. The Tense formed by reduplication, and the Tense which implied a connection between the time of the action and the time of its being spoken about, was called the *Perfect*; the Tense in which no such connection was implied, and which was formed by the addition of *-s*, was called the Aorist; and each, so long as the two were formed in the manner just noticed, was kept separate and distinct

from the other, even as both were kept separate and distinct from the Present and Future of the same Mood, Voice, and Conjugation. This means that from the difference of form nothing beyond the simple single difference of Tense was inferred; one form being just as regular, and just as representative, as the other.

This is what we find in Greek. But it is not what we find in English; indeed, if it were not for the Mœsogothic, the origin and history of the English Perfect would be a matter of very uncertain speculation. No wonder, then, that in England until the study of the Mœsogothic became a recognized department of English Philology, the verbs like *spoke*, &c.—the verbs which represented the old Reduplicates—were simply treated as *Irregular*.

In Latin, however, there was, so far as the forms went, nothing to disguise the identity of words like *mo-mordi* with words like *τέτυφα*, and of words like *scrip-si* with words like *ἔγραψα*. Nevertheless, the Latin Grammar represents them as something very different. Of the Greek tenses, the Perfect and the Aorist, the Latin recognises only one; the result of this being that *mo-mordi* and *scripsi*, &c., &c., instead of being referred to two different Tenses of the same Conjugation, were referred to the same Tense, with a difference of a very vague character—the difference between this or that Conjugation; the difference between this or that kind of Verb; and, above all, the difference concerning which we have heard more than enough in England; viz. the difference between what is called Regularity and Irregularity.

§ 323. For a change in the language of grammarians of this kind there must be reasons. And they are not far to seek.

(1) The Latin had neither the word *Aorist* nor any adequate equivalent to it.

(2) The Latin, in a great number of instances, dropped the Reduplication where the Greek retained it. For one word in Greek which gives us such a form as τυφα or γραφα, from τέ-τυφα or γέ-γραφα, the Latin gives us scores like *feci*, *fugi*, and others, from *fe-fec-i*, *fu-fugi*, and the like.

(3) The Latin had, besides the forms like *feci* and *scrip-si*, a third; that of words like *ama-vi*, *audi-vi*, *mon-u-i*, terminations which give a third affix with only two kinds of Time to match. The result of this is that the precision and definitude which resulted from *two* well-marked forms in Greek, and *two* well-recognized differences of import, was greatly diminished; so that *momordi*, *scripsi*, and *amavi*, &c., might mean either *I have bitten*, or *I bit*; *I have written*, or *I wrote*; *I have loved*, or *I loved*, as the case might be.

(4) Concurrently with this (until we can determine which is which) in the way of Action and Reaction, the distinct character between the two kinds of Past Time became less and less; and all the three Latin forms had but one out of two meanings. Sometimes it was *I have loved*, and the like; sometimes it was *I loved*, and the like.

(5) But there was a fifth influence; whether in the way of a cause or an effect we need not here enquire. The form of Past Time which the Greek expressed by words like τέτυφα, changed; and combinations of the verb denoting possession with the Passive Participle came in to encroach upon the function of the Old Perfect, i.e. *I have beaten* =τέτυφα. With this we are thoroughly familiar in English; the result being that the Old Greek Perfect was merged, in respect to import, with the Aorist. Some, however, of the Perfect forms remained; but as they sunk their distinctive meaning, and dropped their reduplication, they are, at present, but few in any modern language. Still the forms like *spoke* and *swum*, &c., represent them.

(6) The result of this is that, in the end, one of the two forms excludes the other. In Latin there are a few verbs for which we find both tenses—*pango—pepigi—panxi*. But the number decreases, and the rule is that it is always the reduplicate form that gives way.

§ 324. If we put all this together, we not only see that the treatment as a Tense of the Reduplicate Perfect has varied with the language, but, also, that the class to which such Perfects belong—disguised as they are, and fragmentary as is the class itself—is a natural one.

(*a*) Few or none of the so-called Strong Verbs are of foreign origin. Hence new words introduced into

our language always have their past tense Preterit—never Perfect.

(*b*) This means that, as an Inflection, the change of vowel is *Obsolete*.

(*c*) The change is all one way, i.e. words like *spoke*, &c., may take the form of words like *loved*; but not *vice versâ*.

(*d*) The words which are *Strong* in one of the German languages or dialects are generally so in the others.

Tota illa quantacunque Anomalia, Verba exotica vix omnino attingit sed illa sola quæ Nativa sunt—exotica vero illa appello quæ a Latinis, Gallicis, Italicis, Hispanicis, aut etiam Cambro-Britannicis deduximus, quæ quidem multa sunt: Nativa vero illa voco quæ ab antiqua lingua Teutonica, seu Saxonica, originem ducunt, quæ quidem omnia sunt Monosyllaba (aut saltem a Monosyllabis deducta), et plerumque nobis cum Germanis, Danis, *etc.*, communia sunt (levi saltem immutatione facta): quoniam nempe sive Linguæ sive Dialectus ejusdem cum nostra Anglicana sunt originis.—*Wallis*.

(*e*) Derived words are weak rather than strong. The intransitive forms *drink* and *lie* are strong; the transitives *drench* and *lay* are weak.

It is clear that the natural character of these so-called Irregular or anomalous words was, partially, seen by the older scholars; and not only by Wallis, but by Ben Jonson. So far as the latter allowed himself to speak irreverently of either of the two classes, it was the form in *-d* for which he shows the least respect; and, when he calls it 'a common inn to lodge every strange and foreign guest,' he uses a metaphor which shows that he clearly saw the extent to which one process was operative, the other obsolete. To this, however, he assigns 'none but natural and homeborn words, which, though in number they may not be many, a hundred and twenty or thereabouts, yet in variation are so divers and uncertain that they need much

the stamp of some good logic to beat them into proportion.'

Hickes, after giving a single conjugation for the Anglo-Saxon verbs, throws the rest into a single class, with the remark, however, that they follow a principle of their own, along with the additional suggestion *forsan magis proprie secundam conjugationem constituere videantur quam inter anomalia recenseri.*

§ 325. Of this doctrine of a second Conjugation it may be said, at once, that it is immeasurably better than the older doctrine of Anomaly or Irregularity. But there is a great deal in the doctrine of a second Conjugation which, without appearing on the surface, complicates the grammatical expression of the difference. If *spoke* and *loved* are verbs in different conjugations, they are verbs in the same Tense; for it is, manifestly, to escape the assignment of them to different Tenses, that the second Conjugation is resorted to. If, on the other hand, they are verbs of different Tenses, a second Conjugation is superfluous; and, perhaps, inadmissible.

They are, certainly, so when we look at the Greek language; treating vowels like *spoke* as words like *τέτυφα*, and words like *loved* as words like *ἔγραψα*—Tense for Tense. Here, there are no pretensions to a second Conjugation, whilst there is no doubt as to the reality of a second Tense. And it must be added that, in the opinion of the present writer, the Greek rather than the Latin is the language to which we must look. Between the Mœsogothic and the Latin, we get the evidence of an original reduplication, and, with it, in many cases, a change of vowel. We get the loss of that reduplication, and the retention of the modified vowel. We get, too, the loss of the distinction of import which in Greek we find by mere inspection.

Lastly, we get the gradual exclusion of reduplicate forms with a Perfect sense, and the fusion of the two into a single Tense—provided, always, that we take the *sense* of the inflection rather than its *form* as the criterion of its nature, and the character by which we determine its name.

But the conflict between the claims of these two elements to constitute a Tense is a very serious question; and one which is far too complicated to be given here, in detail. If the meaning is to determine it, *loved* and *spoke*, *momordi* and *scripsi* are identical Tenses, and even such combinations as *I have written*, are as good Tenses as *γέγραφα*, &c. I am not prepared to say that, in many cases, they are not. In another part of my work I shall show that the doctrine that a given form must not always be what it was in its origin, and that words, as an old grammarian expresses it, *migrate* from one Part of Speech to another, is a sound one. Nor do I ignore the vast amount of innovation that is involved in such a language as the Latin, by making a fresh Tense, for forms like *momordi*, &c., when separated from forms like *scripsi* and *amavi*, &c.—to which much more may be added. On the other hand, when we have to account for such changes as those of the *-ea-* in *speak*, into that of the *-o-* in *spoke*, we must use the lights that we get from the Mœsogothic, the Latin, and the Greek; and if all these, form for form, lead up to the Greek *τέτυφα*, and *γέγραφα*, the conclusion must be accepted—at least, in a work which professes to get at the import and origin of our Inflections *historically*.

This is as much as can be said upon this question at present. The little that can be added will be found in the '*Syntax*.'

§ 326. The last point to be considered is the extent

to which these disguised Reduplicate Perfects, even in a language like the English, where they are found only as the fragments of an older and fuller system, are still susceptible of order and arrangement. And this will be done briefly. The earlier classifications may be found in Grimm's great Comparative Grammar of the languages of the German family, and Rask's Anglo-saxon Grammar. In the recent works of Professor March and Dr. Morris, this is taken as a ground-work, but with the necessary modifications, and with special reference to the Anglosaxon. What follows here is written more to show that there *is* a method in the arrangement, than to exhaust the details of it.

§ 327. The Vowel may be changed once and once only; or it may be changed oftener than once. Sometimes it is changed in the Perfect only; sometimes in the Participle as well; sometimes in the Perfect itself according to the Number and the Person; and sometimes in the Present; e.g. in A.S. *bláwe, bleow, geblάwen; swimme, swam, swummon, swummen* = (*I*) *blow, blew,* (*we*) *blew, blown;* (*I*) *swim, swam;* (*we*) *swam* (*swum*), *swum.* Sometimes, as will soon be seen, it changes with the Person, in the Present Tense itself.

§ 328. *Vowel Long.*

(1) Change from *o* or *a* to *e.* The Vowel of the Past Participle the same as that of the *Present*: *blow, crow, grow, know, throw, draw, fly, slay—blew, crew, grew, knew, threw, drew, flew, slew—blown, crown,* &c., *slain.*

(2) The long Vowel sound (spelt *ea*) followed by *l, r* (liquids), *k* (a palatal mute), or *v.* Change to *o.* The Vowel of the Past Participle the same as that of the Perfect *steal, bear, swear, tear, wear, break,*

speak, weave—stole, bore, swore, &c.—*stolen, born, sworn,* &c.

(3) The vowel *Long*; the consonant that follows a *Sibilant—freeze, choose—froze, chose—frozen, chosen.*

This is the division wherein the vowel of the *Present* changes; the A. S. conjugation being as follows:—

Present 1st Per.	*2nd Per.*	*3rd Per.*	*Perfect S.*	*Perfect P.*	*Participle.*
Lese	*list*	*list*	*læs*	*læs-on*	*ge-les-en*
(Ge)-nese	*genist*	*genist*	*genæs*	*genæson*	*ge-nes-en*
Cebse	*cŷst*	*cŷst*	*cebs*	*cur-on*	*ge-coren*
Dreôse	*drŷst*	*drŷst*	*dreôs*	*drur-on*	*ge-dror-en*
Freôse	*frŷst*	*frŷst*	*freôs*	*frur-on*	*ge-froren*
Be-greôse	*begrŷst*	*begrŷst*	*greôs*	*grur-on*	*ge-gror-en*
Hreôse	*hrŷst*	*hrŷst*	*hreôs*	*hrur-on*	*ge-hror-en*
Forleôse	*forlŷst*	*forlŷst*	*forleôs*	*forlur-on*	*for-loren*

See March, §§ 199, 206.

(4) Vowel Long—spelt with a single letter, and followed by a mute. Change from *a* to *u* (spelt *-oo-*). Vowel in the Participle the same as in the Present—*shake, take, wake, (for)sake—shook, took, woke, (for-sook)—shaken, taken, waken, (for)saken.*

(5) Vowel Long—spelt with the letter *i*; but, in sound, a diphthong. Changed into *o* in the Perfect, in the Participle into *ĭ* (the *i* in pit). The vowel of the Participle that of the Present, rather than the Perfect.

Present.	*Perfect.*	*Participle.*
Bide	*bode*	*bidden*
Bite	*bit*	*bitten*
Drive	*drove*	*driven*
Ride	*rode*	*ridden*
Shrive	*shrove*	*shriven*
Smite	*smote*	*smitten*
Strike	*stroke*	*stricken*
Strive	*strove*	*stridden*
Thrive	*throve*	*thriven*
Write	*wrote*	*written*

Here, in Anglosaxon, the vowel was changed in the Plural, with which the Participle agreed. In both cases, however, it seems to have been long; or, at any rate, the consonant is not doubled.

Present.	*Perfect.* 1*st Pers.*	*Perfect.* 2*nd Pers.*	*Participle.*
Scîne	*scân*	*scin-on*	*ge-scin-en*
Bite	*bât*	*bit-on*	*ge-bit-en*
Smite	*smât*	*smit-on*	*ge-smit-en*
Ride	*râd*	*rid-on*	*ge-rid-en*
Strice	*strâc*	*stric-on*	*ge-stricen*

§ 329. *Vowel Short.*

Followed by *m*, *n*, *ng*, or *nk*. Change to *a* for the Perfect in the Singular, to *u* for it in the Plural number. The vowel of the Participle that of the *Plural* of the Perfect.

Present.	*Perfect Sing.*	*A. S. Plural.*	*Participle.*
Swim	*swam*	(*swumm-on*)	*swum*
Begin	*began*	(*begunn-on*)	*begun*
Run	*ran*	(*runn-on*)	*run*
Spin	*span*	(*spunn-on*)	*spun*
Win	*wan*	(*wunn-on*)	*won*
Cling	*clang*	(*clung-on*)	*clung*
Fling	*flung*	(*flung-on*)	*flung*
Ring	*rang*	(*rung-on*)	*rung*
Sing	*sang*	(*sung-on*)	*sung*
Spring	*sprang*	(*sprung-on*)	*sprung*
Sting	*stung*	(*stung-on*)	*stung*
Wring	*wrang*	(*wrung-on*)	*wrung*
Drink	*drank*	(*drunc-on*)	*drunk*
Shrink	*shrank*	(*scrunc-on*)	*shrunk*
Sink	*sank*	(*sunc-on*)	*sunk*
Stink	*stunk*	(*stunc-on*)	*stunk*

In the following words the *i* and *ou*, now diphthongs, represent the short sounds of *i* in *pin* and the *u* in *full*. Like *swim*, &c., they had *a* and *u* in the Plural. The Scotch retains both the short vowel and

the double form, the Perfect being regularly in *a*, the Participle in *u*—as *band, fand, grand, wand; bund, fund, grund, wund.*

Present.	*Perfect.*	*Participle.*
Bind	*bound*	*bound*
Find	*found*	*found*
Grind	*ground*	*ground*
Wind	*wound*	*wound*

The loss of the syllabic inflections *-an*, and *-e*, &c., for the Infinitive Mood and the Present Tense, by shortening the word, would encourage the lengthening of the vowel; for in *find-an, grind-an*, &c., the *i* was doubtless sounded as in *swĭm*. So it would be in *clĭmb-an*, of which the Perfect was *clomb* or *clamb* in the Singular, and *clumb-on* in the Plural; the Participle being *clumb-en*.

§ 330. *Reduplication retained.* — *Did.* — This word, in the current English of the present time, stands alone; the solitary instance of the old reduplication after the manner of *τέ-τυφα*. The Anglosaxon form was *di-de*, Old Saxon *dë-da*; in which case it is the *first* of the two *d*'s which gives us the sign of tense, and the last of them the one that belongs to the root.

§ 331. *Hight.*—There is another word in the same condition as *di-d*, i.e. another word wherein the reduplication is preserved. Here the *g* is out of place; the better spelling being *hiht*, in Anglosaxon *hêht*, Mœsogothic *hái-háit*. *Hight*, however, scarcely belongs to the current language; being obsolete, or obsolescent.

> An ancient fabric raised to inform the sight,
> There stood of yore, and Barbican it *hight*.
>
> Dryden, *Mac Flecknoe*.

§ 332. *Did* was the first word that was claimed as

reduplicate Perfect. *Hight* was the second. This was on the strength of the older forms *hêht* in A. S., and *háiháit* in M. G. Still, *hight* is only a reduplicate tense to the *eye*; for if it were spelt as it is pronounced (*hite*), it would show no signs of doubling whatever.

Held has since been added to the list, the O. H. G. form being *heialt*, or *hialt*, the M. G. *háihald*.

§ 333. *Hight* and *held* begin with the sound of *h*, and as *h* is a breathing rather than a true articulate consonant, it is by no means a very stable element in any word; especially when it stands between two vowels. It has evidently done so in both *hight* and *held*.

Such being the case, it is manifest that, in the present forms, it is the consonant of the fundamental verb that is lost; and that of the reduplication which is retained.

Whether there are other words of this kind—words in which the radical consonant is lost, and nothing left behind but the prefix—is a point of some importance.

It by no means follows that, because an exceptional sound like that of *h*, in an exceptional position between two vowels, can be dropped, other consonants can be dropped also. On the other hand, there are facts which connect, or seem to connect, the change of vowel with the elimination of the middle consonant; in which case, when the vowel of the root and the vowel of the reduplication come together, a third sound is the result. The Greek gives us nothing that encourages this idea; for in words like *λέλοιπα*, *πέποιθα*, &c., we have the changed vowel and the reduplicate syllable together. But in Latin, with words like *fūgi*, *fēci*, &c., from *fŭgio*, *făcio*, the lengthening of the vowel is reasonably referred to the elimination of the *second f* in *fŭ-fŭg-i*, and *fĕ-fĭc-i*,

&c. I find it difficult to ascertain how far in the opinion of the two writers who have paid most attention to the question—Professor March and Dr. Morris—this elimination of the radical consonant extends. Is it limited to words like *hight*, or extended to words like *sprang*?

§ 334. *The Preterit.*—The Preterit is formed from the theme (it matters little whether we call it Present Tense, Infinitive Mood, or Root), by the addition of *-ed*, *-d*, or *-t*.

When the theme itself ends in *-d* or *-t*, an *-e* is inserted, which prevents the contact of identical consonants—*mend*, *mend-ed*, &c.

When the theme ends in a Surd consonant, the affix is *-t*—*step*, *stept* (so sounded, though spelt *stepped*).

When the theme ends in anything but an identical letter, or a Surd, the affix is *-d*—*move*, *moved*.

(*a*) These are the real rules of the present language. They are the *real* rules, because when we spell *stept* as *stepped*, we have a matter of *spelling*—not one of *speaking*: and it is Speech, not Writing, which makes Language.

(*b*) They are the rules of the *present* language; because if we pronounce the final *-ed* in words like *blessed*, we pronounce them after an archaic, or obsolete, manner—a manner kept up, as in the reading of the Scriptures, for adequate reasons, but still not the manner of common conversation at the present time.

The general rules for the use of *-ed*, *-t*, or *-d*, are, *mutatis mutandis*, simply those of the *-es*, *-s*, and *-z* of the Possessive Case and Plural Number of the Substantives.

§ 335. There are three natural groups among which the exceptions to this general rule may be distributed.

(1) *Verbs wherein the final sound of the theme* (*-d* or *-t*) *is identical with the initial sound of the affix—as bend, cut*, &c. The principle of this is a

tendency to avoid the addition of the *extra* syllable, *-ed.*

(*a*) *The last sound of the theme -d*—

a. This is done by shortening the vowel when it is long; and it gives us *bled, bred, fed, led, reăd, sped, met,* from *bleed, breed, feed,* &c.

β. By ejecting the *-e,* when the *-d* is preceded by *l, n,* or *r* (*liquids*), and changing the *-d* into *-t.* This gives us *bent, built, girt, lent, rent, sent, spent,* &c., from *bend, build, gird, lend,* &c.

γ. By the negative process of making no change at all — as in *rid, shed, spread,* from *rid, shed, spreăd.*

(*b*) *The last sound of the theme -t.*—Here the negative process repeats itself.

a. Vowel *short*—*burst, cast, cost, cut, hit, hurt, let, put, sit, shut, slit, split, thrust*; all the same form as their respective Presents.

β. Vowel *long*—Preterit *beāt,* Present *bēat.*

§ 336. (2) *Verbs whereof the Vowel is changed.* —When preceded by a Liquid, *t* takes place of *d.* In this case the vowel of the Preterit is always short—not only in words like *smelt* and *burnt* from *smell* and *burn,* where it is short in the Present, but also in words like *meant* and *felt* from *mean* and *feel* where it is long.

In *berĕft, clĕft, kĕpt, lĕft, lŏst, slĕpt, swĕpt, wĕpt,* from *bereāve, cleāve,* &c., the consonant is other than a Liquid: and the vowel is changed—only, however, in respect to its *Quantity.*

In *told* and *sold* from *tell* and *sell* the vowel is changed in respect to its *Quality.* Here the consonant that follows *is* a Liquid. The A. S. forms were *telle, tealde; selle, sealde.*

§ 337. (3) *Verbs whereof the Consonant is changed.*

—In all these the Consonant is either *k* or *g*, or one of the allied sounds. The liability of these to change has been shown in the chapter on Phonesis, and to the Phonetic rules there indicated all the changes that belong to this division are referable.

These Palatals may—

(*a*) Pass into the sound of *y*. The Anglosaxon forms of *lay* and *say* were—

Present.	*Preterit.*	*Participle.*
Lecge	*lægde*	*ge-lægd*
Secge	*sægde*	*ge-sægd*
Lay	*laid*	*laid* (pronounced *lāde*)
Say	*said*	*said* (pronounced *sĕd*)

(*b*) Also into that of *h*, originally a guttural *g*.

Present.	*Preterit.*	*Participle.*
Sece	*sohte*	*ge-soht*
Seek	*sought*	*sought*

(*c*) Also into that of *ng*.

	Present.	*Preterit.*	*Participle.*
Anglosaxon	*Bringe*	*brohte*	*ge-broht*
Modern English	*Bring*	*brought*	*brought*

(*d*) Also into that of *ngk*.

	Infinitive	*Preterit.*	*Participle.*
Anglosaxon	*þencan*	*þôhte*	*ge-þôht = think*
	þincan	*þuhte*	*ge-þuht = seem*

Compare the German *Ich denke = I think*; *mich dünkt = meseems*.

(*e*) Also into that of *tsh*.

	Present.	*Preterit.*	*Participle.*
Anglosaxon	*Tæce*	*tæhte*	*ge-tæht*
Modern English	*Teach*	*taught*	*taught*

Here the Preterit is like that of the preceding

instances. The *Present*, however, is changed: the *k* becoming *tsh*.

Catch, caught, caught does not occur in the oldest English. In Layamon we find *cacche, cahte, caht*. This verb has conformed to the Past Tense of *teach*, &c.—Morris, *Historical Outlines*, &c., p. 171.

Buy. In A. S. *bycge, bohte, ge-boht*.

Work. In Ac. *wyrce*=I work: *worh-te*=*I worked*; *ge-worht*=*worked*. In addition to the change in the consonant, *r* is transposed. *Beseech*.—The main Verb is *sêc-e*=*I seek*. In English *be-seech, be-sought*. The simple Verb *seek* preserves the *k*. The compound changes it after the manner of *teach*, &c.

The Participles.

§ 338. *The forms in -ing and -ed.*

In form, the Present Participle is the most regular Inflection in the language. Its sign is *-ing*, which may be added, without alteration, to every verb which has a Present Participle at all—which the words *is*, *was*, *shall*, and a few others have not.

This is very simple and regular. The question, however, whether the result of this addition of *-ing* be a Participle or a Verbal Abstract is a perplexing one. Something has been said about it in § 302, and more will be said in the *Syntax*.

§ 339. The Preterit form, or that in *-ed*, is nearly as regular as that in *-ing*. Not so that of—

§ 340. *The Perfect Participle*.—This is connected with the class of verbs like *spoke, swam*, &c., where the past tense is formed by the change of vowel; and not by the addition of *-ed*, *-d*, or *-t*. As Perfect Tenses these were less simple and uniform than the Preterits: and their Participles are the same.

The chief points connected with the Participle that are *not* involved in the history of the Perfect are—

a. Omission of the final -n or *-en.*—Sometimes this is wholly obsolete; as in *swum*, *found*, *run*, &c. Sometimes it is obsolescent, or archaic; as *shapen*, *graven*, *gotten*, *bidden*, *trodden*, &c. Sometimes both forms are equally current, but with a difference of meaning; as *drunk* and *drunken*, *bound* and *bounden*; *he had drunk too much*; *a drunken man*; *we are bound to do it*; *it is our bounden duty*. The *e* in *borne* is a mere artificial expedient for indicating a difference of this kind—*born*=*natus*, *borne*=*latus* in Latin.

b. When the *-n*, or *-en*, is thus dropped, the difference between the Participle and the Perfect is reduced; and, when the vowel of the two forms is the same, it is entirely abolished; in other words the two forms become confluent.

c. When the Tense changes from Strong to Weak, the Participle changes also; though not necessarily at the same time. The Participle, as a rule, retains its strong form the longest.

Present.	*Preterit.*	*Participle.*
Hew	*hew-ed*	*hewn*
Mow	*mow-ed*	*mown*
Show	*show-ed*	*shown*
Melt	*melt-ed*	*molten*
Swell	*swell-ed*	*swollen*

d. In A. S. the syllable *-ge-* was prefixed to both the Perfect and Preterit Participles; as *ge-boren*, *ge-lufod* = *borne*, *loved*. The Northumbrian dialects were the first to drop it; the Westsaxon the most steady in retaining it. On the Continent it is dropped in the Scandinavian dialects; retained in the Dutch and

German. It is the *y-* in the archaic form *yclept = called* or *named*, from A. S. *clepian = call* or *name*.

e. Sodden. Two words ending in *th* in A. S. changed it, in the Participle, into *d*.

Cwethe	*cwæth*	*ge-cweden*
Seothe	*sẽâth*	*ge-soden*

f. Seothe changed its vowel in the Plural of the Perfect, belonging to the same class as *choose*, *freeze*, and *lose*.

In *writhe* the *th* was retained.

Present.	*Perfect S.*	*Perfect Pl.*	*Participle.*
Writhe	*wrâth*	*writhon*	*writhen*

See list in March; Grammar, &c., p. 104.

g. In *scathe* the consonant was changed in the Tense but retained in the Participle. A. S. *sceathe*, *sceod*, *sceodon*, *sceathen*.

CHAPTER X.

ANOMALOUS AND AUXILIARY VERBS—'*SHALL*,' '*DARE*,' '*MUST*'—INCIDENCE OF CHANGE WHEN THE REDUPLICATION IS LOST—'*AM*,' '*BE*,' '*WAS*.'

§ 341. Perfects may become invested with the power of Presents. In Greek we see this in words like *οἶδα = I have experienced* or *learned* which = *I know*. In Latin *memini = I have called to mind = I remember*.

§ 342. *Can*, *shall*, and *may* are the most notable words of this class. So far as form and origin go, they are Perfects after the manner of *οἶδα* and *memini*. But they are also the bases of such Preterits as *could*, *should*, and *might*.

§ 343. *Shall.*—Existing forms—*shalt*, *should* (the Preterit), (*shouldest*, *shouldst*). Older form *skall*. The M. G. sign of the Second Person was *skal-t*.

§ 344. *Can.*—The M. G. form of the Second Person was *kan-t*. Existing forms—*could* (the Preterit); (*could-est* or *couldst*)—*ken* = *know* (the actual, or approximate, radical of *con* = *learn*, *study*); as *to con a task*—*cunning* = *knowing*, *crafty* ('*knowledge is power*'). The *-l-*, inserted in the spelling, after the false analogy of *should* and *could*, does its best to disguise its true origin; the result being one of the worst spelt words in the language. The A. S. Preterit was *cuþe*—Participle *cuþ*; whence *un-couth* = *unknown*.

§ 345. *May.*—M. G. Second Person *mag-t*—Present forms (*mayest*)—*might* (the Preterit)—(*mightest*, *mightst*). In A. S. the Second Person was *meaht*; the Preterit *meahte*.

§ 346. *Ought.*—Present form (*oughtest*); Participle *own* = possessed; A. S. *agen*. The A. S. Perfect *ah*; in the Second Person *age*, with *ahte* as a regular Preterit. In M. G. *áih*; Second Person *aiht*; Preterit *áihta*.

§ 347. *Dare*, *Must*, and *Wot.*—These three words agree in having the sound of *-s-* which is not found (in English at least) in the fundamental word.

(*a*) In *dare* we get a little help from the Greek forms *θαρρεῖν* and *θαρσεῖν*: supposing that, sound for sound, and letter for letter, we identify the Sigma with the *-s-* in *durst*. This reappears in the—

PRESENT.

Mæsogothic.	*Anglosaxon.*
1. dars	dear
2. dart	dearst
3. dars	dear

PRETERIT.

1.	daursta	dorste
2.	daurstes	dorste
3.	daursta	dorste

INFINITIVE.

dauran	durran

Here the -*s*- of the first person in M. G. gives us the only -*s* that can be compared with that of the Greek *θαρσεῖν*, the -*s*- of the A. S. Second Person, &c., an -*s* that is certainly extra-radical.

In the present English, *mutatis mutandis*, *dare* may be compared with *owe*; and *durst* with *ought*. *Dare*, like *owe*, as an independent Verb, has a full inflection—*dare*, *daring*, *dared*; and, as such, is both Transitive and Intransitive—*I dare* (*challenge*) *to do it*—*I dare not venture*. For the Intransitive *dare*, we may substitute *durst*; but not for the Transitive.

(*b*) *Must*, in the present English, has only one form.

PRESENT.

Mœsogothic.	*Anglosaxon.*

Perfect	*wisse* M. G.
Preterit	*wiste* A. S.
Infinitive	witan
Pres. Part.	witende
Pass. Part.	witen — wist

§ 348. The non-radical -*s*- in these three words has to be accounted for. The current doctrine is that, to the main verb ending in -*t*-, the weak inflection -*t* is added, and that, thus, when two t^s are brought into contact, the first is changed into -*s*. What, and how many, are the forms that justify this view? There are English verbs which end in -*t*, like *put*, *hit*, *bite*, and others; and some of them take the affix -*te*. But none of them give such results as *lest*, *pust*, *spist*, or the like, from *let*, *put*, or *spit*. This is what we find in English; where the number is sufficiently limited to allow us to make a negative statement. What we may find elsewhere is another question. But the only two words I have found anywhere are the two under notice —these and no more.

§ 349. *Questions concerning the Perfect and Preterit.*—On the structure of the Perfect just as much has hitherto been written as serves to show how forms like *spoke* and *swam*, &c., originated in Tenses like τέτυφα and γέγραφα, &c., and how, when denuded of their reduplication, and otherwise disguised, they lost their character as separate, independent, and regular Perfects. The minor points connected with either their formation or decay were not investigated. There is something, however, to be said about them; and, as one of them is connected with the history of the *Preterit*, it is convenient to consider the two Tenses together.

§ 350. *Origin of the -d in loved*, &c.—For the origin of the sign of the Preterit—the affix -*ed*, -*d*, or

-t—as for the origin of the sign of the Perfect, the Mœsogothic, and the Mœsogothic alone, has given us *data* of any notable value.

a. *Past Tense of the Indicative Mood.*

Singular.	*Dual.*	*Plural.*
1. Nasi-*d*-a	—	nasi-*d*-êdum
2. Nasi-*d*-ês	nasi-*d*-êduts	nasi-*d*-êduþ
3. Nasi-*d*-a	—	nasi-*d*-êdum

b. *Past Tense of the Conjunctive Mood.*

Singular.	*Dual.*	*Plural.*
1. Nasi-*d*-êdjau	—	nasi-*d*-êdeima
2. Nasi-*d*-êdeis	nasi-*d*-êduts	nasi-*d*-êdeiþ
3. Nasi-*d*-êdi	—	nasi-*d*-êdeina

This gives us not only one *-d*, but two; and if we take the second *-d* in *nasidedum*, and connect it with the explanation of the second *-d* in *did*, the elements of a hypothesis emerge; and the notion that the *-d* in *loved*, originally one of the *-d*[s] in *nasi-dêd-um*, is an abbreviated and postpositive *did*, the Perfect of *do*, presents itself: and when we bring into our criticism such combinations as *I did love* from our own language; and such Tenses as *parlerai* and *parlero* from the French and Italian (=I have to speak=*loqui habeo*), neither the incorporation of the two words, nor the change of their place by transposition, presents any notable difficulties.

This doctrine, suggested rather than positively laid down by Grimm, has gained ground. More, however, will be said about it hereafter.

§ 351. *Incidence of the change when the reduplication is lost.*—When words like τέτυφα and γέγραφα are reduced to dissyllables by the loss of one of their consonants, which of the two is the lost one?

When from the earlier reduplicate *pepigi* we get the later and *non*-reduplicate form *pēgi*, which of the p^s is lost and which retained? Is the initial *-p-* cut-off, or the *p* of the middle part of the word elided?

When we get, from the earlier reduplicate, *fe-feal* (*fe-feol* or the like), *feoll* (*fell* from *fall*), is it the *-f-* of the main word which is rejected, and the *f* of the initial reduplication preserved, or *vice versâ*? This is not a point on which we can decide, off-hand, by any general rule. A careful investigation may give us one of the alternatives in one word, and the other in another?

§ 352. I believe this to be the case in English. The *-h-* which is lost in *hight* (*hiht*) and *held* is the one which stood in the middle of the older word, or the radical one. The *h-* which is preserved is the one which stood at the beginning of the older word, or the *h* of the reduplication. But *h*, a mere aspirate, between two vowels, is not only a sound which is easily elided, but one which scarcely ever keeps its place. It by no means follows that, because in words like *hight* (*hiht*) and *held* the radical consonant (if *h* can so be termed) is elided, *b*, *p*, *t*, *d*, &c., or combinations like *sw*, *st*, *sk*, *sc*, or a triad of consonants like the *spr-* in *spring* should be elided also. Each sound should be considered on its own merits; i.e. its likelihood to keep its place or to lose it; and we know that no consonants, in this respect, are exactly in the same condition. The Semivowels are not very stable. The Palatals *k* and *g* have an inordinate tendency to change, and when they become *y* or *w*, or *h*, may comport themselves as the *h-* in *hight* (*hiht*) and *held*. The Continuous consonants may run into the Semivowels, especially *v* into *w*, and then come under the conditions of the pre-eminently unstable *h*. When we get to pairs of consonants like

st, *sk*, *gr*, &c., and *à fortiori*, to such combinations as *spr-*, *scr-*, and the like, the chances of elision are reduced to a *minimum*: for it is manifestly easier to drop the non-radical prefix.

§ 353. Individually, I believe that it is this *non*-radical prefix of the reduplication which, as a general rule, is dropped; and that in those few instances where the elision of the radical consonant occurs, it is due to special causes, and is wholly exceptional. That so unstable a sound as that of *-h* between two vowels should drop out is natural, and that, out of the two vowels thus brought into contact, a single one, with mixed characters, and more or less diphthongal in character, should be developed, I hold to be part of the change. But I consider that the change is a rare one. If the vowels that are thus formed, i.e. by a process of contraction, are of that character that nothing but contraction of the kind under notice will account for, I must admit that, where they occur, they are evidence not only of reduplication, but of a previous elision of the radical consonant from the middle of the word, rather than the dropping of the reduplicate syllable at the beginning of it. This last I hold to be the ordinary and natural process, and, except where the consonant is of that unstable character that it is pretty certain of being elided, or the resulting vowel of that peculiar character which nothing less than contact and contraction would produce, I hold that this initial consonant is the one which, when the word was reduplicate, stood in the middle of it; that it now stands at the beginning, because the reduplication has been dropped; and, above all, that it is the original consonant of the root.

§ 354. The forms with which we have to deal in English are those wherein the reduplication has been

lost, so that the only difference between the Perfect and the Present is a change of vowel.

Of these changes there are two kinds.

(1) The first and oldest is that which we find in the Greek, Latin, and Mœsogothic, in words like λέλοιπα, σέσηπε, τέθεικα, γέγραφα—*peperi*, *peperci*, *fefelli*—*sai-slep*, *gae-grot*, *lai-lo* (=*slept*, *wept*, *laughed*). Here the change is, for aught we know to the contrary, as old as the reduplication itself; but that it is concurrent with the reduplication, and wholly independent of any process connected with the loss of it, is evident.

(2) The second is that which we found in the form *hight* (*hiht*)=*called*. Here the change is not so much concurrent with the reduplication as consequent upon it.

§ 355. In § 330 we may see that the first word in English in which the retention up to the present time of a fragment of the old system of the reduplication of the Perfect was detected was *did*: and that the second was *hight* (*hiht*). To these we now add *held*; in A. S. *heold*; in O. H. G. *hialt* (=*hei-halt*), in the present German *hielt*, in the M. G. *hai-hald*.

Upon *did* there is no remark to be made.

In *hight* (*hiht*) we find the second -*h*- still preserved in the spelling: and, as we know that this second -*h*- is not the *h* that is sounded, and that if it were not for the spelling it would be non-existent, the inference that, in one word at least, it is the radical sound of the middle of the word which is lost, and the *non*-radical sound of the beginning that is preserved, is unmistakeable.

That the same is the case in *held* is, perhaps, equally certain; although it is not so easily seen: for the second *h* is not preserved in the spelling; and, moreover, the -ĕ- is short. The German forms, how-

ever, *hialt* and *hielt*, remove any doubt upon this point.*

§ 356. That in both these words it is the radical *-h-* that has disappeared, and the reduplicated *-h* that is retained, is generally admitted. The fact, however, is one which suggests questions which are by no means so clear. Thus—

(1) What are the details, and nature, of the process?

(2) What is its effect on the vowel; and

(3) How many words are there like *hight* and *held*?

(1) There are three processes by which a consonant in the position of the second *-h-* in *haihait* can be either displaced or eliminated altogether.

(*a*) The second *-ái-* may be dropped out; in which case the *h-* is brought into immediate contact with the final *-t*.

(*b*) The second *-ai-* and the second *-h-* may change places; in which case the word becomes *haiaiht*. Either of these processes will give such forms as *hêht*: and, in either case, the *-h-* is retained.

(*c*) The *-h-* may drop out altogether; in which case the word becomes *haiait*, and the radical *-h* is wholly eliminated.

(2) Each of these processes has a different effect on the vowel or vowels.

(*a*) That of the first is very simple in one respect;

* In the following extract from Uhland's ballad 'The Blind King' it is used, as *held* would *not* be used in English, with the sense of '*has held*,' i.e. the sense of a Perfect rather than a Preterit.

O Sohn, der Feind ist Riesenstark,
Ihm *hielt* noch keiner Stand;
Und, doch, in Dir ist edles Mark,
Ich fühl's am Druck der Hand.

very complex in another. So far as it reduces the two vowels to one it is very simple. So far, however, as it brings the middle consonant in contact with the final one, it is very complex: the chief complication being the identity of its results with the second process; or the one now coming under notice.

(*b*) It is clear, as has already been indicated, that whether, in a word like *haihait*, we merely transpose the second *ai* or eject it altogether, contact of the *-h-* and the *-t* is the result. So far, then, the action of the two processes is the same. In respect, however, to the *-ai-* of the first syllable the difference is considerable. If the second *-ai* be simply ejected the result is *haiht*. If transposition take place it is *haiaiht*. But this brings two vowels in contact with one another, and where such contact occurs changes of some sort are to be expected: and this means that, except where the middle consonant is retained *in situ* or the second vowel is ejected altogether, this contact of vowels takes place, and, with it, the results in the way of change. The vowels may, of course, touch one another, like marbles in a bag, without cohering. But of these cases we take no heed; for they leave their verb with just as many syllables as it had in the beginning.

§ 357. When two vowels have become one the process may safely be called one of *contraction*. The prior process, however, which brings them together is not so simple. It may be the transposition (*Metathesis*), or it may be the absolute elision and elimination of the vowel. In a word like *lailaik*, the M. G. of *laikan*, transposition gives us *laiailk*; elision, *laiaik*; in each of which the vowels come together.

In this the two processes agree. But, in a much more important matter they are in diametrical opposition. When the consonant of the root has been *ejected*

it is got rid-of once and for ever. When it is only *transposed* it keeps its place. It may be subsequently ejected: but this is unimportant. Provided that any older stage of the language has transmitted to us a true instance of Metathesis the reality of one of the processes by which vowels become contracted is assured. Now, in the history of the verb *laikan*, we have such an instance.

§ 358. This, however, leads us to the following table, which is taken from March's *Comparative Grammar*, p. 81; and may be found, in substance, in Morris, *Outlines*, &c., § 265:—

Gothic *haldan*, hold, perf. *hâihald*; O. H. G. *haltan*, *heialt* > *hialt* > *hialt*.
Gothic *stâutan*, strike, perf. *stâistâut*; O. H. G. *stôzan*, *stêrôz* (*r* < *st*) > *steoz*, *stioz*.
Gothic *hâitan*, call, perf. *hâihâit*; A. Sax. *hâtan*, *hêht* < *hæhât*.
Gothic *rêdan*, rede, perf. *râirôth*; A. Sax. *ræ̂dan*, *reôrd* < *ræ̂rôd*.
Gothic *lêtan*, let, perf. *lâilôt*; A. Sax. *læ̂tan*, *leôrt* (*r* < *l*, * * *) < *læ̂lôt*.
Gothic *lâikan*, leap, perf. *lâilâik*; A. Sax. *lâcan*, *leôlc* < *læ̂lâc*.
——————————— A. Sax. *on-dræ̂dan*, *on-dreôrd*, dread.

This gives in *re-ôrd* from *rai-rôth*, and *le-olc* from *lailak*, as good instances of transposition as we can expect. By the change, in *lailot*, of the second *-l-* into *r-*, the evidence is not quite so clear. In *lætan*, however, as well as in *drædan* and *stautan*, the change is in the way of Metathesis or Transposition. With *hêht* and *hialt* there is doubt: because *h* is not a consonant that retains its character through a change of position so well as the ordinary mute and liquids. It is a much more distinct sound in *ha*, *he*, *ho*, and *hu* than in *ah*, *eh*, *oh*, and *uh*, where it may change into a tone, an accent, a guttural *gh*, and what not? In England such a sound as *haht*, if the *h* and *a* changed

places, would ere long be sounded as *āte* or *ait*; in Scotland as *aght* or *acht*. In England it would die out altogether. In Scotland it might become *aw* or *af*, or the like—indeed, this is a matter that a Scotchman is better able to investigate than an Englishman. But in no case would it stand between the vowel of the reduplication and the vowel of the main word, and, by being wholly ejected, bring the two into contact, coalescence, or anything out of which a *tertium quid* could be developed. On the other hand, if there were no transposition, but merely the dropping of the second vowel, there would be nothing vocalic with which the vowel of the reduplication could come in contact. We cannot deal with transpositions like *aht* from *hat*, as with transpositions like *ord* from *rod*. Be this as it may, the *h* in *hight* (*hiht*) is not the *h* in *haihait* ejected. If it were it would have no place in the word at all. All we know of it is its relation to the final *-t*. How it stood in respect to its vowel we know not. It would be in contact with *-t* if it were transposed; and it would also be in contact with *-t*, if the vowel by which it was followed were dropped.

And this tells us that the statement hitherto made concerning *hight* (*hiht*) as (next to *-did*) the second Perfect in our language which was found to have retained its reduplication, is perhaps, to some extent, inaccurate. We find it in writing: and on paper it may be said to survive. But we have no knowledge as to what it was in *language*, or how it was sounded, or whether it was sounded at all. Hence, it is not so much an actual reduplicate as a word in which the evidence of its original reduplication is preserved. In *hialt*, *heialt* we have no *h* at all: and the probability that the *-h-* really was elided is somewhat better. But it is clear with all the other words, that though we have un-

doubted examples of transposition, the word *held* is the only instance hitherto found of what we may call the elision of the radical consonant *in situ*; i.e. its ejection from its proper place between the vowel of the main word and the vowel of the reduplicational prefix; and even this may be reduced to either the loss of the second vowel or to reduplication, followed by the elimination of the *-h*. But with so unstable a sound the determination of the exact process of its ejection is unnecessary. Any change—almost no change at all—is sufficient.

§ 359. This is a long dissertation. But the list is an important one. Until lately most of us considered the so-called Strong Verbs as forms like *λέλοιπα* or *πέποιθα minus* the reduplication; and this is, probably, the view which presents itself in the first instance. But Professor March's list, with which Dr. Morris agrees, to say the least, disturbs it. It draws attention to the fact that in *hight* the initial *h* is that of the prefix. It shows that in *reord* and *leolc* we have a new element, that of transposition; and that in *hialt* we have, probably, the elision of the *h in situ*. By this the number of verbs wherein the consonant of the root has given way to the consonant of the prefix is increased; for, though *stautan*, *rêdan*, and *laikan* are either obsolete or obsolescent, whilst *dread* is only used as a Preterit, the *l-* in *let* is more likely to be the second *-l-* in *lâilôt* than the first: and what may have happened to *lâilôt* may have happened to other words under similar conditions; the only difference between the two groups being that for one of them a *modicum* of evidence has been discovered, which has not been discovered for the other, and which, probably, though the changes may have taken place, never will be.

I am not, then, inclined to limit the number of the

Perfect forms in English wherein the initial letter represents the reduplication rather than the root, to the few individual instances for which a record of the change has come down to us. *H*, with its natural instability, may drop out anywhere. The semivowels, too, may drop out readily; though not so readily as *-h-*. With *-l-* and *-r-*, two of the Liquids, transposition begins; and—so far as our present evidence goes—ends. Other words beginning with the same sounds may have changed even as *raírôth* and *láilôt* changed—or they may not. The two liquids under notice are, probably, more liable to transposition than the other consonants; and among the consonants some are more liable than others. Upon all this, when, by a wide induction, which has yet to be made, we know what conditions favour certain changes, and the extent to which one of them differs from another, we may, in default of special evidence, consider the probabilities of this word having for its initial the consonant of the root, or that word having for its initial the consonant of the reduplication. But here, I submit, we must stop; taking the old view that the initial consonant is the consonant of the root until reasons be given for the contrary.

§ 360. I have written at length upon this point because the question is a new one; because the difference between transposition and elision has not been sufficiently recognized; and, specially, because I think, either rightly or wrongly, that there is a tendency to invest the exceptional cases *heht*, *held*, *let*, &c., with something like the value of a rule, and to put forward the doctrine that the initial consonant is, at least, as often *non*-radical as radical—perhaps oftener—perhaps so often as to constitute the rule rather than the exceptions.

Whether this be the right interpretation of the

following extracts—where it is the two chief expounders of this doctrine that are quoted—is one matter; the accuracy of the doctrine itself is another. Whether this be the right interpretation of the expressed opinions of such influential writers as Professor March and Dr. Morris is a point upon which the reader must be the judge.

Professor March writes—

'Traces of the *process of contraction* are found in the O. H. G., &c., in the following Anglosaxon words.' * * *

These are found in the list as it appears in the present work, p. 380. He continues :—

'*The repeated consonants weaken, and finally fall out and let the vowels together.* In the Anglosaxon relics the first root consonant is saved by *metathesis* with the root vowel. These contractions at first gave rise to several different vowels and diphthongs found in O. H. German. Conformation in analogy with ablaut has brought them to a uniform *eô* or *ê* in Anglosaxon.'—*Comparative Grammar*, p. 81.

This '*process of contraction*,' and these '*repeated consonants*,' which, standing as they do between two vowels, are, manifestly, the consonants of the main word, certainly suggest something which is much more like an ordinary process of the language, with some scope and generality in its operation, than anything of the limited character indicated by the list of examples.

Dr. Morris writes—

'In the Latin, Gothic, and O. E. forms the *vowel change shows that the initial letter of the root has gone, and the first consonant is the initial of the reduplicated syllable.* Thus, Latin *fugi* = *fu* + *fug-i* = *fu* + *ug-i*.

Thus we see the perfect of *facio* was probably formed : (1) *fa-fac-i*; (2) *fe-fic-i*; (3) *fei-ci*; (4) *feci*.

In languages of the Teutonic group we have even clearer examples of reduplication and of the loss of * * * In our verb *held* the first *h* is the reduplicated letter. *The vowel* e *is the result of the union of the vowel of the reduplicated syllable with that of the root.*'

Outlines, &c., § 264.

The list follows; in no essential respect different from that of Professor March: so that, as far as this goes, the *data* are the same with both writers.

Here, the vowel change is indicated as an instrument of criticism; being treated as evidence to the disappearance of the vowel of the *root*—i.e. not only to the fact of the loss of a reduplicate syllable, but to the change of vowel as connected with it. Here, however, new *data* are brought in; viz., the lengthening of the vowels in *fūgi* and *fēci* from *fŭ-fŭgi* and *fĕ-fĭ-ci* in Latin. *Valeat quantum.*

All this applies exclusively to the cases where the radical consonant has disappeared, and, if there were no cases where the change of vowel is *concurrent* with the reduplication, the reasoning would be sufficiently cogent. But, with a language like the Greek, where the change of vowel and the concurrent persistence of the reduplication have lasted from the time of Homer to the present time, there is, to say the least, a great deal to set against it.

§ 361. *Amount of the Reduplication.*—How much of the fundamental verb, or theme, was taken to form a Perfect of which the reduplication is the characteristic? Was it that of the *whole* word, or only that of the beginning of it? Did the Greek *γέγραφα* and the Latin *momordi* arise out of *γραφ-*+*γραφ-*, and *mord-*+*mord-*, or only out of the initial consonants *γ-* and *m*+a connecting vowel? The first view may be the true one; but the reasons for its being so are by no means generally known and recognised; nor do they lie so much on the surface as to speak for themselves. It is certain, however, that there are degrees in the process. The Latin *spo-spondi* and the M. G. *stai-staut* repeat more of the fundamental verb than the Greek *τέτυφα*

and *γέγραφα*. The judgment in favour of the whole word being doubled, is founded upon an *a priori* view as to the probability of one out of two processes; and, so far as it discards the more artificial one, is sound. But still it is a view *a priori*: and this is so much as need be said about it.

§ 362. *The -d- in did, as the real or supposed sign of the Preterit.*—To those who have gone with sufficient care through the details of the question as to whether, in such or such a Perfect, the initial consonant is that of the root or that of the reduplication, and who also hold that the *-d* in *loved* is *one* of the *d*'s in *did*, it must be clear that the same question must be gone into again.

The *-d* in *loved* is one of the *d*'s in *did*. Which of them? The present writer is not aware that the question has been raised: neither has he any inclination to raise it. He rather recommends a suspension of judgment as to the doctrine which underlies it. Seen from one side only, the suggestion of Grimm (and it was only a suggestion), it is plausible. But it suits the Preterit (*I loved*) much better than the Participle (*I am loved*): and very little, if anything, has been done towards explaining the connection, if real; or accounting for the Participial *-d*, if we separate it from that of the Tense. The doctrine that the two must be separated is the recognised one; in which case the *-d* in *I am loved* is the *-t* of the Greek and Latin *t*'s and *θ*'s in such Past Passive Participles as *amatus* and *ποιηθείς*.

§ 363. *Quoth.*—This word, though obsolete, like *hight* (*hiht*) and *ycleped*, claims notice. It is pre-eminently the *Defective* word in our language. It is only found in one form: that of the Past Tense, and generally (if not exclusively) in the Third Person Singular. Moreover, it is followed, rather than pre-

ceded, by its Pronoun—*quoth-he*; and this, again, is sometimes reduced to *-a*—*quoth-a*; in which case the two words may be treated as a single one.

It is purely *Defective*; for it has no Complement: or, if it has one, the Complement is all on one side. We may indeed say that the forms wanting to *quoth* are made good by *say*; as *I say*=*I* (*queath*); *he says* =*he* (*queaths*), &c. But *say* itself is complete in all its inflections: so that there is nothing on the part of *say* for *queath* to make good.

This is Defect on its smallest scale: or reduced to its lowest terms; i.e. to a single form with a single power, and no Complement. Of the other extremes or Defect on a great scale, we get the best sample in the relations of the Strong and Weak Tenses, i.e. the Perfects and Preterits.

As an element in a compound it has as full and regular an inflection as any verb in the language, though with a change of meaning—*I bequeath, he bequeaths, bequeathed* (Preterit), *bequeathing, bequeathed* (Participle). In compounds, however, the Past Tense is a Preterit, whereas in the simple word it was a Perfect. And so it is with the Past Participles. The A. S. inflection was—*cwethan, cwethe, cwæth, gecweden* (as opposed to *bequeathed*).

§ 364. *'Am'—'Be'—'Was.'*—These are what are called Auxiliary Verbs—and that rightly. They are not, however, the only ones; for *have, shall*, and others are also Auxiliary. Still the three under notice form a natural class. They are often called Irregular: and, in some sense, they are so. Their truer and better characteristic is the very conspicuous combination of Defect and Complement.

They are (1) *Am*, &c.; (2) *Be*; and (3) *Was*. Of these the second, with its forms *be, being, been* (and

the archaic *beest* = the Latin *es* and *sis*), has nothing exceptional.

In the third there is a slight amount of irregularity in the two obsolescent forms in *-t—wast* and *wert*.

The first demands more notice. It is the only verb in English which represents the Greek verb in *-μι*; and it varies so much in the form of its persons that without referring to the other Indo-European languages for intermediate forms we can scarcely believe that such words as *am*, *is*, and the Westsaxon *sind*, are all deducible from one root.

This root is *s* preceded by a Vowel, and all the changes it undergoes may be reduced to the four following processes:—

1. The omission of the vowel—Latin *sum* for *e-sum*.

2. The changes of *s-* itself—

a. Before the sign of a Person—as *ahmi* in *Zend*, εἰμὶ in Greek = *asm-i* in Sanskrit.

b. Into *r-*; as in *art* and *are* in English, and *ert* and *er* in Scandinavian.

Forms of the Latin *sum = esum*.

Sanskrit.	*Latin.*	*Lithuanic.*	*Bohemian.*	*Servian.*
Asmi	*sum*	*esmi*	*gsem*	*yesam*
Asi	*es*	*esu*	*gsy*	*yesi*
Asti	*est*	*esi*	*gest*	*yest*
Smas	*sumus*	*esme*	*gsme*	*yesme*
Stha	*estis*	*este*	*gste*	*yeste*
Sánti	*sunt*	—	*gsau*	*yesy*

§ 365. *Did and Became.*—These give us a nearer approach to true Irregularity (*Catachresis*).

They look like Perfects of the verbs *do* and *become*, respectively. But each has two meanings. *Did* may mean either the Latin *fecit* or the Latin *valuit = was competent*, or *adequate, to* something.

The Infinitive of *do*=*facere* was *don*, the Perfect *dide*; in German *thun*, Perfect *that*, Participle *gethan*. The Infinitive of *do*=*valeo* was *dugan*, the Preterit *dugede*. Hence, *Tugend* = *virtue*, and *tüchtich* = *doughty*. In Danish the verb *do* = *facio* is expressed by *gjöre* (*gar*), and there is nothing that corresponds with the English *do* and the German *thun*. But for the English =*valeo*, and the German *taugen*, the word *duge*, Preterit *dugede*, is the ordinary verb. In the literary Danish the -*g*- is elided, and *dugede det noget?* = *was it worth anything?* is pronounced *duede*, &c. In Norway the -*g*- is sounded. In like manner the Middle English gives such forms as *dow*, *deah*, &c.

Mutatis mutandis, the same applies to *became*. *Became* may mean *factum est*, or it may mean *convenit* =*suited*, *fitted*, *did credit to*, &c. The Infinitive of *become*=*facere* was *becuman*, the Perfect *becam*, in German *becommen*, *becam*. The Infinitive of *become* =*convenire* was *becweman*, the Preterit *becwemede*; in German *bequemen*, Preterit *bequemede*.

This use of a common Past Tense for two different Verbs is now no longer a vulgarism: though it is vulgar to say *the land was overflown with water*. The tendency, however, to connect identical Preterits with different, but similar, Presents, is the same in both cases.

§ 366. *Mind and Minded.*—In *I mind my own business* the Verb is in the Present Tense, and it ends in -*d*. In *I minded my own business* it is in the Preterit Tense and has two *d*'. The second according to any view is other than radical. But there is a point of view from which the first may be non-radical also; in which case the theme is not *min*-*d*, but *min* (*mun*, &c.), and the single -*d* as extraneous as the second -*d* in *mind*-*ed*.

Mind, Own, and (Dare).—*Own*, in the sense of *concede*, or *grant* (German *gönnen*), is sometimes placed in the same group with *shall*, *can*, &c.: but like *mind* its inflection is perfectly regular—*I own, he owns, he owned, owning, he has owned.* It is placed, however, as it has been, on account of its connection with *owe* and *own*, in the sense of *obligation* and *possession*. Nevertheless, the words are radically different.

The same applies to *dare*, whether we use it in the sense of the Latin *audeo*, or *provoco* (=*challenge*). It has, however, been already noticed. But this was not so much on its own account as on account of its close connection with *durst*. In itself it is perfectly regular—*I dare, he dares, he dared, daring.*

§ 367. *Exceptions and Irregularities.*—Exceptions to rules are not always irregular; though the etymology of the word suggests that they should be. But rules may be unduly stringent, or less comprehensive than they should be. When they are so it is sometimes the fault of the grammarian; but oftener his misfortune. Of Language itself regularity is the foundation. But for the general purposes of Grammar we cannot divide and sub-divide, explain and refine, until rules defeat the object for which they were meant. If it were not so, the great achievement of a rule of some notable generality without an exception might be practicable. It is known, however, that there are but few of them. And this is why the present distinction is made. Irregularities, so far as they contravene certain rules, will always exist. But Irregularities which are wholly inexplicable, irreducible, and limited to individual instances are rare—perhaps non-existent.

Of *had* and *made* the older forms are *hæfde* and *macode*; the irregularity being limited to the ejection of the *-c-* and *-d-*.

In *could* (A. S. *cuþe*) the *-l-* is the *-l-* of *should* and *would*, foisted in by a false analogy.

Went and *go* are the Tenses of different verbs; the

former of *wend=turned*; so *went his way=wended* (*turned*) *his way.*

How little the ordinary Perfects and the Preterits like *sought* and *wrought* deserve the name of irregular has been seen. Even *could* is a piece of bad spelling rather than an irregularity of language—for, except under the influence of the printer, few of us pronounce the *-l-*.

§ 368. *Retrospect.*—We now have gone through the Conjugation of the Verb, and may repeat the process which was suggested by the Declension of the Noun.

The most we can get is—

(1) For Mood, Number, and Persons, the sound of *-s*; with *-z* or *-es* according to its phonetic relations—and this is Indistinctive (or rather *Non*-distinctive) as against the *-s* of the Possessive Singular, the Nominative Plural and occasional Possessive Plural.

(2) For the Present Participle *-ing*; with which the Verbal in *-ing* is Confluent.

(3) For the Perfect Participle *-en*; which has long ceased to be Operative, and is Obsolescent as a form.

(4) For the Perfect Tense there is change of Vowel; wholly obsolete as applied to new words, and obsolescent as a form; though going out more slowly than the Participle.

(5) For the Preterit Tense and Participle *-d*, *-t*, or *-ed*. These are in full force, but *Non-distinctive* in respect to one another.

Hence of those that are in operation the three forms in *-s* constitute the half; and these are *Non*-distinctive: the only two that are distinctive (*spoke* and *spoken*) being obsolete.

.Yet with all this the English Language may be measured against any one on the face of the earth for

flexibility and comprehensiveness. This is because it is rich in combinations which do the work of Inflections, and which sometimes convey distinctions to which even languages so Synthetic or Inflectional as the Greek and Latin are inadequate. As such they belong to Syntax; and to Syntax these concluding remarks in the Etymological portion of our work lead us.

PART IV.

CHAPTER I.

SYNTAX AS OPPOSED TO ETYMOLOGY.—NAMES.—PROPOSITIONS.—CONCORD.—GOVERNMENT.—COLLOCATION.

§ 369. The word *Syntax* is derived from the Greek words *syn* (*with* or *together*) and *taxis* (*arrangement*). It relates to the arrangement or putting together of words. Etymology deals with the forms of single words; Syntax, with the combination of more words than one.

§ 370. The notice of the Compounds of a language leads from Etymology to Syntax; for it is clear that in expressions like *hot-headed* and *horn-blower*, &c., we have something more than an individual word, and, consequently, something which, in some sense, belongs to syntax. We have *two* words at least. In some cases, as in *midshipman*, &c., we have *three*. We also have them in a state of combination. The combination, however, constitutes but a single word.

§ 371. It is not always an easy matter to distinguish between two separate words and a Compound; a fact which has already been suggested. A crow is a *black bird*. It is not, however, a *bláckbird*. The best criterion is the accent. When the two words are equally accented, the result is a pair of separate words, connected with one another, according to the rules of Syntax: *the crow is a bláck bírd* (*nigra avis*). When

the two words are *un*equally accented the result is a Compound, as the *blackbird is akin to the thrush* (*merula*).

§ 372. In etymology we *decline* and *conjugate*; in syntax we *parse*. Parsing is of two kinds; logical and etymological. Logical parsing gives the analysis of sentences according to their terms and copulas, telling us which is the subject and which the predicate, which the chief, and which the secondary, parts of each. Etymological parsing gives the analysis of sentences according to the parts of speech of which they are composed. It tells us which is the noun, and which the verb, &c. It separates adjectives from substantives, pronouns from adverbs, and the like. It deals with numbers, cases, persons, &c.

§ 373. *Names.*—There are more than a million of persons in London, and each of these has a name. There are more than ten thousand towns and villages in England, and each of these has one also. There are more than fifty racehorses at Newmarket, no one of which is without its name. Yet London and Newmarket are only parts of England, and England is only a part of the world in general. Persons too, and towns, villages, and racehorses are mere fractions of the whole collection of the innumerable somethings, real or imaginary, of the universe. Have all these names? They have and they have not. They have not names in the way that the persons of London, the towns and villages of England, and the racehorses of Newmarket have. They have not names like *Thomas*, *Hammersmith*, or *Eclipse*. Nevertheless they have all names. The thousands of *Johns*, *Thomases*, *Janes*, and *Marys*, that occupy London, are all *persons*, *men*, *women*, *boys*, *girls*, *children*, as the case may be. The numerous *Hammersmiths*, *Newmarkets*, &c., are all *places*, *towns*, *villages*, *hamlets*, &c., as the case may be. The fifty

Eclipses, &c., at Newmarket, are all *horses*, *mares*, &c., as the case may be. The *Hammersmiths*, &c., constitute part of an indefinite collection of individual places, towns, or villages; the words *place*, *town*, *village*, being names for the class or collection thus constituted. The *Eclipses*, &c., of Newmarket, constitute part of an indefinite collection of individual horses, the word *horse* being a name for the classes to which these *Eclipses*, &c., belong. This leads us to a great twofold division of all names whatsoever; names being either *Individual* or *Common*.

§ 374. An *Individual* name is one which denotes a single object and no more. A *Common* name is one which denotes a whole class of objects.

Thomas is a single and particular individual of the class called *man*: *Julius Cæsar*, a single or particular individual of the class called *conquerors*. Or it may be that we look upon him rather as a *hero*. In that case he is an individual of the class of *heroes*. But whether he be a *conqueror*, a *hero*, or a *man*, he is still *Julius Cæsar*; for this is what he is as an individual, irrespective of the particular class under which it may please the speaker to place him, and independent of any class at all.

Examples of this sort may be given *ad infinitum*. The main point, however, to be remarked, remembered, and reflected on, is the following: *Common* names apply to things of which there may be more than one. *Individual* names apply to things of which there is one and no more.

There are many *towns*, but there is only one *London*; many *men*, but only one *Thomas*; many *conquerors*, but only one *Julius Cæsar*.

Individual names may, also, be called *proper* names, and there are many good writers who habitually call

them so, preferring the term *proper* to either *singular* or *individual*. The reason for this lies in the fact of individual names being *appropriated* or made *proper* to certain single individual objects to which they are exclusively attached.

Common names may also be called *general*; and there is no objection to the term. It is possible, indeed, that it may be the better one of the two.

§ 375. Individual names are essentially *singular*, and it is a common as well as true statement, that no *individual name can be plural*. A grammarian would say that *no proper name can be plural*. How, then, can we use such expressions as *both the Bostons are important sea-ports*, or, *as long as Mœcœnases abound, Maros will be plentiful—Sint Mœcœnates non deerunt, Flacce, Marones?*

The *Boston* in Lincolnshire is a different town from the *Boston* in Massachusetts; so, though the same combination of sounds or letters applies to both, it cannot be said that the same *name* is so applied. The same name is one thing; the same word applied to different objects is another. A name is only so far individual as it applies to some individual object. The two Bostons, however, are different objects.

The case of *Mœcœnas* and *Virgil* is different. Here there are but two individuals; one Mæcænas, and one Virgil. But the famous Mæcænas is something more than the particular patron of Virgil. He is the sample, type, or representative of *patrons in general*. Virgil, in like manner, is something more than the particular poet patronised by Mæcænas. He stands for *poets in general*. Hence, the meaning of the Latin line, and of the English sentence that preceded it, is this:—*As long as there are men like Mœcœnas, there will also be*

men like Virgil. But a man like Mæcænas is a patron, and a man like Virgil a poet. Hence—*As long as there are patrons there will be poets also.*

§ 376. We now come to four new terms, that mutually illustrate each other. They run in pairs—(1 and 2), *Substance* and *Attribute*; (3 and 4), *Abstract* and *Concrete.*

Take (for instance) an orange. It strikes our senses. We see with our *eyes* that it is more or less *round*, i.e. that it is endowed with the *property or quality of roundness.* We see, too, that it is more or less *yellow*, i.e. that it is endowed with the *property or quality of yellowness.* We see that it is more or less *smooth*, i.e. endowed with the *property or quality of smoothness.* Our eyes tell us all this; the sight being the sense by which our belief as to the properties in question is conveyed to us. They tell a great deal more; but this it is unnecessary to enlarge on.

On the strength of all this we say that an orange is *round, yellow, smooth, capable of exciting sounds, fragrant, sapid, elastic*, &c.

When we say that an orange is this, we *attribute* to it certain properties, or qualities. What are they? The qualities, or properties, of *roundness, yellowness, smoothness, sonorousness, fragrancy, sapidity.*

And how do we speak when we say that we do so? It is convenient to begin with saying how we do *not* speak. We do *not* say that an *orange has the property of round, yellow, smooth*, &c. On the contrary, we say that it has the property of *round-ness, yellow-ness, smooth-ness*, &c.

So much for the attributes of an *orange*; at least, for some of them. The attributes of a *guinea*, a *loaf*, a *man*, a *fish*, or anything else, may be considered in the same way. They are, of course, when taken

altogether, different from those of an orange. The principle, however, of considering them is the same.

Let us now suppose that all these attributes are, one by one, taken away, *and replaced by others*; that instead of an orange striking our eyes and sense of touch as round, it strikes them as square, or rhomboid; that it loses its fragrance and becomes fetid; that it sounds like a bell, and tastes like a loaf of bread. Would the object still be an orange? Would it not be something else? This leads to the question of the *essential* attributes or *essences* of things. We need not mind them for the present; but may turn our thoughts in a somewhat different direction.

Divest the orange of all its attributes *without supplying it with new ones*. What will it be then? Take away its original colour without replacing it by any fresh one. Let it lose its softness without becoming hard, its roundness without becoming of any other form. Annihilate its weight, taste, and smell. Let it have no means of appealing to eye, ear, taste, smell, or touch, so that it become, at one and the same time, impalpable, invisible, imperceptible. What will it be then? Will it be anything at all?

What becomes of the attributes? We have seen that they were taken away. What was done with them? They were taken away *separately*, and it is separately that they are put aside. *Roundness and yellowness* no longer go together. Each is in its own place; and that is a place by itself. No link now unites them; the orange in which they met being no more.

But we may unite them afresh; say in the idea of a golden ball, a guinea, a full moon, &c. And we may, also, separate them, again and again. United, they give the idea of an object clear, palpable, sensible.

Separated, or abstracted from those objects, they do nothing of the kind. Yet the mind takes cognizance of them. The idea of the particular attribute of yellowness, abstracted from an orange, is not much more difficult than the idea of the orange *minus* the attribute of yellowness. It is merely a case of difference and remainder; the additions and subtractions being made unconsciously and instinctively.

What becomes of the orange? Is it annihilated by the abstraction of its attributes one and all? Few are prepared to say *yes* to that question. Few divest themselves of the notion that sensible, and material, objects are nothing more than the combination of certain properties, qualities, and attributes, each and all of which may be removed in such a way as to leave an absolute nothing. We rather imagine that, where there are certain attributes in union, there is a certain link which connects them; a basis, or foundation, which supports them; a basis, or foundation, different from the attributes themselves, but upon which they rest.

§ 377. This *something sup*ports them. This something stands *under* them. This something is the *substance*, or *understanding*, of objects opposed to, and contrasted with, their *attributes*. Now Concrete terms are the names of Substances; whilst Abstract terms are the names of Attributes; e.g.:—

Abstract.		Concrete.
Brightness,		*Sun.*
Heat,		*Fire.*
Light, &c.		*Spark.*
Mortality,	are Attributes of the	*Animal.*
Vitality,	Substances	*Man.*
Animality,		*Horse.*
Solidity,		*Wood.*
Resistance, &c.		*Stone.*
Fluidity, &c.		*Water.*

Vice Versâ.

Horse, &c.		*Animality.*

§ 378. *Variable and Invariable, Relational and Notional, Names.*—Besides being either Proper or Common, and Abstract or Concrete, names are Invariable or Variable.

Words like *stone, tree, man,* &c., denote certain objects which constitute a class including an indefinite number of individuals. To any of these the name may apply; but we cannot apply it to an object belonging to a different class. It is nonsense to call a *tree* a *stone,* or a *stone* a *tree.* Each name applies to the individuals of a certain group, and, as it cannot be applied otherwise, it is an *invariable* name.

All names, however, are not invariable. The word *I,* for instance, is *variable.* It changes its meaning with the person speaking. When William says *I,* it means William; when John says *I,* it means John. So, again, with *you*—it denotes the person to whom I happen to be speaking at the moment; but the next moment I may alter its meaning by speaking to someone else. The same applies to *that, this, these,* and several other words.

If a *mother* say *I,* it means a *mother* and a *female*; if a *father* say *I,* it means a *father* and a *male.* Even if an inanimate object be personified and be supposed to speak about itself and to say *I,* it means that inanimate object. It denotes the speaker, whoever he may be; but it is not the invariable name of any speaker whatever. Or, it denotes the object spoken of, what-

ever it may be; but it is not the invariable name of any object whatever. The word *this* means a *table*, when the speaker is talking of *tables*; a *dog*, when he is talking of *dogs*, &c.

Why are Pronouns *Variable*? The answer to this lies in the meaning of the word *Attribute*. An Attribute, as we have seen, is some property that we separate, or *abstract*, from a substance. It may be a permanent or inherent one, like the weight, colour, or form of a material object; or it may be a fundamental or characteristic one, like the power of growth in a vegetable or an animal. But it may also be one which has no fixed or permanent character whatever; and may apply to an object only so far as it is in a certain relation to the speaker, or to something spoken about. Thus the word *I*, by which Thomas calls himself when he is speaking to John, means Thomas only so long as Thomas speaks of himself. When he is addressed by John, he is addressed as *thou* or *you*; and, so long as John addresses him, that is his name. It is, of course, his name only so long as John uses it; but it is his name *for the time being*. When Thomas addresses John, the two names change their application, and *I* means Thomas, *thou* John. Again, when, with two oranges lying before me, at different distances, I call one *this* and the other *that*, the meaning, import, or application of the two words is reversed when I change their places. Still, they are names *for the time being*.

Now names of this kind depend on the *Relations* of the objects to which they apply; and as *Relations* change, the import of the name changes with them. Hence, they are *Variable* in respect to their application, and *Pronominal* as Parts of Speech.

The permanent *Attributes* of an object are called

its *Qualities*. As names they are called *Notional*, as Parts of Speech they are *Substantival*.

Number is a Relation rather than a Quality; and hence the Numerals are Pronouns.

§ 379. *Nouns.—'Names' and 'Nouns.'*—The word for Noun is, in French, *nom*. It is the Latin *nomen*; which means *name*. Hence, the two words are the same in respect to their derivation. But the word *Name* is a current English word; used by every Englishman who has a name, which means by everybody. *Noun*, on the other hand, is a word used in a limited sense; or mainly, if not exclusively, in Grammar only. This suggests that the two forms may not, in all cases, bear the same meaning; and such is the case. As words of the same origin they are the same. As words of *similar* meaning they are also the same. But, whether they are words of the *same* meaning has now to be considered.

§ 380. *Adjectives as Names; and Abstracts as Substantives.*—For the purposes of Grammar it is best to consider an Adjective as a part of a name, an element of a name, a word which suggests a name, but which is not a name itself.

'Adjectives are very improperly called Nouns; for they are not the names of things. The adjectives *good* and *white* are applied to the Nouns *man*, *snow* to express the qualities belonging to those subjects: but the names of those qualities in the abstract, considered in themselves, that is, without being attributed to any subject, are *goodness*, *whiteness*, and these are Nouns or Substantives.'

This is the opinion of Bishop Lowth, and I am not aware that, in respect to its assertion of what we call the *non*-nominal character of Adjectives, it has ever been denied. It has certainly never been refuted. It has *not* affected the ordinary vocabulary of the grammarian; nor is it necessary that it should do. All that

is necessary is that the word *Noun* should not be absolutely, and in every respect, identified with the word Name.

That words like *good* and *white* are not Names after the manner of *goodness* and *whiteness*, and that words like *goodness* and *whiteness are* Names, is true. But it does not follow, because *goodness* and *whiteness* are both Names and Nouns, that they are, also, *Substantives*. It is certain that if we take the word *Substantive* in its etymological sense they are *not* Substantives. A word like *stone*, *gold*, or *man*, &c., is one which implies *many* Qualities; or, at least, more than one. It is *heavy*, or *hard*, or *yellow*, or *mortal*, and what not? and *heavy*, and *hard*, and *yellow* are words which suggest the names *heaviness*, *hardness*, or *yellowness*, as the names of this or that Quality.

After saying that a *stone is heavy*, or that *gold is yellow* (which is merely saying that *a stone is a heavy thing*, or that *gold is a yellow thing*), the question repeats itself. What are words like *heavy* and *yellow?* They are *parts* of the name *heavy thing* or *yellow thing*. But a part of a name is not a name. That the missing part can always be supplied in thought is certain: and as this is the case, the words under notice are very good names for the purposes of Logic. But in Grammar the difference between *white* and *white thing* is a wide one.

The fact is that words like *stone* and *gold* are the names of objects that, besides the single quality of *heaviness* and *yellowness*, have others. When we call any object *a stone*, or *gold*, the name implies more qualities than one; and of these the most characteristic determines the name. *This* name is a Substantive; because something intangible, invisible, and, to our senses, wholly inappreciable, is supposed to lie at

the bottom of these several qualities (to *stand under them*) and to combine them into a unity. But each separate quality has no such substance about it.

So far as their Declension goes, Abstract Nouns are Substantival rather than either Pronominal or Adjectival; and, such being the case, they are Substantives for the purposes of ordinary grammar. There are cases, however, where the difference between the true Substantive with many Attributes combined, and the Abstract Noun, which is the name for a single Attribute isolated, is something more than a mere point of derivation.

§ 381. *Pronouns as Names and as Substantives.* —So far as their Declension goes, *Pronouns* are other than Substantival. In English they are (or were) Adjectival; or, *vice versâ*, the Adjectival Declension was Pronominal. But there are languages in which the Adjective, in its Declension, agrees with the Substantive. In respect to their import Pronouns may stand for either a true Substantive (as *this stone, that tree*) or for an Abstract (as *this bashfulness surprises me, that boldness daunted me*). They are Names in both cases. But they are not names like either *stone* and *tree*, or *bashfulness* and *boldness*. A *stone* always means a *stone* as opposed to a *tree*; and *bashfulness* can never be converted into *boldness* by merely shifting the places of the objects to which the two words apply; as we can do by calling them *this* and *that*.

This, of course, is founded on the fact of the Pronoun being a name determined by the *Relations* of an object which are changeable; whilst Substantival and Abstract Names are founded upon an Attribute of a more permanent kind—and *Quality*. Hence, the peculiarity of a Pronoun, as a name, lies in the fact of its being changeable, temporal, ephemeral, or whatever

we choose to call it. Still it is a name *for the time being*—and, as such, though it differs from the true Substantive and the Abstract in its Declension, it agrees with them in the part it takes in the structure of Propositions.

§ 382. *Many-worded Names.*—We have seen how, in cases of *Composition*, two names may be treated as one: e.g., *rose-tree*, *sun-dial*, &c. In *midshipman* we have three. How much farther we can go in this direction may be seen from the following manipulation of such a word as *fire*:—

Fire burns.

1. Prefix the definite article.—*The fire burns.*
2. Insert an adjective.—*The bright fire burns.*
3. Add an adverb.—*The very bright fire burns.*
4. Add a participle, and convert *bright* into its corresponding adverb.—*The very brightly-burning fire burns.*
5. Introduce a second substantive, showing its relations to the word *fire* by means of a preposition.—*The very brightly-burning fire of wood burns.*
6. Insert *which* after *fire*, followed by a secondary proposition.—*The very brightly-burning fire which was made this morning of wood burns.*
7. Add another secondary *proposition* relating to *wood*.—*The very brightly-burning fire which was made this morning out of the wood which was brought from the country burns.*
8. Add another secondary proposition by means of a conjunction.—*The very brightly-blazing fire which was made this morning out of the wood which was brought from the country, because there was a sale, &c., burns.*

It is clear that processes like this may be carried on *ad infinitum*, so that a sentence of any amount of complexity will be the result. Notwithstanding all this, the primary and fundamental portion of the term is manifestly the word *fire*.

These give us *many-worded names*.

§ 383. *Propositions.*—*Names* which belong as

much to '*Etymology*' as to '*Syntax*,' lead us to *Propositions* which belong wholly to '*Syntax*.'

The Proposition of the Grammarian is a much wider one than that of the Logician; and it is not the Grammarian that has extended it. The Grammarian simply takes it as he finds it in Language, and with no limitations except those that lie within the domain of Language itself. The Logician, on the other hand, takes but one sort of Proposition; and he thus limits himself, because it is for one, and for one particular purpose only, that he uses it—the purpose of ratiocination.

The one main argument which may be opposed to the views here put forward is the doctrine favoured by many grammarians that all sentences ought to be reduced to the logical form, consisting of a subject, predicate, and copula. That this view of language is all-important for the syllogism, and, consequently, for argument, is admitted; but it is not admitted that the first object in the formation of language was argument. Earlier and more pressing objects were to enunciate facts and to give commands.

In truth the process by which the logician forces (for it is often sheer force) every sentence into his favourite form, so as to exhibit the so-called substantive verb, is altogether artificial; and not a little harm has been done to grammar by regarding language too much from the logician's point of view. *Key: Language, its Origin and Development*, 187—p. 16.

The essential character of the Grammarian's Proposition is the fact of its having two elements; one of which tells us *what it is that we speak about*, and the other what it is that *we say about it*. If we say *I walk*, the name of the object spoken about is given in the word *I*; while *walk* tells us what the object expressed by *I* does. In *who walks*? we have exactly the same elements. The Proposition, however, instead of saying *who* does anything, asks *what* some one does? Nevertheless, *who* is as good an element in the proposition as *I*. It means *somebody I wish to learn something*

about. Of course, this is implied rather than directly conveyed. In a command like *walk*! there is the same amount of implied meaning. But we know who or what is spoken about; for it is the person addressed. He has no explicit, or separate, name; but he has a reality as the Subject of the Proposition; and from the word *walk* we know what is said about him. Now, of these three Propositions the logician excludes both the Question and the Command; for the only Proposition that he cares for is that in which something is either affirmed or denied. Upon this he can argue, but he cannot do so upon Commands or Questions, though in both there is something said about something or somebody, and also something, or somebody, about which something is said.

§ 384. *The Copula*. — Whether this '*something said*' be said in the way of Affirmation or Denial is all that the Logician enquires; and, for this, he takes a third element into his proposition—the *Copula*. He might, perhaps, dispense with it, for he might assume that, unless there were anything to the contrary, two words in apposition would be in the Affirmative. Thus *weather hot* would=not *not*-hot. But he wants something more explicit than this. He wants a word; and language supplies him with '*is*.' But before he can use it as a copula he has to limit its import in one direction, to enlarge it in another, and to recognize in it little more than its opposition to '*is not*.'

Now, whatever may be the Copular element in Language it is widely different from a word that merely says '*Yes*' or '*No*;' respecting such or such a statement, for though it does this with certain modifications of its own natural import, it does it with superadded notions of Mood, Tense, and Person, of which the logician divests it.

On the other hand, however, the technical language of Grammar is founded on that of Logic; and that to such an extent that the logical proposition has assumed the character of the philological one. In the present work it will occasionally be necessary to use the word '*Copula*.' But in most cases it perplexes and misleads the grammarian more than it helps him.

§ 385. *Subjects and Predicates.*—On the other hand, the logical terms '*Subject*' and '*Predicate*' are indispensable.

The object concerning which we make an assertion is called the *Subject*. *Man*, *summer*, *winter*, &c., are Subjects; and we can assert of them that they are *mortal*, or *warm*, or *cold*, &c.; or the contrary.

The assertion made concerning any object, or concerning the subject of our discourse, is called the *Predicate*. *Mortal*, *warm*, *cold*, &c., are Predicates: and we can speak of certain things as *mortal*, *warm*, *cold*, or the contrary.

The following words, amongst many others, are capable of forming, *by themselves*, Subjects:—

man	bow	wealth	ox	pen	atmosphere
mother	fishing-rod	length	ass	ink	firmament
daughter	hunter	fire	bird	virtue	sky
horse	shooter	water	egg	vice	essence
dog	book	soul	winter	apple	truth, &c.

The following words, amongst many others, are capable of forming, *by themselves*, Predicates:—

good	deep	shooting	hot	fatherlike	moved
great	happy	laughing	cold	bodily	beaten
red	womanly	conquered	strong	essential	sifted
weak	atmospheric	drifted	weak	important	buried, &c.

There is no subject without its corresponding predi-

cate; no predicate without its corresponding subject; and without both a subject and predicate there is no such thing as a proposition. Without propositions there are no questions, commands, or declarations; and without these, there would scarcely be such a thing as language. The little which there would be would consist merely of exclamations like *oh! ah! pish*, &c.

(*a*) The words in Italics ('*by themselves*') claim special attention.

There are plenty of words which can form *parts* of a Subject or of a Predicate; but a *part* is one thing, a *whole* another.

Thus—the Articles *a* and *the* can form a part of a Subject like *the man*; *a man*; and so can *bravely*, as *he is fighting bravely*, part of a Predicate.

Words like *with* and *from* can do the same; but they must stand between two Nouns—as *he is with me*; *it is from heaven*, &c.

Also words like *and* and *or*; but they must connect two Subjects—as *this and that*; *John or Thomas*, &c.

There is, also, one class which can form not only a Predicate, but something more; as *I live=I am living*, &c.

(*b*) Again—nothing has been said whether words which can form a Subject can, or can *not*, form a Predicate as well; and *vice versâ*.

(*c*) Thirdly—concerning words that form a Predicate *and something more*, no notice has been taken at all. These two questions, like the first, belong to the examination of the '*Parts of Speech*.'

§ 386. *Declarations — Commands — Questions.*—These are the three leading classes of Propositions in philology.

(*a*) In the first—which is the chief one—the Subject (as a rule) *precedes* the Predicate, as *He is brave*, &c.

(*b*) In Imperative propositions the Subject when expressed (as in *walk thou!*), for the most part, follows it. But it is generally omitted; as *walk!*

(*c*) In Interrogative Propositions the Subject and Predicate are *transposed*; as *What is man? Who are you?*

§ 387. This must be understood to be written solely and wholly with the view of showing how thoroughly the Commands and Questions, in Language, must not only be recognised, but the extent to which, in the way of arrangement, order, or collocation, they have a Syntax of their own, as opposed to that of the Declaratory Propositions. Before we can make '*Walk!*' a Predicate, we must reduce it to '*Be thou walking*;' whilst in '*What is Man?*' the Substantive Verb, with its place between the Subject and the Predicate, is, except so far as it is used in a Question, exactly the same as the ordinary logical copula. In the answer '*Man is mortal*' the logical and philological forms are identical. This requires explanation; and it will be given as we proceed.

The Declaratory, the Imperative, and the Interrogative Propositions are the chief ones. But in sentences like *How well you look!* and *Would I could*, we have the two elements—here held to be both essential to a Proposition and necessary to its constitution. If they were more important, it might be necessary to say more about them. I do not, however, see how we can deny them the rank of Propositions; though Propositions of a maimed and incomplete character.

§ 388. *Parts of Speech.* — '*Noun*,' '*Pronoun*,' *Verb*, *Participle* (*Declined*), '*Adverb*,' *Preposition*, *Conjunction*, *Interjection* (*Undeclined*).—Such are the '*Parts of Speech*' in the older *Latin* Grammars, or, at least, in some of them. In Greek the *Article* is added. Sometimes the Participle (half Adjective, and half Verb) is omitted, and, sometimes, the *Noun* is divided into the *Substantive*, and *Adjective*. But this distinction between the *Declined* and the *Undeclined* is natural, and the sequence is unexceptionable;

while, in respect to the classes themselves, the *Nouns*, &c., are still what they were, and still, as they always were, the same in English as in Greek and Latin.

But the tests by means of which we distinguish a *Noun* or an *Interjection* from anything else have changed. The *Syntax* of every language depends on its *Etymology*, and we have seen what the character of the *Etymology* in English really is. It is that of a highly Analytic language—the most Analytic in the world—as contrasted with that of the Latin, the Greek, and the Sanskrit, the typical representatives of the Synthetic stage.

The French is nearly as Analytic as the English. But compare the Adjectives of the two languages. The English are wholly destitute of any true Inflection. The French has not only *le bon père = the good father*, but *la bonne mère = the good mother*; not to mention the distinction between the Articles. In Latin *bonus pater = good father*; *bona mater = good mother*; *bonum telum = good weapon*. Meanwhile the plural runs *boni patres*, *bonæ matres*, *bona tela*. The Frenchman who said *bon mère* or *bonne père* might be accused of making a false concord; inasmuch as he would join an adjective in one gender to a substantive in another. No Englishman can possibly commit an error of this kind; because in the word *good* there is no change at all, and because, in English, we say *good father*, *good mother*, *good thing*, *good fathers*, *good mothers*, and *good things* indifferently.

The same applies to the articles. In French there are the forms *un* and *une = a* (or *an*); along with *le*, *la*, *les*, meaning *the*. Meanwhile, the German says *der*, *die*, *das*, *einer*, *eine*, *eines*, where the Englishman says simply *the* and *a* (or *an*). Of course, then, the details

of the syntax of the article must be simpler in English than in German.

But the Greek gives us the extreme contrast. For every Inflection in English, the Greek has scores—each of which is an outward and visible mark of the place of the word in the language.

The equivalent to these in English is the place that each word takes in the structure of a Proposition.

Some parts of speech can form terms *by themselves*. Others can only form *parts* of terms. This distinction, which is here repeated, should be specially attended to.

§ 389. *Details.*—The pronoun and the substantive.

The pronoun and the substantive can, *by themselves*, form *either* the subject or the predicate. They are both *names*. But the pronoun is a *convertible*, the substantive an *inconvertible* one.

The adjective and the participle can, *by themselves*, form the predicate of a proposition. The participle differs from the adjective in implying a corresponding verb.

The *finite* verb can form *both* the predicate and the copula.

The adverb can form no term by itself, but can, when associated with a verb, a participle, or an adjective, form *part of one*.

The preposition can form no term by itself, neither can it without *two* terms capable of doing so. It connects the two by *government*.

The conjunction can form no term by itself, neither can it (with a few exceptions) enter *into* a proposition at all. Its presence implies two propositions *between* which it finds place, and which it either connects or disconnects.

The affirmative and negative words '*Yes*' and '*No*'

can, *by themselves*, constitute a proposition. But they always imply, and depend upon, a previous one.

Have you done this? *Yes.*
Have you done this? *No.*

The interjection neither forms nor enters into a proposition.

CHAPTER II.

CONCORD—GOVERNMENT—PLEONASM—ELLIPSIS—PERSONIFICATION.

§ 390. *The Concords.*—Concord is derived from the Latin word *concordia*, and signifies *agreement*.

The word *man* is the name of a male, and, in respect to its gender, is masculine. The word *she* relates to a female, and in respect to its gender, is feminine. We do not, when speaking of the same person, say I saw the man and *she* saw me; or I saw *him* and *she* saw me. If we do, there is a *discordance* in the matter of *Gender*. On the other,

I saw him and he saw me,
I saw her and she saw me,

are concords; and, as there are more kinds of concords than one, this is called the concord of *gender*.

The other concords will be noticed in their details as we proceed. But a general view of their nature and numbers may be given now.

If I say *I saw* these *man*, or *I saw* this *men*, there is a discord. *This man* and *these men* are the true combinations. Here we have a concord of *Number*.

If I say *I* sees *John*, there is a discord in the way of *Person*.

If I say *he is* him, there is a discord of case. The true combination is *he* is *he*. This gives us a concord of *Case*.

If I say *I do this that I* might *gain by it*, or I *did this that I* might *gain by* it, this is a *discord*. The right expression is either *I* did *this* that I *might gain by it*, or *I* do *this that* I may gain by it. This gives us a concord of *Tense*. This is not generally recognized as a concord, but it evidently is one.

§ 391. *Apposition.*—In expressions like *George, King of England*, we must notice—

1. That the words *King* and *George* are in the same case.

2. That they denote the same object. The word *George* applied to that particular monarch means the same person as the *King* of England; and the words King of England applied to the same monarch mean the same person as *George*.

3. That they explain each other. If we say simply the *King of England*, we do not sufficiently explain ourselves; since we may mean a *Henry*, an *Edward*, or a *William*. And if we say simply *George*, we do not sufficiently explain ourselves; since we may mean any person in the world whose name is *George*. But if we say *George, King of England*, we explain what *king* and what *George* is meant.

Words that thus explain each other, mean the same thing, and are in the same case, may be said to be *placed alongside of each other*, or to be in *apposition*. The Latin word *appositio* means *putting by the side of*. The following are specimens of apposition:—*Solomon, the son of David.—Crœsus, King of Lydia.—Content, the source of happiness.—John's the farmer's wife.—*

Oliver's the spy's evidence.—Cæsar, the Roman emperor, invades Britain.—Here the words *Roman emperor* explain, or define, the word *Cæsar*; and the sentence, filled up, might stand, *Cæsar, that is, the Roman emperor*, &c. Again, the words *Roman emperor* might be wholly ejected; or, if not ejected, they might be thrown into a parenthesis. The practical bearing of this fact is exhibited by changing the form of the sentence, and inserting the conjunction *and*. In this case, instead of one person, two are spoken of, and the verb *invades* must be changed from the singular to the plural. Now the words *Roman emperor* are said to be in apposition to *Cæsar*. They constitute, not an additional idea, but an explanation of the original one. They are, as it were, *laid alongside* (*appositi*) *of* the word *Cæsar*. Cases of doubtful number, wherein two substantives precede a verb, and wherein it is uncertain whether the verb should be singular or plural, are decided by determining whether the substantives be in apposition or the contrary. No matter how many nouns there may be, so long as it can be shown that they are in apposition, the verb is in the singular number, provided that the main noun is also singular.

§ 392. Apposition is, manifestly, a Concord. Nor is it the last of them. The Concord between the *Subject and the Predicate*, though of less importance in English than in most other languages, requires notice.

The Predicate invariably agrees with the Subject in Case; and, as the Subject is always Nominative, the Predicate is Nominative also. There is no exception to this Concord: though there is no construction in which it is more disguised. It is only when the Subject and Predicate are connected by the Verb *is*, or some allied word, that it is seen at once—*he is brave, we are tired, they are soldiers*, &c.

Here, although the Nominative Case has no proper sign, we see that *brave*, *tired*, and *soldiers* are in the same case as *he*, *we*, and *they*: and if we translated the sentences into Latin we should write *ille est fortis*; *nos sumus fessi*, *illi sunt milites*. Nor could we see how any other Case would be tolerable. The truth is that this Concord, like all the others, is a natural one; indeed, it would not be a Concord if it were the contrary.

But between knowing that this is the construction, and calling the process by its right name, there is a difference. That the Noun which follows the Substantive Verb as a Predicate is in the Nominative Case, and that the Subject is the same, we know. But the ordinary way in which we teach it is that it is a process of *Government*. Sometimes the formula is special; i.e. to the effect that Verbs Substantive *govern* a Nominative Case. Sometimes it is invested with something like generality, and becomes '*Verbs Substantive are followed by the Case by which they are preceded.*' Of course, when it is the Subject that precedes, its case is the Nominative. The fact is true enough: but the notion that it is an instance of Government is a misconception.

The origin of this error lies in the great extent to which Verbs are what we may call a *governing* class. They are best represented by those of the Transitive division, and every one of these *governs* some case or other; and that an Oblique one. Other Verbs are supposed to do the same; and the result is that such a genuine *Concord* as that of the Subject and Predicate gets described as an instance of Government; which is the reverse of Concord rather than a form of it.

§ 393. *Government.*—Concord means what its name denotes; *agreement* in certain points between any two words of which number, gender, &c., have been the chief. The effect of all concords is to keep such words in the same grammatical place as they were.

Government or *Regimen* puts each word out of two in a *different* place. Thus in *I strike him*, while *I* is in the nominative case, and *strike* in the corresponding person, *him* is in the objective case, and, so being, agrees with neither of them.

The chief forms of government are:

1. Government of a noun by a noun, as the *father's son.*

2. Government of a noun by a verb, as *I strike him.*

3. Government of a noun by a preposition, as *the father of the son; speak to me.*

4. Government of a verb by a conjunction or a relative pronoun, e.g.:

He strikes *me*:—if *he* strike *me*, *I shall strike again.*

The man who did this shall die, whosoever *he* be—which is generally considered to be better grammar than *the man who did this shall die*, whosoever *he* is.

§ 394. *Collocation.*—The order or arrangement of the words of a sentence is in English a matter of more than ordinary importance; and it is easy to see why it should be so. In languages, like the Latin, where the inflections are numerous, words like *bonus dominus* or *pulchra filia* may be placed far apart from one another, and so may words like *milites pugnant*, or *pueri ludite*, and thousands of others in similar circumstances. This is because in the terminations *-us*, *-a*, we have certain outward and visible signs of gender, and these show that the words in which they occur agree with one another in that respect. And the same is the case with *-es*, *-i*, *-nt*, and *-ite*, except that the agreement here is in the way of number, and it is number of which these syllables are the signs. But

in English, where the adjectives have no signs of anything at all, or, in other words, no inflection, while the remaining parts of speech have but few, no such latitude is admissible. Hence, words which agree with one another must, as a general rule, be kept in one another's neighbourhood.

These are the three chief heads under which the great majority of the rules of syntax may be arranged. There are none of them of an abstruse character; indeed, the class of concords is so thoroughly a matter of common sense that, at the first view, it seems scarcely worth explanation; for it is clear enough that in the concords of number, gender, case, and person, the two words in agreement are really two names of the same object, and such being the case, *must*, in both cases, be of the same gender, number, and the like. This is so simple a matter, that, at the first view, it appears that we want no grammarian to enlarge upon it.

§ 395. Such would, doubtless, be the case if the concords, &c., stood alone, i.e., if there was nothing to disturb them. But this is not the case. The following is a notice, not of all, but only of some of these disturbing influences. They are well known and generally recognised. They have been, to some extent, classified, and some of them have names—old names dating back to the classical time of Greek language; and thus showing that they have belonged to grammar ever since it was first cultivated.

§ 396. *Ellipsis.*—Such a name is *Ellipsis*, signifying 'omission,' 'deficiency,' or 'falling short,' or 'short coming.'

This was bought at *Rundell and Bridge's*, i.e. shop, warehouse, or place of business. I am going *to St. Paul's*, i.e. cathedral.

§ 397. *Pleonasm.*—Such a name is *Pleonasm*, signifying excess.

The king *he* is just.	I saw *her*, the queen.
The men *they* were there.	The king *his* crown.

In the comparative degree we occasionally find, even in good writers, besides the syllable *-er*, the word *more*; as, *the more serener spirit.* Expressions like these are pleonastic, since the word *more* is a superfluity.

In the superlative degree we occasionally find, even in good writers, besides the syllable *-est*, the word *most*; as *the most straitest sect.* Expressions like these are pleonastic, since the word *most* is a superfluity.

§ 398. *Personification.*—Such a name is Personification, of which the following are instances:

Gold, whose touch seductive leads to crime.
The cities who aspired to liberty.

The unexceptionable forms for these two texts are: 1. gold, the touch *of which*, &c.; 2. the cities *which* aspired, &c.

Still the exceptionable texts can be explained, perhaps excused. We may say that *a city* is what it is on the strength of the human individuals that constitute it; and we say *Gold* is treated as a personal agent, like Sin, Death, Virtue and Vice, &c.

§ 399. *Violations* (*real* or *apparent*) *of the concord of number.*—*I have not travelled this twenty years.*—As *this* is singular and *twenty years* plural, there is an apparent violation of the concord of number. Still, it is only apparent. The words *twenty years* may be considered to mean, not *twenty separate years taken severally*, but *a number of years amounting to twenty*

dealt with as a single period. In this latter case the words *twenty years*, though plural in form, are singular in sense.

These sort of people.—Here *these* is plural, and sort is singular; so that there is a violation (real or apparent) of the concord of number. Still, as the word *sort* implies the existence of more persons than one, the expression is open to the same kind of explanation as the preceding one.

The reason of this confusion of number is clear. There are in all languages certain substantives called Collectives. Of these collectives the word *sixpence* is a good example. It involves two notions: (1) that of *six separate pennies*; (2) that of *six pennies dealt with as a single sum.* In the first case it is plural; since in talking of *six separate pennies* we contemplate a plurality of parts. In the second case it is singular, since in talking of *a single sum* we lose sight of the plurality of parts, and contemplate only the unity of sum that results from them. In all collective substantives there is a mixture of two notions. *Army, parliament, people, mob, gang, set, family*, &c., are collectives.

By remembering that in all languages there is a tendency to *personify*, we can explain many apparent violations of the concord of gender.

By remembering that in all languages there is a certain number of *collective* substantives, we can explain many apparent violations of the concord of gender.

§ 400. *Attraction.*—This is a word with rather a wide sense; but, in the present work, it will be confined to a disturbing influence limited to Complex sentences, and, even in them, unless there is a notable amount of well marked Cases, of no great importance. Of the

few questions, however, connected with it some are found even in so uninflected a language as the English.

It is only in Complex sentences that they occur: and of these, only in those in which there is a Relative and an Antecedent.

Of the Antecedent the Relative is, of course, only another name; i.e. in phrases like *I saw the man whom you spoke of*, the word *whom* applies to the same person as *man*. Now the Antecedent and Relative, though they necessarily agree in both Number and Gender, may either agree or disagree in Case: for we may say—

1. John, *who* trusts me, comes here;
2. John, *whom* I trust, comes here;
3. John, *whose* trust is in me, comes here.

It is not uncommon that when there are two Verbs—one in the Antecedent clause and the other in the Relative—they may govern different cases; and if there were no disturbing cause, they would do so as a matter of course. But the Relative and the Antecedent refer to the same object; and this has a tendency to create disturbance. In *I use the books* (*which*) *I possess*, there is, in English, no danger; inasmuch as *use* and *possess* govern the same Case: and if they did not, it would not matter, for, except the Possessive, all the Oblique Cases are alike. But, in Greek, *use* (*χρῶμαι*) governs a Dative, *possess* (*ἔχω*) an Accusative. In fact, however, they both govern the same Case—*χρῶμαι βιβλίοις οἷς ἔχω*. Here *οἷς* = *which*, and is governed by *ἔχω*, is said to be attracted to the case governed by *χρῶμαι*. The fact that the Relative applies to the same object as the Antecedent is the natural explanation of this class of anomalies.

CHAPTER III.

SPECIAL SYNTAX.—SIMPLE PROPOSITIONS.—THE NOUN.—PRONOUNS.—SUBSTANTIVES.—ARTICLES.—ADJECTIVES.

§ 401. The special details of English Syntax now come under notice. They will be arranged according to the several '*Parts of Speech*;' these being determined by the place a word takes in a Proposition.

§ 402. *Syntax of the Pronoun.*—A Pronoun is a *Variable*, or *Convertible* name; and can, *by itself*, constitute either the Subject or the Predicate of a Proposition; as *I am he, this is John, what is that?* It agrees with the Substantive in this respect, but differs from it in being *Convertible* or *Variable.*

We have seen that as the Pronouns had the fuller inflection, they preceded both the substantive and the adjective in Etymology. For the same reason they will precede them in Syntax. Whether we say *feed the horse* or the *horse feeds* is indifferent; inasmuch as, in *substantives* like *horse*, there is no difference between the objective and nominative. Whether we say *a good book* or *good books* is indifferent; inasmuch as in *adjectives* like *good* there is no difference between the plural and the singular. Whether we say *feed he* or *feed him* is by no means indifferent; inasmuch as in *pronouns* like *he*, &c., the objective and the nominative cases differ in form.

A Pronoun can constitute either the Subject or the Predicate of a Proposition. But some do this more decidedly than others. With words like *who, what, this, these, that, those, I, thou, we*, and the like, their power is plain and clear; and they form Substantives, not in respect to the place they take in a proposition, but in respect to the principle upon which they do so. The Substantive, as a Name, is Invariable, the Pronoun Variable.

But the aforesaid words which so decidedly share the nature of substantives, are not the only Pronouns. There are, besides, such words as *some, any, many*, of which the character is adjectival rather than substantival. Still, they can form terms; and that by themselves. At the same time they are often accompanied by a substantive, and, in some cases, almost require one. In expressions like *some are here, any will do, many are called*, &c., the substantive, to which they are the equiva-

lent, can generally be inserted with advantage; so that we may say, *some men*, *any instrument*, *many individuals*. All the pronouns of this class are undeclined. The nearest approaches to an exception to the foregoing statement are supplied by the word *same*, and the Ordinal Numbers; which, instead of standing *quite* alone, are generally preceded by the definite article, so that we say *the same*, *the first*, &c. Here, however, the article is to be looked on as part of the pronoun. For a further elucidation of this, as well as for the nature of the article itself, see below.

§ 403. *Pleonasm.*—Pleonasm occurs with Pronouns in expressions like—

1. The king, *he* is just.
2. I saw *her*, the queen.
3. The men, *they* were there.
4. The king, *his* crown.

Mars *his* sword,
Nor Neptune's trident, nor Apollo's bow.
Ben Jonson: Cynthia's Revels, i. 1.

Pallas *her* glass.
Bacon: Advancement of Learning, 278.

The Count *his* galleys.
Twelfth Night, iii. 3. 26.

Mars *his* true moving.
1 *Henry VI.* i. 2. 1.

Charles *his* gleeks.
1 *Henry VI.* iii. 2. 123.
Abbott: Shakespearian Grammar, § 217.

§ 404. *I and me as Predicates.*—*I* is so undoubtedly the Nominative Case of the Pronoun of the First Person, and the rule that the Predicate is in the same Case as the Subject is so absolute, that the correctness of such a sentence as '*It is I*' is absolutely unimpeachable.

We know, however, that a great deal has been written about it. And something will be written now. Not, however, with the view of impugning the general opinion as to its propriety, but with that of ascertaining how far it is the *only* proper form. Does it exclude the combi-

nation *It is me*? If it do, what follows? To the question *who is that*? the answer is *It is I*. But, as the Subject and Copula are implied in the question, it may be conveyed by the single word *I*. Can *me* be used instead?

It is certain, as a matter of fact, that it *is* so used; and it is equally certain that though *It is I* is very good English, *c'est je* is not such excellent French. On the contrary, *c'est moi*, which is the English *It is me*, is the only tolerated expression.

§ 405. *My and Mine—Thy and Thine.*—Of these the forms in *-y* are only used when the substantive to which they refer is *expressed*; as *this is my book*; while those in *-n* are only used when the substantive is understood; as *this book is mine.*

What applies to these two forms of the Possessive Pronoun of the First and Second Persons, *Singular*, ending in *-n*, applies, also, to those of the (so-called) Third Person, and the Plural forms in general—*her-s*, *our-s*, *your-s*, *their-s*.

This is a discovery of Sir Isaac Newton's is different in sense from *this is a discovery of Sir Isaac Newton.* The latter means *this is how Sir Isaac Newton was discovered*: the former means *of Sir Isaac Newton's discoveries this is one.*

In all such sentences there are *two* substantives: one with which the article agrees, and which is expressed; and one by which the possessive case *s* is governed, and which is omitted, as being understood.

The pronominal possessive cases, *my*, *thy*, &c., are not in *all* respects like the possessive cases of the substantives (*father's*, *mother's*, &c.)

We cannot say *an enemy of my* —, *a notion of thy* —, &c. Yet—

We *can* say *these are good books*, but we cannot, *now*, say *these are mine books.* Hence—

Rule 1.—The adjectival pronouns like *mine*, *thine*, *ours*, &c., are only used when the substantive is *understood*; as *this book is mine*, i.e. *my book*.

Rule 2.—The possessive cases are only used when the substantive is *expressed*; as *this is my book* (not *this is mine book*, nor yet *this book is my*).

§ 406. *You and Ye.*—As far as the practice of the present speech goes, the word *you* is Nominative: since we say *you move*, *you were speaking*, &c. Why should it not be treated as such? There is—

> As I have made *ye* one, lords, one remain;
> So I go stronger *you* more honour gain.
>
> *Henry VIII.* iv. 2.

> What gain *you* by forbidding it to teaze *ye*,
> It now can neither trouble you nor please *ye*.
>
> *Dryden.*

§ 407. *Thou and You.*—When we say *you* instead of *thou*, it is doubtful whether, in strict language, this is a point of Grammar. I imagine that in addressing the person spoken to, the courtesy consists in treating him as something more than a single individual. This is the *Pronomen reverentiæ*. Akin to it is—

The Dativus Ethicus; as in *Rob me the Exchequer*. Here the *me=for me, for my sake, at my request*.

> *Your* serpent of Egypt is lord now of your mud by the operation of *your* sun; so is your crocodile.
>
> *Antony and Cleopatra*, ii. 7, 29.

> I would teach these nineteen the special rules; as *your* punto, *your* reverso, *your* stoccata, *your* imbroccato, *your* passada, *your* montanto.
>
> *Bobadil, in Every Man in his Humour*, iv. 5.

Abbott: Shakespearian Grammar, § 221.

See also §§ 231–236 for an elaborate exposition of Shakespear's use of *thou* and *you*, &c.

§ 408. *His and Her.*—These are Possessive, and correspond with the Latin *ejus*. They are not

Adjectives, and they by no means correspond with the Latin *suus, sua, suum.*

§ 409. *The Reflective construction.*—The true Reflective = the Latin *se* is wanting in the present English: the word *self* being used in its stead. Nevertheless, it does not wholly exclude the simple pronoun. We may say *I strike me* or *thou strikest thee*, and that without ambiguity. *He strikes him*, however, is ambiguous, as *him* may be either the speaker and striker or some one else.

§ 410. The reflective pronoun, in English, *follows* the governing verb: also—

In the *Imperative* Mood the simple Pronoun follows it.

Hence, when the word self is omitted the construction is ambiguous. *Mount ye* may mean either *be mounted* or *mount yourselves.*

§ 411. *This and that.*—When these two Demonstratives, which convey the notion of comparative nearness and distance, follow two nouns with which they coincide, the current rule is that *this* refers to the latter, and *that* to the former. The most familiar example is the following—in Latin and in *verse*—verse being by no means the best quarter for rules of Collocation:—

Quocunque aspicias nihil est nisi *pontus* et *aer*:
Nubibus *hic* tumidus, fluctubus *ille* minax.

I hold this to be wholly artificial—in English at least. I thought, or felt, even when I was first taught it as a school-boy, that it was repugnant to such previous notions as either instinct or imitation had implanted in me; and I think so now. We can see which is which in the extract before us from what we know of the properties of the ocean and the atmosphere; and in such a passage as—

'Alexander and Cæsar were the great heroes of antiquity—*this* a Roman, *that* a Greek.'

We could arrive at the same conclusion from our information *aliunde.*

But if any one said to us—

'He sent me the balance in ducats and doubloons. *These* I got changed by Mr. *A*, and those by Mr. *B*,'

I doubt whether any one would feel any assurance as to which of the two sorts of coin Messrs. *A* and *B*, respectively, changed.

If he were inclined to consider the matter, and tried to make out what the collocation *ought* to mean, he would, perhaps, take such a pair of words as *the one* and *the other*, or *the first* and *the second*; or he might call *this* the Pronoun of comparative *nearness* Number 1, and *that* the Pronoun of comparative distance Number 2. If so, the result would be in direct opposition to the rule.

The fact is that in cases of this kind there are two ways of measuring what we call logical distance: and it is possible that one person may think in one way and another in the other. One may measure distance from the end of the previous clause, and, conducting his discourse in a straight line, consider the last word he has heard as the nearest. Another may think of the two clauses as parallels; in which case the first word of the previous clause is the nearest. It is difficult, however, for one person to say how another thinks in matters of this kind, and not very easy to say how he thinks himself.

Still, one point I hold to be certain; viz., that the question is not one of Grammar. Grammar can never tell us how we ought to think in such a matter as this. It can only tell us how to express such thoughts as we have.

And it is for the sake of drawing this distinction that I have enlarged upon an apparently unimportant point. There are other questions besides this wherein, until we know how the speaker *thinks*, it is not in the province of the grammarian to say how he should either speak or write. The present is one of these *extra*-grammatical questions, and, in my mind, the more perplexing one as to use of '*will*' and '*shall*' is another of them.

§ 412. *The Indeterminate Pronoun—'one says.'*

—Different languages have different modes of expressing indeterminate propositions. In Greek, Latin, and English the passive voice is used—*λέγεται, dicitur, it is said.* The Italian uses the reflective pronoun; as, *si dice=it says itself.* Sometimes the plural pronoun of the third person is used. Thus, in our language, *they say=the world at large says.* Finally, *man* has an indeterminate sense in the Modern German; as, *man sagt = man* says = *they say.* The same word was also used indeterminately in the Old, although it is not so used in the Modern, English. In the Old

English the *-n* was occasionally lost, and *man* or *men* became *me*. In the present English it is *one*, as in *one says*. The present writer, as others have done before him, believes that this is, word for word, the French *on* in *on dit*. But, as this was in Old French *homme*, and, in Latin, *homo*, meaning for meaning, the *import* of the three combinations is the same in the three languages. Whether what applies to the particular phrase *one says* applies to the forms in *-s*, as in *one's own*, or *my wife and little ones*, indeed, whether it applies to any second combination in our language is another question. Individually, I have given the doctrine that *on=man* a far wider application than I do at present. But that *one says*, even if it stand alone, is a Gallicism, and that the element *one* is *not* the Numeral, is, in my mind, the true explanation of the form.

There are few questions for which the nature of the appropriate evidence is clearer. Instances of any form of the word *one* (*ains*, *ein*, or *en*) being used with the power of the *on* in *on dit*, and in the place of *man* in *man sagt*, in any of the German languages not affected by French influences, would be to the purpose: and instances of the Numeral *one* used *anywhere* in the sense of *everyone*, would be to the purpose also. But evidence to its use as *some one*, or *some man*, or *vice versâ*, is *not* to the purpose.

§ 413. '*It*' *and* '*There*.'—Two other pronouns, or, to speak more in accordance with the present habit of the English language, one pronoun, and one adverb of pronominal origin, are also used indeterminately, viz., *it* and *there*.

It can be either the Subject or the Predicate of a sentence,—*it is this—this is it—I am it—it is I*. When *it* is the Subject of a proposition, the verb neces-

sarily agrees with it, and can be of the singular number only; no matter what be the number of the Predicate —*it is this*—*it is these*. When *it* is the Predicate of a proposition, the number of the verb depends upon the number of the Subject.

'*Therc*' can only be the Predicate of a proposition; differing in this respect from *it*. Hence, it never affects the number of the verb; which is determined by the nature of the Subject—*there is a man*, &c.—*there are men*, &c.

But this applies only to the word *there* when it is indefinite, or indeterminate. Where it is definite, or determinate, it is still a Predicate; but it is in its proper place as such, i.e. at the *end* of the proposition. Even here it can be transposed.

(1)

Indefinite, or Indeterminate.

There is something in the way.
There is no one here.
There are thieves in the house.

(2)

Definitc, or Determinate.

Some one is concealed *there*.
The thieves are *there*.
You will find them *there*.

Or, transposed,

There you will find them.

Indefinite and Definite in the same proposition.

There is some one there.

§ 414. In such phrases as *it rains*, *it freezes*, &c., it is difficult to say in express terms what *it* stands for. Suppose we are asked *what rains?* or *what freezes*—the answer is difficult. We might say *the rain*, *the weather*, *the sky*, or what not? Yet, none of these

answers are satisfactory. To say the *rain rains, the sky rains*, &c., sounds strange. Yet we all know the meaning of the expression—obscure as it may be in its details. We all know that the word *it* is essential to the sentence; and that if we omitted it and simply said *rains*, the grammar would be faulty. We also know that it is the subject of the proposition.

A curious way of giving precision to this indefinite power of the word *it* is seen in the following list:—

Pluit	raynes	Deus meus.
Gelat	freses	„ tuus.
Degelat	thowes	„ suus.
Ningit	snawes	„ ipsius.
Tonat	thoners	„ sanctus.
Grandinat	hayles	„ omnipotens.
Fulgurat	lownes	„ Creator.

§ 415. '*It*' may follow an *in*transitive verb. It does this in colloquial phrases, as *go it*: in which it, manifestly, is not in that definite state of regimen, or government, that it is when *it* follows a *transitive* verb; as in *take it, keep it*, &c.

Go it here is, undoubtedly, a verb. In the following instances it is not so much a verb as a substantive with the import of a verb.

It is often added to nouns or words that are not generally used as verbs, in order to give them the force of verbs.

> *Foot* it.—*Tempest*, i. 2, 380.
> To *queen* it.—*Henry VIII.* ii. 3, 37.
> To *prince it.*—*Cymbeline*, iii. 4, 85.
> Lord Angelo *dukes* it well.
>
> Measure for Measure, iii. 2, 100.

and later—

> Whether the charmer *sinner* it or *saint* it,
> If folly grows romantic I must paint it.
>
> *Pope: Moral Essays*, ii. 15.

Abbott: Shakespearian Grammar, § 226.

So far as this construction is explicable, it must be explained by supposing that *it* means something done in the way of *going*, i.e. of performing with *feet* (as dancing is performed)—of doing after the manner of a *queen*, a *prince*, a *sinner*, or a *saint*, and the like.

§ 416. In *I strike me*, the verb *strike* is transitive. In *I fear me*, the verb *fear* is intransitive or neuter; unless indeed *fear* mean *terrify*—which it does not. So also *we repent us* and others. Here, after a neuter or intransitive verb, the reflective pronoun appears out of place, or as an expletive.

§ 417. We may now pause upon the fact of our having in the present English no true Reflective like the Latin *se*, the German *sich*, and the Scandinavian *sik* or *sig*—a remarkable deficiency; with which the absence of such an Adjective as *suus*, the German *sein*, or the Scandinavian *sin* is connected. This forces upon us such constructions as *his mother* and *her mother*: where the pronoun is the Possessive Case, and no concord of Gender is required. It gives prominence to the word *self* in *myself*, *thyself*. It makes such a reflective verb as *se battre*, *sich schlagen*, *kalle sig*, in French, German, and the Scandinavian languages, to say the least, improbable. Indeed, in a larger work more could be said upon the effects of its absence, than upon those of its presence. In Beowulf we get in the adjective *sin* just a trace of it.

This is why I have said that the development of a Passive Voice, like that of the Scandinavian languages, is, in English, improbable rather than impossible. The words *busk* and *bask* have been treated as Reflective forms, after the Norse pattern; and, as such, due to '*Norse influences*.' Their elements are held to *bua* + *sik* = *to make oneself ready*, and *bak* + *sik* = *to bake oneself*. This may, or may not, be the case. But, even if it be, there is no reason to refer them to contact with Norsemen, so long as the original reflective is a probable element in the older Anglosaxon.

But there is more in the matter than this. The Reflective Pronoun may lend itself to two processes in two different stages of a language: and, before it has developed a Passive Voice, may have developed a series of forms of a Deponent, rather than a Passive, character. If so it is possible that the *r* (which represents an earlier *-s*) in the Scandinavian Singular for *all* the persons of the Present Tense may have been originally the *-s* of the Reflective Pronoun: and what *-r* is in Scandinavian, *-s* may have been in the Northumbrian. That there are notable objections to this on the surface I am well aware. But the Norse *-r*, and the Northumbrian *-s*, give us little more than a conflict of difficulties. I have, therefore, not assumed the suggested doctrine to the extent of building a single argument upon it; and I scarcely venture to call it an hypothesis. But that there is much that can be found in favour of it I am sure. The limitation of the *-r* to the singular number in the Norse is the chief objection; and I prefer to recognize the fact of its being so, rather than to explain it away.

§ 418.
Substantives.

A Substantive is an *Invariable*, or Inconvertible, name; and it can, *by itself*, constitute either the Subject or the Predicate of a Proposition—as *summer is coming, this is gold.* It is by this invariability, or inconvertibility, that it differs from the Pronoun.

§ 419. The real Syntax of the Substantive lies within its own division. One Substantive may govern another. This gives us the old rule that when two substantives come together the latter is put in the Genitive (Possessive) Case—as

The man's hat.
The father's son.

The Collocation here gives us one of the few absolutely unexceptionable rules of our language. The Genitive, or Possessive, never follows, but always precedes the case by which it is governed.

§ 420. *Ellipsis and Pleonasm.*—To Ellipsis belong such combinations as 'St. Paul's,' 'Rundell and Bridge's,' and others. They are common in other languages;

and, generally, the words understood are the same throughout. Those connected with the idea of *house*, or *family*, are the commonest. In Latin *ubi ad Dianæ veneris* = *ædem Dianæ*. In Greek Νηλεὺς Κόδρου = Κόδρου *υἱός* (*son*).

Of Pleonasm the most familiar instances are those where, besides the Substantive, there is a superadded and a superfluous Pronoun; as

The king he is just.
My banks they are furnished, &c.

The Possessive form *his*, where thus used, has a fictitious importance, because, out of the contraction of such pleonasms as *Mars his sword*, *the Count his galleys*, and the like, the doctrine that the *-s* in *his* is the *-s* of the Genitive case has originated; indeed it is possible that some may believe it at the present moment. See *Abbott*, *&c.*, § 217; and *Morris*, *&c.*, § 100, *with note*.

§ 421.

Adjectives.

An Adjective is a word which, *by itself*, can form a Term.

But it can form only *one* of the two terms of a Proposition. It can form the *Predicate*; but it can *not* form the *Subject*.

This is because it is *not a name*; at least, not in the same way that Substantives and Pronouns are.

It is a word which suggests a *Name*; rather than the Name itself.

This name is the corresponding Abstract term—as *red*, *red-ness*, &c.

§ 422. The chief points in the Syntax of the Adjective are those connected with the Degrees of Comparison.

— —

When two objects are compared, the Comparative, when more than two, the Superlative Degree, should be used—*this is the better of the two, but this is the best of all.*

The Positive preceded by the word *more* may stand instead of the Comparative. We may say *more wise*, instead of *wiser*.

The Positive preceded by the word *most* may stand instead of the Superlative. We may say *most wise* instead of *wisest*.

That they can be used is universally known. Neither is there anything remarkable in their syntax. Common sense tells us what they mean. When, however, do we use the one form, when the other? This depends upon the nature of the Adjective. In general terms, we may say that the object of the circumlocution is to keep the length of the word within certain limits. It is, *probably*, better to say *more fruitful* than *fruitfuller*. It is *certainly* better to say *more pusillanimous* than *pusillanimouser*. But it is doubtful whether this is the only rule to go by. A great many Adjectives (*fruitful* amongst the number) are Compounds, in which case the addition of an *extra* syllable presents an accumulation of subordinate parts, which, to some speakers, may be inconvenient or disagreeable. Thirdly, there is a large number of Adjectives which are of foreign origin. To some of these an English affix *-er* or *-est* would be exceptionable.

Thus much, however, may safely be said—

1. That when the word is, at one and the same time, monosyllabic in form and English in origin, the forms in *-er* and *-est* are the proper ones.

2. That when the word is trisyllabic, compound, and of foreign origin, the combinations in *more* and *most* are to be resorted to.

For intermediate cases the writer may consult his own taste. Of dissyllables, the words that end in *-y* are those that, next to our native monosyllables, have the best claim to be inflected—as *holy, holier, holiest* —*manly, manlier, manliest*; upon which we may remark, by the way, that they are all Anglosaxon.

§ 423. The adjective *like* governs a case, and it is, at present, the only adjective that does so. When we say this is *good for John*, the government proceeds not from the adjective *good*, but from the preposition *for*. The word *like*, however, really governs a case.

§ 424. *Pleonasm.*—This we find in expressions like *the more serener spirit; the most straitest sect.*

§ 425. The extent to which the Adjective of the present time stands in contrast to the Adjective of the earlier stages of our language has already been explained. It is now as uninflected as an Adverb. Hence, so far as the outer form of an Adjective in Concord with its Substantive is concerned, error or confusion is impossible: for in the Adjective there is no distinction of either Gender or Number. Still, such distinctions *have* existed; and of these one, at least, claims attention.

That Adjectives in the Neuter Gender may be used Adverbially is a familiar rule in Greek and Latin, as well as in English; and when we say *the sun shines bright, the time flies fast, the snail moves slow*, we use not only an Adjective, but an Adjective in the Neuter Gender. It has, at present, no outward or visible sign of its Neutrality. Virtually, however, it is as real a Neuter as if it had; for when the Genders of the Adjectives were distinguished from one another by inflections, the sign of the Neuter was the sign of the Adjective when used as an Adverb.

In the examples just given we may write for *bright*, *fast*, *slow*, and the like, *brightly*, *fastly*, *slowly*, &c., and in the eyes of some these are the better words. However, we have a choice between the two. When the Adjective itself ends in *-ly* we have no such choice. We cannot well derive such a word as *dailyly* from *daily*: but must use such phrases as *he labours daily*, *he sleeps nightly*, *he watches hourly*, and others; in all of which the simple Adjective is used as an adverb.

In the way of Collocation (which is independent of inflection) the Adjective *precedes* the Substantive; though not so regularly as the Possessive Case (*man's hat*, &c.) precedes it.

For rhetorical purposes the Adjective and the Substantive (or Pronoun), as the terms of a proposition, may change places—as *Great is Diana of the Ephesians*. Here the Adjective *great* is by no means the Subject; nor is *Diana* the Predicate. There is only a transposition of the terms.

§ 426.

The Article.

The proper place of the Article is with the Adverb, Preposition, and Conjunction, or those Parts of Speech which can form only portions of a term, rather than with the Noun and Verb, which can, by themselves and single-handed, form *whole* terms. Its manifest connection, however, with the Pronoun, and the closeness of its relations to the Substantive, make it convenient to arrange it with the Nouns.

The recognised Articles in English are *the* and *an*; and it is, perhaps, not necessary to add to the Number. Nevertheless, it will soon be shown that there are other words which, if not actual Articles, are what we may

call *Sub*articular in character. *No* is one of these; and *every* is another. Neither of these words has any independent existence, except when coupled with substantive or pronoun. We can say *every man* or *every one*; and we can say *no man* or *no one*; but we cannot say *every* for *every one*, and we cannot use *no* as we use *none*, or *not one*.

§ 427. When two or more substantives, following each other, denote the same object, the article precedes the first only. Thus we say, *the secretary and treasurer*, when the two offices are held by one person. When two or more substantives following each other denote different objects, the article is repeated, and precedes each. We say *the* (or *a*) *secretary and the* (or *a*) *treasurer*, when the two offices are held by different persons. This rule is much neglected.

§ 428. Before a consonant, *an* becomes *a*; as *an axe*, a *man*. In *adder*, which is properly *nadder*, and in *nag*, which is properly *ag*, there is a *misdivision* (*a nag* for *an ag*, *an adder* for *a nadder*). So, also, in the old glossaries.

Hec auris	a *n*ere	i.e. an ear.
hec aquila	a *n*eggle	— an eagle.
hec anguilla	a *n*ele	— an eel.
hec erinaceus	a *n*urchon	— an urchin.
hic comes	a *n*erle	— an earl.
hic senior	a *n*ald man	— an old man.
hic exul	a *n*owtlay	— an outlaw.
hic lutricius	a *n*otyre	— an otter.
hec alba	a *n*awbe	— an aube.
hec amictus	a *n*amyt	— an amice.
hec securis	a *n*ax	— an axe.
hec axis	a *n*axyltre	— an axletree.
hec ancora	a *n*ankyre	— an anchor.

§ 429. The construction of the pronouns *my*, *thy*, *her*, *our*, *your*, and *their* is, in respect to their

Syntax, in the same predicament with *no*, *every*, and the Articles. We cannot use them as ordinary Possessive Cases, or as Adjectives, except in combination with a Noun—we can say *these are good books*, *these are John's books*, *these are my books*, and, so far, *my* comports itself like a Possessive Case or an Adjective. But in phrases like *these books are good*, and *these books are John's*, we must use *mine* rather than *my*; i.e. we can say *these books are mine*, but not *these books are my*. Though we need not go so far as to call *my*, *thy*, and the like, Articles, we shall do well in attending to the Articular, or Subarticular, character of their Syntax.

Indeed, the Articular construction itself is that of Inflection rather than a separate word. Except when emphatic the Articles are wholly unaccented. In the Norse we have seen them absolutely incorporated with their Substantives; and in the Fin languages and in the Ossete we find a similar incorporation of the Possessive Pronoun. If these latter may be termed *subarticular*, the Articles themselves are *subinflectional*.

§ 430. From the Syntax of the words *my*, *thy*, *her*, *our*, *your*, and *their*, we pass to that of the words *mine*, *thine*, *hers*, *ours*, *yours*, and *theirs*. These are used just where *my*, &c., is *not* used; i.e. we say *this book is mine*, &c., but not *this is mine book*.

The history of this change is a long one. For the use of *mine* where we now use *my*, the reader is referred to *Abbott, &c.*, § 237. The investigation, however, of the exact nature of the difference between the two combinations is important. The vowel, or diphthongal forms, *my*, *thy*, &c., are used when the Pronoun is *part* of a term—Subject or Predicate as the case may be. The form in *-n*, as *mine*, *thine*, &c., is used chiefly

in the Predicate; in which case it is separated from its Substantive by the copula.

In the first case the form is *Subarticular*, in the latter *Predicative*.

When the Pronoun under notice constitutes the *whole* term, the noun is supplied from the context; and *this book is mine = this book is my book*.

When constituting the *part* of a Predicate, and preceded by the preposition *of*, the noun is also supplied by the context. But, in this case, it is not *necessary* that the noun supplied by the context should be exactly the one that the context gives us by name. Thus in *this book is one of mine*, it is not necessary that *book* is the special name understood. *Book*, undoubtedly, is the special object under notice. But it is only one of a class. Hence *one of mine* may mean one of my *articles of property*. Whether, when a man who has only *one* book would say *this is a book of mine* is another question. But we can imagine cases where he would do so. He may be claiming other articles besides; and then *mine* means *one of my possessions*, *one of the missing articles*, or what not?

§ 431. '*Horse of Jackson's*.'—As compared with *Jackson's horse*, this, as the Possessive Case of a Substantive, is exactly in the relation of *a book of mine* to *my book*; i.e. its construction is Predicative and Elliptic, rather than Subarticular.

§ 432. This is, apparently, a refinement. But it is an excusable, and indeed a necessary, one. I have written about *Jackson's horse* from memory; because, in one of numerous discussions as to the import of the letter *-s*, I have heard it actually urged as an argument against the present interpretation that Jackson had, or might have had, only *one* horse.

The answer to this is easier shown in Latin than in

English. The *horse* was not so much *equus e Jacksoni equis*, but *equus e Jacksonianis*; i.e. Jackson's chattels in general.

This is the answer for those who may care to give one. The better answer, however, is that the actual number of Jackson's horses is an extra-grammatical question.

Again, this seems either over-refinement or useless wrangling; for the argument from Jackson's stable I did not find in high quarters. But the suggestion that though a '*Castle of the Duke of Northumberland's*' might be good grammar in speaking of ducal domains, whereon the castles might be numerous, it was not above suspicion when applied to the residence of the owner of a single domicile, may be found in a paper of no less a philologue than the late Archdeacon Hare; and I think that in the following extract there is something dangerously akin to the same doctrine:—

> '*This of yours* is now, as in E. E. (Early English), generally applied to one out of a class, whether the class exist or be imaginary. We could say "this coat of yours," but not (except colloquially) "this head of yours." It is, however, commonly used in Shakespeare, where even the conception of a class is impossible.
>
> Nor scar that whiter skin of *hers* than snow.
>
> *Othello*, v. 2, 4.
>
> Will not a calf-skin stop that mouth of *thine*?
>
> *King John*, iii. 1, 299.'
>
> *Abbott: Shakespearian Grammar*, § 339.

Here I differ unwillingly from Mr. Abbott so far as he considers that in the combinations this *head of yours*, *that whiter skin of yours*, *that mouth of thine*, there is no notion of a *class*. On the contrary, I hold that the class is a real one; though it does not imply that the person addressed had more *heads*, *skins*, or *mouths* than one. The class to which the *heads*, &c.,

belong, are those of the world at large; and *thine* and *yours*, &c., mean that the person addressed is the possessor of the particular one spoken about.

It seems to me that the preposition *of* always implies a class, or, if not a class in the ordinary sense of the term, a part of a whole of some kind. But this class, or whole, is equivocal in respect to its constitution. A *head*, a *skin*, or a *mouth* are parts of the attributes, qualities, possessions, or whatever we choose to call them, of the object spoken about; i.e. they are his, *inter alia*, the other contents being heterogeneous. On the other hand, however, they belong to a homogeneous class of the same sort of objects found elsewhere; one of which is specially noticed as being *mine*, *thine*, *his*, or *hers*, &c. Between these two, in the import of the word *of* (for this is the one upon which the notion of a class of any kind hinges) there is unsteadiness and ambiguity. That *a head of mine* would imply that I had a second head I admit. But this is a difference between the import of the Definite and Indefinite Article. Hence, in our criticism, the double character of the class, and different powers of the two Articles, must be remembered. The construction, at any rate, is clear. The Preposition *of* governs the name of the class; one which is not apparent in the clause, but one which is understood or supplied; whilst it is this understood, or supplied, Noun which governs the case in *-s*.

§ 433. The origin of these explanations lies in a fact which, from being practically unimportant in so uninflected a language as the English, has been either overlooked or ignored; viz., the *Concord* between the Subject and the Predicate. That it is *not* a case of *Government* is stated in § 392. This is the real meaning of the rule that the Verb Substantive (with others akin to it) governs the Noun that follows them in the same

case as that of the Noun which precedes them. The Latin, from which language the rule seems to have been taken, best illustrates what the Concord really is.

It *is* a Concord of Case—*I am John=sum Johannes.*

It is *not* a Concord of Number—*vulnera totus erat.*

It is *not* a Concord of Gender—*triste lupus stabulis =a wolf is a bad (thing) for the folds.*

In this last instance the Predicate speaks of the Subject as a member of a class; and it is the Gender of the name of that class which determines the Gender of the Predicate—and this is naturally, in most cases, the Neuter.

§ 434. *The Case Absolute.*—Nouns standing absolutely are of two sorts: (1) Those originating in an Accusative; (2) those originating in a Dative, case.

In expressing *distance* or *duration*, either in *time* or *space*, we use the noun absolutely; as *he walked* ten miles (i.e. *the space of ten miles*); *he stood* three hours (i.e. *the space of three hours*). Here the words *stood* and *walk* are intransitive; so that it is not by them that the words *miles* and *hours* are governed. They are virtually Accusatives.

In sentences like *the door being open, the steed was stolen—the sun having arisen, the labourers proceeded to work*, the construction is different.

In the *Substantives*, where there is no distinction between the nominative and the objective cases, it is of no practical importance to inquire as to the particular case in which the words like *door* and *sun* stand. In the *Pronouns*, however, where there *is* a distinction between the nominative and objective cases, this inquiry must be made.

1. *He made the best proverbs of any one*, him *only excepted.*

2. *He made the best proverbs of any one*, he *only excepted.*

Which of these two expressions is correct? This we can decide only by determining in what case nouns standing absolutely in the way that *door*, *sun*, and *him* (or *he*), now stand, were found in that stage of our language when the nominative and objective cases were distinguished by separate forms.

In Anglosaxon this case was the *Dative*; as *up-a-sprungenre sunnan=the sun having arisen.*

In A. S., also, *him* was a dative case, so that the case out of which expressions like the ones in question originated, was dative. Hence of the two phrases, *him excepted*, and *he excepted*, the former is the one which is *historically* correct.

It is also the form which is *logically* correct. Almost all absolute expressions of this kind have reference, more or less direct, to the *cause* of the action denoted. In sentences like *the stable door being open, the horse was stolen,—the sun having arisen, the labourers got up to work,* this idea of either a cause, or a coincidence like a cause, is pretty clear.

Now the practice of language in general teaches us this, viz., that where there is no proper instrumental case expressive of cause or agency, the ablative is the case that generally supplies its place, and where there is no ablative, the dative. Hence the Latins had their ablative, the Anglosaxons their dative absolute. The genitive absolute in Greek is explicable upon other principles.

In spite, however, both of history and logic, the so-called authorities are in favour of the use of the nominative case in the absolute construction.

CHAPTER IV.

SYNTAX OF THE VERB AND PARTICIPLE.—GOVERNMENT.—CONCORD.—TENSES.—IMPERSONAL VERBS.—AUXILIARY VERBS.—PARTICIPLES.—*IN*, *-EN*, AND *-D*.—*IN*, *-ING*.

§ 435. The place that a verb takes in a Proposition varies with its character as *Indeterminate* or *Finite*.

(1) The Indeterminate Verb, like the Substantive and Pronoun, can, *by itself*, form *either* the Subject or the Predicate. So far as it does this it does neither more nor less than the Substantive and Pronoun; and it does it on the same principle. All three are *Names*—(1) the Substantive, a permanent and inconvertible one founded upon the *qualities* of the object to which it applies; (2) the Pronoun, a variable or convertible one, founded upon the *relations* of its object; (3) the Verb, a name which is both permanent and inconvertible, but differing from a Substantive in being founded upon a state or action rather than on an attribute of either Quality or Relation.

(2) The Finite Verb can form *both* the Subject and the Predicate—as *no* = *I swim*; *amo* = *I love*, &c.

It does this, however, not because, as a name, it has any prerogative over either the Pronoun or the Substantive; but because it is, in reality, *two* names packed-up into one; i.e. it is the name of the action *plus* that of the agent.

§ 436. *Government of Verbs.*—Verbs, whether Indeterminate or Finite, are, in respect to their government, (1) Transitive, (2) Intransitive.

Respecting the Government of these two sorts of verbs, there are the two following rules:—

1. Transitive verbs always govern the substantive in the objective case; as *I strike him, he strikes me, they teach us, the man leads the horse*, &c.

2. Intransitive verbs govern no case at all; as *I sleep, I walk, I think*, &c.

The same word has often two meanings, one of which is transitive, and the other intransitive; as, 1. *I move*,—where the verb is intransitive, and denotes the mere act of motion. 2. *I move my limbs*,—where the verb is transitive, and where the action affects a certain object (*my limbs*); or, 1. *I walk*,—where the verb is intransitive, and denotes the mere act of walking. 2. *I walk the horse*,—where the words *I walk* are equivalent to *I cause to walk*, and are also transitive, denoting an action affecting a certain object (*the horse*).

Unless this fact of the same verb having transitive and intransitive meanings be borne in mind, transitive verbs will appear to be without an objective case, and intransitive verbs to govern one.

No Verb in the present English governs a Possessive, or Genitive case.—In combinations like *eat of the fruit of the tree*, the government is that of the preposition *of*. Neither is *fruit* in the Possessive case. That in Greek and Latin there were Verbs that *did* govern a Possessive is well known. And so did certain Verbs in Anglosaxon—*weolde thises middangeardes* = (*he*) *ruled* (*wealded*) *this earth*(*s*).

The Verb *give* governs a dative case. Phrases like *give it him, whom shall I give it?* are perfectly correct, and the prepositional construction in *give it to him*, or *to whom shall I give it?* is unnecessary.

The ordinary government of the Transitive Verb in English is that of *Accusative*.

The government of verbs, as illustrated by the preceding examples, is *objective*. But it may also be *modal*. It is modal when the noun which follows the verb is not the name of any object affected by the verb, but the name of something explaining the manner in which the action of the verb takes place, the instrument with which it is done, the end for which it is done, &c.

The government of transitive verbs is necessarily objective. It may also be modal,—*I strike the enemy with the sword=ferio hostem gladio.*

The government of intransitive verbs can only be modal. When we say *I walk the horse*, the word *walk* has changed its meaning, and signifies *make to walk*, and is, by the very fact of its being followed by the name of an object, converted from an intransitive into a transitive verb.

The modal construction may also be called the *adverbial construction*; because the effect of the noun is akin to that of an adverb,—*I fight with bravery=I fight bravely; he walks a king=he walks regally.*

The modal construction sometimes takes the appearance of the objective: inasmuch as intransitive verbs are frequently followed by a substantive; which substantive is in the objective case. *To break the sleep of the righteous* is *to affect, by breaking, the sleep of the righteous*: but, *to sleep the sleep of the righteous*, is not *to affect, by sleeping, the sleep of the righteous*; since the act of sleeping is an act that affects no object whatever. It is a *state*. We may, indeed, give it the appearance of a transitive verb, as we do when we say, *the opiate slept the patient*, meaning thereby *lulled to sleep*; but the transitive character is only apparent. *To sleep the sleep of the righteous* is *to sleep in agreement with*—or *according to*—or *after the manner of*—

the sleep of the righteous, and the construction is adverbial.

This is the construction of a Verb with a Substantive—*allied in meaning with itself—nomen sibi cognatum.* It partakes of the nature of a tautology.

§ 437. But, besides governing the Noun, one Verb may govern another; and, where this is the case, the verb governed is in the Infinitive Mood; i.e. is Indeterminate.

The syntax of the Indeterminate verb, when thus in a state of regimen, is twofold; though its double character is disguised by the confluence of the Gerundial form in *-nne* with the Infinitive form in *-an.*

When one verb is followed by another *without* the preposition *to*, the construction must be considered to have grown out of the A. S. form in *-an.*

I may go,	*not*	I may *to* go.
I might go,	—	I might *to* go.
I can move,	—	I can *to* move.
I could move,	—	I could *to* move.
I will speak,	—	I will *to* speak.
I would speak,	—	I would *to* speak.
I shall wait,	—	I shall *to* wait.
I should wait,	—	I should *to* wait.
Let me go,	—	Let me *to* go.
He let me go,	—	He let me *to* go.
I do speak,	—	I do *to* speak.
I did speak,	—	I did *to* speak.
I dare go,	—	I dare *to* go.
I durst go,	—	I durst *to* go.

Thou shalt not *see* thy brother's ox or his ass *fall* down by the way.
We *heard* him *say*, I will destroy the temple.
I *feel* the pain *abate.*
He *bid* her *alight.*
I would fain *have* any one *name* to me that tongue that any one can speak as he should do by the rules of grammar.

This, in the present English, is the rarer of the two constructions.

Gerundial.—When one verb is followed by another, preceded by the preposition *to*, i.e. *I begin to move*, the construction must be considered to have grown out of the A. S. form in *-nne*. This is the case with the great majority of English verbs.

§ 438. *I am to speak.*—Three facts explain this idiom.

1. The idea of *direction towards an object* conveyed by the dative case and by combinations equivalent to it.

2. The extent to which the ideas of necessity, obligation, or intention are connected with the idea of *something that has to be done, or something towards which some action has a tendency.*

3. The fact is that expressions like the one in question historically represent an original dative case or its equivalent; since *to speak* grows out of the Anglosaxon form *to sprecanne*, which, although called a gerund, is really a dative case of the infinitive mood.

In *I am to blame* the usual sense is Passive, i.e. *I am to be blamed.* As early, however, as the Anglosaxon period, the gerunds were liable to be used in a passive sense: *he is to lufigenne*=not *he is to love*, but *he is to be loved.*

The principle of this confusion may be discovered by considering that *an object to be blamed* is *an object for some one to blame*, just as *an object to be loved* is *an object for some one to love.*

Johnson thought that in such phrases the word *blame* was a noun. If he meant a noun in the way that *culpa* is one, his view was wrong. But if he meant a noun in the way that *culpare* and *ad culpandum* are nouns, it was right.

§ 439. *Concord of the Verb.*—The verb agrees with

its Noun in *Number* and in *Person*; as *I walk*, not *I walks*—*we walk*, not *we walks*.

In the way of *Gender* there is no question of Concord with the Verb proper; though with the Participle it may, of course, present itself. In this respect, however, the Participle of the present English is like the Adjective—wholly uninflected.

The Concord—whether of Tense or Mood—will be noticed in the sequel. *This* is, of course, peculiar to the Verb; just as Gender is to the Noun.

In the way of *Mood* the construction of the Gerundial and Infinitive forms of the Indeterminate Verb has already been noticed.

The construction of the Conjunctive, Subjunctive, Potential, or Conditional Mood belongs to the Syntax of Complex Propositions.

The Imperative Mood has three characteristics.

It can only be used in the Second Person.

It can either use or omit its Pronoun.

When used, the Pronoun precedes, rather than follows, the Verb.

§ 440. *Tense and Time.*—*Time* is one thing; *Tense* another. To constitute a Tense there must be an Inflection. *Vocat* in Latin, and *calls* in English, are Tenses. *Vocatus sum* and *I am* (or *have*) *called* are combinations of separate words, and of different elements, by which we get a substitute for a true Tense rather than the Tense itself.

In *Syntax*, however, it is these substitutes, and combinations, which command our chief attention. The true inflectional Tenses belong to *Etymology*.

The foundation of our criticism is, of course, the different kinds of Time with which an action may be connected.

1. *Present.*—This is when an action is taking

place at the time of speaking, and incomplete.—*I am beating, I am being beaten.* It is *not* expressed, in English, by the simple Present Tense; since *I beat* means *I am in the habit of beating.*

2. *Aorist.*—This is when an action took place in past time, or previous to the time of speaking, and has no connection with the time of speaking.—*I struck, I was stricken.* It is expressed, in English, by the Preterit, in Greek by the Aorist. The term Aorist, from the Greek *ἀ-ὁριστος=undefined*, is a convenient name for this sort of time.

3. *Future.*—This is when an action has neither taken place, nor is taking place at the time of speaking, but which is stated as one which *will* take place. —It is expressed, in English, by the combination of *will* or *shall* with an infinitive mood; in Latin and Greek by an inflection. *I shall* (or) *will speak, λέξ-σω, dica-m.*

None of these expressions imply more than a single action; in other words, they have no relation to any second action occurring simultaneously with them, before them, or after them,—*I am speaking now, I spoke yesterday, I shall speak to-morrow.*

By considering past, present, or future actions not only by themselves, but as related to other past, present, or future actions, we get fresh varieties of expression. Thus, an act may have been going on, when some other act, itself one of past time, interrupted it. Here the action agrees with a present action in being incomplete; but it differs from it in having been rendered incomplete by an action that is past. This is exactly the case with the—

4. *Imperfect.—I was reading when he entered.* Here we have two acts; the act of *reading* and the act of *entering.* Both are past as regards the time of

speaking, but both are present as regards each other. This is expressed, in English, by the past tense of the verb substantive and the present participle, *I was speaking*; and in Latin and Greek by the imperfect tense, *dicebam*, ἔτυπτον.

5. *Perfect.*—Action past, but connected with the present by its effects or consequences.—*I* have *written, and here is the letter.* Expressed in English by the auxiliary verb *have* followed by the *participle passive in the Accusative Case and Neuter Gender.* The Greek expresses this by the reduplicate perfect: τέτυφα = *I have beaten.*

6. *Pluperfect.*—Action past, but connected with a second action subsequent to it, *which is also past*—*I* had *written when he came in.*

7. *Future present.*—Action future as regards the time of speaking; present as regards some future time. —*I shall* be speaking *about this time to-morrow.*

8. *Future Preterit.*—Action future as regards the time of speaking, past as regards some future time.—*I shall* have spoken *by this time to-morrow.*

§ 441. These are the chief expressions which are simply determined by the relations of actions to each other and to the time of speaking, either in the English or any other language. But over and above the simple idea of *time*, there may be others superadded: thus, the phrase, *I do speak*, means, not only that *I am in the habit of speaking*, but that I also *insist* upon it being understood that I am so.

Again, an action that is mentioned as either taking place, or as having taken place at a given time, may take place again and again. Hence the idea of *habit* may arise out of the idea of either present time or aorist time.

The emphatic Present and Preterit.—Expressed

by *do* (or *did*), as stated above. A man says *I do* (or *did*) *speak*, *read*, &c., when, either directly or by implication, it is asserted or implied that he does not. As a question implies doubt, *do* is used in interrogations.

Do et *did* indicant emphatice tempus præsens et præteritum imperfectum. *Uro, urebam; I burn, I burned:* vel (emphatice) *I do burn, I did burn.*—WALLIS, p. 106.

§ 442. *The Predictive Future.—I shall be there to-morrow.*—This means simply that the speaker will be present. It gives no clue to the circumstances that will determine his being so.

The Promissive Future.—I will be there to-morrow.—This means not only that the speaker will be present, but that he *intends* being so.

§ 443. *The representative expression of past and future time.*—An action may be past; yet, for the sake of bringing it more vividly before the hearers, we may make it present. *He walks* (for *walked*) *up to him, and knocks* (for *knocked*) *him down*, is, by no means, the natural habitual power of the English present. So, in respect to a future, *I beat you if you don't leave off*, for *I will beat you*. This is sometimes called the *historic* use of the present tense. I find it more convenient to call it the representative use: inasmuch as it is used more after the principles of painting than of history; the former of which, necessarily, *represents* things as present, the latter, more naturally, describes them as *past*.

§ 444. Notwithstanding its name, the present tense in English, does not express a strictly *present* action. It rather expresses an habitual one. *He speaks well=he is a good speaker*. If a man means to say that he is in the act of speaking, he says *I am speaking*. It has also,

especially when combined with a subjunctive mood, a future power—*I beat you* (=*I will beat you*) *if you don't leave off.* Again—the English preterit is the equivalent, not to the Greek perfect, but to the Greek aorist. *I beat*=ἔτυψα, not τέτυφα. The true perfect is expressed, in English, by the auxiliary *have*+the past participle.

§ 445. *Meseems.*—Equivalent to *it seems to me; mihi videtur; φαίνεταί μοι.* Here, *seems* is intransitive; and *me* has the power of a dative case.

Methinks.—In the Anglosaxon there are two forms; *þencan*=*to think*, and *þincan*=*to seem.* It is from the latter that the verb in *methinks* comes. The verb is intransitive; the pronoun dative.

> *Methought* I saw my late espoused wife
> Brought to me, like Alcestis, from the grave.
>
> MILTON.

Me listeth or *me lists.*—Equivalent to *it pleases me*=*me juvat.* Anglosaxon *lystan*=*to wish, to choose*, also *to please, to delight.* Unlike the other two, this verb is transitive, so that *me* is accusative. These three are the only true impersonal verbs in the English language. They form a class by themselves, because no pronoun accompanies them, as is the case with the equivalent expressions *it appears, it pleases*, and with all the other verbs in the language.

§ 446. The Auxiliary Verbs, in English, play a most important part in the Syntax of the language. They may be classified upon a variety of principles. The following, however, are all that need here be applied.

According to their inflectional or non-inflectional powers.—Inflectional auxiliaries are those that may either replace or be replaced by an inflection. Thus—*I am struck*=the Latin *ferior* and the Greek τύπ-

τομαι. These auxiliaries are in the same relation to verbs that prepositions are to nouns. The chief inflectional auxiliaries are:—

1. *Have;* equivalent to an inflection in the way of tense—*I have bitten=mo-mordi.*

2. *Shall;* ditto. *I shall call=voc-abo.*

3. *Will;* ditto. *I will call=voc-abo.*

4. *May;* equivalent to an inflection in the way of mood. *I am come that I may see=venio ut vid-eam.*

5. *Be;* equivalent to an inflection in the way of voice. *To be beaten=verberari, τύπτεσθαι.*

6. *Am, art, is, are;* ditto. Also equivalent to an inflection in the way of tense. *I am moving=move-o.*

7. *Was, were;* ditto. *I was beaten=ἐ-τύφθην: I was moving=move-bam.*

§ 447. *According to their non-auxiliary significations.*—The power of the word *have* in the combination *I have a horse,* is clear enough. In *I have ridden a horse,* it is by no means so clear. The power of the same word in the combination *I have been,* is not at all clear; nevertheless it is a power which has grown out of the idea of possession. This shows that the power of a verb as an auxiliary may be a modification of its original power; *i.e.* of the power it has in non-auxiliary constructions. Sometimes the difference is very little: the word *let,* in *let us go,* has its natural sense of permission unimpaired. Sometimes it is all but lost. *Can* and *may* exist chiefly as auxiliaries.

1. Auxiliary derived from the idea of possession—*have.*

2. Auxiliaries derived from the idea of existence—*be, is, was.*

3. Auxiliary derived from the idea of future destination dependent upon circumstances external to the agent—*shall.*

4. Auxiliary derived from the idea of future destination dependent upon the volition of the agent—*will*. *Shall* is simply Predictive; *will* is Predictive and Promissive as well.

5. Auxiliary derived from the idea of power, dependent upon circumstances external to the agent—*may*.

6. Auxiliary derived from the idea of power, dependent upon circumstances internal to the agent—*can*. *May* is simply Permissive; *can* is Potential. In respect to the idea of power residing in the agent as the cause which determines a contingent action, *can* is in the same relation to *may* as *will* is to *shall*.

7. Auxiliary derived from the idea of sufferance—*let*.

8. Auxiliary derived from the idea of necessity—*must*.

9. Auxiliary derived from the idea of action—*do*.

§ 448. *In respect to their mode of construction.*—Auxiliary verbs combine with others in three ways.

1. *With Participles.*—*a.*) With the present, or active participle—*I am speaking*: *b*) With the past, or passive, participle—*I am beaten, I have beaten*.

2. *With infinitives.*—*a*) With the objective infinitive—*I can speak*: *b*) With the gerundial infinitive—*I have to speak*.

3. *With both infinitives and participles.*—*I shall have done, I mean to have done*.

§ 449. *Participles.*—A Participle, like an Adjective, can form the Predicate of a Proposition, but not the Subject.

So far as its Inflection goes, the Participle agrees with the Adjective. So far as it suggests a state or an action rather than a *quality* it is an adjective.

§ 450. *The Past Participle preceded by Have.*—Upon this it is advisable to make the following classifications:—

1. The combination with the participle of a *Transitive verb*,—*I have ridden the mare; thou hast broken the sword; he has smitten the enemy.*

2. The combination with the participle of an *Intransitive verb*,—*I have waited; thou hast hungered; he has slept.*

3. The combination with the participle of the Verb Substantive,—*I have been; thou hast been; he has been.*

It is by examples of the first of these three divisions that the true construction is to be shown.

For an object of any sort to be in the possession of a person, it must previously have existed. If I possess a mare, that mare must have had a previous existence. Hence, in all expressions like *I have ridden a mare*, there are two ideas, a past idea in the participle, and a present idea in the word denoting possession.

For an object of any sort, affected in a particular manner, to be in the possession of a person, it must previously have been affected in the manner required. If I possess a mare that has been ridden, the riding must have taken place before I mention the fact of the ridden mare being in my possession; inasmuch as I speak of it as a thing already done,—the participle, *ridden*, being in the past tense.

I have ridden a mare=I have a mare ridden=I have a mare as a ridden mare. In this case the syntax is of the usual sort. (1.) *Have=own=habeo=teneo*; (2.) *mare* is the accusative case=*equam*; (3.) *ridden* is a past participle, agreeing either with *mare*, or *with a word in apposition with it understood.* Mark the words in italics. The word *ridden* does *not* agree with *mare*, since it is, virtually, of the neuter gender.

The true construction is arrived at by supplying the

word *thing*. *I have a mare as a ridden thing*=*habeo equam equitatum* (neuter).

(2) The combination of *have* with an *in*transitive verb is irreducible to the idea of possession: indeed it is illogical. In *I have waited*, we cannot make the idea expressed by the word *waited* the object of the verb *have* or *possess*. The expression has become a part of language by means of the extension of a false analogy. It is an instance of an illegitimate imitation.

(3) The combination of *have* with *been* is more illogical still, and is a stronger instance of the influence of an illegitimate imitation. In German and Italian, where the ordinary Intransitive Participles are combined with *have*, the Participle of the *Substantive Verb* is combined with *am*.

Italian; *io sono stato*
German; *ich bin gewesen* } = *I am been.*

The Scandinavian language and the French agree with the English.

Danish; *jeg har varet.*
French; *j'ai été.*

§ 451. *The Past Participle preceded by Am; Be, Been*, &c.—The Participles *moved*, *beaten*, *struck*, *given*, are Participles of a *past* tense. Hence, *I am moved* should mean, not *I am in the act of being moved*, but *I am a person who has been moved*;—*he is beaten* should mean, not *he is a person who is in the act of suffering a beating*, but *one who has suffered a beating*: in other words the sense of the combination should be *past*, and not *present*. By a comparison between the English and Latin languages this anomaly becomes very apparent. The Latin word *motus* is exactly equivalent to the English word moved. Each

is a Participle of the passive voice, and of the past tense. Besides this, *sum* in Latin equals *I am* in English. Yet the Latin phrase *motus sum* is equivalent, not to the English combination *I am moved*, but to the combination *I have been moved*; *i.e.* it has a past and not a present sense. In Greek the difference is plainer still, because in Greek there are two Participles Passive, one for the present, and another for the past tense; *e.g.* τυπτόμενος εἰμὶ = *I am one in the act of undergoing a beating*; τετυμμένος εἰμὶ = *I am one who has undergone a beating.*

Nevertheless the sense, in English, of such combinations as *I am moved*, &c., is *Present.* The absence of any such Tense in English as *moveor* in Latin and τύπτομαι in Greek goes far towards explaining this difference.

§ 452. *The Participle in -ing.*—Taken themselves words of this class are of the simplest. These appear in three very natural constructions.

(1) *He is dying.*—Here *dying* is Predicative = *moritur* (*est moriens*).

(2) *The last rays of the dying day.*—Here it is purely Participial = *morientis diei.*

(3) *Day glimmers o'er the dying and the dead.*—Here it is Substantival after the manner of an Adjective whose Substantive is understood—*morientes et mortuos.*

All this is purely Participial; and, as the Participle is as destitute of Inflection as the Adjective, its Syntax is limited to the Collocation in the Predicative, and to the use of *the* in the Substantival forms.

It happens, however, that the form and construction are two of the most disputed points in English. It has already been shown that between the Verbal Noun and the Indeterminate Verb, there is a close

connection in import; that between the Participle in -*nd*, and the Verbal Noun in -*ng*, there was in Anglo-saxon and the older English, a well-marked difference of form; but that during the middle period of our language the two forms became identical (or *Confluent*). Ambiguous, or equivocal, forms and constructions were noticed by our earlier grammarians; such as Lowth and others. In such a sentence as *What is the meaning of the lady's holding up her fan?* it was not difficult to see that, so far as the Definite Article went, the construction was Substantival, but that so far as there was no preposition before *fan* it was Participial. The *lady holding up her fan* would have been wholly Participial, and *the lady's holding up of her fan* would have been wholly Substantival: but *the lady's holding up her fan* was partly Participial and partly Substantival. What, then, was the form in -*ing* when the sentence was taken as a whole? This was, evidently, more easily asked than answered. An edition of Horne Tooke's 'Diversions of Purley,' by the late Richard Taylor, put the general question as to the import of -*ing* in something like the form of a definite doctrine. It drew attention to words like *morning*, where there was no such verb as *to morn*; to constructions like *morning walk*; where the collocation was that of *running brook*, *moving crowd*, or *flying bird*; and above all to the so-called vulgarisms, pronunciations, or archaisms like *a-hunting*, *a-roaming*, and others, wherein the construction was that of a Substantive in the Oblique Case, preceded by a preposition (*on*, or *in*), which was first worn down into *a*, and then dropped altogether. This was not ill-timed. Even in Grimm's *Deutsche Grammatik*, the construction of *dying day*=*the day on which a person dies* is treated as if *dying* were a Participle.

There is a great deal in this that is clear enough to speak for itself; but there is a wide difference between the reducibility of the different constructions, and sometimes between different words in the same construction. There are differences, too, of meaning (slight ones, perhaps, but still real) between such combinations as *I was hunting* and *I was a-hunting*, which may make one expression the more correct in one case, and the other in another. And there is a great deal of miscellaneous detail beside. I cannot, however, find that this is the view with which the hypothesis has been taken up. It has certainly been adopted and promulgated. But, in my mind, more has been done in publishing, than in verifying, it: and that it has been prematurely extended to a doubtful, if not an illegitimate, degree. Unfortunately, in this, as in several other similar cases, it is not easy to find a writer who explicitly and unmistakeably tells the reader how far he goes, where he stops, and whether he stops at all; i.e. whether he stops short of the absolute elimination of the Present Participle as a separate and independent Part of Speech, and the substitution of the Verbal Abstract in its place. That there are quarters in which something of this kind may be found is certain; and it is certain, that whether right or wrong, it wants a fuller exposition than it has hitherto found.

§ 453. The difficulty, then, respecting the forms in *-ing* lies in the equivocal character of the words to which it belongs. If one of them thus ending is clearly and admittedly a Substantive, we know how to deal with it; and we know how to deal with it if it is a Participle. In some cases, too, we can tell by mere inspection, either from the outward form of the word, or from its place in the proposition, to which of the two

classes a word belongs. Thus in *Seeing is believing* the word *seeing* constitutes a *Subject*, and that *by itself*: and as we can just as easily say *believing is seeing*, the word *believing* does the same. Again, in such words as *risings*, *watchings*, (*the risings in the North*; *the watchings of a sleepless man*), the inflection in *-s* is absolutely unknown in the Participle. Notwithstanding this, there is a wide margin for uncertainty and ambiguity.

Given, however, the Part of Speech, the construction is easy. When the word is Substantival, it governs the noun by which it is preceded in the Possessive Case, and the noun by which it is followed through the Preposition *of*—*what is the meaning of the lady's holding-up* of *her fan?*

It does this in the way of government when it governs anything at all. The Participle, on the other hand, when it governs anything (which it only does when its verb is Transitive) governs it directly, and as a *Verb*, rather than indirectly, through a *Preposition*. Another sign of the Substantive is the Definite Article *the*. Sometimes there is the omission of the Article, sometimes that of the Person.

> *The seeing* these effects will be
> Both noisome and infectious.
>
> *Cymb.* i. 5. 25.
>
> Nothing in his life
> Became him like the *leaving it*.
>
> *Macb.* i. 4. 8.
>
> *Abbott*, &c., § 93.

There is a slight overstatement in the following extract as to the generality at present of the use of the Definite Article. In combinations like '*Seeing is believing*,' where it would be out of place, it is omitted as regularly now as ever it was. The remarks, however,

will illustrate the kind of irregularity which has a tendency to occur.

The Verbal differs in Elizabethan English from its modern use (*a*). We do not employ the verbal as a noun followed by 'of,' unless the verbal be preceded by 'the' or some such defining adjective. But such phrases as the following are of constant occurrence in Elizabethan English:—

To dissuade the people from *making of* league.
North's Plutarch, 170.

By *winning* only of *Sicilia*.
Id. 171.

(*b*) On the other hand, when the verbal is constituted a noun by the dependence of 'the,' or any other adjective (except a possessive adjective) upon it, we cannot omit the *of*. The Elizabethans can.

'To plague thee for thy *foul misleading* me.'
3 *Hen. VI.* i. 97.

We should prefer now to omit the 'thy' as well as 'foul,' though we have rejected such phrases as—

'Upon *his leaving* our house.'
Goldsmith.
Ibid. § 373.

§ 454. '*Considering all things*' and '*all things considered.*'—Such a combination as '*all things considered*' may be continued and completed in *two* ways. We may say either '*it is evident that*,' &c., or *we can see that*, &c. Thus—

'All things considered, *it is* evident that the result will be ruinous.'
'All things considered, *we* can see that the result will be ruinous.'

Here the Participle is Passive, and the construction that of the Case Absolute.

In '*considering all things*' the Participle is Active and the conditions of the continuation are limited to a single construction. We can, with a clear understanding of the construction, say—

Considering all things, we can see *that* the result will be ruinous.

But we cannot, with an equally clear understanding of the construction, say—

Considering all things, *it is* evident *that* the result will be ruinous.

Nevertheless we *do* say so; though, if we are asked who is the considerer, or how the considering is done, we are perplexed as to our answer.

In respect to its import the combination is that which we get from the Case Absolute; and there is something like the notion of either cause or condition at the bottom of it. But it is *indefinite*; inasmuch as the Participle, when it stands alone, is (like the Infinitive Mood) at least as much of a Substantive as a Verb. Dr. Abbott, implicitly, tells us this; for (§ 357) he gives us examples of the Infinitive Mood, used in the same sense; and he gives us Infinitive Moods which he compares with it, and explains it in the same language as he does equivalent combinations with the Verbal (or Participle).

To do the deed,
Promotion follows. *W. T.* i. 2. 356.

To know my deed, 'twere best not know myself.
Macbeth, ii. 2. 73.

Here the meaning is '*if the deed were done*,' or '*the deed being done*.' The two forms run easily into the Latin—*me actore*, or *me agente*; though in the first the agent is less definite than the action.

In the following the meaning is '*in respect to*,' or '*as far as it concerns*'=*quod ad* (*me*) *attinet*. Still, like the Case Absolute, it lies without the pale of the ordinary construction:—

To belie him I will not.
A. W. iv. 3. 209.

To sue to live, I find I seek to die,
And *seeking* death find life.
Mirror for Magistrates, iii. 1. 43.

In the following we have the form in *-ing*:—

> Why, were thy education ne'er so mean,
> *Having* thy limbs, a thousand fairer courses
> Offer themselves to thy election.
>
> *Ben Jonson: Every Man in his Humour*, ii. 1. § 372.

Here Dr. Abbott (§ 373), after an explanation upon which I lay somewhat less stress than he does, and after referring to the previously-quoted passages, writes, in respect to *having*, that it = '*since thou hast thy limbs*.'

All this is the Case Absolute, but with the additional element of indefinitude in the name of the agent being kept back: and in this it agrees with '*all things considered*.'

The construction, then, is *Absolute*. It is, also, Indefinite: indeed, it is given by Dr. Abbott, as the '*Indefinite use of the Infinitive*.' But between Indefinitude and Confusion the barrier is but slight. Unless we make *considering* a Case Absolute, we have faulty Grammar, but average English. If we translate '*considering*' by '*consideratione*,' we have unexceptionable Grammar, but doubtful English. I believe, however, that few will do so. There are other ways of accounting for it. In *I am to blame=I am to be blamed* we have the transfer of an Active sense to a Passive. But I doubt whether this be the explanation. Any one who analyses the clauses with which this section began will see that, when he gets to the word '*that*,' the construction suits either form of the preliminary one. I submit, then, that when this is the case, the exact process that connects it with the preliminary one is neglected, overlooked, or ignored. Sometimes its character is determined by the matters considered, sometimes by the persons who consider, and that,

between these two, confusion may arise. We may call this *attraction* if we like; but I believe that between the Action and Reaction of the two clauses in a sentence, the solution to the difficulty is to be found.

CHAPTER V.

ADVERBS.

§ 455. An Adverb is a word incapable of forming, by itself, a *whole* term; but capable of forming *part* of one; in which case it is connected with the verb; e.g. *the sun shines brightly.*

The syntax of the adverb is simpler than that of any other part of speech, excepting, perhaps, that of the adjective.

Adverbs have no concord; neither have they any government.

When we say that Adverbs, &c., are words which, though they can form a *part* of a Proposition, cannot form a *whole* one, we imply that, in the Proposition in which they occur, some Noun or Verb (i.e. some word which *can* form a whole one) is necessary; and in the relations which the Adverb, the Preposition, and the Conjunction bear to these fundamental and essential words lie the characters by which, as Parts of Speech, they are distinguished from one another.

With the Adverb only *one* of these is required. This is either the Verb or the Participle—*he fights bravely; he is fighting bravely.* But as Adjectives differ from Participles in conveying the notion of a state rather than that of an action, Adverbs may combine with Adjectives as well—*he is very brave.*

Provided, then, that under the term Verb we include the Participles and the Adjectives, *Adverb* is a well-chosen name for the class.

§ 456. The Adverbs, like the Adjectives, have their Degrees of Comparison, and the few rules upon this point that are given in § 422 apply to both Parts of Speech alike.

(*a*) The Adjective in the Neuter Gender may be used Adverbially—*the sun shines bright=brightly.*

(*b*) When the Adjective itself ends in *-ly*, the addition of the Adverbial *-ly* is, to say the least, cumbrous. We can say *bravely*; but not *manlily.*

(*c*) The addition of *-er* and *-est* is not, perhaps, so freely used as it might be. *Oftener* is, perhaps, commoner than *more often.* But, then, there is no such Adjective as *often.* When, as in *bright, slow*, &c., there is an Adjective, the Neuter form for the Degrees of Comparison is generally preferred to the affixes *-er* and *-est* of the Adverb itself; i.e. *the sun shines brighter to-day than it did yesterday*, rather than *the sun shines brightlier*, &c. The combination *more*, as *more brightly*, has a similar preference. In short, the actual Comparison of the Adverb is rare, if not obsolescent; and what applies to the Comparative Degree applies to the Superlative also.

§ 457. *Adverbs apparently categorematic.*—A few Adverbs seem to form, *by themselves*, a Predicate; and, so doing, form either real or apparent exceptions to the definition of this Part of Speech.

Adverbs after '*is*.'—We still say 'that is *well*;' but, perhaps, no other Adverb (except '*soon*') is now thus used. Shakespeare, however, has—

'That's *verily*.'—*Tempest*, ii. 1. 321.
'That's *worthily*.'—*Coriol.* iv. 1. 53.
'Lucius' banishment was *wrongfully*.'—*T. A.* iv. 4. 16.

Some verb, as 'said,' or 'done,' is easily understood. 'In harbour' has the force of a verb in—

'*Safely* in harbour
Is the king's ship.'—*Tempest*, i. 2. 226.

Abbott: Shakesperian Grammar, &c., § 78.

With *there* (as in *it is there*), and more rarely with *then* (*it was then*), the construction is rather that of a Pronoun in an Oblique Case, with the names for *place* (*direction*) and *time* understood.

§ 458. *Migration.*—Horne Tooke, in his '*Diversions of Purley*,' remarks upon a *dictum* of Servius, '*quodvis verbum, quum desinit esse quod est, migrat in Adverbium*,' that it means when a grammarian does not know what to do with a word he makes it an Adverb.

Professor Key, too, has devoted a whole chapter of his work upon Language to the question as to whether the Adverb be really a Part of Speech or not. Questions of this kind suggest that what we have seen on a small scale, in the case of the Definite and Indefinite Articles, will be seen on a large scale, in that of the Adverbs. As far as form and origin went, the words *the* and *an* were Pronominal. So far, however, as their import in the structure of sentences went, they were far removed from the Pronoun. With the Adverbs the principle of the question is the same: for there is a conflict between their origin as so many individual words, and their import as elements in a proposition. But, instead of constituting, like the Articles, a small class which could be referred at once to Pronouns, they constitute not only a large class, but a very heterogeneous one—indeed, much such a one as we expect from the *dictum* of Servius. The mere inspection of any ordinary list tells us this. Almost every

Adjective can be traced to some other Part of Speech —words like *need* (as *needs must go=of necessity*), *unawares*, *backwards*, and others in *-s* to the Genitive Singular of Substantives; words like *there* and *then* to the oblique cases of Pronouns; and above all the forms in *-ly* to the Adjectives; not to mention the Neuter Adjectives with Adverbial imports; and the long list of compounds like *perchance*, *perhaps*, *peradventure*, *alive*, *agog*, *above*, *agape*, *together*, *altogether*, *besides*, *moreover*, &c.

CHAPTER VI.

PREPOSITIONS.

§ 459. The Preposition, like the Adverb, can only form a *part* of a Proposition.

Of those words which, *by themselves*, can form a term, the Preposition requires *two*, with which it must be connected. The Adverb required only *one*.

The Adverb required either a *Verb* or a *Participle*; or else an *Adjective*—all closely allied Parts of Speech. The Preposition requires either a *Noun* or a *Pronoun*. In this it will agree with the Conjunction, by which, as a Part of Speech, it will be followed, rather than with the Adverb by which it has been preceded. Indeed, it is the Conjunction with which the Preposition is more closely connected than with the Adverb. Hence the Syntax of the Pronoun is intermediate, or transitional, between that of the Simple and the Complex Propositions.

§ 460. A Preposition, then, is a word which can enter into a proposition only when combined with a

Substantive or a Pronoun; and of these there must be *two*; as

John is going *to* London.
James is coming *from* London.

The following words, along with several others, are Prepositions—*in*, *on*, *of*, *at*, *up*, *by*, *to*, *for*, *from*, *till*, *with*, *through*; and any one can find out for himself that wherever there is a Proposition in which any words of this kind enter there is always a word corresponding with *John* or *James* in the extract, and another that corresponds with *London*. The latter is *governed* by the Preposition. We may, of course, transpose the parts of the sentence, or clause, and say—

To London John is going.
From London James is coming.

But it is only an exceptional transposition, like—

Great is Diana of the Ephesians, &c.

There may be more than two such Substantives or Pronouns in a sentence, or a clause; as the *Sun from the sky, shines upon the Earth, through the air, with his bright beams*, &c. But still there are *two*. They need not be different ones; for *the Sun* is the Subject throughout; but *upon*, *through*, &c., are the several Prepositions, each governing its special Substantive or Pronoun.

§ 461. All Prepositions govern a case. If a word fail to do this, it fails to be a preposition. In the first of the two following sentences the word *up* is a preposition, in the second an adverb.

1. *I climbed up the tree.*
2. *I climbed up.*

All prepositions in English *precede* the noun which

they govern. *I climbed up the tree*, never *I climbed the tree up*. This is a matter not of government, but of collocation. The same, however, is the case in most languages; and, from the frequency of its occurrence, the term *pre-position* (or *prefix*) has originated. Nevertheless, it is by no means a philological necessity. In more languages than one the prepositions are *post-positive*, i.e. they *follow* their noun.

Nevertheless, in English they always *precede* it. Still it is only the noun which they govern that is preceded by them. They *follow* the one upon which the sentence or the clause depends. As a class they are *Inter*-positions rather than either *Pre*-positions or *Post*-positions. Still, for English and many other languages, the name *Preposition* is an adequate one.

§ 462. Every Preposition in English governs a Case; and in the *present* English no Preposition governs a Possessive or Genitive. This remark is made, because expressions like the *part of the body* =*pars corporis*,—*a piece of the bread*=*portio panis*, make it appear as if the preposition *of* did so. The true expression is, that the preposition *of*, followed by an objective case, is equivalent, in many instances, to the Genitive Case of the classical languages.

It is not so safe to say in the present English that no preposition governs a dative. The expression *give it him* is good English; and it is also equivalent to the Latin *da ei*. But we may also say *give it to him*. Now the German *zu*=*to* governs a Dative case, and in Anglosaxon, the preposition *to*, when prefixed to the infinitive mood, required the case that followed it to be a Dative.

§ 463. In constructions like

To err is human, *to forgive* divine,

the combination *to err*=erring=error; whilst *to forgive*=*forgiving*=

forgiveness. Here the Preposition must be considered as incorporated with the Indeterminate Verb, which has the sense of a Substantive, just like an inseparable inflection—and a very rare and remarkable instance of amalgamation this is. In the following example, although a Grecism, the combination is governed like a Noun in the Objective Case by another Preposition.

> Yet not to have been dipt in Lethe's lake
> Could save the son of Thetis *from to die*.

This is from Milton; but the so-called vulgarism *I am ready for to go* is genuine English.

§ 464. In compounds like *upstanding*, and approximate compounds like *standing-up*, the apparent Preposition is, in reality, an Adverb.

The present Objective Case includes, with *Substantives*, (though not with the typical) Pronouns, the Accusative and Dative. These in Anglosaxon were distinguished.

But even in Anglosaxon the Dative represented: (1) The Dative proper; (2) the Ablative; (3) the Instrumental; and (4) the Locative. Each of these had its special Pronoun, viz.:

> The Dative = *to*.
> The Ablative = *from*.
> The Instrumental = *with*.
> The Locative = *in*.

And these are the Cases which, even at present, though the signs are lost, are the cases which *to*, *from*, *with*, and *in* virtually govern.

In A. S. the government was real; at least, more so than it is in the present English. When Datives, Instrumentals, and Accusatives had different signs there was room for false combinations in the way of Government.

At present where, with the exception of Possessive, all the Oblique cases are alike, error on this score is impossible.

§ 465. In the way of history, the following Prepositions have become obsolete:

Mid displaced by *with.*
Oð „ „ *until, even to.*
Ymbe „ „ *around, roundabout.*

On the other hand, *in* as compared with *on*, was rare in Anglo-saxon. Of the following words there has been a change rather than a loss—*eke*, *ær*, *fear*, *geond*, *neah*.

Now what cases did these prepositions chiefly govern? If we look to the Latin or the Greek we shall not be surprised if we find that, as a rule, they governed more cases than one. They do this most in the Greek. In the Greek, too, there are more cases governed. Still, in both languages, we find that, in some cases, the connexion with the Preposition and its Case is special and exclusive; *e.g. de* governs nothing but an Ablative, ἐκ nothing but a Genitive.

Putting the Instrumental and Locative out of the question, we shall find that the Case which is governed by the fewest Prepositions is the Genitive or Possessive; then the Accusative. This leaves us only the Dative, and this is governed by more Prepositions than both the others put together.

Van and *utan=from* and *out of* governed the Genitive.

Through, *with*, and *ymbe* were the words that most exclusively governed an *Accusative.*

All the other Prepositions were followed by the *Dative* rather than any other case; viz. *at=to; be=by; for; from; of; to.*

Of these *of* is the most important; because its chief use is in combinations like *of a father*, *of men* and the like, where it can generally be rendered by the Genitive (Possessive) form (or Case) in -*s*; as *father's son=son of father* and *vice versâ*. This engenders a hopelessly lax way of speaking. Because *of* is part of a combination which has a Genitive or Possessive sense, it passes for 'the *sign of the Genitive Case.*' How far this error affects English Grammar is well known. The French it pervades from first to last. Yet the evidence that the Case governed by *de* is virtually Ablative is notorious. There is no practical remedy for this. All that the present writer can do is to draw attention to the fact that a preposition in a certain combination, forming a substitute for a case, is a very different thing from one governing that Case, when it has a true Inflectional sign as such.

In combinations like *all the more*, *all the better*, &c., the word *the* is not the uninflected Definite Article, but the *by*, or the Instrumental Case of *that.*

§ 466. And this leads us to the part played by Prepositions in the passage of languages from a Synthetic to an Analytic condition. This *mutatis mutandis* is

that of the Auxiliary Verbs. As these last, in combinations like *I was speaking*=*loquebar*, or *I have beaten*=*τέτυφα*, give us substitutes for the old inflectional Tenses, &c., so do the Prepositions give us substitutes for the lost inflectional Cases. In English, where we have no true Case except the Possessive, the part played by the Pronouns is important; and in the French, where there is not even a true Pronoun or Genitive Case, it is more important still.

CHAPTER VII.

THE SYNTAX OF COMPLEX PROPOSITIONS—THE CONJUNCTION.

§ 467. Syntax deals with (1) the connection of Words, and (2) the connection of Propositions. The Syntax that deals with that of words, or the Syntax of simple propositions, has already come under notice. The Syntax that deals with the connection of propositions now commands attention. Attention, too, must be given to the word *connection*. It, by no means, follows that because we find a long list of propositions following each other, there is a connection between them. Like marbles in a bag, to use an old illustration, they may touch without cohering; having as little relation to each other, as so many different essays or chapters. This is the case with proverbs, riddles, and the like, where each sentence constitutes a whole. In ordinary composition, however, this extreme isolation is rare. In ordinary composition the chances are, that out of three propositions, the middle one will have a double relation; one with its predecessor, one with its follower. This relation sometimes is, and sometimes is not, expressed by a special word.

Laying, then, out of our account those propositions,

which, though they may stand in juxta-position with one another, have no *grammatical* connection, we come to the consideration of those sentences in which there are not only two (or more) propositions, but also a connecting link between them: or, if not this, something in the nature of the one, which implies, or presupposes, the other. This is the case with Questions and Answers. But though Questions and Answers, along with a few other details of minor importance, come under this division of Syntax; they, by no means, constitute the most important part of it. The most important part of it is constituted by the Conjunctions and the Relative Pronouns.

§ 468. It is convenient to begin with the Conjunctions.

Notwithstanding their apparent unimportance, few Parts of Speech require closer consideration than the Conjunctions; and that most especially in reference to their Syntax. We do not see this very conspicuously in English, because in English the difference between the *Moods* of the Verb, is at a *minimum*. We have not much to do with the Subjunctive; and of Optative Moods we have none. But in Greek we know that, between the Optative and the Subjunctive, a very notable portion of the Syntax is devoted to several not very easy investigations.

§ 469. The principle, however, by which Conjunctions take their place as Parts of Speech, and exercise their influence in the Government and Concord of Verbs, is the same in all languages.

The Conjunctions, like the Prepositions and Adverbs, are Uninflected, and like the Prepositions and Adverbs, are incapable of forming, *by themselves*, either the Subject or the Predicate of a Proposition. But here the agreement ceases. Both the Adverb and the Pre-

position form parts of the term in which they appear; indeed, if they did not, we could not call them *parts*. But the Conjunction forms neither the part of a Term nor the whole of one.

It comes *between* two; but forms a part of neither.

Generally, though, perhaps, *not always*, these two terms belong to different Propositions. Hence, practically, Conjunctions may be said to connect* *Propositions*.

§ 470. If so, in order to understand how many different kinds of Conjunctions can exist, we must know all the ways in which one proposition may be connected with another. Many propositions are wholly unconnected. Propositions delivered at long intervals, or by different persons, have, for the most part, no relation to each other. In consecutive conversation, however, one statement is connected with another. Thus—

I am pleased,
because
This has happened;
but
I should have been disappointed,
if
It had fallen out otherwise,
and
I think
that
My friends will be more surprised
than
Satisfied with the arrangement.

---

* That Conjunctions connect Terms is beyond all doubt; and, when the Terms thus connected belong to different Propositions, they connect (*through* such terms) different Propositions. Whether, however, they connect two or more terms *within the same Proposition* is a point which is disputed. This is a question far too wide and complex for investigation in such a work as the present. Contrary to his earlier opinion the writer thinks that, in some exceptional instances, it is *Terms* rather than *Propositions* which the Conjunction connects. Thus *All men are black or white* cannot be expanded into two propositions without over-refinement.

§ 471. *Copulatives and Disjunctives.*—Conjunctions which connect two or more Terms are called Copulative; as *and.*

Conjunctions which connect one of two Terms are called Disjunctive; as *or.* Disjunctives are either true Disjunctives or Subdisjunctives. A true Disjunctive separates *things.* When we say *the sun or the moon is shining*, we separate two different objects, one of which shines by day, the other by night. Subdisjunctives separate *names.* When we say *Victoria, or the Queen of England, is our sovereign*, we speak of the same object, under different names.

§ 472. The idea expressed by a Copulative may be strengthened and made clearer by the addition of the words *each, both, all,* or the like. Thus, we may say (*both*) *sun and moon are shining*, and *Venus, Jupiter, and the Dogstar are* (*all*) *visible.*

The idea expressed by a Disjunctive may be strengthened and made clearer by the addition of *either.* We may say (*either*) *the sun or the moon is shining.*

The idea expressed by a Subdisjunctive may be strengthened and made clearer by the phrase *in other words.* We may say *Queen Victoria,* (*in other words*) *the Queen of England,* &c.

In all these cases, the words *both,* &c., *either,* &c., and *in other words,* &c., are no true Conjunctions. They strengthen the Conjunction. The Conjunction, however, exists without them.

§ 473. *Or* and *either* have their corresponding Negatives—*nor* and *neither. I will either come or send* is right. So is *I will neither come nor send.* But *I will neither come or send* is wrong.

When a question is asked, *whether* takes the place of *either.*

Words like *either* are generally treated as Conjunc-

tions. This, however, they are not. The most that can be said of them is that they form part of certain Conjunctional expressions. They never stand alone. Meanwhile the words with which they correspond, can, as a general rule, do without them. We say *this or that*, *mine or his*, quite as correctly as (*either*) *this or that*, (*neither*) *mine nor his*. If then, they are not conjunctions, what are they? *Both* is decidedly a Pronoun. *Either*, however, *neither* and *whether*, seem to be both Pronouns and Adverbs. When *either* means *one out of two*, it is a Pronoun. When it means *in the way of an alternative*, it is an Adverb.

§ 474. Other Conjunctions are Causal, Illative, and Conditional.

Causals give the cause of a given effect.

The day is warm
because
The sun shines.

Illatives give the effect of a given cause.

The sun shines,
therefore
The day is warm.

Conditional—

The night will be fine
if
the stars shine.

Than implies Comparison. *But* is Adversative.

§ 475. *Government of Conditional Conjunctions.*—Conditional Conjunctions govern the Subjunctive Mood. The chief Conditional is *if*. To say *if the sun shines the day will be clear* is not considered such good English as *if the sun shine*, &c.

Although the word *if* is the type and specimen of the conditional conjunction, there are several others

so closely related to it in meaning as to agree with it in requiring a subjunctive mood to follow them.

1. *Except* I be by Silvia in the night,
There is no music in the nightingale.

2. Let us go and sacrifice to the Lord our God *lest* he *fall* upon us with pestilence.

3. Let him not go *lest* he *die*.

4. He shall not eat of the holy thing *unless* he *wash* his flesh with water.

5. *Although* my house *be* not so with God.

6. —Revenge back on Revenge itself recoils.
Let it. I reck not *so* it *light* well aimed.

7. Seek out his wickedness *till* thou *find* none.

And so on with *before, ere, as long as*.

On the other hand, the word *if* itself is not *always*, or, at least, not always *equally* conditional; conditional conjunctions being of two sorts:—

1. Those which express a condition as an actual fact, and one admitted as such by the speaker:

2. Those which express a condition as a possible fact, and one which the speaker either does not admit, or admits only in a qualified manner.

Since *the children are so badly brought up*, &c.—This is an instance of the first construction. The speaker admits, as an actual fact, the *bad bringing-up of the children*.

If *the children* be *so badly brought-up*, &c.—This is an instance of the second. The speaker admits as a possible (perhaps as a probable) fact the *bad bringing-up of the children*; but he does not adopt it as an indubitable one.

Now, if every conjunction had a fixed unvariable meaning, there would be no difficulty in determining whether a condition were absolute and beyond doubt, or possible and liable to doubt. But such is not the case.

If may precede propositions wherein there is so

little doubt implied that it may be treated as equivalent to *since*; in which case it is fitly followed by the Indicative Mood.

Hence we must look to the meaning of the sentence in general, rather than to the particular conjunction used.

As a point of practice, the following method of determining the amount of doubt expressed in a conditional proposition is useful: — Insert, immediately after the conjunction, one of the two following phrases —(1) *as is the case*; (2) *as may or may not be the case*. By ascertaining which of these two supplements expresses the meaning of the speaker, we ascertain the mood of the verb which follows.

When the first formula is the one required, there is no element of doubt, and the verb should be in the indicative mood. *If* (*as is the case*) *he is gone, I must follow him.* Here *if*=*since*.

When the second formula is the one required, there *is* an element of doubt, and the verb should be in the subjunctive mood. *If* (*as may or may not be the case*) *he be gone, I must follow him.*

§ 476. *Than* and *But*.—No conjunction governs a case. When a word governs a case, be it ever so like a conjunction, it is not one in reality. It is a preposition.

Than follows adjectives and adverbs of the comparative degree; as *this is better than that.*

Than is, in respect to its etymology, neither more nor less than *then*. It is not difficult to see the connection in sense between such sentences as *I like this better than I like that*, and *I like this—then* (*afterwards* or *next in order*) *I like that.*

Than is sometimes treated as a preposition when it governs a case.

Thou art a girl as much fairer than *her*
As he was a poet sublimer than *me*.—*Prior*.
You are a much greater loser than me.—*Swift*.

It is better, however, to make it a conjunction, in which case the noun which follows it depends upon the Verb of the antecedent clause. 1. *I like you better than he*=*I like you better than he likes you.* 2. *I like you better than him*=*I like you better than I like him.*

But, in respect to its etymology, is *be-utan*=*by out.* It is not difficult to see the connection in sense between such sentences as *all but one*, and *all without* (or *except*) one.

But, then, is a Preposition and an Adverb, as well as a Conjunction. Prepositional Construction.—*They all ran away but me*, i.e. *except me.* Conjunctional Construction.—*They all ran away but I*, i.e. *but I did not run away.*

Copulatives, Disjunctives, and Subdisjunctives must be considered in respect to the *Number* of the verb with which they come in contact. Copulatives *always* require a plural verb.

§ 477. *The Concord of Persons.*—A difficulty that occurs frequently in the Latin language is rare in English. In expressions like *ego et ille*, followed by a verb, there arises a question as to the person in which that verb shall be used. Is it to be in the first person in order to agree with *ego*, or in the *third* in order to agree with *ille*? For the sake of laying down a rule upon these and similar points, the classical grammarians arrange the Persons (as they do the Genders) according to their *dignity*, making the Verb agree with the most *worthy.* In respect to persons, the first is more worthy than the second, and the second more worthy than the third. Hence, they said—

Ego et *Balbus sustulimus* manus.
Tu et Balbus sustulistis manus.

Now, in English, the plural form is the same for all hree persons. Hence we say *I and you are friends*, *ou and I are friends*, *I and he are friends*, &c., so hat for the practice of language, the question as to the elative dignity of the three persons is a matter of in- lifference. Nevertheless, it *may* occur, even in English. Whenever two or more pronouns of different persons, nd of the *singular* number, follow each other *disjunc- ively*, the question of concord arises. *I or you—you r he—he or I.* I believe that, in these cases, the rule s as follows:

1. Whenever the word *either* or *neither* precedes the pronouns, the verb is in the third person. *Either you r I is in the wrong—neither you nor I is in the wrong.* In this case *either* is a pronoun, and means *one of us wo.*

2. Whenever the disjunctive is simple, *i.e.* unac- ompanied with the word *either* or *neither*, the verb grees with the *first* of the two pronouns.

I or *he am* in the wrong.
He or *I is* in the wrong.
Thou or *he art* in the wrong.
He or *thou is* in the wrong.

§ 478. *The Concord of Tenses.*—When *that* signi- ies intention, the Verb which follows must be in the ame Tense as the Verb which precedes it.

1. I *do* this that I *may* succeed.
2. I *did* this that I *might* succeed.

This is a Concord of *Tense.*

CHAPTER VIII.

THE SYNTAX OF COMPLEX PROPOSITIONS — THE RELATIVE AND ANTECEDENT.

§ 479. *The Concords of the Relative and Antecedent.*—'*Relative*' and '*Antecedent*' are words of which either one implies the other. There is no Relative without an Antecedent; and no Antecedent without a Relative.

As the Relative, in respect to its import, is simply the Antecedent under another name, the two words must be of the same Gender and the same Number; so that *Gender* and *Number* are the two Concords of the Relative and the Antecedent. In these they *must* agree.

In the matter of *Case*, however, there is no such necessary agreement; for the man or woman, the person or thing, or the men or women, &c., that are agents in one clause may be the objects of the action in the other. In 'I trust *John*'—*John* is the object. In '*John* trusts me'—*John* is the agent.

§ 480. The Antecedent may appear in either the Subject or the Predicate, as *He steals trash who steals my purse—I punished him who stole my purse.*

§ 481. The arrangement of the clauses is not necessarily linear; *i.e.* they need not precede and follow one another; though in the preceding they have done so. They might, however, have run—*he, who steals my purse, steals trash—him, who stole my purse, I punished.*

§ 482. Neither is it necessary that *both* the Relative and the Antecedent should be used. In phrases like *the books I want are come* the Relative, in *Who steals my purse steals trash* the Antecedent, is omit-

ted. For a fuller notice of the *omission of the Relative*, see *Abbott*, &c. 244.

§ 483. *Attraction.*—This is a term of the same kind as *Ellipsis* and *Pleonasm*; for it is a name of one of those processes by which the ordinary rules for the Concords are disturbed. One of these Concords is, as we have seen, that between the Relative and the Antecedent; and the process that disturbs it is named *Attraction.* Though Attraction plays a part in the explanation of certain irregular constructions in English, the English is not the best language for explaining its nature and operation. A familiar example will best illustrate it. The Greek for *I use* is *χρῶμαι*; for *book βιβλίον*; for *which*, *οἷς* is the Dative, and *ἃ* the Accusative Plural. For *I have* the Greek is *ἔχω*. But *χρῶμαι* governs a Dative Case, *ἔχω* an Accusative. In what case then will the Relative Pronoun *which* be when we translate *I use the books which I have*? The answer is plain. It will be in the case which is governed by the word corresponding with *have*, and *not* in that which is governed by the word corresponding with *use*. Hence the translation should be *χρῶμαι βιβλίοις ἃ ἔχω*. Instead of this, however, it is *χρῶμαι βιβλίοις οἷς ἔχω*. But the disturbance is readily referred to its cause.

The regimen, or government, of the Antecedent extends itself to, or *attracts* the Relative. And that very naturally, inasmuch as the Relative and the Antecedent equally apply to the same object.

§ 484. *Attraction and Ellipsis.*—Along with this influence in the way of Attraction we should consider the fact noticed in § 482; viz. that of the omission of one of the two elements now under notice; and having done this, proceed to analyze such sentences as the following:

He whom I accuse has, by this time, entered the city gates.

It is better to leave something undone, than to acquire fame when *he whom* we serve is away.

Here both the Relative and the Antecedent are in full. But, as we have seen that either of them may be ejected, we may write

He I accuse has by this time entered the gates,

or

Whom I accuse has by this time, &c.

So also with

Better to leave undone than to acquire fame when *he* we serve is away.

Better, &c., acquire fame when *who* we serve is away.

In all this we have Ellipsis. But, besides this, Attraction may play a part in these various and multiform constructions. Hence the real texts of which the preceding instances are only illustrative variations are—

Him I accuse
By this the city ports has enter'd.

Coriolanus, v. 5.

Better to leave undone
Than to acquire when *him* we serve's away.

Antony and Cleopatra.

Here *him* = *he whom.*

§ 485. *It is I—c'est moi.*—It is the opinion of the present writer that by the doctrine of *Attraction* the much-abused construction *It is me* is something more than excused. Whenever it is Antecedent: in other words, when it is followed by the Relative Pronoun (as it is very often), the Accusative Case is quite as common as the Nominative: *It is I* who *have come to see you*, or It is *I* whom *you wish to see.* When sentences like these are found in extenso the condi-

tions under which we expect Attraction lie on the surface and are conspicuously visible.

But when *It is I* either constitutes the whole sentence, or has no Relative to follow it, the conditions of Attraction are anything but conspicuous. However, it is only in appearance that they are wanting. There is always a second clause *implied*; and, in it, an unexpressed Relative. The bearing of this is, manifestly, upon the debateable question as to the propriety of the (so called) Accusative *me*, in the combination *It is me=It is I*. When this answers the question *What is that?* the answer may consist of a single word, viz. *I* or *me*, as the case may be. The arguments against the latter phrase lie on the surface, and there has never been a want of grammarians who have insisted upon them with all the zeal that conviction can engender. On the other hand the vulgarism, as it has been called, has found able defenders: one of the best arguments in its favour being the fact of vulgarity. It is, without doubt, a pure spontaneous growth of the English language when independent of the influence of the grammarian. It is something more even than this; for it is French as well as English—and that to a greater extent. In French *c'est moi* absolutely excludes *c'est je*. Yet *It is me* is not a Gallicism. It is the result, as has been suggested, of Attraction; though whether it is always so in English or whether it is ever so in French is another question.

§ 486. Another way by which the use of the (so-called) Accusative can be defended lies in the likelihood of its being no Accusative at all: for it does not follow that because *I* is the Nominative, *Me* may not be Nominative also. The one by no means excludes the other. Neither is a second form superfluous. The difference, in the matter of its inflection, between the Adjective when it constitutes a Predicate, and the Adjective when it is in the ordinary state of construction, has already been noticed; and it is not too much to say that the *Predicative*

Construction like the influence of Attraction is one of sufficient importance to be recognized as an element of criticism.

Hence, there may be two kinds of *me* in the place of *I*—one brought about by Attraction, and one the result of the Predicative construction question.

Caution.—It does not follow that because *It is me* may be justified, we can also say *It is him*, *It is her*, *It is them*, though the conditions of the Attraction are the same. In *him*, *her*, and *them* we have positive signs of an oblique case; and this naturally checks rather than favours the Attractional influence. On the other hand, *I* has no signs of anything, and consequently favours rather than checks it. It is not denied that *him*, *her*, and *them* may take the place of *he*, *she*, and *they*. It is only suggested that they do not do it so readily as *me* takes the place of *I*.

§ 487. *It is I your master who*, &c.—The Personal Pronouns, especially the First and Second, are, so to say, essentially Personal; and, when they stand by themselves before a Verb, there is no doubt as to the Person in which the Verb should be used. *I command* and *he commands* are as manifestly right as *I commands* and *he command* are wrong. But ordinary Substantives are, when they stand alone, of the *third Person*; so that just as we say *he commands you*, we also, say *your master commands you*. *Your master command you* is wrong; and *I commands* is no better.

What, then, is the construction when the Pronoun *I*, or *thou*, is put in *Apposition* with such a Substantive as *master*? With which should the verb which follows agree in respect to Person? Should we say *It is I, your master, who command you*, or *It is I, your master, who commands you*.

Here the Verb in the second clause is governed neither by the Personal Pronoun, *I*, nor the Substantive *master*, but by the Relative *Who*; and this means—with which, out of the two antecedents (*I* and *master*), does the Relative agree?

There are so many ways of looking upon this ques-

tion, which is by no means one of much practical importance, that it is more of a *crux grammatica* than aught else. The purely formal view of the matter I believe to depend upon the view we take of the Person of the ordinary Substantive. In ninety-nine cases out of a hundred—perhaps in nine hundred and ninety-nine out of a thousand—it is in the *Third Person*; and, when this is the case, the notion that they are naturally more akin to *he*, *she*, and *it*, than to *I* and *Thou*, presents itself spontaneously. In reality, however, they are of no Person at all, until they are used either in the place of, or in apposition with, one of their determinant Pronouns; hence, when we say *I your master*, *thou my master*, *he our master*, &c., there is, in reality, no conflict, in the way of Person, between the Pronoun and the Substantive. They are both names of the same objects, *i.e.* the speaker, the person (or object) spoken to, or the person (or object) spoken about. Hence, words like *master* are only of the third person when they stand alone, or with *he*, *she*, or *it* before them. They are, however, so often in this predicament that it not only seems as if they were so essentially; but it is somewhat difficult to conceive them otherwise. Yet, if the doctrine of this notice be true, *master*, so long as it is in apposition with *I*, is of the same person as *I*. If so, expressions like *it is I*, *your master*, *who commands you*, are only *excusable*—excusable on the ground of the apposition being, to some extent, concealed, or over-ruled.

The true Apposition is that of *master* and *I*—both names of the speaker; with which one is as good a First Person as the other. This is a *Concord*. But *Concords*, as we have seen, are pre-eminently liable to disturbing causes. Attraction, as we have seen, may, undoubtedly, disturb them.

Special affinities in the way of import may disturb them, *e.g.* in the verb *command* and the substantive *master* (i.e. *commander*), there is a connection in sense which may over-rule that of *I* as a Personal Pronoun. And, above all, there are differences which may disturb the formal connection in the way of stress, emphasis, or accent, between the two antecedents which are concealed in written, and only recognised in spoken language. In short it is scarcely possible to say when the one construction prevails over the other.

§ 488. In combinations like *Solomon, the son of David, who built the Temple*, the first four words must be treated as a single name, otherwise David is the builder; the Relative, as a rule, referring to the noun which it most immediately follows.

CHAPTER IX.

INTERROGATIVE AND NEGATIVE CONSTRUCTIONS—THE RECIPROCAL CONSTRUCTION.

§ 489. Questions are either Direct or Oblique.

Direct.—Who is he?
Oblique.—Who do you say that he is?

Between the combined effects of Ellipsis and Attraction the Syntax of the oblique question is somewhat irregular. With the Substantive there is no practical difficulty, but with the Pronouns *who* and *whom*, the Accusative and Nominative Cases differ in form, and, so doing, claim special attention. Difficulties in constructions of this kind are best investigated by framing the answer to them, and noting the character

of the Verb. Where it is transitive the pronoun that follows it will be in the Accusative, when it is the Verb Substantive it will be in the Nominative Case.

Whom do you say that they seek?
I say that they seek *him*.
Who do you say that John is?
I say that John is *he*, &c.

Less accurately—

And he axed hem and seide, *whom* seien the people that I am? Thei answereden and seiden, Jon Baptist—and he seide to hem, But *whom* seien ye that I am?—WYCLIFFE, Luke ix.

Tell me in sadness *whom* she is you love.
Romeo and Juliet, i. 1.

And as John fulfilled his course, he said, *whom* think ye that I am?—Acts xiii. 25.

§ 490. *Yes* and *No* are, perhaps, words sufficiently peculiar to justify us in treating them as a separate Part of Speech; for it may be observed that, unlike any word hitherto noticed, they constitute a whole Proposition by themselves. *Yes*=*it is*, while *no*=*it is not*. At the same time, they depend upon what has preceded, for unless a question has been asked how is an answer to be given? There is nothing to reply to.

§ 491. When the Copula precedes the Predicate, the question is Categorical, and its answer is *Yes* or *No*. Question. *Is John at home?* Answer. *Yes* or *No*, as the case may be.

When the Predicate precedes the Copula the question is Indefinite, and the answer may be anything whatever. To *where is John?* we may answer *at home, abroad, in the garden, in London, I do not know*, &c., &c.

§ 492. In all questions there is a transposition of the terms. In *what is this?* the word *what* is the Predicate. Yet it begins the sentence. In *are you*

at home? the word *are*, though it begins the sentence, is a *Copula*.

§ 493. *Questions of Appeal.*—A question to which no answer can be given is much the same as a Negative. A person who, in extreme perplexity, says *what am I to do?* really means *I know not what to do.* These are called *Questions of Appeal.*

> Or hear'st thou rather pure ætherial stream
> Whose fountain *who* can tell?

Here, *who*=*no one*, and is a secondary interrogation superadded to the main one expressed by *hear'st thou.* The English (for the construction as it stands is Greek) of the extract is *or art thou called a pure ætherial stream whose fountain no one knows?*

§ 494. What may be called the *distribution* of the negative is pretty regular in English. Thus, when the word *not* comes between an indicative, imperative, or subjunctive mood and an infinitive verb, it almost always is taken with the word which it follows—*I can not eat* may mean either *I can—not eat* (*i.e. I can abstain*), or *I can not—eat* (*i.e. I am unable to eat*); but, as stated above, it *almost* always has the latter signification.

But not *always.* In Byron's Deformed Transformed we find the following lines:—

> Clay! not dead, but soulless,
> Though no mortal man would choose thee,
> An immortal no less
> Deigns *not to refuse* thee.

Here *not to refuse*=*to accept*; and is probably a Grecism. *To not refuse* would, perhaps, be better.

The next expression is still more foreign to the English idiom:—

> Yet *not* to have been dipped in Lethe's lake
> *Could save* the son of Thetis from to die.

Here *not* is to be taken with *could*.

In the present English, two negatives make an affirmative. *I have not not seen him=I have seen him.* In Greek this was not the case. *Duæ aut plures negativæ apud Græcos vehementius negant* is a well-known rule. The Anglo-saxon idiom differed from the English and coincided with the Greek. The French negative is only apparently double; words like *point*, *pas*, do not mean *not*, but *at all*. *Je ne parle pas=I not speak at all*, not *I not speak not*.

§ 495. When a *Finite* Verb is accompanied by a Negative, the Negative follows, and the Verb precedes: as *he spoke not*, *he moved not*, never *he not spoke*, or *he not moved*. This rule is absolute; though in many cases it looks as if it were otherwise. In expressions like *not to advance is to retreat* the negative stands first. But *to advance* is not a *Finite* Verb. It is rather a Noun. Again in *he does not advance*, &c., the case is the same. But the verb, again, is other than Finite. The true peculiarity of the Negative construction is that, except for the purposes of either metre or rhetoric, it prefers the circumlocution of *do* to the use of the simple Verb; as I *do not say so* rather than *I say not so*. Hence the Verb to which the negative belongs is *do*; and this, as the rule requires, it *follows*. The difference between *I cannot eat*, and *I can—not eat* has just been indicated.

Wallis's rule, which is quite as absolute as the present one, is to the same effect. It must be understood, however, to treat the Indeterminate Verb as other than Verbal.

Adverbium negandi non (*not*) verbo postponitur (nempe auxiliari primo si adsit; aut si non adsit auxiliare verbo principali): aliis tamen orationis partibus præfigi solet.

P. 113.

§ 496. *The Reciprocal Construction.*—In all sentences containing the statement of a reciprocal or mutual action there are in reality two assertions: one that A. *strikes* (or *loves*) B.; and another that B. *strikes* (or *loves*) A. Hence, if the expression exactly coincided with the fact signified, there would always be two full propositions. This, however, is not the habit of language. Hence arises a more compendious form of expression, giving origin to an ellipsis of a peculiar kind. Phrases like *Eteocles and Polynices killed each other* are elliptic, for *Eteocles and Polynices killed —each the other.* Here the second proposition expands and explains the first, whilst the first supplies the verb to the second; so that each clause is elliptic. The first is without the object, the second without the verb. That the verb must be in the plural number, that one of the nouns must be in the nominative case, and the other in the objective, is self-evident from the structure of the sentence.

This is the syntax. As to the power of the words *each* and *one*, I am not prepared to say that in the common practice of the English language there is any distinction between them. A distinction, however, if it existed, would give precision to our language. Where *two* persons performed a reciprocal action, the expression might be, *one another*; as, *Eteocles and Polynices killed one another.* Where *more than two* persons were engaged on each side of a reciprocal action, the expression might be, *each other*; as, *the ten champions praised each other.* This amount of perspicuity is attained, by different processes, in the French, Spanish, and Scandinavian languages.

(1.) French.—*Ils* (*i. e.* A. and B.) *se battaient—l'un l'autre. Ils* (A. B. C.) *se battaient—les uns les autres.*

(2.) In Spanish, *uno otro*=*l'un l'autre*, and *unos otros*=*les uns les autres.*

(3.) Danish.—*Hin*ander=the French *l'un l'autre*; whilst *hverandre*=*les uns les autres.*

CHAPTER X.

COMPOSITION DEFINED.—ACCENT.—ORDER OF ELEMENTS.—APPARENT EXCEPTIONS.—DETAILS.

§ 497. *Composition.—Composition is the joining together, in language, of two different words, treated as a single term.* Observe the following elements in this definition—

1. *In language.*—Words like *merry-making* are divided by the hyphen. Now, it is very plain that if all words *spelt* with a hyphen were to be considered as compounds, the formation of them would be not a matter of speech or *language*, but one of writing or spelling. This distinguishes compounds in language from mere printers' compounds.

2. *Different.*—In words like *tomtom*, *bonbon*, *sëlp-sëlpo* (*self-same*) we have the junction of two words, though not of two *different* ones. This gives us *gemination*, or *doubling*, rather than true composition.

3. *Words.*—In *father-s*, *clear-er*, *four-th*, &c., there is the addition of a letter or a syllable, and it may be even of the part of a word. There is no addition, however, of a whole one. This distinguishes composition from *derivation.*

4. *Treating the combination as a single term.*—In the eyes of one grammarian the term *mountain height* may be as truly a compound as *sunbeam.* In the eyes

of another it may be no compound, but two words like *Alpine height.*

It is in the determination of differences of this kind that the *Accent* plays an important part.

Compare such a word as *blúe bottle* in the combination *blúe-bottle fly*, or such a one as *blúe-stocking*= *learned female* with *blúe bóttle*, and *blúe stócking* as separate words. Compare, also, *bláck-bírd*, meaning *a bird that is black*, with *bláckbird* the Latin *merula*; or *blúe béll*, meaning a *bell that is blue*, with *blúebell*, the flower. Expressions like a *shárp, édged instrument*, meaning *an instrument that is sharp and has edges*, as opposed to *a shárp-edged instrument*, meaning *an instrument with sharp edges*, further exemplify this difference. Subject to a few exceptions, it may be laid down, that, in the English language, *there is no composition unless there be either a change of form or a change of accent.*

§ 493. *Differences of meaning.*—In *a red house*, each word preserves its natural and original meaning, and the statement suggested by the term is *that a house is red.* By a parity of reasoning, *a mad house* should mean a *house that is mad*; and, provided that each word retain its natural meaning and its natural accent, such is the fact. Let a *house* mean, as it often does, a *family.* Then the phrase, *a mad house*, means that the house or *family is mad*, just as *a red house* means that the *house is red.* Such, however, is not the current meaning of the word. Every one knows that *a mad house* means *a house for mad men*; in which case it is treated as a compound word, and has a marked accent on the first syllable. Compared, then, with such words as *red house*, meaning a house of a *red colour*, and compared with such words as *mad house* meaning a *deranged family*, the word, in its

common sense, expresses a *compound* idea, as opposed to *two* ideas. Such is the commentary upon *treating the combination as a single term*; or, in other words, such is the difference between a *compound* word and *two* words.

§ 499. *Order of elements.*—In compound words it is the *first* term that defines or particularises the *second*. That the idea given by the word *apple-tree* is not referable to the words *apple* and *tree*, irrespective of the order in which they occur, may be seen by reversing the position of them. *Tree-apple*, although not existing in the language, is as correct a term as *thorn-apple*. In *tree-apple*, the particular sort of *apple* meant is denoted by the word *tree*, and if there were in our gardens various sorts of plants called *apples*, of which some grew along the ground and others upon trees, such a word would be required in order to be opposed to *earth-apple*, or *ground-apple*, or some word of the kind. However, as the word is *not* current in the language, the class of compounds indicated by it may seem to be merely imaginary. Yet nothing is further from being the case. A *tree-rose* is a *rose*, a *rose-tree* is a *tree*, of a particular sort. A *ground-nut* is a *nut* particularised by growing in the ground. A *nut-ground* is a *ground* particularised by producing nuts. A *finger-ring*, as distinguished from *ear-rings* and from *rings* in general, is a *ring* for the *finger*. A *ring-finger*, as distinguished from *fore-fingers* and from *fingers* in general, is a *finger* whereon *rings* are worn.

§ 500. *Third element in compounds.*—It is clear, that in every compound there are *two* parts, i.e. the whole or part of the original, and the whole or part of the superadded, word. Are there ever *more* than two? Yes. There is, sometimes, a third element, viz., a vowel, consonant, or syllable, that joins the first word with the

second. In the older forms of all the German languages the presence of this third element was the rule rather than the exception. In the present English it exists in but few words; and that doubtfully.

(*a*) The *-a-* in *black-a-moor* is possibly such a connecting element.

(*b*) The *-in-* in *night-in-gale* is, perhaps, one also. Compare the German form *nacht-i-gall*, and remember the tendency of vowels to take the sound of *-ng* before *g*.

(*c*) The *-s-* in words like *Thur-s-day*, *hunt-s-man*, may be the same; but it may also be the sign of the Possessive Case.

§ 501. *Compound radicals.*—Words like *midshipman*, *gentlemanlike*, &c., must be treated as formations from a compound radical: and analysed thus—*mid-ship-man*, *gentleman-like*.

§ 502. The classification of Compounds in respect to their *form* begins with the two extremes.

At one end they pass into the ordinary combinations of the rules of Concord and Government between two separate words in Syntax—as *Thursday* = *Thoris dies* = *Thor's day*.

At the other they pass into Derivatives; as in the case of *manly*, as opposed to *manlike*. There is no such single word as *-ly*. But we know that it is only *like* in a newer form. This leads us to Etymology; or the Grammar of single words.

(1) *Substantives preceded by Substantives*; the first being *governed* by the second in the Genitive Case —*Thur-s-day*, as opposed to *Sun-day*; *land-s-man*, as opposed to *sea-man*; *headsman*; *sportsman*, *huntsman*, &c.

Substantives preceded by Adjectives—*blindworm*, *freeman*, *blackthorn*, *holyday*, *quicksilver*, &c. These

are, in Latin, *cæcus anguis, liber homo, nigra spina, sancta dies, vivum argentum* (*argentum vivum*).

Substantives preceded by Verbs—turnspit, spitfire, daredevil, &c.

Here the first element is just what it would be if the two words were unconnected, or even separated by others intervening = *Thor's* (*sacred*) *day*, the *blind* (*and*) *slow worm; spit* (*flame and*) *fire*, and the like. No word has changed either its form, or its relations in the way of government, nor yet its import as a Part of Speech, on the strength of the closeness of the contact, or the change of accent, which indicates its subordination as a syllable.

The same is *nearly* the case with the Active Participles of Transitive Verbs, preceded by a Substantive. A *fruit-bearing tree* differs from a *tree bearing fruit* only in the transposition of its element and the Accent. The government is that of an ordinary Accusative Case.

When the first element in compounds of this kind is an Adjective, there is modification of the construction. *Soft-flowing* means *softly* rather than *soft*; and corresponds with the Latin *molliter* rather than *molle*. But a *Neuter* Adjective both in Latin and English, may stand for an Adverb: so that the difference between the Adverbial and the Adjectival construction is but nominal.

As an Adjective, without its Substantive, is not an object of Government; the verb in combinations like *soft-flowing* is Intransitive. With Pronouns, however, it may be Transitive; for a Pronoun, by itself, can be governed in a Case. This gives us compounds like *all-seeing, self-supporting*.

But the Pronoun partakes of the nature of both the Substantive and the Adjective; and, according to the extent that it inclines to one or the other, the sense and construction are equivocal. *All-seeing* may mean

either *seeing everything*, which is Substantival, or *seeing universally*, which is Adverbial and Adjectival.

§ 503. In the combinations which follow we have neither such clear cases of government as we have in *Thursday* and *fruit-bearing*, nor such clear cases of Concord as we have in *blindworm*. There is Government; but it is of indirect and indefinite character; and there is, so far as the outward form of the combination is concerned, Apposition in the way of Concord. The closer contact, however, which has reduced two words into one has modified the import of one of the elements as a Part of Speech—and this is *first* of the two; the one that particularizes, or circumscribes, the import of the second; and, thirdly, the one that carries the Accent—*dáystar*, *rósetree*, *séaman*, *cóllarbone*, *súnlight*, &c., &c. It is not easy to give the exact circumlocutions which correspond with the compounds. They, generally, involve a Preposition, and so far as they do this may be said to be in the case that such a Preposition would govern. In some instances the Preposition is, perhaps, sufficiently clear for two different persons to agree upon it. A *wine-cellar*, for instance, would probably be rendered *a cellar* for *wine*, by nine speakers out of ten; and *oak-tree* rendered a *tree that is an oak*. But such instances are exceptional; though where we get them, we get an instance of Government in the first case, and of Apposition in the second.

§ 504. The reduction of compounds into what would be their equivalents, if they were decomposed and exhibited with the full details of their construction, is not clear in respect to Government on the part of the Preposition. And it is no clearer in respect to that of the Verb. Indeed, it is the Verbal, rather tha the Verb itself, that plays any not t i Syntax of Compounds.

In Composition the Verb pure and simple has a very limited function. As a *Prefix* before a Substantive, we find it in words like *báckbite*, *brówbeat*, *dáredevil*, *spítfire*, *túrncoat*, *túrnspit*, and others; but they are by no means numerous. As *Affixes*, the Verbs are very rare; for we can easily believe that when such combinations as *báckbite* and *spítfire* are uncommon, transpositions of them, such as *bíteback* and *fírespit*, are rarer still. Indeed, it is safe to say that when they exist at all, they exist only as Verbals, in *-ing* or *-en* divested of their terminations. So far then as such words as *to stárgaze*, *to déerstalk*, *to shéepsteal*, &c., exist, they do not so much mean to *gaze at stars*, to *stalk deer*, or to *steal sheep*, as to play the part of a *stargazer*, a *deerstalker*, or a *sheepstealer*, or to have the habit of *sheepstealing*, *deerstalking*, or *stargazing*.

§ 505. *Substantival Participles.*—These are words like *mop-headed*, *hot-headed*, *cold-hearted*, &c., where the second element is a Substantive, and the first either a Substantive or an Adjective. Meanwhile the Affix is that of a Participle.

Every object in existence, however much its name may be a Substantive, can be made Participial in both form and import by connecting it with some other to which it belongs as an attribute. Thus, any object, whether person or thing, to which a *head* or *heart* belongs, is one which is endued with, or possessed of a *head*, a *heart*, or what not? In other words, it is *headed* or *hearted*. When these *heads* or *hearts* are of any exceptional or peculiar character, that character is indicated by a Prefix. The *head* is *moplike*. The *head* is *as a mop*, or *moplike* when the combination is Substantival, and it is simply *cold* or *hot* when it is Adjectival. The object to which it belongs, or appertains, is *mop-headed*, *cold-hearted*, or *hot-headed* as the

case may be; and it is the object thus characterized that is *mop-headed*, or *cold-hearted*. We rarely, however, use the second element by itself, inasmuch as it rarely occurs to us to say that such-or-such an object has a *head* or *heart* purely and simply. It is only when the *head* or *heart* is characterized by something different from *heads* and *hearts* in general that we use the Participial affix.

This is how pure Substantives take the form of Participles, and how they generally do so as compounds. *A cóld héarted man* is one who *is cold*, and also *has a heart*. *A cóld-hearted man* is one who *has* a *cóld héart*. The mere fact of his having a *heart* at all is rarely enough of a characteristic to develop a Substantival Participle.

Still, there are *some* words in English thus formed; and, perhaps, the best known example is the much abused word *talented*; which has the misfortune of having been condemned by *Coleridge*; who likened it to such words as *shillinged* or *guineaed*. This was good just so far as it went. *Talented* means endowed with mental accomplishments analogous to great possessions in money, and, for this, the best equivalent was the name of the highest denomination in the way of metallic wealth. It was the most general term because it was the largest.

Of simple Substantival Participles there is no better, because no more familiar example than *landed* in the phrase *landed interest*, which means the interest determined by *land*, or that of the *landowners*. The doctrine that Participial forms always imply corresponding Verbs is untenable.

Spottiswoode & Co., Printers, New-street Square, London.

ESSENTIAL RULES AND PRINCIPLES

FOR THE

STUDY OF ENGLISH GRAMMAR

BY

R. G. LATHAM, M.A., M.D., &c.

LATE FELLOW OF KING'S COLLEGE, CAMBRIDGE

PREFACE.

THE PRESENT treatise, though shorter than the recently published editions of two of my earlier works on the English Language, is not exactly an introduction to them; not a Primer, or a First Step, or any elementary work suggested by such a title. It is something more and something less than this. It is limited to the Etymology and Syntax, or, in other words, to the purely grammatical part of our language. On the Prosody, the Dialects, and the Early History, Origin, and Affinities of our language it says nothing—these being considered in other works, and under special headings.

Thus limited as to the general character of its grammar and structure, it simply aims at giving the leading principles and the recognised results of the study of it, in a compendious form. From this point of view is it hoped to be useful in two ways. It may serve as a sketch of what the student may expect to find when he proceeds farther, or it may serve as a recapitulation of such details as he may already have become familiar with.

GRAMMAR OF SINGLE WORDS 109

RULES AND PRINCIPLES

FOR THE STUDY OF

ENGLISH GRAMMAR.

ETYMOLOGY.

1. THE *essential* parts of grammar are etymology and syntax.

Orthography and prosody are also parts of grammar, but they are not essential parts.

There is no orthography until a language is reduced to writing, and no prosody until there is poetry and metre. But the essential and fundamental subject of the grammarian is speech, and this we have in all languages, whether they be written or unwritten, whether they be only spoken as prose or reduced to metre.

2. Etymology treats of, and deals with, *single* words only. When *two* or more words are connected according to certain rules or laws of speech, we have syntax. This difference between the changes of form that *one* word may exhibit, and the combinations which may occur when *two* (or more) words are connected in syntax, is fundamental and absolute, *so far as the separation is practicable.*

This last reservation is necessary, because in certain cases the two divisions graduate into one another. Such

cases, however, are exceptional, and for most practical purposes the two divisions may be kept apart.

The order in which the two are taken is indifferent. We may either begin with single words and show how, by combining them with others, we may construct sentences or propositions, or we may take a sentence or proposition, and by analysis reduce it to the single words of which it is composed.

It is usual, however, to take etymology first, and accordingly in the present work etymology will have the precedence.

COMPOSITION AND DERIVATION.

3. *Composition* takes place when two separate words are joined together so as to form a single word—*day-light, nut-brown, dogstar, fatherlike, peacock.*

4. *Derivation* takes place when one word undergoes a change by either addition or alteration, as *hunt-er, wood-en, drunk-ard, spin-ster*, &c.

Composition implies the combination of whole words; derivation the addition of parts of words.

5. Certain additions to the nouns and verbs are called *Inflections*, inflection being a peculiar variety of derivation.

The inflection of a noun (or pronoun) is called its *Declension*, and nouns are said to *be declined*. *Father's* as the possessive singular, and *fathers* as the nominative plural, of *father*, give us instances of declension. The *'s* is a sign of case, the *s* a sign of number. In the pronoun, the *-t* in *what* is a sign of gender. The Inflection of the verb is called its *Conjugation*, and verbs are said to be *Conjugated*. The *s* in *loves*, and the *d* in *loved*, give us instances of conjugation. The *s* is a sign of person, the *d* a sign of tense.

6. The two words in composition must be treated as one. The crow is a *blǻck bírd*, but not a *blǻckbird*. A *blúe bóttle* is a *bottle of a blue colour*; and a *blúe stócking* is a *stocking that is a blue*. But a *blúebottle* fly is an insect, and a *blúestocking* is a learned lady. A *shárp édged instrument* is an instrument that is sharp and has edges. A *shárp-edged instrument* is an instrument with a sharp edge.

7. It is easy to see that in these and similar combinations there is a difference in the accent. Where the words are separate there is an accent upon each of them. Where they are united in composition the accent is on the first only. This change in the way of accent is the best character of a compound as opposed to a *pair* of words.

8. In compound words it is the first term that defines or particularizes the second. Sometimes it is not very easy to give the exact meaning of a compound in separate words. A *wine-cellar* may certainly be described as a *cellar for wine*; and an *oak-tree* may be rendered as a *tree that is an oak*. The meaning of words like *blackbird*, *whitethorn*, *blindworm*, &c., is clearer still. In many cases, however, the exact rendering is obscure. In all cases, however, the first syllable is the most important, and is that on which the accent lies.

9. Besides the two fundamental words of which every compound consists, there is sometimes a third element, viz., a connecting vowel, consonant or syllable, as *black-a-moor*, *night-in-gale*, *hand-i-work*. The older the stage of the language the more numerous are these connecting elements. In English, however, the third element is exceptional.

10. Sometimes there are three words in a compound,

as *midshipman*, *gentlemanlike*. The division here is *mídship-man*, *géntleman-like*, not *mid-shípman* and *gentle-mánlike*.

11. Words in composition frequently undergo changes which they would not undergo as separate and independent words; *e.g.*, *like* becomes *-ly*, as in *manly*, *gentlemanly*, from *manlike*, *gentlemanlike*. This form in *-ly* gives us an admirable illustration of the way in which derivation and composition may run into each other.

Sometimes words may change their meaning; and sometimes they may (one or both) become obsolete, or drop out of the language altogether.

The *-ric* in *bishopric*, as a separate word, was *rice*=meaning *domain*, *power*, or *jurisdiction*.

The *-dom* in *kingdom* and *dukedom* was *dôm*, word for word, the present word *doom*=*judgment*, *jurisdiction*.

The *-head* in *Godhead* is the same word as the *-hood* in *manhood*, *brotherhood*, *hardihood*. Its older form was *hâd*; its meaning *state*, *character*, or *condition*.

The *-ship* in *friendship*, *hardship*, *lordship* is, word for word, the modern *shape* = *form*, *likeness*. The *-scape* (or *skip*) in *landscape* (or *landskip*) is the same word.

The *-less* in *worthless*, &c. has nothing to do with the *less* connected with *little*. Its true connection is with the word *loose*, A. S. *leâs*.

12. The two most important of these disguised elements are the syllables *-teen* and *-ty*, as used in words like *thir-teen*, &c., and *thir-ty*, &c., where *-teen* denotes addition; *-ty*, multiplication. Each is a modification of the older form *taihun*, *tigun*, or *tehan*, in Greek δέκα, in Latin *decem*, word for word. *Tig* is a substantive, meaning a collection of *tens*, i. e., a *dec-ad*. In the Icelandic we have it in its full inflection.

Nom.	Fjórir tigir manna	=	*four tens of men.*
Gen.	Fjögurra tiga manna	=	*of four tens of men.*
Dat.	Fjórum tigum manna	=	*to four tens of men.*
Acc.	Fjóra tiga manna	=	*four tens of men.*

13. Compounds, of course, must consist of *two* words at least. But it is clear that, if certain subsequent changes take place, the shortening process may go on so far as to reduce two words to one, *i.e.* dissyllables, or even polysyllables, to *mono*syllables.

This reduction actually occurs. The common words *which* and *such* are contractions of *whilk* and *swilk*, which are compounds of *who* + *like* and *so* + *like*. In Scotch and Frisian, where *sic* and *sok* stand for *such*, the reduction goes still farther. Moreover, there is the West-Saxon provincialism *thick* or *thec*, meaning *this* (*that*), which is from *thilk*, which is from *thi-lik*.

In *not* (*n-o-t*) we have *three* distinct words thus reduced to a monosyllable, and that a very short one. *Not* is a contraction of *naught* (*n-aught* = *not anything*). *Aught*, however, itself is a compound. The first element is the *ev-* in *ev-er*; the second the word *whit* = *bit, piece, jot.*

14. It will be stated more than once that etymology and syntax may graduate into one another. The instance of the word *not* is an instance of composition taking the appearance of derivation. The case of derivation running into composition and that of derivatives taking the garb of compounds are not so easy; nor is it always practicable to find instances of each in a single language. Indeed, the conclusions of the comparative philologist are leading us gradually to the doctrine that all derivatives were originally compounds—even such elements as the *-s* in *father-s*, the *-t* in *i-t*, and many others, which it is hard to deduce from separate and independent words, or to say what meanings such words may once have had. Nevertheless, this is the direction which comparative philology suggests.

15. In *fatherlike* we have *two* whole words. In *fathers* we have a whole word, but only *one*. In the letter *'s*, however, we get an addition of some kind, the result being more than one word and less than two.

16. In this lies the difference between derivation and composition. Where there is one word, and nothing else, we have a theme or root, according as we choose to call it. In this case there is neither derivation nor composition. Where we have two distinct, separable whole words treated as one, we have undoubted composition. Thirdly, when we have a single word, but something additional attached to it without making a second, we have derivation. But, as we have seen, derivation and composition have a tendency to run into, or graduate into, one another.

17. There are two ways of classifying derivational elements. Thus, from the derivatives *lead-en*, *child-ish*, *bitter-ness*, *mead-ow*, &c. we take the signs *-en*, *-ish*, *-ness*, and *-ow*, and arrange them alphabetically, stating under each its influence on the word to which it is attached. For some purposes this arrangement is useful, *e.g.* if we wish to compare the derivational elements in English with those of other languages, this order is the most convenient, and the one that best suits comparative philology.

18. The arrangement that best suits the special grammarian is somewhat different. Here the most natural classes are made by arranging the derivational elements according to their *powers*. This gives *three* classes.

19. The first class contains those affixes which change the word to which they are affixed as a *part of speech*; in other words, convert substantives into adjectives, or *vice versa*.

The terminations *-y*, *-ish*, and *-en* change substantives into adjectives.

The *-y*, as in *windy*, *bloody*, *stormy*, *dusty*, *hearty*, &c., was originally *-ig*.

The *-ish*, as in *childish*, *English*, &c., was originally *-isc*. In *Welsh* and *Scotch* we have contracted forms of *Walish* and *Scottish*. It has another power when attached to adjectives, as will soon be seen.

The termination *-en*, as in *woollen*, *flaxen*, *wooden*, *oaken*, *golden*, *braxen*, *leaden*, and a few others, tells us that the object to which it applies is made of *wool*, *flax*, *wood* and the like as a material. This class of words was once much more numerous than it is at present, and words like *tre-en*, *stonen*, *silvern*, *coppern*, *glasen*, *hornen*, along with many others, were current. There was, also, in some words, a departure from the notion of material—*bæren*, *gæten*, *swinen*, *yteren* meant appertaining to *bears*, *goats*, *swine*, *others*. The oldest form was *-ein*, as *silubr-ein-s* = made of *silver*, *thaurn-ein-s* = made of *thorn* in Mœsogothic. The final *-s* is the sign of the nominative case, masculine gender, like the *-s* in *bonus* and *tristis*.

The terminations *-ness* and *-th* change adjectives into substantives. These substantives are always *abstract*, as *blind-ness*, *good-ness*, *leng-th*, *streng-th*.

The termination *-en* changes adjectives in verbs; as in *whiten* = *make white*, *gladden* = *make glad*; *fatten*, *sweeten*. It has the same power when attached to the substantives *length* and *strength*, from which form *lengthen* and *strengthen*. We cannot, however, say *depthen* and *widthen*, but only *deepen* and *widen*. This affix was always either what it is now (*-en*) or *-an*—in other words, it was originally different from the *-en* in *woollen*, &c., with which it is now identical.

20. The affixes of the second class are those which indicate distinctions of meaning between words which, as a *part of speech*, belong to the same class. Thus,

though *hill* and *duck*, *hillock* and *duckling*, are all substantives, there is a difference of import between the simpler and the derived forms. A hill*ock* is a small hill, and duck*ling* a small or young duck.

The terminations *-ck*, *-kin*, and *-ling* are diminutival affixes, or diminutives. The words *emmet* and *gimlet* are diminutives, which originally ended in *-ick*—*emmick* = *little ant*, and *gaffdick* = *little fork* or *prong*.

The diminutives in *-ck* are not so common in the present English as they were in the older language; nor are they so common in England as in Scotland.

The same applies to the diminutive in *-kin*, as *lambkin*, *mannikin*, *pipkin* (*little pipe*), *gerkin* (*little cucumber*).

The chief diminutives in *-el* or *-le* are *nozzle*, *speckle*, *sparkle*, *knuckle*, and a few others from *nose*, *speck*, *spark*, *knock* (the German *knock* = *bone*). *Throstle*, from *thrush*, is also a diminutive. The true *thrush* is the mistletoe thrush, which is the larger, the *throstle* is the song-thrush, which is the smaller, bird.

The ordinary forms in *-ing* are neither very common nor very well marked. The words *birding* = *little bird*, and *lording* = *little lord* (used in a somewhat contemptuous sense) are the usual examples of it. But *lordling* is the commoner form for the latter, and *birdling* (like *duckling*), if the word were used at all, would probably be the favoured form. The real import of the word is best seen in a combination which is, to a certain extent, a proper name, viz. Edgar Athe*ling*. This means *Edgar of noble descent*. As such it partakes of the Greek *Patronymica* in ιδης, as *Pelides* = *the son of Peleus*, *Atrides* = *the son of Atreus*, and the like. As such it was the common equivalent in Anglo-Saxon to our affix

= *son*. The relation of a son to his father is akin to the relation of the smaller to the greater, so that patronymics are, in some sense, diminutival.

This termination is here noticed for two reasons: (1.) It is one of the elements in the commoner form in *ling* (*l-ing*), which is a *double* diminutive. (2.) It is the *-ing* of the numerous local names, like *Hastings*, *Billing*, *Padding-ton*, &c., which by hypothesis are considered to be patronymic or gentile names of certain associations of the German conquerors of Britain, who established themselves on the several areas now ending in either *-ings*, or *-ing*—sometimes, as in *Padding-ton*, with a superadded affix. The occurrence of it as a geographical *proper* name invests it with a value which it would not have as an element in a *common* one.

The termination *-ard* generally carries with it the idea of disparagement, as in *drunkard*, *laggard*, *sluggard*, *stinkard*, &c. In *braggart* the *-d* has changed into *-t*. It was originally an augmentative.

21. The third class of derivative affixes is of a very negative character. They scarcely alter the meaning of the word to which they are affixed at all. The *-en* in *maid-en*, as opposed to *maid*, and the *-ow* in *shadow*, as opposed to shade, illustrate this. We may truly say of these that we cannot use either *maiden* for *maid*, or *shadow* for *shade*, indifferently in all cases. But the difference is not that between *hill* and *hillock*, and, still less, equal to that between *strong*, *streng-th*, and *streng-th-en*.

The *-en* in *maid-en* is the *-en* in *wood-en*, &c., and certainly not the *-en* in *wid-en*, *streng-th-en*, &c. The original difference between these and the *-en* in *wood-en*, &c. has already been explained.

INFLECTION.

22. Inflection is a particular variety of derivation. It falls into (1) declension, (2) conjugation. The amount of both declension and conjugation varies greatly in different languages. There is more inflection in the Greek than in the Latin, more in the Latin than in the German—very little in the English.

23. The inflections of the noun are (1) gender, (2) number, and (3) case.

The verbs, also, have number. But gender is peculiar to, and characteristic of, the noun.

Adjectives are nouns which, in the present English, have lost their signs of inflection. In the older stages, however, of the language, they were fully developed, so that their natural place in grammar is, in this respect, that of the substantive and the pronoun.

24. The same is the case with the participles. They are now destitute of inflection. In the older stages, however, of the language they were inflected, and that like the adjectives.

25. In sense, import, or meaning the participles are connected with the verb rather than with either the substantive or the pronoun.

Laying this out of the question, we may say that the characteristic inflections of the nouns are those of—(1) gender; (2) number; and (3) case.

The inflection of the noun is called its declension, that of the verb its conjugation.

The pronoun has a fuller declension than the substantive. There is, in the substantive, no such sign of a dative case as the *-m* in *whom*; and no such signs of gender as the *-r* in *her*, and the *-t* in *what*.

26. Of cases, the substantive has three; of numbers

two. But the only sign is the sound of the letter -*s*. In sound the plural form *fathers* is the same as that of *father's*, the possessive case.

The identity, however, of the three signs is only an accident of the present state of our language. Originally they were distinct.

The possessive singular was -*es*; the nominative and objective plural was -*as*; the possessive plural was *a*.

In the first two, the vowel being dropped, the endings became identical.

In the possessive plural the original -*a* was dropped, and -*s* of the possessive singular adopted. But it is only in a few words that this form has any real existence: *men's, women's, children's, oxen's, i.e.* the few plurals wherein the nominative of that number does *not* end in -*s*.

27. In *writing*, we draw distinctions by means of the apostrophe—*the father's son, the two fathers, the fathers' sons, i.e.* the sons of different fathers. Distinctions, however, which rest upon merely artificial devices and expedients are not distinctions in *language*.

28. *Plurals not ending in* -*s*.—1, 2. *Man* singular, *men* plural.—The plural of *woman* is to the ear, or in actual language, *wimmen*; *i.e.* the vowel of the first syllable is changed.

3, 4, 5. *Foot, feet; tooth, teeth; goose, geese.*—The difference between these words, again, lies in the vowel of the two numbers. In respect to quantity, in *foot* the vowel is short; in *tooth* and *goose*, long.

6, 7. *Mouse, mice; louse, lice.*—The sound of the -*ce* of the plural is simply that of the singular -*se*. If the spelling, however, were *mise, lise*, the words would run the risk of being pronounced *mize, lize*.

8. *Kye* is, in Scotch and the older English, the plural

of *cow*. In Anglo-Saxon the forms are for the singular *cu*, for the plural *cy*.

9. *Childer*. This is collective rather than a true plural form. In the older English, *lamb*, *calf*, and a few other words form their plurals in *r*.

10. *Brethre*. This is an earlier form than *brethren*, being in same class with *mice*, *teeth*, &c. &c., formed by a change of vowel.

11. *Oxen*. In A.S. a whole declension formed its plurals in *-n*; and the same is the case in both German and Dutch. Except, however, in this single word, the termination has become extinct.

Kine. This is the result of the combination of two elements: (1) the changed vowel, as in *kye* from *cow*; and (2) the *-n*, as in *oxen*.

Brethren.—Like *kine*, a double formation: (1) change of vowel; (2) addition of *-n*—*brethre*, *brethren*.

Children.—Also a double formation—*child-er-en*.

29. *Plural of Substantives ending in Vowels*.—Whether a substantive ending in a vowel or a diphthong forms its plural by the addition of a long syllable, like the *ō* in *cargoes* (spelt *oe*), or a short one, like the *i* in *ladies* (spelt *ie*, but sounded short), depends upon two points: (1) the character of the vowel as broad or slender; and (2) the nature of the syllable as accented and unaccented: the rules being as follows:—

(a.) When the syllable is accented, the vowel, whether broad or slender, is long; as, *days*, *ways*, *blows*, *shows*, *hoes*, *pews*, *flews*, *flies*, *sighs*, *boys*, *hoys*, *teas*, *seas*, *fleas*.

(b.) When the vowel is *un*accented, the vowel, if broad, is *long*; if slender, *short*; as *caraways*, *runaways*, *holidays*, *cargoes*, *embargoes*, *heroes*, *echoes*, *grottoes*, *folios*,

cuckoos; but words like *lady, baby, valley, money,* &c., give *ladies, babies, valleys, moneys,* &c., sounded *ladiz, babiz, valliz, moniz,* &c.

30. The *-s-* in *houses.*—In *house* the *s* has its ordinary sound; *i.e.* as the *s* in *seal.* In *houses* it is sounded as *z.*

The same change takes place when the word ends in *-th,* as *mouth, truth.* The plural of these is sounded as if it were written *moudhz, trudhz.*

Pence, as a contraction of *pennies,* and *dice* as a contraction of *die,* are naturally sounded *penz* and *dize.* They are collective forms rather than plural. *Sixpence* means not so much six separate pennies as a single coin equivalent to them, while *dice* means a pair of *dies* for the purpose of gaming, rather than an indefinite number of separate *dies* for stamping.

31. *Eaves, alms.*—Here the *-s* is no sign of plurality, but a part of the original word. A.S. *efese, ælmesse.*

Riches, summons.—The *-s* part of the original word, the original word being not English, but *French*—*richesse, semonse.*

Pains—means—amends; all of French origin. The *-s,* however, is the sign of a true plural—*peine, peines*; *moyen, moyens*; *amende, amendes.* This separates them from the preceding group.

Physics, optics, politics, ethics, pneumatics, hydraulics, mechanics, dynamics, statics, &c. All these words are of Greek origin. They are from certain adjectives in the neuter gender, *e.g.,* φυσικά = *matters connected with Nature,* ὀπτικά = *matters connected with vision,* &c. Hence, though the sense is singular rather than plural in the present English, the *-s,* as an inflection, is plural rather than singular.

Peas.—The *-s*, the *-s* in the Latin *pisum* = *a pea*, *i.e.* really a part of the *singular* noun.

32. The only notable exceptions to the rules that the plurals in *-s* are identical in sound with the possessive cases consist in certain words ending in *-f*, as *shelf*, *wife*, *life*, &c. Here the possessive case is perfectly regular, as *shelf*, *shelf's*, *wife*, *wife's*. In the plural the *f* is changed into *v*, as *shelves*, *wives*, *lives*.

33. *Gender of Substantives.*—The preceding pages have treated on *declension*, which is itself a variety of *inflection*. But though they have noticed both declension in the way of number, and declension in the way of case, they have said nothing about the declension of gender. Yet English substantives have certainly signs of gender. The *-ess* in words like *peer-ess*, *princ-ess*, &c., though a decided sign of gender, is scarcely an English word. But the *-en* in *vix-en* = the German *füchs-inn* = *female fox*, is undeniably both a sign of gender, and an *English* one; and the older the stage of the language, the more numerous these truly English signs of gender become.

In words like *king*, *queen*, *horse*, *mare*, *cock*, *hen*, and many others, there are different names for the males and females, and the names of the males are masculine, and the names of the females are feminine, and all this is in the way of gender. But it is not declension.

In compounds like *man-servant*, *maid-servant*, *he-goat*, and *she-goat*, along with others, there is also a distinction of gender. But there is no difference of declension.

In words like *hero*, *heroine*, *peer*, *peeress*, *actor*, *actress*, there is a difference of gender expressed by a special affix; and in this we have an approach to declension. But though the words in every one of these pair differ from one another in their termination, there is no difference between them in respect to their case and number. The possessive case and the plural of *hero*, *peer*, and *actor* are formed by the addition of *s*; and so are those of *heroine*, *peeress*, and *actress*—*hero's*, *heroes*, *heroine's*—*peer's*, *peers*, *peeresses*—*actor*, *actor's*, *actors*, *actresses*.

True declension requires more than this; but the whole system of gender is so incomplete in the present stage of the English, that the difference is best explained by an example from a language where the inflection is fuller, namely, the Latin. It is only necessary to premise that *genitor* means *father*, and *genitrix*, *mother*. The syllables in italics are the signs of case and number; the syllables *or* and *ix* those of gender.

	Singular			*Plural*	
Nom.	Genitor	Genitrix.	*Nom.*	Genitor-*es.*	
Gen.	Genitor-*is*	Genitric-*is.*	*Gen.*	Genitor-*um.*	
Dat.	Genitor-*i*	Genitric-*i.*	*Dat.*	Genitor-*ibus.*	
Acc.	Genitor-*em*	Genitric-*em.*	*Voc.*	Genitor-*es.*	
Voc.	Genitor	Genitrix.	*Abl.*	Genitor-*ibus.*	

Here the difference of gender has no influence on the declension. On the other hand, in *dominus* = *a lord*, or *master*, and *domina* = *a lady*, or *mistress*, the declension *is* affected, and the signs of both number and case are varied according to the gender.

	Singular			*Plural*	
Nom.	Domin-*a*	Domin-*us.*	*Nom.*	Domin-*æ*	Domin-*i.*
Gen.	Domin-*æ*	Domin-*i.*	*Gen.*	Domin-*arum*	Domin-*orum*
Dat.	Domin-*æ*	Domin-*o.*	*Dat.*	Domin-*is*	Domin-*is.*
Acc.	Domin-*am*	Domin-*um.*	*Acc.*	Domin-*as*	Domin-*os.*
Voc.	Domin-*a*	Domin-*e.*	*Voc.*	Domin-*æ*	Domin-*os.*

It is clear that, in the present English, so far as gender is concerned, words like *hero* and *heroine*, *actor* and *actress* are declined like *genitor* and *genitrix*. Of a declension like that of *dominus* and *domina*, we have, in the present stage of our language, and for the class of substantives, no trace. In *his* and *her*, *him* and *her*, *he* and *it* (*hit*), as well as in *who* and *what*, we have a true declension in the way of gender. But these words are pronouns, not substantives. Substantives, in the present stage of our language, have nothing nearer to the declension of gender than words like *peer-ess* and *vix-en*.

ADJECTIVES.

34. Adjectives in English are absolutely destitute of inflection. We say *good man*, *good woman*, *good thing*, *good men*, *good women*, *good things*, *a good man's hat*, *a good woman's bonnet*, *a good thing's value*. The substantive may be changed, but the adjective is unchangeable, yet the two words are said to agree with one another, and that truly. The real fact, however, is that, as the adjective has no signs of gender, number, or case, there

is no possibility of disagreement. In A.S. it *had* such signs, and in A.S. there was, of course, a positive agreement, a concord between the two parts of speech in this respect.

35. The nearest approach to an inflection on the part of the adjective is found the so-called degrees of comparison. But in the degrees of comparison the signs are not like those of the *-s* in *father-s*, or the *-t* in *wha-t*, &c., but like those of the *-ck* in *hillock*, and the other derivational elements of the second class. In other words, the degrees of comparison are not inflections.

36. An adjective shows that the name with which it is connected either possesses, or does not possess, a certain quality; *white bread*, *black ink*, *clear glass*, are combinations which tell us that the *bread*, *ink*, and *glass* have the qualities of *whiteness*, *blackness*, and *clearness*.

Some sorts of bread may be blacker than other sorts, and some particular sort may be the *blackest* of all. This means that objects may have certain qualities in different degrees. One piece of glass may be *brighter* than another, and a third may be the *brightest* of all.

Before we perceive the difference we must have compared the different objects. Hence adjectives are said to have their degrees of *comparison*.

The positive degree gives the adjective in its simplest form, as *white*, *black*, *clear*. Some deny that this is a degree at all, inasmuch as there is no comparison. But the difference is of no great practical importance.

The comparative is formed by the addition of *-er*, as *bright*, *bright-er*.

The superlative is formed from the positive by the addition of *-est*, as *bright*, *bright-est*.

37. In Anglo-Saxon the *adverbs* had, like the adjectives, degrees of comparison, though there was a slight difference between them. The adjectives added *-re* and *-est*, as *scearp, scearpre, scearpest* = *sharp, sharper, sharpest*; the adverbs *-or* and *-ost*, as *scearp, scearpor, scearpost* = *sharply, more sharply, most sharply*.

Moreover, the Anglo-Saxon adjectives often changed the vowel, making it *small*, and, by so doing, accommodating it to the vowel of termination, in the way of *Umlaut*.

Positive.	*Comparative.*	*Superlative.*	
lang	lengre	lengest	*long*
strang	strengre	strengest	*strong*
geong	gyngre	gyngest	*young*
sceort	scytre	scyrtest	*short*
heáh	hyrre	hyhst	*high*
eald	*yldre*	*yldest*	*old*

Of this change, the word last quoted is a still existing specimen, as in the substantive *elder, elders*.

The explanation of the present pronunciation of the word *rather* is connected with this. The *a* is pronounced like the *a* in *father*. But *rather* is an *adverb*, in which the comparative was *-or-*; *rathor*, not *rather*. The positive and comparative degrees of the *adjective* are obsolete. These were *rather* and *rathest*, with the *a* sounded as in *spade*. The meaning of the adjective was *early, forward, soon*; and, in Milton, the *rathe primrose* meant the early *primrose*. The adverb means *preferably, more willingly, sooner*; and, as in the adverbs, the sign of comparison was *-o*, which is a broad vowel, and (besides this) acted on the vowel of the preceding syllable so as to make it broad also, the *-a* in the present adverb is sounded like the *-a* in *father*.

38. *The old comparatives* in *-s*.—*Worse*.

The comparative degree, as we have seen, is formed from the positive by the addition of *-er*, the superlative by that of *-est*. Nothing is much simpler than this.

But the superlative may also be formed from the comparative by changing the *r* of the comparative into *s*, and adding *t*; as *dark-er, dark-es, dark-es-t, cold-er, cold-es, cold-es-t*, &c. This is anything but simple.

Simple, however, or not, it is necessary that the alternative should be noticed, inasmuch as the Mœsogothic is oldest of any German, and the Mœsogothic comparative is naturally held to give us the oldest form. Now the comparative of the Mœsogothic

was *not* formed by the sound of *-r*, but by the sound of the sibilant *-s*, *ts*, or *z;* and words like *ald-iza*, *bat-iza*, *sut-iza*, were the original forms of what became in old High-German *alt-iro*, *bets-iro*, *suats-iro*, and in English, *old-er*, *bett-er*, *sweet-er*.

Vairsiza, then, in Mœsogothic was the form of the O. H. G. *wirsiro*, the M. H. G. *wirser*, the O. S. *wersa*, the A. S. *wyrsa*, and the O. N. *vërri*, the Danish *værre*, the Swedish *värre*.

39. *More.*—This in Mœsogothic is *maiza*, the *z* being the sign of the comparative degree, the fundamental word being *mah*, in the Greek *μέγας*, and in the Latin *magnus*. The same is the root in the English words *might*, *main*, *may*, *much*, *muckle*, and (?) *many*. There is no word, however, in the present English from which we can derive *more*, or which we can call the positive form of *more* and *most*. The nearest approach to it in respect to its form is the obsolete word *moe*, but this is considered to be only a shortened form of *more*.

Less.—This is held to be connected with the word *lazy* rather than with the word *little*. *Lasivôza* is, in Mœsogothic, an ordinary comparative of *lasiv-s;* *o* being the connecting vowel, and *z* the *s* which we have seen representing the later *-r*. See § 38.

Next, *best*, *last.*—Contractions of *nighest*, *bet-st*, and *lat-st* = from the root *better* and from *late*.

Near, *nearer.*—The first of these forms was in A.S. *neah;* with *nearre*, *near*, and *nyr* for its comparative. Hence, the present *-r* in *near* is no true *r* at all, but the (vulgar) *arr* in *idearr* and *Mariarr*.

Farther.—This is the comparative of *far;* and means *more far*, or *more distant*. The *-th-* is no part of the root, but euphonic.

Further.—This is the comparative of *fore;* and means *more forward*. The *-th-* is the *th* in *forth* = *forward*, *onward*.

Former—In A.S. *forma*, was the *superlative* of *fore*; the *-m-* being the *-m-* in the Latin *primus*, and the Lithuanic *pirmas*.

40. The superlatives, ending in *-most*, like *foremost*, *hindmost*, *utmost*, and others, though apparently very simple, are, in reality, very complex, forms. They look as if they were compounds of the word *most*. But in Anglo-Saxon we have the *-m-* standing alone.

Anglo-Saxon.	*English.*	*Anglo-Saxon.*	*English.*
innema	inmost	forma	foremost
ûtema	outmost	æftema	aftermost
siðema	latest	ufema	utmost
lætema	latest	hindema	hindmost
niðema	nethermost	midema	midmost

To this form in *-m-* the ordinary sign *-st* is *superadded*.

Hence, in the present English, the different parts of the syllable *most* come from different quarters. The *m* is the *m* in the Anglo-Saxon words *innema*, &c.; whilst the *-st* is the common sign of the superlative. In separating, then, such words as *midmost* into its component parts, we should write—

mid-m-ost	not	mid-most	fore-m-ost	not	fore-most
ut-m-ost	—	ut-most	in-m-ost	—	in-most
up-m-ost	—	up-most	hind-m-ost	—	hind-most

In certain words the syllable *m-ost* is added to a word already ending in *er*; that is, to a word already marked with the sign of the comparative degree.

neth-er-most	hind-er-most
utt-er-most	out-er-most
upp-er-most	inn-er-most

41. *Defect and Complement.*—In such sequences in the way of degree as *good*, *better*, *bad*, *worse*, and a few others, there is no *irregularity*, but only *defect*. The old

comparative of *good* is lost, and the original positive of *better* is lost also. The same is the case with *bad, worse.* Here what one word has lost the other retains; so that what is defective on one side is made good (complemented) on the other. This is defect and complement.

42. The sign of the comparative, *i.e.* the syllable *-er*, is equivalent in import to the word *more*, and *vice versâ*. The sign of the superlative, *-est*, is in a similar relation to the word *most*. We may say either *bright-er*, or *more bright*, *bright-est*, or *most bright*. The forms in *-er* and *-est* are synthetic, and belong to etymology. The pairs of words, like *more bright* and *most bright*, are analytic, and belong to syntax.

43. The adjective, at the present time, is of all our nouns the most destitute of inflection. In Anglo-Saxon it had not only its signs of gender, number, and case, but it had also a double series, or system, of them. When the adjective was used *without* the definite article its declension ran thus:

	Sing.			*Plur.*		
	Masc.	*Fem.*	*Neut.*	*Masc.*	*Fem.*	*Neut.*
N.	blind	blind	blind	blinde	blinde	blinde
A.	blindne	blinde	blind	blinde	blinde	blinde
D.	blindum	blindre	blindum	blindum	blindum	blindum
**A.*	blinde	—	blinde	blinde	blinde	blinde
G.	blindes	blindre	blindes	blindra	blindra	blinda

When preceded by the definite article, thus—

	Sing.			*Plur.*
	Masc.	*Fem.*	*Neut.*	*All genders.*
Nom.	blinda	blinde	blinde	blindan
Acc.	blindan	blindan	blinde	blindan
Dat.	blindan	blindan	blindan	blindum
**Abl.*	blindan	blindan	blindan	blindum
Gen.	blindan	blindan	blindan	blindena

* This (*Ablative*) is Rask's name. *Instrumental* is another.

Of this difference we have traces as late as the fifteenth century, and in reading the poetry of Chaucer we must be careful *not* to treat the final *e*, when preceded by *the*, as *mute*.

PRONOUNS.

44. The true personal pronouns are those of the first and second persons only, viz. *I* and *thou*.

He, *she*, *it*, and *they*, the so-called pronouns of the third person, are, in reality, demonstrative pronouns.

Of the true personal pronouns the first denotes the person speaking, whoever he may be; the second (whoever he may be) the person spoken to.

In neither of these is there any distinction of gender, nor is it needed.

The so-called pronoun of the third person is the name of the person or object spoken *about*. The person may be either a male or a female; and the object a *thing*, *i.e.* something of no definite gender at all, or neuter.

Hence, in the pronouns of the third person, there are not only *three* genders, but three corresponding series of forms—*he*, *she*, *it*.

Of the true personal pronouns, or those of the first and second persons, the declension is wholly different from that of all other nouns; and this is the case not only in English, but in all the Indo-European languages.

I stands entirely by itself, and is found only in the nominative case.

Me and *my* have no nominative case at all; neither is the *-y* in *my* nor the *-n* in *mine* the sign of an ordinary possessive.

We, our, and *us*, in the plural number, are sufficiently unlike each other to pass for different words rather than variations of a single root.

In *thou* and *thee* we have a difference between the nominative and the objective singular. For nominative and objective plural we have *ye* and *you*, interchangeable in meaning. Meanwhile the connection between the two pairs of words, or the form in *-th* and the form in *-y*, is more obscure than that between the plural forms of the first person.

45. The demonstrative pronouns give us the typical pronominal inflection. They give us a case in *-m*, as *him* and *whom*; and they also give us a true sign of the neuter gender in the words *wha-t*, *tha-t*, *i-t* (*hit*), from *he*. The interrogatives and relatives follow the inflection of the demonstratives.

The definite article, which is now wholly uninflected, was originally declined through three genders, two numbers, and (at least) four cases.

When this was the case, the pronoun of the third person, *he*, had an equally complete declension; and its plurals, which are now those of *the* or *that*, were the ordinary modifications of *he*.

At the same time the words *that* and *this*, which now pass for the true demonstratives, had a mixed, and not very intelligible, declension of their own.

Finally, the word which is now *she*, and which passes for the feminine of *he*, corresponded with a true masculine form, *se*. They were used, however, as the definite article; which, in West Saxon, at least, ran *se, seo, þæt*, like the Greek *ὁ, ἡ, τό*.

46. The exact details of all this we may collect from the following table:—

	Singular.			*Plural.*
	Masc.	*Fem.*	*Neut.*	*All Genders.*
Nom.	he	heo	hit	hi.
Acc.	hine	heo	hit	hi.
Dat.	him	hire	him	him.
Gen.	his	hire	his	heora.
Nom.	(þe)	(þeo)	þæt	þá.
Acc.	þane	þa	þæt	þá.
Dat.	þam	þam	þam	þám·
Gen.	þæs	þære	þæs	þara.
Abl.	þi	?	þi	——
Nom.	þes	þeós	þis	þás.
Acc.	þisne	þás	þis	þás.
Dat.	þissum	þisse	þissum	þissum.
Gen.	þisses	þisse	þisses	þissa.

For *se*.

Nominative singular masculine *se*.
„ „ feminine *seo*.

When *heo* disappeared from the declension of *he*, *seo* took its place. *Se*, the masculine form for the article, gave way to *þe*, which, as an article, lost all the inflections of its singular number; its inflections for the plural being transferred to that of *he*.

In all this there is loss, defect, and substitution. So far, however, as the mere signs of declension are concerned, there is nothing like irregularity. On the contrary, the correspondence between the forms of *he* and those of *the* is very regular. So are the forms *se* and *seo* —*so far as they go*.

47. *This* and *these*.—The obscurest of all these terminations is, undoubtedly, the *-s* in *this* and *those*, and I doubt whether any true view as to its origin, adequately explained, is to be found in any ordinary text-book.

The evidence of the following forms is decidedly in favour of its being the *se* of the old definite article, appended to the root *th-*, and incorporated with it. The language from which we get this valuable illustration of the old noun, in its oldest known form, is the Norse; and that in its oldest stage.

Singular.

	Masc.	*Fem.*	*Neut.*
Dat.	*þaimsi*	*þasi*	*þvisa.*
Acc.	*þansi*	*þinsi*	*þansi.*
	þinasi	*þinasa*	*þinsi.*
Neut.	*þatsi.*	—	—

Plural.

	Masc.	*Fem.*	*Neut.*
Nom.	*þaisi* (ɔ : *þairsi*)	*þasi* (ɔ : *þársi*)	*þausi* (*þusi*)
Dat.	*þaimsi*	—	—
Acc.	*þasi* (ɔ : *þasi*)	*þasi þasi* (ɔ : *þarsi*)	—
Neut.	*þausi* (*þusi*).	—	—

48. With this end the details of the true and typical declension of the pronouns as represented by the demonstrative and interrogative; for there are only three other pronouns that have any declension at all, and that is the declension of the *substantives* (1) *self, self's, selves;* (2), *one,* one's, ones;* (3), *other, other's, others.*

49. The remaining pronouns are declined like *adjectives,* or follow the adjectival declension. But, as the adjective is not declined at all, this remark seems meaningless. Such, however, it is not. The pronouns and the

---

* As in *one says—one does not like to hear one's friend abused —my wife and little ones are well.* There can be little doubt but that in some cases the indefinite *one* is the French *on* in *on dit= one says.* How far, however, this is the case in other combinations is a doubtful question.

adjectives which are now *un*declined were once declined; and when this was the case, the two parts of speech were declined alike.

MISCELLANEOUS NOTICES CONNECTED WITH THE INFLECTION OF THE PRONOUNS.

50. The combination *t-h-e* has two meanings and a double origin. When used as the definite article, it represents the Anglo-Saxon *þe*. When it comes before a comparative degree it represents the Anglo-Saxon *þi*, *þy*, or *þvi*. This was the definite article in the instrumental case. '*All the more*' was in A.S. '*eall þe máre*,' corresponding to the Latin *eo magis* = *by that much more*.

Then is now an adverb of time. In A.S. it was the masculine accusative of *the*.

There is now an adverb of place. In A.S. it was the feminine dative of *the*.

The meaning of *then* is *at that time*, the substantive denoting *time* being understood. The meaning of *there* is *at that place*, or *in that direction*, the substantive denoting this being understood. This shows us how one part of speech can change into another, and how out of a pronoun in the oblique case, the noun with which it agrees being lost, an adverb may be deduced.

What has taken place with *then* and *there* has also taken place with *when* and *where*, the accusative and dative of *who*. *Here* = *in this place* or *in this direction*, stands in the same relation to *he*.

From these forms in *-n* we get, by the addition of *-es* or *-s*, the present forms in *-ce*—*hence*, *thence*, *whence*, originally *hennes*, *whennes*, *thennes*.

THE NUMERALS.

51. The numerals fall into two divisions: (1,) *cardinals*, as *one, two, three, four, five, six, seven, eight, nine, ten*; and (2) *ordinals*, as *first, second, third, fourth, fifth, sixth, seventh, eighth, ninth, tenth*, &c.

The affixes *-teen*, as in *thirteen* = 3 + 10, and *-ty*, as in *thirty* = 3 × 10, have been already noticed.

52. The *ordinals* are of two kinds: (1,) *first* and *second*, which have no connection, as words, with the cardinals *one* and *two*; (2,) the remainder, from *third* to *tenth* (or *twelfth*) inclusive, in which *-d* or *-th* is added to the corresponding cardinal—*three, thir-d, ten, ten-th*, &c.

The word *first* is, word for word, the superlative degree of *fore* = *foremost*, or *most in front*. Its character as an ordinal is not so much founded on its relation to the corresponding cardinal (*one*), as upon its relations to the numbers of the series that succeed it, of which it is the *first* in *order*.

The word *second* is from the Latin *secundus*, from *sequor* = *I follow*. It means *next to the first*. Here, again, its relations are rather with *first*, which it follows, and with *third*, which it precedes, than with *two*.

As to the remaining ordinals, their import in connection with *order* is not so clear.

Word for word, the derivatives, like *third, fourth*, &c., are, manifestly, the ordinals of *three* and *four*. Yet the relation between *third* and *three*, &c. is not founded on the notion of *order*. The exact nature of this relation is not so clear; but it is certain that the words *first* and *second* are ordinal in their relations to one another, and not to *one* and *two*, their corresponding cardinals; whereas *third* and *fourth* are ordinal (so far as they are so at all) to *three* and *four*, the corresponding cardinals.

The appreciation of the difference is important, because in the words *first* and *second* we have elements which correct the notion of the ordinality in numerals with that of the degrees of comparison in adjectives. It does not, however, follow that because this occurs with the first two numerals of the list, it runs through the whole series.

53. Another fact which commands attention is the difference between the existing forms of the present numerals and the older ones; and, from this point of view, the names for 7, 9, and 10, *seven, nine*, and *ten*, are important.

For *sev-en*, the Scandinavian languages give us the simpler forms *syv*, and *sju*, *i.e.* forms without the *-n*. The Greek gives

us ἑπ-τὰ, where there is no *-n*, but a *-t*. The Latin, in *sep-t-em*, gives us both *-t-* and *-n* (in the shape of *-m*).

The older forms of both *nine* and *ten* were dissyllabic—*negen*, and *tegen*, *tihun*, *taihun*. This *-g-* or *-h-* is the Latin *-c-* in *de-cem*, and the Greek *-k-* in δέκ-α. For 9, it is represented by the Latin *-v-* in *novem*; the *-m* in both *novem* and *decem* representing the English *-n*—*nine*, *ten*. There is a good deal of speculation connected with these additions of *-m* (*n*) and *-t-*.

Respecting the origin of these, the current doctrine is that they are no part of the original cardinal form at all. This in the names for 7, 9, and 10 is held to be *syv*, *neg*, and *dek*—or some theory equally simple. The *-t-* and *-m-*, on the other hand, are held to be signs of the *ordinals*, which have, so to say, been thrown back, or reflected on the cardinals.

54. *Eleven and twelve.*—The peculiarity of these words is conspicuous on the surface. The names for 13, 14, &c. are compounds of *three + ten*, *four + ten*, &c. Yet the names of *eleven* and *twelve* are not *one-teen* and *two-teen*, though they are thus in Latin and Greek—as in the former language *undecim*, *duodecim*, in the latter ἕνδεκα, δώδεκα. Nor is it difficult to see that the *e-* in *e-leven = one*, and the *tw* = in *tw-lf = two*—word for word. Moreover, the *-lv* and *-lf* in the second element of the compound point to the same affix. What then is the meaning of this *-lf* (or *lev-(en)*? Thirty years ago it was sufficient to say that it was the *l-v* in the word *leave*, and meant *ten over*, or *ten* with a remainder of *one*, or *two* But this view has been improved on. In so important a member of the Indo-European family of languages as the Lithuanic, arguments have been found for believing that the *-l* may be the *d* in *decem* and δέκα, the *t-* in *ten* (*tig-un*), and moreover that the *v* may be a modification of *k*. If so, *tev = tig*, or *dek*, and the elements are the same as in *thirteen*, *fourteen*, and the like. In confirmation of this view it is generally added that the whole series, from 11 to 19 inclusive, is in Lithuanic formed by this affix *-lik*—*vieno-lika*, *dwa-lika* = 12, *devyno-lika*, *deszimt-lika* = 18 and 19. Hence, we infer that the *-lf* and *-lv*, in *eleven* and *twelve*, are the same as the *-lik-* throughout the whole Lithuanian series, *i.e.* the name for 10.

"But it is clear that the view may be reversed, and that it may be maintained that by reversing the assumption the Lithuanic *-lik-* may be the same in import as the *lv* in English, and the uniformity consists, not in the use of a word meaning *ten* being consistently adhered to, but in the consistent use of a word meaning *over*, or *in excess*.

"I have never seen this alternative suggested as it ought to be, if observed. More than this, I have never found it explicitly

stated that the change from *d* to *l* is a matter of mere inference, and not a fact founded on the word *lika* being used for *ten* in a definite and straightforward manner. The Lithuanic for 10 is *deszimpt*, and the letter changes between *l* and *d* and between *k* and *v* are got from other quarters, not too distinctly exhibited. Most of all, the word *lik* itself is, in Lithuanic, just what it is in the Latin *linquo*, *lic-t-us*; viz. the English word *leave*.

The new doctrine may be preferable to the older one, or the contrary. This is a point upon which the reader must form his own opinion. Those, however, who propound it should give the evidence on both sides; and this they have not done. In the opinion of the present writer the old doctrine is the sound one.

55. *Hundred*, *thousand*, and *million*.—The third of these names is from the Latin *mille* = 1000; the second, in Latin, Greek, and Sanskrit, is given by three different words; the Slavonic, Lithuanic, and German languages alone use the present form; Sl. *tusantja*; Lit. *tukstanti*; M. G. *tusundi*. That the *hund-* in *hund-red* is, word for word, the *cent-* in the Latin *cent-um*, is certain; *cent-* being believed to have arisen out of some such as *dakan-dakanta* = *ten decads*. In some way or other, too, it is held that the *-nd*, in the words meaning 1000 (*thousand*), is from the same origin.

THE VERBALS.

56. Words like *hunting* and *hunter* are called verbal substantives. The form in *-ing* gives us the name of the act, that in *-er* of the agent.

THE VERBS.

57. The verb is the name of either an action or a state; as *beat*, *drive*, *live*, &c. The inflection of a verb is called its conjugation.

58. The conjugation of the verb, in the present English, is very simple. In the earlier stages of the language it was more elaborate.

59. The points connected with the conjugation of the verb are mood, tense, and person.

60. The infinitive mood is simply the inflected verb; so is the imperative; so, also, with the single exception of the words *were* and *wert*, is the subjunctive or conjunctive.. The third person singular of this mood undoubtedly differs from the corresponding person of the indicative; for we say *if he speak the truth*, rather than *he speaks the truth*. The difference, however, on the part of the conjunctive is indicated, not by any sign of inflection, but by the absence, or want, of one.

61. The present participle is formed by the addition of *-ing*, and the formation is one of the most regular ones in the language, *speak*, *move*, *be*, *speak-ing*, *mov-ing*, *be-ing*.

62. The past participles, such as *called*, *spoken*, &c., are best considered in conjunction with the past tenses. The tenses of the present English are three: (1,) the present, (2,) the perfect, and (3) the preterit.

The present has no special sign of tense. Neither has it any special sign of either number or person in the plural. In the singular, it has *no* sign for the first person; though it has the termination *-st* for the second, and *-s* for the third. Hence the inflection runs:

I speak	*We speak*
Thou speak-est	*Ye speak*
He speak-s	*They speak*

The second person is obsolete or obsolescent. The older form of the third was *-th*, as *he* or *she speaketh*.

63. The perfect has, in respect to its persons, only one inflection, and that obsolete or obsolescent.

I spoke	*We spoke*
(Thou spokest)	*Ye spoke*
He spoke	*They spoke*

64. The preterit, in respect to its signs of number and person, is as destitute of inflection as the perfect. It has only one sign, and that is the obsolete *-st* of the second person singular.

I moved	*We moved*
(Thou movedst)	*Ye moved*
He moved	*They moved*

FORMATION OF THE PERFECT.

The Vowel long.—(1.) Change from *o* or *a* to *e*. Vowel of the participle the same as that of the imperative mood and the present tense.

Blow	*blew*	*blown*
Crow	*crew*	*crown*
Grow	*grew*	*grown*
Know	*knew*	*known*
Throw	*threw*	*thrown*
Draw	*drew*	*drawn*
Fly	*flew*	*flown*
Slay	*slew*	*slain*

(2.) Vowel long (spelt *ea*), followed by the liquids *l* or *r*, by *k* or by *v*.

Steal	* *stole*	*stolen*
Bear	* *bore*	*borne*
Swear	* *swore*	*sworn*
Tear	* *tore*	*torn*
Wear	* *wore*	*worn*
Break	* *broke*	*broken*
Speak	* *spoke*	*spoken*
Weave	* *wove*	*woven*

(3.) Vowel long, followed by a sibilant.

Freeze	*froze*	*frozen*
Choose	*chose*	*chosen*

---

* In all these there is a second obsolete or obsolescent form—*stale, bare, sware, tare, ware, brake, spake.* The form in *-o-*, however, was the one which determined the participle.

(4.) Vowel long, change from *a* to *oo*.

Shake	*shook*	*shaken*
Take	*took*	*taken*
Wake	*woke*	*waken*

(5.) Vowel long, or rather the diphthong *ei* (spelt with *i*), changed to *o* in the perfect, and to *i* in the participle.

Bide	*bid*	*bidden*
Bite	*bit*	*bitten*
Drive	*drove*	*driven*
Ride	*rode*	*ridden*
Strive	*strove*	*striven*
Smite	*smote*	*smitten*
Strike	*struck*	*stricken*
Strive	*strove*	*striven*
Thrive	*throve*	*thriven*
Write	*wrote*	*written*

Vowel short.—(6.) The vowel a short *i*, followed by *m*, *n*, *ng*, or *nk*, change to *a* in the singular number, and to *u* in the plural.

Present.	*Perfect.*	*Participle.*
Swim	*swam*	*swum*
Begin	*began*	*begun*
Run	*ran*	*run*
Spin	*span*	*spun*
Win	*wan*	*wun*
Cling	*clang*	*clung*
Fling	*flang*	*flung*
Ring	*rang*	*rung*
Sing	*sang*	*sung*
Spring	*sprang*	*sprung*
Sting	*stang*	*stung*
Wring	*wrang*	*wrung*
Drink	*drank*	*drunk*
Sink	*sank*	*sunk*
Stink	*stank*	*stunk*

(7.) *Bind, find, wind, grind.*—Here the *i* is now

sounded long; and the change in the perfect is to *ou*—*found, wound, ground.* Originally it was short, and then this perfect was like *swam, band, fand, wand, bunden, funden, grunden.*

Did—this was in Anglo-Saxon *dide;* in Old Saxon *dëda.*

65. *The Preterit Tense.*—The fullest form in which the characteristic sign in *-ed* of the preterit is known is in the plural of the Mœsogothic; where *nasi*-dêd-*um* = *we saved,* from the infinitive *nasi-an,* and present *nasi-a.* This double *-d* is found in both the indicative and the conjunctive moods; but in the indicative mood, only in the singular number.

a. *Preterit Tense of the Indicative Mood.*

	Singular.	*Dual.*	*Plural.*
1.	nasi-*d*-a	—	nasi-*d*-ê*d*um
2.	nasi-*d*-ês	nasi-*d*-ê*d*uts	nasi-*d*-ê*d*uþ
3.	nasi-*d*-a	—	nasi-*d*-ê*d*um

b. *Preterit Tense of the Conjunctive Mood.*

	Singular.	*Dual.*	*Plural.*
1.	nasi-*d*-ê*d*jau	—	nasi-*d*-ê*d*eima
2.	nasi-*d*-ê*d*eis	nasi-*d*-ê*d*uts	nasi-*d*-ê*d*ei
3.	nasi-*d*-ê*d*i	—	nasi-*d*-ê*d*eina

66. *The connecting Vowel.*—The next element is the letter *i*—*nas*-i-*dêdum.* This is the connecting link between the theme and the sign of tense; for it belongs neither to the tense nor the main word. The Mœsogothic has three such connectives: *nas*-i-*da* = *I saved;* *salb*-o-*da* = *I healed;* *hab*-ai-*da* = *I had.* The first two are found in the Anglo-Saxon *ner*-e-*de* = *I saved;* *luf*-o-*de* = *I loved.* Here *d,* and *d* only, is the sign of the tense.

67. Then follow the signs of person—*lufod-e, lufod-est;* *lufod-e* with *lufod-on,* for all the three persons of the plural,

Of these the second (*loved-st*) is the only one still in existence, though scarcely common and current.

Of the connecting vowels the *o* has become obsolete, while *-e* is becoming so, or *obsolescent*. So far as we *pronounce* it in the reading of the Bible, or use it for the purposes of metre, it is, in words like *blessed, moved*, &c., a part of the *spoken* language. In *loved, moved, stabbed*, &c., as used in ordinary language, it is a sound to the eye only; in other words, no sound at all.

When, however, the fundamental verb ends in an explosive dental (*d* or *t*), the *e* is *sounded;* inasmuch as it prevents the concurrence of two similar sounds.

If the final sound of the fundamental verb be a surd, *p, f, k*, or *s*, the *d* of the affix becomes *t;* in other words, is accommodated to the original consonant in respect to its sonancy. This is what we have already seen in the *s* or *z* of the plural number and possessive case of substantives. Indeed the change is only a portion of a general euphonic law, notice of which has been taken elsewhere.

68. Subject to these rules, the formation of the English preterit is not only simpler than that of the perfect, but remarkable for its regularity: a term which has misled most of us into calling the perfects *irregular*.

(1) Verbs ending in *-d:*

rid	rid	rid	shred	shred	shred
shed	shed	shed	spread	spread	spread

(2) Verbs ending in *-t:*

burst	burst	burst	put	put	put
cast	cast	cast	set	set	set
cost	cost	cost	shut	shut	shut
cut	cut	cut	slit	slit	slit
hit	hit	hit	split	split	split
hurt	hurt	hurt	sweat	sweat	sweat
knit	knit	knit	thrust	thrust	thrust

When the *d* is preceded by *l*, *n*, or *r* (liquids), the *e* is ejected, and, along with it, one of the *d*'s, the other being changed to *t*.

bend	bent	bent	lend	lent	lent
build	built	built	rend	rent	rent
gild	gilt	gilt	send	sent	sent
gird	girt	girt	spend	spent	spent

In all these cases the vowel is short. When long, however, it is shortened; though it is by no means necessary that this shortening should be expressed in the spelling. Unless this be borne in mind the ear will be misled by the eye.

bleed	bled	bled	lead	led	led
breed	bred	bred	read	read	read
feed	fed	fed	speed	sped	sped

69. In *bereāve, cleāve, creēp, keēp, leāve, lōse, sleēp, sweēp, weēp*, of which the respective preterits are *berĕft, clĕft, kĕpt, lĕft, lŏst, slĕpt, swĕpt, wĕpt*, we have the vowel shortened—but still the same vowel; the consonant that follows being *not* (as in *burnt*, &c.) a liquid. Here the vowel is the same; but it is changed in respect to *quantity*.

70. In *tĕll, tōld; sĕll, sōld*, it is changed not only in respect to quantity, but to *quality* as well.

71. *Verbs in which the final consonant is* k *or* g.—The allied sounds of *k* and *g* (as in *gun*) undergo the same, or nearly the same, changes; and they are numerous.

a. They pass into the sound of *y*. The Anglo-Saxon forms of *lay* and *say* were—

Present.	Preterit.	Participle.
lecge	*lægde*	*ge-lægd*
secge	*sægde*	*ge-sægd*
lay	*laid*	*laid* (pronounced *lade*)
say	*said*	*said* (pronounced *sed*)

b. Also into that of *h*, originally a guttural *g*. The Anglo-Saxon forms of *seek* were—

	Present.	Preterit.	Participle.
	sece	*sohte*	*ge-soht*
Hence	*seek*	*sought*	*sought*

c. Also into that of *ng*.

Anglo-Saxon	*bringe*	*brohte*	*ge-broht*
Modern Englsih	*bring*	*brought*	*brought*

d. Also into that of *ngk*.

	Infinitive.	Preterit.	Participle.
Anglo-Saxon	*þencan*	*þôhte*	*ge-þôht=think*
	þincan	*þuhte*	*ge-þuht=seem*

Compare the German *ich denke = I think; mich dünkt = meseems.*

e. Also into that of *tsh*.

	Present.	Preterit.	Participle.
Anglo-Saxon	*tæce*	*tæhte*	*ge-tæht*
Modern English	*teach*	*taught*	*taught*

Here the preterit is like that of the preceding instances. The *present*, however, is changed: the *k* becoming *tsh*.

Catch, caught, caught, does not occur in the oldest English. In Layamon we find *cacche, cahte, caht*. This verb has conformed to the past tense of *teach*, &c.—(Morris, *Historical Outlines*, &c. p. 171.)

Buy.—In A. S. *bycge, bohte, ge-boht.*

Work.—In A.S. *wyrce* = I work: *worh-te = I worked; ge-worht = worked.* In addition to the change in the consonant, *r* is transposed. *Beseech.*—The main verb is *sêc-e = I seek.* In English *be-seech, be-sought.* The simple verb *seek* preserves the *k*. The compound changes it after the manner of *teach*, &c.

THE PARTICIPLE.

72. Nouns, as has been previously stated, are declined; verbs conjugated. Both declension and conjugation are a species of inflection.

The participle is generally associated in grammar with the verb. The sign of the participle, however, is not an inflection. It is a word like the comparative and imperative degrees of adjectives, or words like *colder* and *coldest*. The syllables *-er* and *-est* are, in the present state of the language, unchanged. In its older stages they took additional syllables, as the signs of gender, number, and case. They have, however, fallen into disuse; but, when they existed, they were the same as those of the adjective.

So far, then, as its declension goes, the participle is akin to the adjective.

But, in respect to its meaning, the participle is akin to the verb. Adjectives merely suggest qualities, states, or conditions. Participles imply actions. A *sleepy man* is a man *inclined to sleep*, or one with the quality of sleepiness. A *sleeping man* is one actually in the act of *sleeping*, as opposed to that of *waking*.

Again adjectives, such as *black*, *blue*, *hot*, *cold*, *wise*, or *brave*, &c., may be simple underived words. Participles are never simple words; on the contrary, they have always two elements, the termination, which is the sign of its participial character, and the main word to which it is affixed—*e.g. sleep-ing*, *roar-ing*, *stand-ing*, &c., and the first element, in every true participle, is a verb.

The participles, however, when inflected, have case and gender; which the verb has not. And they have no persons; which the verb *has*.

The participles are three in number; one for each tense.

The present participle is, as regards voice, active.

The other two participles, or the participles of past time, are, in the matter of voice, passive.

73. In respect to its formation, the present participle, or the participle of the active voice, is the most regular inflection in our language. It is simply formed by the addition of *-ing*.

The participle of the preterit tense is nearly, though not quite, as simple and regular.

74. The perfect participle is, by no means, either simple or regular.

When the tense changes from strong to weak, the participle generally does the same; though not always at the same time. It is generally the *last* to change.

Hew *hewed* *hewn*

75. With words like *swim*, *begin*, *run*, *sing*, *drink*, *shrink*, and *sink*, where there are two forms for the perfect, one in *ă*, and the other in *ŭ*, the participle invariably takes the latter. It is absolutely wrong to say I *have swam*, *began*, *rang*, *sang*, *drank*, *shrank*, or *sank*, however proper such forms may be for the perfect.

76. When the main verb contains an *-n*, an *-ng*, an *-nk*, or an *-m*, the affix *-en* is dropped—*swum*, *begun*, *run*, *spun*, *won*, *clung*, *flung*, *rung*, *sung*, *sprung*, *stung*, *wrung*, *drunk*, *shrunk*, *sunk*, *stunk*, *ground*, *found*, *wound*, *bound*.

Shrunken, *bounden*, and *drunken* are the exceptions to this list; for in these words *both* forms occur. The forms in *-en*, however, are adjectival rather than purely participial, as a *shrunken sinew*, *our bounden duty*, a *drunken vagabond*.

The *-e* in *borne* is merely an artificial expedient signifying the difference between *born*, meaning *brought into* life, and *borne* = *carried*.

When the *-n* or *-en* is thus dropped, the distinction between the participle and the tense is diminished; and if the vowels of the forms are the same, there is no difference between them, *e.g. spin, win, cling, fling*, and *sting, spun, won*, &c.

77. In A.S. the participle of certain words like *freeze* changed the *-s* of the main word into *-r*. The old form of the word *frozen* was *ge-froren*. Milton uses *frore*. At present, however, the only word in which the *-r* is retained is *lorn* (as in *for-lorn*). This was in A.S. *forluron*. In the literary German it is *verloren*. In both cases it is the perfect participle of the verb signifying *to lose*. This is the division wherein the vowel of the *present* changes; the A.S. conjugation being as follows:

Present 1st Per.	*2nd Per.*	*3rd Per.*	*Perfect S.*	*Perfect P.*	*Participle.*
lese	*list*	*list*	*læs*	*læson*	*ge-les-en*
(ge)-nese	*genist*	*genist*	*genæs*	*genæson*	*ge-nes-en*
ceôse	*cŷst*	*cŷst*	*ceâs*	*cur-on*	*ge-coren*
dreôse	*drŷst*	*drŷst*	*dreâs*	*drur-on*	*ge-dror-en*
freôse	*frŷst*	*frŷst*	*freâs*	*frur-on*	*ge-froren*
be-greôse	*begrŷst*	*begrŷst*	*greâs*	*grur-on*	*ge-gror-en*
hreôse	*hrŷst*	*hrŷst*	*hreâs*	*hrur-on*	*ge-hror-en*
forleôse	*forlŷst*	*forlŷst*	*forleâs*	*forlur-on*	*for-loren*

78. Under certain conditions a perfect may take the guise of a present tense, especially if, for any reason or other, the present tense itself has become obsolete, and the reduplication of the perfect has been dropped. The only test is the meaning, and a little consideration will tell us that in many conceptions the difference between past time and present comes to very little. *I have found out*, or *I have been informed*, is past; but *I know* is pre-

sent. *I have called to mind*, or *I have recollected*, is past; *I remember*, however, is present. In Greek and Latin both *οἶδα* and *memini* are perfects. It is usual, however, to translate them as presents, *i.e. I know*, and *I remember*.

79. A word thus invested with the character of a present tense may become the base of a preterit; and of this class of words we have in (1) *can*, (2) *shall*, and (3) *may*, three notable examples. From these we get *could*, *should*, and *might*, as preterits. The simpler forms, though presents in sense, are, in origin, perfects.

80. *Aught* is a preterit, from the perfect *ah*, of which the present was *age*. *To age = to owe*. *Owe*, as a separate independent word, has as a regular preterit *owed*.

81. *Durst*, in some respects, stands in the same relation to *dare* as aught does to *owe*. *Dare*, like *owe*, has a regular conjugation—*darest*, *dares*, *dared*. *Durst* undergoes no change of form whatever; neither has it a transitive power. We can, and do, use such expressions as *I durst* or *durst not do this*. But we cannot say *I 'durst' you to do this*. In other words, we cannot use *durst* in the sense of *challenge* or *defy*. We *can* do this with *dare—I dare you to touch me*.

82. *Must*, like *durst*, has only one form; and, as in *durst*, the form is in *-st*. It is one which has yet to be satisfactorily explained.

THE VERB SUBSTANTIVE.

83. *The root in -s*. This is the *-s* in the word *is*.

It is not difficult to believe that this is *s* in the Latin *est* and the Greek *ἐστὶ*; and such is really the case. What becomes of the *-s* in the words *am*, *art*, and *are* is the chief question connected with this auxiliar.

84. *Be*, *being*, *been* are the existing forms of the

auxiliary in *b*. *Beest = thou art*, is obsolete, or obsolescent. The German form of the first person is *bin*—as *ich bin = I am; du bist = thou art*. This *-n* represents an older *-m*, giving *bim*, *beom*, &c. Hence *be*, like the root of *am*, is one of the words in which the old person in *-m* is still retained.

85. *Was* and *were* are only current forms of the old infinitive *wesan*, for *wast*, if not obsolete or obsolescent, is an archaism.

Of the three substantive verbs *was* is the only one which is exclusively peculiar to the German family. We have seen that *am* is found throughout the whole Indo-European class. The same is the case with *be*—which is the Greek *φύω*, *φύμι*, the Latin *fui*.

It agrees with the other two in being defective; and the present tense *indicative* is the tense from which it is most especially excluded. We use *be* in the sense of *am*, *are*, *is*, &c.; but we never so use *was* or *wes*. This exclusion, however, does not apply to the *imperative* mood, wherein the older language gives us *wes* and *wesath* in the sense *be*, conveying a command. Moreover, *wesan*, *wesende*, and *gewesen = be*, *being*, *been*.

DEFECT: CONFLUENCE.

86. *Quoth* is an excellent example of a defective verb. It is only found in the present tense, and then chiefly in the third person singular. The compound *be-queath*, however, is conjugated both regularly and completely—*to bequeath*, *I bequeath* (*thou bequeathest*), *bequeathed* (both as a tense and as a participle), *bequeathing*.

87. The words *did*, *became*, and *thought*, are examples of what we may call the confluence of two forms, originally distinct, but now identical.

Did, *do*, in the sense of *perform an act*, is a wholly

different verb from *do* in the sense of *be sufficient, be suitable*, and the like. The first *do* corresponds with the Latin *ago* or *facio;* the second with the Latin *valeo*. Of the latter, the root was *dug-an*, the perfect *deah*, the preterit *dohte*. For the perfect *do = facio*, or *ago*, see § 64.

Became.—When this verb corresponded with the Latin *fio*, the infinitive was *becommen*, the perfect *becam*. When it meant *suit, befit*, and corresponded with the Latin *decet*, the infinitive was *becommen*, and the preterit *becommede*.

Thought.—The Anglo-Saxon inflections for the word *þencan = consider* (Latin *puto*) were *þence = (I) think; þôhte = thought, ge-þôht*, participle.

The Anglo-Saxon inflection for the word meaning *seem* was *þincan, þince, þûhte, ge-þuht*.

SYNTAX.

88. Syntax treats of separate words in combination with each other, and by so doing, differs from etymology, which relates to single words only.

Speech consists chiefly in (1) commands, (2) questions, and (3) statements or assertions.

The combinations by which such commands, questions, and statements are made, are called propositions; so that propositions are, at least, of three kinds.

89. Propositions which convey commands are called imperative; as *go, speak, move, do this, do not go*, and the like. As they are generally addressed to some one present, the name of the person commanded may be omitted. Instead of saying *Speak, John, John, speak, Speak thou*, &c., we may simply say *Speak*.

Propositions which convey questions are called interrogative; as *What is this? who are you? is it here? where is it?*

Propositions which convey statements are called declaratory; as *Summer is coming, I am here, this is he.*

90. The class of declaratory propositions is far larger and more important than both the others put together; for nearly all ordinary conversation, and the vast majority of written literature, consists mainly in statements.

These say either that something *is*, or that something *is not*. In the first the proposition is affirmative, and conveys an affirmation. In the second it is negative and conveys a denial. *The weather is warm, the men are not coming.*

91. In Logic it is only the declaratory propositions that are recognised; questions and commands being especially excluded.

This, however, is not because they are other than propositions, but because Logic deals with speech only so far as it is applied to the purposes of argument, and because it is only upon declarations—affirmative or negative—that any argument can be founded.

92. The essential parts, however, of the three divisions are the same, and there are in each two constant and indispensable elements—(1) that concerning which something is said, (2) that which is said concerning it. In *the sun is warm*, the *sun* is the object spoken about, or the subject to which what is said applies. The fact of its *warmth* is that which is asserted concerning it. The *sun is warm* is an affirmative, the *moon is not warm* is a negative proposition. Without these two elements no proposition is possible: and they are just as

necessary for questions and commands as they are for declarations. The object spoken to is the subject in imperative propositions; though it is oftener understood than expressed. The subject in the question is that object concerning which the question is asked, *i.e.* the name of the object about which information is required. In *what is this?* the word *this* is the subject. The peculiarity of the word *what* is that it is to some extent a name and to some extent not a name. It is a name with which there is nothing to correspond except so far as it is supplied by the answer. The question merely indicates the desire of the asker for information: the nearest equivalent to it being some such expression as *something concerning which I require information*; in other words, it is a name of something as yet unknown, and, so to say, a name of something nameless. When the answer is given, we know for the first time what this really is.

Question—What is this? *Answer*—A stone.

The object concerning which we make an assertion is called the *subject*. *Man*, *summer*, *winter*, &c., are subjects; and we can assert of them that they are *mortal*, or *warm*, or *cold*, &c.; or the contrary.

The assertion made concerning any object, or concerning the subject of our discourse, is called the *predicate*. *Mortal*, *warm*, *cold*, &c., are predicates: and we can speak of certain things as *mortal*, *warm*, *cold*, or the contrary.

93. The following words, amongst many others, are capable of forming, *by themselves*, subjects:—

man	bow	wealth	ox	pen	atmosphere
mother	fishing-rod	length	ass	ink	firmament
daughter	hunter	fire	bird	virtue	sky
horse	shooter	water	egg	vice	essence
dog	book	soul	winter	apple	truth, &c.

The following words, amongst many others, are capable of forming, *by themselves*, predicates:—

good	deep	shooting	hot	fatherlike	moved
great	happy	laughing	cold	bodily	beaten
red	womanly	conquered	strong	essential	sifted
weak	atmospheric	drifted	weak	important	buried, &c.

94. The simplest propositions are those which consist of three words, one for the subject and one for the predicate at each end, and between them the words *am*, *art*, *is*, or *are*, as a connecting link between them. *I am glad, thou art John, he is Peter, we are faithful.* There the subject is at the beginning and the predicate at the end of the sentence.

95. In declaratory propositions this is the usual order, with the subject first; though sometimes there is a transposition—*glad am I—great is Diana of the Ephesians.*

96. In either case, however, their place is at one of the two extremities; and hence, from the Latin word *terminus = boundary*, we use the word *term* as a general name for the subject and predicate taken together. The intermediate word is called the *copula* or connective link.

97. It is easy to see in the previous examples, that *am*, *art*, *is*, and *are* are copulas. So it is in such sentences as *fire is burning, summer is coming.*

But in sentences like *fire burns*, it is by no means easy to lay our finger on the exact correspondent to the copula of the logicians. In Logic it is the verb substantive. But the logical copula is not the copula of the grammarians: neither is it, in grammar, either so definite or so important as the terms.

98. This must be understood to be written solely and wholly with the view of showing how thoroughly the commands and questions, in language, must not only be recognised, but the

extent to which, in the way of arrangement, order, or collocation, they have a syntax of their own, as opposed to that of the declaratory propositions. Before we can make *Walk!* a predicate, we must reduce it to *Be thou walking*; whilst in *What is man?* the substantive verb, with its place between the subject and the predicate, is, except so far as it is used in a question, exactly the same as the ordinary logical copula. In the answer *Man is mortal*, the logical and philological forms are identical.

99. The declaratory, the imperative, and the interrogative propositions are the chief ones. But in sentences like *How well you look!* and *Would I could*, we have the two elements—here held to be both essential to a proposition and necessary to its constitution. If they were more important, it might be necessary to say more about them. I do not, however, see how we can deny them the rank of propositions; though propositions of a maimed and incomplete character.

100. When a sentence contains less than three words, there is either no separate copula at all, or the copula has coalesced with the predicate. It is usual to say that in expressions like *fire burns*, *summer comes*, the verb delivers both copula and predicate in one. It is certain that for *fire burns* and *summer comes*, we may say *fire is burning*, *summer is coming*. The combinations, however, only *approach* one another in meaning, being far from absolutely identical.

101. In language where the verb in the first, second, or third person may be expressed by a single word, and without the use of such pronouns as *I*, *thou*, *he*, &c., the subject, predicate, and copula may be contained in a single word; as *Amo* = *I love* = *I am loving*—*No* = *I swim* = *I am swimming*, and constitute by itself a sentence.

102. In words like the Latin *no* = *I swim*, and the English *go* = *go thou*, we have the subject and predicate, which naturally imply two words, packed in as close a compass as can easily be found. In the Latin *eo* = *I go*,

we have just two letters; yet there are two terms. But it is enough to show what can be done in compression of two words into one.

103. On the other hand, a single term may be expanded into many more words than one, by means of subordinate words. This leads to the opposite extreme. How two terms may be compressed into two letters we have seen. How a single term may take the dimensions of a whole sentence may be seen in what is called—

104. ***Many-worded terms, or many-worded names.*** It has already been stated that in cases of *composition*, two names may be treated as one: *e.g. rose-tree, sun-dial*, &c. In *midshipman* we have three. How much farther we can go in this direction may be seen from the following manipulation of such a word as *fire* :—

Fire burns.

1. Prefix the definite *article.*—***The fire burns.***
2. Insert an *adjective.*—***The bright fire burns.***
3. Add an *adverb.*—***The very bright fire burns quickly.***
4. Add a participle, and convert *bright* into its corresponding adverb.—***The very brightly-burning fire burns.***
5. Introduce a second substantive, showing its relations to the word *fire* by means of a *preposition.*—***The very brightly-burning fire of wood burns.***
6. Insert *which* after *fire*, followed by a secondary proposition. —***The very brightly-burning fire which was made this morning of wood burns.***
7. Add another secondary *proposition* relating to *wood.*—***The very brightly-burning fire which was made this morning out of the wood which was brought from the country burns.***
8. Add another secondary proposition by means of a conjunction.—***The very brightly-blazing fire which was made this morning out of the wood which was brought from the country, because there was a sale, &c., burns.***

It is clear that processes like this may be carried on *ad infinitum*, so that a sentence of any amount of complexity will be the result. Notwithstanding all this,

the primary and fundamental portion of the term is manifestly the word *fire*.

These give us *many-worded names*.

105. It is clear that, with the exceptions of the subordinate nouns, pronouns and verbs—all of which are *names*—there are other words in the passage which are not names at all; and which *by themselves* cannot form a term. Such are *the*, *very*, *quickly*, *of*, *because*. They can only form part of a term, by either modifying the meaning of one of the leading names, or by connecting two or more such. None of these subordinate words stand alone; but, on the contrary, they are all members of a class. *The* is an article; but *a* is an article also. *Very* and *quickly* are adverbs; but there are hundreds of adverbs besides. *Of* is a preposition; but *from*, *to*, *through* are the same; so that there is a whole class of prepositions. *Because* is a conjunction; but *therefore* and others are the same. Hence, every one of these represent a class as a *Part of Speech*.

106. Every one of these individual words, and every one of the words like it, is, as a *Part of Speech*, what it is on the strength of the place it takes in the structure, or formation of a proposition.

107. In languages where the pronoun, the substantive, and the verb have a great amount of inflection, and consequently a great number of outward and visible signs whereby a pronoun may be distinguished from a substantive, and a substantive from a verb in the signs of gender, number, case, tense, mood, voice and the like, we can separate the chief parts of speech from each other by the mere form. In Latin, if words like *dominorum*, *verberaverim*, and the like stood absolutely alone and without a word of context, we should know at once

that the first was a noun and the second a verb—and so on with most of the others. But in English the inflections are so few and so indistinct that it is difficult to do this. Hence, in determining the part of speech to which a word belongs, we must in English look to the context; this being the place it takes in the construction of a proposition—upon which, for the present, as much has been said as is necessary.

SYNTAX AND ITS PRIMARY DIVISIONS.

108. Syntax falls into three divisions:—(1) the structure of simplepropositions; (2) the structure of complex propositions, in which we have *two* (or more) propositions connected by either the conjunction or the relative pronoun; and (3) the structure of compound words, where *composition* graduates into etymology, and at times takes the guise of derivation.

109. For the syntax of both simple and complex propositions the chief principles are referable to the following heads: (1) concord; (2) government; (3) collocation.

110. *Concord—the predicate and the subject.*—The predicate invariably agrees with the subject in case; and, as the subject is always nominative, the predicate is nominative also. There is no exception to this concord: though there is no construction in which it is more disguised. It is only when the subject and predicate are connected by the verb *is*, or some allied word, that it is seen at once—*he is brave, we are tired, they are soldiers*, &c.

111. *Apposition.*—In expressions like *George, King of England*, we must notice—

1. That the words *King* and *George* are in the same case.

2. That they denote the same object. The word *George* applied to that particular monarch means the same person as the *King* of England; and the words King of England applied to the same monarch mean the same person as *George*.

3. That they explain each other. If we say simply the *King of England*, we do not sufficiently explain ourselves; since we may mean a *Henry*, an *Edward*, or a *William*. And if we say simply *George*, we do not sufficiently explain ourselves; since we may mean any person in the world whose name is *George*. But if we say *George, King of England*, we explain what *king* and what *George* is meant.

Government or *Regimen* puts each word out of two in a *different* place. Thus in *I strike him*, while *I* is in the nominative case, and *strike* in the corresponding person, *him* is in the objective case, and, so being, agrees with neither of them.

The chief forms of government are:

1. Government of a noun by a noun, as the *father's son*.

2. Government of a noun by a verb, as *I strike him*.

3. Government of a noun by a preposition, as *the father of the son; speak to me.*

4. Government of a verb by a verb.

5. Government of a verb by a conjunction or a relative pronoun, *e.g.*:

He strikes *me*:—if *he* strike *me, I shall strike again.*

112. *Collocation.*—The order or arrangement of the words of a sentence is in English a matter of more than ordinary importance; but it is easy to see why it should be so. In languages like the Latin, where the inflections are numerous, words like

bonus dominus or *pulchra filia* may be placed far apart from one another, and so may words like *milites pugnant*, or *pueri ludite*, and thousands of others in similar circumstances. This is because in the terminations *-us*, *-a*, we have certain outward and visible signs of gender, and these show that the words in which they occur agree with one another in that respect. And the same is the case with *-es*, *-i*, *-nt*, *-ite*, except that the agreement here is in the way of number, and it is the number of which these syllables are the signs. But in English the order is of necessity much more regular; inasmuch as there are in English very few words which tell by a difference of form what they are, as genders, numbers, persons, and the like.

113. The chief and simplest general rules in the collocation of English words are:

(*a*) That in *Indicative* propositions the subject (for the most part) *precedes* the predicate; as, *He is brave*, &c.

(*b*) In imperative propositions the subject, when expressed (as in *walk thou!*), for the most part follows it. But it is generally omitted; as, *walk!*

(*c*) In interrogative propositions the subject and predicate are *transposed; as, What is man? Who are you?*

114. When one noun is governed by another in the possessive case, the governing noun precedes, the noun which is governed follows: as, a *man's hat*, not a *hat man's*. This rule is invariable.

115. The adjective precedes its substantive when it stands alone; as, *a brave man, a strong man.*

When there are more adjectives than one, they may *follow* their substantive; as, a *man brave and strong.*

116. The subject precedes the predicate; as, *the fire is warm*, rather than *warm is the fire.*

This order may be inverted, sometimes with effect. Thus *Great is Diana of the Ephesians* is a much more striking exclamation than *Diana of the Ephesians is great.* But the transposition of the terms by no means converts a subject into a predicate, or a predicate into a subject.

117. This transposition of the term is a means of determining the import of the word *there* when used indefinitely. In expressions like *There are robbers in the house*, and *The robbers in the house are there*, the subject in both cases is *robbers*. If knowing whereabouts they are, and pointing to the spot, we say, *They are there*, the import of *there* is determinate. When we say *There are robbers in the house*, it is indeterminate. We may or may not know exactly their whereabouts, but we do not state it.

118. The negative particle *not* always *follows* its verb; as, *I know not*, not *I not know*.

119. There is no exception to this rule, although combinations like the one just given are by no means common. We usually use the adjunct *do*; as, *I do not* (or *don't*) *know*. This, however, only tells us that the real negative is in most cases *do* rather than the verb which follows; and it is *after* the verb *do* that the negative particle stands.

120. Neither are such combinations as:

Clay, not dead but soulless,
Though no mortal man would choose you,
An immortal no less
Deigns not to refuse you.
Byron, *Deformed Transformed.*

Here *not-to-refuse=accept*, and as it is in the infinitive mood, is more of a noun than a verb.

121. A great deal of syntax, though taught as a part of grammar, is, in reality, so much a matter of ordinary common sense that many of the rules seem at first sight to be unnecessary. This is specially the case with concords. Practically, however, there are several conflicting principles, and when these present themselves, a real or apparent violation of some rule is the result. The principle, however, is generally an intelligible one.

122. Such is the case in instances of *personification*; e.g.:

Gold, whose touch seductive leads to crime.
The cities who aspired to liberty.

The unexceptionable forms of these two texts are: 1,

gold, the touch of *which*, &c.; 2, the cities *which* aspired, &c.

Still there is an explanation; perhaps an excuse. We may say that *a city* is what it is on the strength of the human individuals that constitute it; and we say *gold* is treated as a personal agent, like Sin, Death, Virtue, and Vice, &c.

123. Again, in such expressions as *I have not travelled this twenty years*, where *this* is singular and *twenty years* plural, there is an apparent violation of the concord of number. Still, it is only apparent. The words *twenty years* may be considered to mean, not *twenty separate years taken severally*, but *a number of years amounting to twenty*.

In *these sort of people*, the *these* is plural, and so is *people*, while *sort* is singular; and with *sort* the word *these* is supposed to agree. The agreement, however, such as it is, is between the thing implied rather than the thing expressed.

124. A substantive is a word which *by itself* can form *either* the subject or the predicate of a proposition. As a name, it is an *invariable*, or *inconvertible* one; and in being this, differs from the pronoun, which is *variable* or *convertible*.

The difference between an inconvertible and convertible name is this. An object named *stone*, *man*, *sun*, and the like, until it is converted into something else, is always an object of the same kind. A *stone* is not likely to be converted into anything else, so that words like *stone* apply to objects of the same kind for any length of time. No one calls anything a *rose* at one time and a *stone* at another, or thinks that a *stone* and a *rose* can exchange names. A *child*, undoubtedly, may grow into a *man*, and so change his name. But the name is to a great extent inconvertible, invariable, and permanent. This is because *stones*, *roses*, *men*, *children*, are characterized by certain qualities which are more or less permanent, and which cannot be changed

from one object to another at a moment's notice—indeed, sometimes are not interchangeable at all.

With variable or inconvertible names the case is diametrically opposite. When John Smith is talking to William Brown, he does not generally call himself by his full and proper name, nor does he call the person he is speaking to William Brown; nor does he speak in the third person at all. He generally calls himself I, and William Brown, YOU. He says '*I wish* YOU *to do this*,' not '*John Smith wishes William Brown to do this.*' Yet *I, for the time being*, and so long as John Smith uses it, is as good a name as *William Brown;* being the name which he gives to himself. In like manner *you, for the time being*, is as good a name for the person spoken to as *William Brown.* But it is only this so long as John Brown is the person spoken to. When *William Brown* answers John Smith, he calls himself *I*, and John Smith he calls *you.* But, for the time being, both *I* and *you* are *names.* They can be changed or interchanged every moment; but this does not prevent them from being names. They are *always* names; though they do not always apply to the same individual. This is because *I* is always the name of the individual speaking, whoever he may be; a name by which he designates himself, and YOU is always the name of the person spoken to, whoever he may be—a name by which the speaker designates him. The name, then, is variable or convertible, and it is this because its import varies with the *relations* of the individual object speaking, spoken to, or spoken about.

125. When one substantive governs another the noun that is governed is in the genitive, or possessive case; as *the man's hat, the father's child.* The order is, as seen, invariable.

126. There is not much difference in meaning between such expressions as *a man's hat* and *the hat of a man.* But it is a great error to say that because the combination '*of a man*' is nearly equivalent to the single word '*man's*,' and that because the latter is in the genitive case, the preposition *of* is the *sign* of a genitive case; or that it governs a genitive case. It is no sign of a case at all; but, on the contrary, a part of a combination which serves as a substitute for a case. Neither when it governs a case is that case the genitive. In

phrases where it is followed, and seems to govern one, both the meaning and the construction are different.

127. When the connection between two substantives is of that close and intricate nature that when one of them is named the other is implied or understood, the governing substantive may be omitted; and in very familiar combinations omission is the rule rather than the exception. This gives us elliptical phrases, as *Rundell and Bridges, St. Paul's, Swan and Edgar's*, and numerous others.

128. The syntax of the article is that of an appendage to the noun; and as the article is wholly uninflected, its construction is of the simplest.

129. When two or more substantives denote the same object, the article precedes the first only. We say *the secretary and treasurer* when the two offices are united in the same person. We say *the* (*a*) *secretary and the* (*a*) *treasurer* when the two offices are held by different persons.

THE ADJECTIVE.

130. An adjective, as a part of speech, is a word which can *by itself* constitute the predicate of a proposition, but cannot, by itself, constitute the subject of one. It is a *noun*; being classed as such by grammarians in general. But it is scarcely a *name*.

Adjectives are very improperly called nouns; for they are not the names of things. The adjectives *good* and *white* are applied to the nouns *man*, *snow*, to express the qualities belonging to those subjects: but the names of those qualities in the abstract, considered in themselves, that is, without being attributed to any subject, are *goodness*, *whiteness*; and these are nouns or substantives.

This is the opinion of Bishop Lowth. It has

never been effectively denied; yet it has never been acted upon sufficiently to affect the ordinary vocabulary of our grammar, nor is it necessary that it should do this. All that is necessary is that the words *noun* and *name* be not too closely associated in meaning.

131. Words like *good* and *white*, &c. are not names like *good-ness* and *white-ness*, &c., which are the names of abstract qualities. Every adjective can be converted into such a name of this kind by the addition of the syllable *-ness*.

132. Words like *good* and *white*, &c. are not names like *good man* or *white object*; which are the names of certain substances. Every adjective, however, can be converted into such a name by the addition of the name of the object to which it applies.

133. The adjective, then, though very nearly a name, is something less than one. It is, perhaps, rather mechanical to say that it is a *part of a name*. It may safely, however, be called a word that implies a name.

134. In expressions like the *man is good*, *the woman is fair*, the *flower is white*, &c., the construction of the adjective is predicative—so called because the adjective *by itself* constitutes a predicate.

135. In this it is necessary to see exactly what the adjective implies, and what it does not. That the *man is a good man*, the *woman a fair woman*, and the *flower* a *white flower*, is manifest; but this is not exactly what the adjective implies. It rather implies that the *man*, the *woman*, or the *flower* belong to a class of *good*, *fair*, or *white* objects—and this difference has a bearing of some importance.

136. Constructions like the *man is good*, *the woman is fair*, *the flower is white*, are called *predicative*; and they

should be compared, or rather, contrasted with such combinations as *the good man, the white flower, the yellow guinea*, and the like; in all of which we have not only the adjective, but the substantive with which it agrees. In the predicative constructions, on the other hand, no such substantive appears: and the adjective alone, and single-handed, constitutes the predicate.

137. In the present stage of our language, this difference is of no very great importance; inasmuch as the adjective of the present time is wholly destitute of the signs of case, gender, and number, so that any violation of its concord with the substantive is impossible. Whether we speak of a male or a female, of a single individual, or of more individuals than one, of a passive or of an active object, the form of the adjective is immutable —*a good man, a good woman, good men, good women, of a good man, to the good women*, and so on throughout all possible combinations. Whatever else we can do with an English adjective, we cannot make it violate a concord.

138. But all this is only because there are no outward and visible signs of its genders, numbers, and cases; and in § 43 we may not only see that in an earlier stage there was a full adjectival declension, but also see what it was.

139. In Anglo-Saxon there was not only a system of cases, numbers, and genders for the adjective, but a difference between what was called the *definite* and *indefinite* declension of them. This was not a difference between two classes of adjectives, but a difference of form between identical adjectives in different contexts. Thus while we say in the present English, *a blind son, a blind daughter, a blind eye; the blind son, the blind daughter, the blind eye; blind sons, the blind sons*, and the like, the A. S. forms were *án blind son, án blind dohtor, án blind eage; se blinda son, seo blinde dohtor, þæt blinde eage, blinda sonu, þæs blindan sonu*, &c.

140. This brings us to the question as to the gender of the adjective when it stands by itself, and by itself constitutes the predicate of a proposition. For example, in three such propositions as the *man is good*, *the woman is good*, *the shilling is good*, the three substantives are of three different genders, *i.e.* masculine, feminine and neuter respectively.

141. It is enough to state on this point that it is *not* the gender of the subject, whether substantive or pronoun, that determines the gender of predicative adjectives. On the contrary, the adjective of the predicate is neuter, or of no particular gender at all.

142. Nor need this perplex us. It is true that *men*, *women*, and *shillings* are *good*: as *good men*, *good women*, and *good shillings*: but this is not the only way of classing them. They are also good *objects*, *things*, *entities*, or members of some class or other in which *men*, *women*, *shillings*, and an indefinite number of other subordinate classes are comprised. The substantive, then, which is understood when the predicate consists of an adjective only, is not so much the name of the subject as the name of some larger class to which it is assigned.

143. Strictly speaking, then, it is only in the way of its external form that the predicate of a proposition can be expressed by an adjective alone. In import it implies a substantive.

144. The adjective *like* governs a case, and it is the only adjective that does so. In expressions *good for John*, *bad for me*, &c., the government lies in the preposition *for* and not in the adjective.

145. Both the superlative and comparative degrees may be doubled, or expressed *pleonastically*—*e.g. the more*

serener spirit—(*Milton*): *the most straitest sect of the Pharisees*—(*Acts*).

146. Instead of the affixes *-er* and *-st* for the comparative and superlative degrees, we may use the words *more* and *most*; as *more brave = braver*; *most brave = bravest*. There is no practicable rule that can be laid down as to the combination which is to be preferred. On the other hand there are three leading principles which are clear enough to speak for themselves.

1. When a word consists of several syllables already, it is not advisable to add to the number unnecessarily. Every one would say *stronger* rather than *more strong*. No one would prefer *pusillanimouser* to *more pusillanimous*. The call upon our taste and judgment in the way of choice between the two, lies in the words of intermediate length.

2. When the word is already a derivative or a compound, the addition of a second extraneous element not only adds to the length but increases the superadded element.

3. *Cæteris paribus*, a word of English origin in a doubtful case will better bear the addition of the *extra* syllable *-er* or *-est*, than a word of foreign origin.

147. All adjectives may be used adverbially; though it does not follow that all languages use them to the same extent. In the present English we have, in the addition of the syllable *-ly*, so convenient a method of converting an adjective into an adverb, that expressions like *come quick*, *the moon shines bright* (for *quickly* and *brightly*) are comparatively rare.

148. The gender of these adverbial adjectives is *virtually* neuter; the word 'virtually' meaning that, though there are in the present English no distinctive signs of

genders, the gender, *when such signs existed*, was always *neuter*. The analogy of other languages supports the generality of the rule; Greek, ὡς κάλον ὄσδει, Latin, '*dulce ridentem—dulce loquentem*,' &c.

149. The limitations as to the addition of *-ly* with an adverbial power are by no means so numerous as those which are noticed in § 147. There are few words which are either so long, or so composite, or yet so exotic as to contra-indicate the addition of *-ly*. We say *pusillanimously*, *fancifully*, *excellently*, and scores of other words where the addition of the *-er* and *-est* of the degrees of comparison would be out of the question. The only objection to the addition of the adverbial *-ly* is when the adjective itself ends in it, as *manly*, *holy*, *daily*, and others. There the addition of a second *-ly* is inconvenient, and the simple adjective (*virtually* in the neuter gender) is generally preferred—*we pray for our daily bread*, *we eat the bread which we pray for daily*.

150. For the comparative and superlative degrees we prefer the purely adjectival forms with an adverbial sense to either of the true adverbial ones; *i.e.* we say *brighter* and *quicker*, *tighter* and *tightest*, rather than either *quicklier* or more *quickly*; *tighter* or more *tightly*.

151. A pronoun is a *name*, and, as such, may be said to be more of a noun than the adjective is; and, being a name, it can constitute *either* the subject or the predicate of a proposition—*I am he*; *that is you*; *what is that?*

On the other hand, it is a *convertible*, or *variable* name; and, being thus, is less of a noun than the substantive is; inasmuch as convertible or variable names change their import, or application, with the relations of the

speaker, the object spoken to, or the object spoken about. And these relations may change every moment. Hence, words like *I*, *those*, *this*, *that*, may not apply to the same object for two seconds consecutively. The name *I*, while John is speaking to William, means John; being the name that John takes to himself *for the time being*; while the name *thou* (or *you*), *for the time being*, means William. However, when William answers, he becomes *I*, and John, when spoken to, becomes *thou* or *you*. Nevertheless, the words are *names for the time being*, which adjectives are *not*; and, on the strength of their being this, they can take a place in the structure of propositions, which adjectives can *not* take.

152. The declension of the pronoun is fuller than that of the substantive. In the *-t* of *it*, *that* and *what*, it gives us a sign of gender. And so it does in the *-r* of *her*, as opposed to the *-m* of *him*.

In the difference we have an instrument of criticism which is sometimes useful. The substantive has only one case that bears any positive sign or mark, viz. the *'s* in *ship's*, &c. Hence in sentences like

> The *door* being open, the steed was stolen,
> The *sun* having arisen, the labourers set to work,

It is difficult to answer a very common question—In what case are the words *door* and *sun*? Are they nominative or are they objective?

By substituting, however, for the substantive the pronouns *him* and *he*, we can, at least, put the difference in clear form, *e.g.*

He made the best proverbs of any one, *him* only excepted, who, &c.

He made the best proverbs of any one, *he* only excepted, &c.

Here we can, at least, say which of the two cases—the nominative or objective—is used. Which is the better expression, is another question. In the older stages of the language, it was the dative. At present the nominative prevails.

153. *The personal pronouns.*—In reference to the personal pronouns, a point upon which a great deal has

been said and written, is the comparative merits of *I* and *me* when used as the predicate, as, *it is I, it is me.* That the former combination is undoubted and unimpeachable grammar, no one denies. The real question is whether it excludes the use of the word *me.* Now it is certain that many Englishmen say *it is me;* especially when answering a question. *Who's there?* Answer, *Me.* In French, too, the corresponding form, *c'est moi,* is not only the recognised expression, but one that absolutely excludes the combination *c'est je.* It is clear from this that, however much the use of *me* may be forbidden by grammarians, it is no solecism.

154. *You and ye—Pronomen reverentiæ.*—So far as the present English is concerned, *you* is a nominative form and *ye* is obsolete. Moreover, *you* has superseded both *thou* and *thee.* This use of the plural form of the singular is sometimes called the *reverential* construction. There is considered to be some courtesy in addressing a single individual as if he were something more than such, and most languages avoid the use of the forms corresponding to *thou.* At the same time the verb is plural, *you speak,* not *you speakest.* Hence, there is not so much the substitution of *you* for *thou,* as the substitution of the plural numbers for the singular.

155. *Dativus ethicus.*—In such phrases as *rob me the exchequer* (Henry IV.), the *me* is equivalent *for me; at my request, as I wish you,* &c. This is conveniently called the *dativus ethicus.*

With the second person *you* may be considered to mean *at your service.*

Your worm is *your* only emperor for diet; your fat king and *your* lean beggar is but variable service.

Hamlet, iv. 3.

Your serpent of Egypt is lord now of *your* mud by the operation of *your* sun: so is *your* crocodile.

Antony and Cleopatra, ii. 7.

I would teach these nineteen the special rules, as *your* punto, *your* reverso, *your* stoccata, *your* imbroccato, *your* passada, *your* montanto.

B. Jonson.—Bobadil, in *Every Man in his Humour*, iv. 5.

None of the instances that illustrate these constructions are susceptible of an exact rendering; nor is it probable that any two persons would fill up the more indefinite elements of these imports in exactly the same way. Dr. Abbot writes that in the following passage *you* is used for '*look you;*' and it is doubtful whether anything be nearer to it.

And 'a would manage *you* his piece thus, and come *you* in and come *you* out.

Shakspeare, *Henry II.* iii. 2.

156. *The pronouns of the third person—the reflective pronoun.*—The true and proper pronoun of the third person is neither *he* nor *she*, nor yet is it *it;* which is merely a neuter form of *he*. Nor yet is it *they* for the plural number. All these words, whatever they may mean now, are historically demonstrative, rather than personal pronouns.

It is probable that a truly *personal* pronoun of the *third* person, after the manner of *I* and *thou*, has no existence, as a separate word. This is because *I* and *thou* are words that are self-explaining to a degree which no other word approaches. They mean the person speaking and the person spoken to, and (except in soliloquies) the presence of the one implies the presence of the other. Hence they are naturally without any sign of gender: which is, to say the least, superfluous. Both, too, must

be used as nominatives, though not, of course, exclusively. The name of the third person is that of the object spoken about; which may be either a male or a female, and if only one name be assigned to it, is anything but self-explaining. Moreover, it may be no person at all.

This name is easily supplied by the demonstrative pronoun; and out of this the approximate third person is generally developed.

Such, at least, is the case in the English.

157. At the same time there is often a pronoun which is certainly personal; and one which agrees with *I* and *thou* in having no sign of gender, and that for the same reason. The agent and object of the action may be identical, as when a man strikes *himself*. No sign of gender is needed here, for when any one says, *I strike me*, a sign of gender is superfluous. On the other hand, if the two names (that of the object and the agent) are to be different, the name of the object is naturally incapable of occurring in the nominative case, or as that of the subject.

Though a pronoun of this kind is conspicuous from its absence in English, it is found in all the other languages of the class to which the English belongs. In other words, it is the Greek *ἑ*, the Latin *se*, the German *sich*, the Icelandic *sik*, the Danish *sig*. It is known as the *reflective pronoun*.

Now, the very absence of true and simple reflective pronouns in English has had so much influence upon our language that there is more to be said about it than there would be if it were present: in other words, there is a series of makeshifts, or expedients, by which its place has to be supplied which require notice.

158. In the first place, there is no word like the

Greek σός, the Latin *suus*, the French *son*, the German *sein*; in all of which there is a distinction of gender. Wanting this, we have, instead of a possessive pronoun of the third person, to resort to the possessive cases *his* or *her*; the result being that we get combinations like *his mother* and *her father*, where, instead of a *concord* in the way of gender, like *pater suus* and *mater sua*, we have a case of *government*, like *pater ejus* and *mater ejus*.

159. Another result is the necessity of using the verb *self* when the sense is reflective; for, though we can say *I hit me, thou hittest thee*, without ambiguity, a third person cannot do so; inasmuch as *he hits him* may mean either the hitter hitting himself, or the hitter hitting some one else.

It is not stated here that the omission of *self* is unknown in English. It is enough, for the sake of illustration, to state that it is exceptional.

> I thought *me* richer than the Persian king.—*Ben Jonson.*
> He sat *him* down at a pillar's base.—*Byron.*

160. The details of the compounds of *self* are a complex question.

The construction of *my-self*, *thy-self*, *our-selves*, and *your-selves* is that of a genitive, or possessive case *governed* by a substantive. In *him-self* and *them-selves* the combination is in the way of *concord*, or apposition. In *herself* the case of the element *her* is equivocal, being *either* possessive or objective. In *itself*, so long as the spelling with a single *s* is held to represent the origin of the combination, the construction is that of *himself*, and *themselves*. But if it be held that an *-s* has been dropped, and that the true form is *its-self*, the construction is that of *myself* and *thyself*.

161. So much for the compounds when treated as single words. When we come to the context further complications present themselves. When used in the nominative case they are seldom used alone; being generally strengthened by the addition of the original pronoun—*I myself*, *thou thyself*, *we ourselves*, rather than *myself*, *thyself*, *ourselves*, simply and singly.

162. When the combination is *I myself* or *thou thyself* and a verb follows, the construction is pretty clear. No one hesitates to say *I, myself, am weak; thou, thyself, art humble.* But when *I* or *thou* is absent, the construction is doubtful; and we may say either *myself am weak* or *myself is weak.*

Finally, when the two forms *himself* and *themselves* are not only used as nominative cases, but are also preceded by *he* and *they*, the anomaly of the resulting combinations, *he him-self*, and *they them-selves*, becomes obtrusively manifest; and all we can do is to accept them as actual facts in our language and to explain them as we best can.

163. In this matter the history of the compound is our best guide. The word *self* has had two meanings, and has belonged, at different times, to different parts of speech. At present, when it stands alone, it is a substantive; and its nearest synonym is *individuality*, *personality*, or some similar term in which the notion of *identity* or *sameness* is involved. Hence, the Latin parallels to *myself* and *ourselves* are (approximately) *mea* (*mei*) *individualitas*, *nostræ* (*nostrûm*) *individualitates*; those to *himself* and *themselves* being *se* (*eum*) *individuum*, *se* (*eos*) *individuos.*

Finally, there are the two anomalous forms, viz. *himself* and *themselves*, and when, as in *he himself* and

they themselves, the nominative form of the independent pronoun is compared with the objective form of the compound—*he* with *him* and *they* with *them*—the anomaly becomes (as we have already seen) obtrusively evident.

This is what we get for the elements of the two combinations as they stand at present; and if there were such a word as *ipsitas*, from *ipse*, the rendering of the word *self*, as a substantive, would be closer than it is.

164. But it is not as an abstract substantive like either *individualitas* or *ipsitas* that the word *self* first occurs. Nor was the Latin *ipse*, or the present *self*, its exact meaning. This was rather the Latin *idem*, or the English *same*: the difference being not very great, but still considerable. Indeed, *self* was neither more nor less than the old word for *same*; just as it is, at the present time, in German. It was this and something more. In the West-Saxon it was not only the equivalent to the Latin *idem*, but it was the *only one*; inasmuch as the word *same* only existed as an adverb, meaning *together*. With its present sense, it shows itself for the first time in the Northern dialects. Hence, the old construction would be that of an adjective (or adjectival pronoun), and *ic selfa*, *mín selfes*, *me selfum*, *meh selfne*, would be declined like *ego idem*, *mei ejusdem*, *ei eidem*, *eum eundem*, or, take a more real illustration, *se ipse*, *sui ipsius*, &c.

165. At the *present* time the word *self* is neither adjectival, nor is it synonymous with *same*; though evidence of the connection in sense is found in the compound *self-same*. Nor is the notion of *sameness* one in which there are no degrees of difference. There is the sameness of mere similarity and the sameness of absolute

identity; and I think it safe to say that it is the latter which is the likeliest to strike the speakers in the first and second person. In these the feeling of what we may call personal *selfness* is at the *maximum*, and *my self*, and *thy self* are the result. In respect to objects that are merely spoken about, and which are things rather than persons, the feeling is at its *minimum*, and in *himself*, *themselves*, &c., we have *him the same*, *them the same*.

166. *Possessive Pronouns—my, thy: mine, thine, &c.* —The construction of *my* and *thy*, or the two forms in *-y*, is that of the article, and we may call it, if we like, *subarticular*. The construction of *mine* and *thine*, or the two forms in *-n*, is *predicative*.

We can no more say *this hat is my* (or *thy*) than we can say *this hat is the*. By using the word *hat* a second time we can make a sentence—*the hat is my hat*, *the hat is the hat*. But we cannot use either *my* or *the* by itself; however clearly we may see what is required to complete the sentence. In most cases, when we can do this, we omit the word that is dispensed with, and say that it is *understood*, i.e. supplied in thought though not expressed in form. But we cannot do this with the article, and we cannot do it with the pronouns *my* and *thy*.

167. The converse is the case with the forms in *-n*. It is, perhaps, too much to say that expressions like *this is mine* (or, *this hat is mine hat*) are un-English; since we get them occasionally as archaisms. As a rule, however, the word *hat* (or the like), which in the forms in *-y* we *must* express and may not *understand*, require the very opposite construction; and the word which corresponds with *hat* must be understood and may *not be expressed*.

168. *Its*, although as an etymological form it is a strange distortion of *his*, has nothing different from *his*

in its syntax, so far as it is used in the current language of the present time. In the following extracts, however, we find *it* in its stead; and that in both numbers.

> Your knighthood shall come on *it* knees.
> Ben Jonson, *Silent Woman*, ii. 3.
>
> *It* knighthood shall fight all *it* friends.
>
> The hedge-sparrow fed the cuckoo so long,
> That it 's had *it* head bit off by *it* young.
> Shakspeare, *King Lear*, i. 4.

Here the expression looks as if it belonged to either the language of ridicule, or to the particular dialect which nurses use towards children. But it is not limited to this; *e.g.*

> That which groweth of *it* own accord.
> *Leviticus*, xxv. 5.

The first point to remark here is that the word is *not* an abbreviation of *its*; inasmuch as *its* in the sixteenth century had not superseded *his* as the neuter genitive (possessive) case. Nor was it even in the ascendancy. Hence, if *it* stood for a genitive case at all, that genitive case was, in form, *his*.

The second is that the form is old.

> Forthy, the derke see *hit* is domed evermore;
> For *hit* dedeȝ of deth duren there ȝet.
> Therefore, the dark dead sea is doomed evermore,
> For its deeds of death endure (last) there yet.
> —*Alliterative Poems*. B. l. 1021. (*Fourteenth century*. S. Morris's *Historical Outlines*, &c. § 173.)

Thirdly, that, in the fourteenth and fifteenth centuries, we find the form *hise* with the sense of a genitive plural.

Fourthly, that for *its own* (*it own* in the extract of Leviticus) we find *the own*.

A certain sede which groweth there of *the own* accorde.
Fardell of Facion, 1555. (Morris's *Outlines, &c.* § 173.)

Fifthly, that in Icelandic, *hitt* is the neuter form of the definite article; in Danish and Swedish *et*.

I think that this is what *it* is in our language; and that *hise* is a demonstrative pronoun that stands in the same relation to the root of *he* that *these* does to that of *the*.

When *it* follows an intransitive verb its import is very indefinite. When we say *he had a penny and gave it to a beggar*, we know that *it* means the penny. But in words like *go it, come it strong*, or (to take a more classical example from Pope)—

Whether the charmer *sinner it* or *saint it*—
If folly grows romantic I must paint it,

the exact meaning of *it* is vague. It means an action in the manner of *going, coming, playing the sinner, playing the saint*, and the like.

169. Again, in such phrases as *it rains, it snows, it freezes*, there is something that it stands for; though it is probable that no two persons would give it exactly the same name. What rains? what snows? what freezes? &c. A curious one is given in the following extract from an old glossary:—

pluit	raynes	Deus meus
gelat	freses	tuus
degelat	thowes	suus
ningit	snawes	ipsius
tonat	thoners	sanctus
grandinat	hayles	omnipotens
fulgurat	lownes	Creator

Akin to this is '*they say*,' where *they* means *the world at large*, or people in general.

170. *It* can be either the subject or the predicate of a proposition—*it is this; this is it; I am it; it is I.* When *it* is the subject, the verb, of course, agrees with it in number, so that whatever may be the number of the predicate, the verb is singular—*it is this, it is those.*

171. *There* is never the subject of a proposition; but is, in all cases, the predicate, even when it is the first word in a proposition; and, being this, stands in the place of the subject. Nevertheless, it is only a *predicate transposed,* like *Great is Diana of the Ephesians.* Nor is this transposition without its import. When we speak definitely, determinately, or with knowledge, *there* stands in its proper place; *i.e.* at the end of the proposition, *e.g.:*

Some one is concealed *there.*
The thieves are *there.*
You will find them *there.*

When the sense is indefinite, indeterminate, and is the result of incomplete knowledge, *there* stands in the place of the subject; *i.e.* at the beginning of the proposition.

There is something wrong.
There are thieves in the house.

172. *Redundant, or pleonastic, constructions.*—These we find in such expressions as—

The king, *he* is just.
I saw *her,* the queen.
My banks *they* are furnished with bees.—*Shenstone.*

Mars *his* sword.—B. Jonson, *Cynthia's Revels,* i. 1.

Pallas *her* glass.—Bacon, *Advancement of Learning.*

The *more serener* spirit.
The *straitest sect.*

And numerous other well-known examples.

VERBS.

173. Verbs, though generally placed in strong contrast to nouns, are, in reality, so far as they are names, *nominal;* i.e., they partake of the character of the *noun*. But they are not substantival, *i.e.* they are not the names of anything that has a substance, either actually or conceivably; not words like *fire*, *water*, *stone*, or even abstractions like *life*, *health*, *being*, and the like. They are rather words that we must compare with the adjective; and just as words like *warm*, *cool*, *heavy*, &c. imply the *warmth*, *coolness*, *heaviness*, &c. of the *fire*, *water*, *stone*, &c., so do words like *live*, *be*, *sleep*, *run*, *swim*, &c. denote either a *state* or an *action* of somebody or something that *warms*, *exists*, *sleeps*, *runs*, *swims*, and so on.

174. In every such state or action there are two names involved—the name of the *act* (or state) itself, as *sleeping*, *running*, &c.; and the name of the *agent*, as *sleep -er*, *runn -er*. These names are substantives; but from the character of their chief element, they are called *verbals*, or verbal substantives, the form in *-ing* being, specially, the verbal abstract. Hence, every verb has, or may have, two verbals—one in *-ing*, the other in *-er*.

175. But it does not follow that because such forms are possible they always exist. Instead of *sleeper*, &c. we may say *the man who*, or *he who sleeps;* while the name of the action is often identical with the verb; *e.g.* *I have had a run*, *I have enjoyed a walk*, *I have had a swim in the Thames*. Logically, however, the names of possible agents are exactly as numerous as the names of

possible actions, and that these are very numerous we know without attempting to count them.

176. Vast, however, as is the number of known and conceivable actions (or states), each one with its proper and special agent, a little thought will tell us that *three* names are sufficient for them all; inasmuch as everything that has been done, or will be done, or can be imagined as a deed, is, and must be, done by one of three doers. It must be done by either the object speaking, or the object spoken to, or else by some object spoken about; and for each three classes we know that we have, at least, three short and convenient names—*I*, *thou*, and *he*. We can make more of them by investing them with gender and number, but under these three *persons* can all the names, actual or possible, of all actual or possible agents be reduced.

177. Such is the mechanism of the system of the *persons* of the verb; and it is the one which has much to do in investing that part of speech with the prerogative implied by the name *verbum* in Latin, *ῥῆμα* in Greek, *i.e.* the *word κατ' ἐξοχήν*, or *par éminence*. It can do (though not in all languages) what the noun can *not*. It can, single-handed and by itself alone, constitute *both* the terms of a proposition, *i.e.* the predicate and the subject as well.

178. It has just been stated that it is not in all languages that the verb can do this. It is now added that it is not every part of the verb that can do it all. No verb can do it when it is in the infinitive mood.

179. The exposition of this, though simple, cannot conveniently begin without having recourse to Latin, or some language in which the signs of persons are both operative and well marked.

Thus, in Latin, the single word *amo* forms a proposition; and it does this because the termination serves as the name of the agent, thereby constituting the subject; while the syllable *am-* denotes the action. In *do* = I give, *eo* = *I go*, *no* = *I swim*, and others, a single letter serves for a whole term. When the inflections are wanting, a separate word—*I*, *thou*, *he*—&c. generally serves in its stead. In English, except in the imperative mood, and a few exceptional verbs, like *me-seems* = (*it*) *seems* (*to*) *me*, they *are* wanting; so that the English for *amo*, *do*, *eo*, *no* (each proposition being a single word), is *I love*, *I give*, *I go*, *I swim* (each proposition being a pair of words).

180. We may, then, clearly see how it is that a verb can, by itself, form a whole proposition, how it does so, and in what capacity. It does *not* do it simply as a verb, or the name of action (or state). Neither *amare* nor *dare*, neither *ire* nor *nare* (the infinitives of *amo*, &c.) can do this; though they are names of exactly the same action as is implied by *amo*, *do*, &c. But the name of an action without the name of an actor is not sufficient to form a proposition. In words like *amo* and *eo*, &c. we have *two* names; just as we have two names in *I love*, *I go*, and the like; the only difference being that in the Latin verbs they are comprehended in a single word.

181. All verbs in the *infinitive* mood are limited to the expression of the action only; and no sign of person accompanies them. They are simply the names of actions (or states) *minus* the agent.

In respect to their place and powers in a proposition, verbs in the infinitive mood are nouns; and can form the subjects of propositions:

To err is human, *to forgive* divine.
To see is *to believe*.

Here, *to err = erring, error; to forgive = forgiving, forgiveness;* and *to see is to believe* = the familiar sentence *seeing is believing.*

182. Though the preposition *to* governs an oblique case, and though the subject of a proposition must be in the nominative case, the construction of the foregoing proposition is regular. In spite of the preposition, *to err* is a nominative case.

183. This is because the two words are dealt with as one; or, if we choose to say so, the word *to* is not so much as either a preposition or an adverb; but the sign of the infinitive mood.

We have already seen something like this in such combinations as *himself*, used as a nominative, and in apposition with *he—he himself.*

184. *Concord.*—The *concords* of the verb. There is no gender in verbs, and consequently no concord relating to it. The concords of number and person (which have no existence in the infinitive mood) are matters that few can err in, and are simple enough to explain themselves. Few say *I speaks*, or *he speakest.*

185. *Collocation.* — Respecting collocation in the syntax of verbs the most important is that respecting the place of the *negative.*

The negative always *follows* its verb; as *I can not, I know not*—never *I not know, I not can.*

Phrases like *I do not know*, where *not* precedes *know*, form no exception to this very general rule. They *precede* the second word (*know*), but they follow the first (*do*); and *do*, or the first, is the word to which they belong in ordinary negations.

A rule, however, of considerable generality proceeds from this, viz. that in ordinary conversation we prefer to

add *do*, rather than confine ourselves to the single verb.

Where *not* really *precedes* the word, the phrase is affirmative rather than negative. See §§ 118, 119, 120.

In the following lines the construction is extremely forced:—

> Yet not to have been dipped in Lethe lake
> Did save the son of Thetis from to die.
>
> Milton.

Here *to die* means death; which is merely an ordinary Hellenism; and if *not* had agreed with *to have been dipped* it would have also been a Hellenism. But it agrees with *could save*, which is neither a Hellenism nor ordinary English.

186. *Government.*—The government in the syntax of verbs is the most important part of it.

Caution.—A word may follow a verb without being governed by it.

The verb, though often followed by a preposition, does not *govern* one: indeed, as the preposition has always but one form, we could not say what the government was, if there were any. But it does something of the same sort. The import of the verb determines the preposition that it is associated with. We cannot use such a word as *by* or *to* with a verb meaning subtraction; or *from* with a verb implying addition. But this is not government in the ordinary sense of the term.

The substantive verb—*am, is, are*, &c.—in sentences like *it is I, it was we who, &c., it is John*, and the like, does not govern the noun by which *it* is followed. Neither does the word *call*, along with others, do so, in sentences like *I am called James.* The word that follows the verb is, in all such cases, in the nominative case. And hence has come the rule that verbs substantive, along with others, govern a nominative case. They do no such thing. The improved rule is, that verbs substantive, &c. govern the same case as the one by which they were preceded. This is the same rule over again invested with a show of generality. The truth is, that there is no case of *government* at all. It is a case of *concord*—the concord of predicate with the subject.

187. What a verb governs is as follows:

(1.) It governs the noun; and that in an oblique case.

(2.) It governs the verb; and that in the infinitive mood.

188. *Government of verb and noun.*—No verb governs a nominative case. The apparent instances are *concords.* See § 110.

No verb governs a possessive case. In expressions like *eat of the bread*, the word that governs *bread* is *of.*

But it does not follow that because no verb *now* governs a genitive case there never was a verb that did so. The verb *wealdan = rule* governed one; as *God wealde middangeardes = God wielded (ruled) earth's.*

In *give it him*, the verb *does* govern a dative case—though, if we choose to say that the expression is elliptical for *give it to him*, it does not. As verbs, however, of *giving*, as a general rule, actually govern a dative case *as verbs*, the exception is needless. On the other hand, neither government excludes the other.

Practically, we may consider that the government of transitive verbs, the only ones that govern in any case at all, is that of accusative case.

189. In order to govern any case at all, a verb must be transitive, and affect by its action the object that it governs. In such expressions as *he walked a mile, he slept an hour*, neither the *mile* nor the *hour* are affected by the verb that precedes.

The construction here is adverbial; inasmuch as it tells not what the action conveyed by the verb effected, but the manner in which it was done. This word *manner* means a great deal, and extends to the condition of *time, place*, and much more. In grammar it is called a *mode.* The construction of such a sentence as *he smote the enemy with the sword*, where the verb is tran-

sitive, is both objective and modal. In *walking a mile*, or *speaking an hour*, it is modal only.

In like manner, to *sleep the sleep of the righteous* is to *sleep according to or after the manner* of the righteous. Here, as far as the mere form, the verb and the noun are absolutely identical; while in meaning they are closely allied. This is called the construction of a verb with its *cognate noun—nomen sibi cognatum.*

The same combination of sounds that may give us an intransitive verb in the generality of cases may also at times convey a transitive meaning, and *vice versâ*. *Walk* and *sleep* may mean *cause to walk* and *cause to sleep*; as *he walked the horse, the opiate slept the patient.*

When transitive words take an intransitive sense, the case is not so clear. *Move*, for instance, as in *I move my limbs*, is transitive. But we may simply say *I move = I am in motion.* Upon this, however, we may refine, and say that an object that *moves* when no external cause of motion is present, *moves itself*, and in *it moves* the construction is reflective, with the reflective pronoun understood.

190. *Government of the verb and verb.*—When a verb governs a verb, the one that is governed is always in the infinitive mood. This rule is absolute; and at first sight it seems simple. This is because, in the present English, the infinitive mood has no sign of inflection, and is consequently unvaried in its form. Still there is a difference that should be observed and explained. In most verbs the infinitive mood is preceded by the preposition *to*, which itself follows the governing verb; as *I begin to think, he fears to speak.* In many combinations, however, the *to* is not only absent, but, if present, would be out of place.

I may go,	*not*	I may *to* go
I might go,	„	I might *to* go
I can move,	„	I can *to* move
I could move,	„	I could *to* move
I will speak,	„	I will *to* speak
I would speak,	„	I would *to* speak
I shall wait,	„	I shall *to* wait
I should wait,	„	I should *to* wait
Let me go,	„	Let me *to* go
He let me go,	„	He let me *to* go
I do speak,	„	I do *to* speak
I did speak,	„	I did *to* speak
I dare go,	„	I dare *to* go
I durst go,	„	I durst *to* go

Thou shalt not *see* thy brother's ox or his ass *fall* down by the way—We *heard* him *say*, I will destroy the temple—I *feel* the pain *abate*—He *bid* her *alight*—I would fain *have* any one *name* to me that tongue that any one can speak as he should do by the rules of grammar.

This difference is explained by the Anglo-Saxon. In that stage of our language there were two forms of the infinitive—*lufian* = the Latin *amare*, and *to lufianne* = the Latin *ad amandum*. Out of the former we get combinations like *may go*, without the preposition; out of the latter, combinations with the preposition, like *begin to go*.

191. So long as we look at the infinitive mood as a mood consisting of a single form, we take an inadequate view of its dimensions. We also have a tendency to make it less of a noun than it really is. At any rate we are disposed to overlook the fact that it is *declined*, and has cases. The *lufianne* in the preceding section was a *dative* case; the *lufian* (with the single *-n*), an accusative. Had it formed a proposition by itself it would have been a nominative.

Such is the declension of the infinitive verb in the languages of the German family. In the Greek the verb itself remains unchanged, but is substantival enough to take to itself the definite article in the neuter

gender; and, as this is declined, a virtual declension of the verb is the result—at least for the purposes of syntax. In Latin, where there is no article, we have a mixture of the ordinary infinitive with the so-called *gerunds* and *supines*.

West-Saxon.	*Greek.*	*Latin.*
1. *lufian*	τὸ φθονεῖν	*invidere*
2. (*lufiannes*)	τοῦ φθονεῖν	*invidendi*
3. *lufianne*	τῷ φθονεῖν	*invidendum, invidendo*
4. *lufian*	τὸ φθονεῖν	*invidere, ad invidendum*

It is convenient to call the construction with *to* gerundial; and to compare *love* with *amare*, and *to love* with *ad amandum*.

This is about as far as we can go with the government of the verb in general; this meaning the government that is common to the verbs in the infinitive mood (wherein there are no persons), and the government of the indicative, imperative, and subjunctive (conjunctive, potential) moods, in which the persons are conspicuous and characteristic.

To say this, to say that the person is the characteristic of the three above-named moods, and that the absence of it is the characteristic of the verb in the infinitive mood, cannot but suggest the propriety of some general name for each of the two classes; and, to many, it may suggest the special names *personal* and *impersonal* as the best. Theoretically, they *are* the best. But, unfortunately, the term *impersonal* is in use in another sense; whilst *infinitive* is the name of a mood, and, as such, too restricted in its signification.

192. To extend the statement of the previous section we may add that we have now gone as far with the syntax of verbs as we can go without distinctive names for these two important classes, which are really

personal and impersonal; but which we cannot designate by those terms.

Finite and *indeterminate* will be the two names used in the sequel; and they are more closely allied to each other than they seem to be. *Finis* and *terminus*, both in Latin and in the language of logic, mean *term*.

The *finite* verbs, then, are those that contain *both* the terms of a proposition, *i.e.* the name of the action and the name of the agent as well.

The *indeterminate* verbs are those that deliver the name of the action only, and can, consequently, form only *one* of the terms of a proposition.

193. With the *finite* verb, as opposed to the *indeterminate*, we get, over and above the syntax of the characteristic *persons* (of which so much has already been said), the syntax of the tenses and the syntax of moods.

194. *Persons.*—With the persons we connect the *numbers*; and, in respect to concord of the verb with *its noun in person and number*, the little that was necessary has already been said.

The chief remaining point is the fact that in English the *person* is sometimes omitted.

(*a*) It is generally wanting in the imperative mood: where we say *walk!* *go!* But the word wanting is so thoroughly understood, that, when present, it is often a superfluity. It is the name of the person spoken to; so that it is only when more persons than one are addressed, one or some of them specified, that such combinations as *walk thou*, or *go ye*, are required.

(*b*) At the other extreme stands the word *meseems* = (*it*) *seems* (*to*) *me*. Here *it* is understood; but even when we supply it its exact import is uncertain. See § 169.

195. *Time and Tense.*—Time is one thing; tense another.

1. *Present*—(*real and approximate*). Of the three divisions of time, *past*, *present*, and *future*, it is only the first and the last that can be clearly conceived. We can look back on what has gone before, and can foresee what is coming hereafter; but the present time is a mere point, changing even while we think or speak about it. The present *time*, in grammar, is chiefly negative, *i.e. not* past, and *not* future. In English it is expressed by the substantive verb and the participle in *-ing*; as *he is speaking*; *he is being spoken to.*

It is *not* expressed by the so-called *present* tense. *I walk a mile daily*; *he dines at six*; *he is bowling badly, though, in general, he bowls well.* All this implies habitual actions rather than actions actually going on at the time of speaking. A speaker who at breakfast-time says that he *dines at six*, means that *six* is his dinner-hour. He is not dining at the time he is speaking; though he dined at six yesterday in past, and will dine again at six to-day in future, time. This applies chiefly to single acts, and acts liable to be repeated.

When the acts are continuously prolonged, and become permanent *states*, the time is present, past, and future at once. This is specially the case with the most permanent and universal of all states, viz. that of existence or *being*, as denoted by the verb substantive.

In any case the present, as a division of time, is one for which there are no definite limits, and, yet, the one from which we must measure both the future and the past. And it is much the same in grammar. The *present* tense, in English, is not exactly present in time; yet is (in

English at least) the tense which first presents itself in our grammars.

196.—2. *Preterit*, or simple *past* time; previous to the time of speaking, and not connected with it by any continuance of the action or state spoken about. In Greek, aorist, *ἔγραψα = I wrote.*

3. *Future*; subsequent to time of speaking. *I am about to speak; I shall or will speak.* Greek, *γράψω = I am about to write.* Latin, *scribam.*

Time, implying two actions or states:—

4. *Imperfect.—I was speaking when he came to me.* The action is going on when it is interrupted by another. But both are in past time. Greek, *ἔτυπτον = I was beating;* Latin, *scribebam = I was writing.*

5. *Perfect.*—Action past; but connected with the present time by its consequences—*I have written a letter and here it is; I have learned my lesson and am ready to repeat it; I have learnt my lesson and do not mean to look at it again.* Greek, *γέγραφα = I have written;* Latin, *momordi = I have bitten.* In Latin, however, the reduplicate forms, though originally perfects, have also the power of the preterit.

6. *Pluperfect.*—Action past, connected with another action subsequent to it. In this the *plu*perfect differs from the *im*perfect, where the first action is interrupted by the second before it is complete—*I had written when he came in.* Greek, *ἐτετυφεῖν = I had beaten; amaveram = I had loved.*

7. *Future present.*—Action, future as regards the time of speaking; present as regards some future time: *I shall be speaking to-morrow at noon.*

8. *Future past.—I shall have spoken by to-morrow night.*

197. *Tense.*—The single word *write* = the Latin *scribo*, and the Greek *γράφω*, is, according to all opinions, a true tense. It is a single word, with an inflection for its sign, belonging not to syntax, but to *etymology*.

The single word called in Latin *scripsi* = in Greek *ἔγραψα*, is the same.

The Greek *γέγραφα* is, like the preceding, a single word, a true tense, and a part of *etymology* rather than of syntax.

Its English equivalent, *I have written*, is *not* a single word; nor does its illustration belong to etymology. On the contrary, it belongs to syntax, and the periphrasis is a combination of words, equivalent to a true tense, but, whether a tense or the contrary, not a tense after the manner of *γράφω*, *ἔγραψα*, *scribo*, *scripsi*, *γέγραφα*, and others.

The present writer does not consider it a tense at all.

At the same time he must allow it to be as good a tense as the Latin *monitus sum*, *amatus sum*, and the like; which are generally considered tenses. It is probable that though neither may be true tenses, both will for some time be treated as if they were; and, provided the distinction between time indicated by a single word with a special inflection, and time indicated by a combination of more words than one, be borne in mind, no great harm comes from the treatment.

198. The words *struck*, *swam*, *spoke*, and about a hundred others, which form their past tense by changing the vowel of the present, are undoubted tenses—as good tenses as *write*, *γράφω*, *ἔγραψα*, and the like. More especially are they as good tenses as *γέγραφα*, inasmuch as they were once formed in the same manner, and almost to a certainty had the same power.

At present, however, they have the same power as the tenses ending in *-ed*, *i.e.* those like *called*, *moved*, and the majority of English verbs. Hence, both are tenses. Are both the same tenses? Tested by the *import*, they are the same. Tested by the form and *history*, they are different. In form they are different. In meaning they are identical.

The *forms* represent the *history* of the word. The *meanings* are confluent.

But this applies to the finite verbs only. With the participle it is different. The finite verb follows one rule; the participle another.

199. According to the present writer the true tenses and their equivalents are classed as forms and constructions of *past* time generally. Of the two tenses of past time, the one represented by the forms in *-d*, corresponding with the Greek aorist, are *preterits* — *I called*, &c.; whereas those that are represented by words like *spoke*, formed by a change of vowel, and corresponding with the Greek perfect, are *perfects*.

In the finite verb, the import of *both* the forms is that of the Greek aorist, and that *absolutely*. *I rode* never means *I have ridden*.

In the participle the import of *both* forms (words like *written* and words like *loved*) is, to say the least, more perfect than aorist. This means (and the illustration is most conveniently taken from the Greek) that in sentences like *I have written a letter*, the word *written* = γεγραμμένον, rather than γραφθέν; though in *I wrote*, the word *wrote* = ἔγραψα rather than γέγραφα.

200. '*Do*,' *emphatic*.—*Do* and *did*, as tenses, imply time. But they do something more. *I speak* means not only that I am in the act or habit of speaking, but

that I insist upon its being understood that I am. I say *I do* or *I did speak* when it is either asserted or implied that I do (or did) *not* speak. This is the *emphatic* use of *do*.

When they do *agree, their unanimity is wonderful.* This implies that generally they do *not* agree.

For the use of *do* in negative sentences, see §§ 118, 119. Compare, also, phrases like *does he say so? does he not say so?* in questions. They are far commoner than *says he so? says he not so?* &c.

201. The verbs that govern the infinitive (verb or noun) mood in the *accusative* case, are those that are connected with it under the term *auxiliary—shall, will, may, can, must, let. Do*, which is rather emphatic than auxiliar, does the same.

202. The remaining verbs govern in the *dative case; i.e.* with *to*.

When *to* is absent, the construction of the governed verb agrees with the Latin *amare;* when present, with *ad amandum, e.g., possum amare, incipio ad amandum.*

203. *Syntax of the active*, or *present participle.*—The original form of the present participle which now ends in *-ing*, was *-and, -end*, or *-ind—e.g. hwistliand = whistling; clænsiand = cleansing.*

204. If this fact stood alone, it would not be noticed in the present page; for it would belong to etymology rather than to syntax. But it is complicated by the syllable *-ing* being, also, the characteristic termination of the verbal abstract. Originally, the termination was *-ung;* but just as *-and* of the participle became *-ing*, so did the *-u-* of the verbal become *-i-*, and the two forms became confluent; *i.e. hwistlung* and *clænsung* became *whistling* and *cleansing.*

More than this, the meanings of the two forms became confluent also, or, at least, very nearly so. When in the dative case and governed by *on*, combinations like *ic wæs on hwistlunge, ic wæs on cleansunge*, had only to soften the *on* into *a* and drop the final *-e* (the sign of the dative case) to give us *I was a-whistling, I was a-cleansing*, and the like: and these have only to drop the *a*, when they come out *I was whistling, I was cleansing*, absolutely identical in form with the present participles of *whistle* and *cleanse*, &c.

205. This is the case when the adjective is *predicative*. When it precedes a substantive, and, to all appearances, agrees with it like an ordinary adjective, the reduction is not so easy. In *growing tree, moving crowd*, &c., there is no reducing of them to such combinations as *a-moving, a-hunting*. Still there are such combinations as *wedding-morn, dying-day*, &c., where the construction is substantive; the meaning being the *morn* on which there is a *wedding*; the *day* on which there is a *death*. In *morning* this construction is even more evident; inasmuch as there is no such verb as *morn*.

206. Presuming then that the rule must be general, we may easily see that a case may be made out strongly in favour of the participle, as such, having become displaced and superseded by the verbal substantive. But there is no need to make the rule general.

207. In *I am reminded, I am beaten*, &c., the participle is *perfect* rather than preterit (aorist); inasmuch as it means not so much *one in the act of being reminded*, or *one in the act of being beaten*, as *one who has been reminded* (or *beaten*). Compare *monitus sum = I am one who has been advised*, which, in Latin, is always treated as

perfect tense passive, and not a present one; though *sum* is present. Ample historical evidence on this point is adducible.

208. *I have written, ridden*, &c. Here *I* is the subject, and *have = possess*. It is in the present tense, just as it would be if instead we wrote *possess*. It implies *possession* of some kind or other; though in a very broad way. This does not imply that the *horse* is mine; but only that the *riding* of it is something appertaining to me.

In *I have written a letter and am now ready to post it*, both the past power of *have* and the notion of possession is more manifest.

Have, then, governs its substantive in the objective case.

Ridden, written, and the like agree with *horse, letter*, and the like, and is in the same case, *i.e.* the objective. If we said *horse ridden*, or *letter written*, both the concord and the government would be clearer. But we don't say so. Nevertheless the concord and the government are just what they would be if we did.

The participle is the *perfect* participle, not the preterit (or aorist), *i.e.* it means the horse that *has been* ridden. It is *past* so far as the riding goes. But it is present, because while I am speaking I have a connection with, perhaps a sort of property in the riding.

Something here is, of course, understood—the horse which *I have* being a *ridden horse*. But the text, if completed, would *not* be *I have a horse = a ridden horse*. It would rather be *I have a horse = a ridden thing*. Even if the horse were a mare, the sentence in Latin would not run *habeo equam equitatam*; but *habeo equam equitatum*.

209. This series of steps (every one of which can be demonstrated historically) is only good as logical syntax

so long as the verb is transitive, and can govern a case. When the verb is *in*transitive, and has no substantive to follow it, *i.e.* no substantive with which the participle can agree, the explanation is different.

In this we must hold that the normal construction has extended its influence beyond its due limits and established a false analogy—a very common occurrence in language.

Such is the case with *I have slept, I have waited, I have hungered*, and hundreds of other instances.

210. With the substantive verb—*I have been*—the notion of anything liable to government is at its *minimum*; and in most languages the extension of the precedent established by the government of the transitive stops when we come to *been*. The Germans and the Italians say—

Ich bin *gewesen* = *I* am *been*.
Io sono *stato* = *I* am *been*.

Only in the French, the English, and the Scandinavian languages do we find—

*J'*ai *été*.
I have *been*.
Jeg har *varet*.

211. An adverb is a word which cannot, by itself, form a term; nor can it form part of one without an adjective, a participle, or a verb—*he acts wisely, he is acting wisely, he is wisely brave*.

212. A preposition is a word which cannot, by *itself*, form a term; nor can it form part of one without *two* names, between which it stands; and, so standing, connects them: *The sun* with *his beams*, from *the sky*, *shines* through *the air*, *on the earth*.

SYNTAX OF COMPLEX PROPOSITIONS.

213. Syntax deals with (1) the connection of words, and (2) the connection of propositions. The syntax that deals with that of words, or the syntax of simple propositions, has already come under notice. The syntax that deals with the connection of propositions now commands attention. Attention, too, must be given to the word *connection*. It by no means follows, that because we find a long list of propositions following each other, there is a connection between them. Like marbles in a bag, to use an old illustration, they may touch without cohering; having as little relation to each other as so many different essays or chapters. This is the case with proverbs, riddles, and the like, where each sentence constitutes a whole. In ordinary composition, however, this extreme isolation is rare. There is, in general, not only contact, but connection.

214. The chief part in these connections is borne by (1) the conjunction, and (2) the relative pronouns.

215. The conjunctions, like the prepositions and the adverbs, are uninflected, and like the prepositions and the adverbs are incapable of forming, by themselves, either the subject or the predicate of a proposition. But here the agreement ceases. Both the adverb and preposition are undoubtedly *contained* in the proposition to which they belong. A conjunction, on the other hand, is *not* so contained. The proper place is *between* two different propositions rather than *within* any single one. Thus—

I am pleased,
because
This has happened:
but
I should have been disappointed,

if
It had fallen out otherwise,
and
I think
that
My friends will be more surprised
than
Satisfied with the arrangement.

216. This being the case, if we wish to understand how many different kinds of conjunctions can exist, we must know all the ways in which one proposition may be connected with another. Many propositions are wholly unconnected. Propositions delivered at long intervals, or by different persons, have, for the most part, no relation to each other. In consecutive conversation, however, one statement is connected with another, and it is the conjunction that connects them.

217. That conjunctions connect terms is beyond all doubt; and when the terms thus connected belong to different propositions, they connect (*through* such terms) different *propositions*. Whether, however, they connect two or more terms *within the same proposition* is a point which is disputed. This is a question far too wide and complex for investigation in such a work as the present. Contrary to his earlier opinion, the writer thinks that, in some exceptional instances, it is *terms* rather than *propositions* which the conjunction connects. Thus *all men are black or white* cannot be expanded into two propositions without over-refinement.

218. The conjunction which connects two or more terms is called the *copulative*. It is *and*.

The conjunction which connects one of two terms, while it disconnects the other, is called the *disjunctive*. It is *or*.

When the construction is either copulative or disjunctive, the two propositions are so abbreviated to form

single sentences and to look like single propositions. This is because two different subjects may have the same predicate; as

The sun and moon shine,

or, *vice versa*, a single subject may have two predicates; as

The sun shines and burns.

Sentences like these *in extenso* are—

The sun shines—the moon shines
The sun shines—the sun burns.

219. A little consideration will tell us that for every possible way of connecting two propositions there is not only a special class of conjunctions, of which the names *copulative* and *disjunctive* are only samples, but that each class is likely to consist of a single word. Thus, it is submitted that there is only one copulative conjunction, namely, *and*. Also, that there is only one disjunctive, namely, *or*. There is only one relation to be expressed, and any second mode of expression would be superfluous. Such is what strict language requires; and what we generally find.

220. This leads us to a second class of words which, without being true conjunctions, strengthen the conjunctional power of the word with which they are connected; e.g. *both John and Thomas are coming*. Here *and* alone is the true conjunction; *both* being a superadded word, and a different part of speech.

In like manner, when we say *either John or Thomas is coming*, the word *either* strengthens the word *or*; but without being a conjunction.

The most, then, that can be said of such words as

both and *either* is, that they form a part of certain conjunctival expressions—*not* that they are conjunctives.

221. They are *not* conjunctives as *parts of speech*. As parts of speech we cannot always say what they are. When *both* means *the two taken together*, it is very like an adverb. When it means *each of the two*, it is a pronoun. When *either* means *one out of two*, it is a *pronoun*. When it means *in the way of an alternative*, it is an *adverb*.

222. Both copulatives and disjunctives join and disjoin in different manners. When we say *pens and ink are both necessary for writing*, the *pens* are more clearly distinguished from the ink, and are more separate as objects, than they are in such a phrase as *pen and ink* when it merely means *writing*. Also, the *eggs and bacon are the products of hens and pigs respectively*, are considered as two different things much more clearly than they are considered when we say *eggs and bacon is a good savoury dish*. The products of the farm are different: the dish is *one*. Hence we say, in the latter instance, *is* instead of *are*.

223. When the elements of a proposition are double, and the result is something single (as it has been shown to be in the previous instances), grammatical perplexities suggest themselves. If we say *eggs* with *bacon*, or *eggs* plus *bacon*, or write *eggs-and-bacon*, the propriety of the verb in the singular number is manifest. But, then, the question that emerges is also perplexing. Is the *and* in such constructions as these really a *conjunction?* Is it not rather a preposition? This is one of the chief points that require special notice under the head of conjunctions copulative.

224. A parallel point suggests itself with the disjunctive.

225. A true disjunctive separates *things*. When we say the *sun or* the *moon is shining*, we separate two different *objects*. When we say *Victoria, or the Queen of England, is our sovereign*, we separate two different *names*.

226. When the disjunctive *or* separates *names* only, it is called a *sub*-disjunctive. For the word *and*, when two objects unite to make one, we have no recognised term. The construction, however, is *prepositional*.

227. Thus far the syntax of the copulative and the disjunctive agree. But the disjunctive has besides this a characteristic of its own. There is no such a word in English as *nand = not and*. There is, however, such a word as *nor = not or*. This means that the disjunctive has its corresponding *negative*.

228. Just too as we can form from *or* the compound *nor*, can we from *either* form the compound *neither*. Here we must take care to be consistent. We must say *I will either come or send*, and *I will neither come nor send*. We must *not* say *I will neither come* or *send*.

229. Putting all this together, we find in copulatives and disjunctives only, a good many of the peculiarities of the syntax of the conjunction.

(1.) Firstly, there is the packing of two propositions into a single sentence or clause—as *the sun and the moon shine—the sun or the moon shines*.

(2.) There is the process by which the two kinds of construction are *strengthened:* along with the question as to the part of speech to which the *strengthening* word belongs.

(3.) There is the difference between disjunctive and sub-disjunctive.

(4.) There is the negative disjunctive—*nor, neither*, along with the rules for the consistent use of it.

230. The copulative, disjunctive, and sub-disjunctive are more especially connected with the syntax of *number*. Copulatives naturally require the verb to be *plural*; disjunctives and sub-disjunctives, to be *singular*. *Both you and I are writing—either you or I was speaking.*

231. The copulative and disjunctive conjunctions are those of which the syntax is most important. Next in order comes the syntax of the *conditional*.

The night will be fine
if
The moon shine,

or,

If
The moon shine,
The night will be fine.

Here there is a condition upon which depends the fineness of the night; and in this condition there is an element of uncertainty, with a construction to correspond.

232. In the preceding example we have written *if the moon shine*, not *if the moon shines*; in other words, we have used the verb in the conjunctive, subjunctive, potential, or conditional *mood*; and *not* in the indicative. This gives us a case of *government*; and the rule is that the conditional conjunctions govern the subjunctive mood. The chief conditional is *if*. To say *if the sun shines the day will be clear* is not considered such good English as *if the sun shine*, &c.

Although the word *if* is the type and specimen of the conditional conjunction, there are several others so closely related to it in meaning as to agree with it in requiring a subjunctive mood to follow them.

1. *Except* I be by Silvia in the night,
There is no music in the nightingale.

2. Let us go and sacrifice to the Lord our God *lest* he *fall* upon us with pestilence.

3. Let him not go *lest* he *die*.

4. He shall not eat of the holy thing *unless* he *wash* his flesh with water.

5. *Although* my house *be* not so with God.

6. —Revenge back on itself recoils.
Let it. I reck not *so* it *light* well aimed.

7. Seek out his wickedness *till* thou *find* none.

233. There is no rule which is more neglected than this concerning the use of the conjunctive mood after *if*: and there are many instances where *if* is rightly followed by an indicative. This is because the word is not always equally conditional; or, if equally conditional, equally indicative of uncertainty.

234. The conditions of a given state or action may be so generally admitted, as to apply no appreciable amount of uncertainty. As a point of practice, the following method of determining the amount of doubt expressed in a conditional proposition is useful:—Insert, immediately after the conjunction, one of the two following phrases—(1) *as is the case;* (2) *as may or may not be the case.* By ascertaining which of these two supplements expresses the meaning of the speaker, we ascertain the mood of the verb which follows.

When the first formula is the one required, there is no element of doubt, and the verb should be in the indicative mood. *If* (*as is the case*) *he is gone, I must follow him.* Here *if* = *since.*

When the second formula is the one required, there *is* an element of doubt, and the verb should be in the subjunctive mood. *If* (*as may or may not be the case*) *he be gone, I must follow him.*

235. Whether call the mood *conjunctive* or *subjunctive,*

it is clear that it depends upon the presence of a conjunction.

In English the conjugation of the moods is at a *minimum*. In Latin it is both considerable and complex. In Greek it is of inordinate importance; for in Greek we have not only a conjunctive, subjunctive or potential mood, but an optative as well.

236. Now it is only where there are complex propositions that a subjunctive mood is possible. Hence, it is with the conjunction and the relative pronoun, as parts of speech, that the syntax of the conjunctive mood is especially connected.

237. (*a*) *That: indicative of intention.*—In respect to its origin this word is a pronoun rather than a conjunction; and, even in respect to its import, it is still largely pronominal. When the antecedent proposition conveys the notion of an act being done, with a view to a result, and implying intention, we are in the habit of calling this result a *final* cause. Of course, it is, in reality, an *effect*. So far, however, as the anticipation of it is a motive, it partakes of the character of a cause. In this case one of the powers of *that*, though not a true *causal* conjunction, is in some sense *causal*. Out of this arises the following *concord*.

(*a*) If the tense in the first proposition be present, the tense in the second must be the same—as *I* do *this that I* may *help my friends* (not *might*).

(*b*) If the tense in the first proposition be in past time, the second must be in past time also—*I* did *this that I* might *help my friends* (not *may*).

238. *Observe.*—This is a rule in several languages; notably, in the Latin and Greek. In the former the details are exactly the same as in English: *hoc ago ut amicis prosim—hos egi* (trans-

late *did*, not *have done*) *ut amicis proderem*. In Greek, however, the concord is one of *mood*; the conjunctive taking the place of the present, the optative of the past tense.

239. (*b*) *That, as used in exposition.*—In phrases like *he said—he told me—he promised—he swore—he prophesied—he wished that*, &c., what is the import of the word *that?* We can only answer this when we know what follows. This, however long the clause may be (and it may amount to a long speech), is indicated, anticipated, or foreshadowed, in the word *that*, which contains it all implicitly, and by anticipation.

240. From this point of view *that* is still a pronoun. It means *what follows.*

241. There are two ways of exhibiting this. We may say either—*He said that A. said, that such or such things happened or would happen*, &c.

Or, we may say—*He spoke thus*—the continuation being a speech separate from and independent of the previous clause.

In the former of these two processes the two clauses are much more closely connected with one another than they are in the latter, and *that* is much more of a conjunction, or binding link.

242. No distinction is better understood than this; but the names that convey the difference are more Latin than English.

243. When we say *he spoke thus*, &c., the speech is *direct.*

244. When we say *he said that*, &c., the speech is *oblique.*

245. The *obliqua oratio* is the Latin name for the latter; and in the Latin language the text of the matter of the speech is continued in the infinitive mood of the

verb and the accusative case of the noun. When the speech is *direct*, a new and independent clause begins; and no conjunctive link appears.

246. It is as the connecting link in the *obliqua oratio* that the English pronoun *that* has its application as a *conjunction.* In Latin there is *an expansion of the fundamental proposition*—not a *second* one.

247. *Than* and *but.*—The power of *than* is *comparative.* *But*, implying an objection, or exception, is *adversative.* Their construction is ambiguous.

248. No conjunction governs a case. When a word governs a case, be it ever so like a conjunction, it is not one in reality. It is a preposition.

Than follows adjectives and adverbs of the comparative degree; as *this is better than that.*

Than is, in respect to its etymology, neither more nor less than *then.* It is not difficult to see the connection in sense between such sentences as *I like this better than I like that*, and *I like this—then* (*afterwards* or *next in order*) *I like that.*

Than is sometimes treated as a preposition when it governs a case.

(1.) *I like you better than he = I like you better than he likes you.* (2.) *I like you better than him = I like you better than I like him.*

> Thou art a girl as much fairer than *her*
> As he was a poet sublimer than *me.*—*Prior.*
> You are a much greater loser than me.—*Swift.*

But, in its origin, is *be = utan = by out.* In sentences such as *they all ran away but me*, the construction is *prepositional*, and *but = except.* In *they all ran away but I*, the construction is *conjunctional*, and *but I = I did not.*

249. The conjunctions of which the syntax is the

simplest, and those that are most decidedly separated from the prepositions which they connect, are *because* and *therefore*.

(1)
The day is warm;
because
The sun shines.

(2)
The sun shines
therefore
The day will be warm.

Because is causal; *therefore* the illative conjunction.

250. *The Concord of Persons.*—A difficulty that occurs frequently in the Latin language is rare in English. In expressions like *ego et ille*, followed by a verb, there arises a question as to the person in which that verb shall be used. Is it to be in the first person, in order to agree with *ego*, or in the *third*, in order to agree with *ille*? For the sake of laying down a rule upon these and similar points, the classical grammarians arrange the persons (as they do the genders) according to their *dignity*, making the verb agree with the most *worthy*. In respect to persons, the first is more worthy than the second, and the second more worthy than the third. Hence, they said—

Ego et *Balbus sustulimus* manus.
Tu et *Balbus sustulistis* manus.

Now, in English, the plural form is the same for all three persons. Hence we say, *I and you are friends; you and I are friends, I and he are friends*, &c.; so that, for the practice of language, the question as to the relative dignity of the three persons is a matter of indifference. Nevertheless, it *may* occur even in English. Whenever two or more pronouns of different persons,

and of the *singular* number, follow each other *disjunctively*, the question of concord arises. *I or you,—you or he,—he or I.* I believe that, in these cases, the rule is as follows:—

1. Whenever the word *either* or *neither* precedes the pronouns, the verb is in the third person. *Either you or I is in the wrong—neither you nor I is in the wrong.* In this case *either* is a pronoun, and means *one of us two.*

2. Whenever the disjunctive is simple, *i.e.* unaccompanied with the word *either* or *neither*, the verb agrees with the *first* of the two pronouns.

I or *he am* in the wrong.
He or *I is* in the wrong.
Thou or *he art* in the wrong.
He or *thou is* in the wrong.

THE ANTECEDENT AND ITS RELATIVE.

251. *The Concords.—Relative* and *antecedent* are words of which either one implies the other. There is no relative without an antecedent; and no antecedent without a relative.

As the relative, in respect to its import, is simply the antecedent under another name, the two words must be of the same gender and the same number; so that *gender* and *number* are the two concords of the relative and the antecedent. In these they *must* agree.

In the matter of *case*, however, there is no such necessary agreement; for the man or woman, the person or thing, or the men or women, &c., that are agents in one clause may be the objects of the action in the other. In 'I trust *John*'—*John* is the object. In '*John* trusts me'—*John* is the agent.

The antecedent naturally precedes the relative; for without knowing what the antecedent means, we have

no knowledge as to the import of the relative. When this is the case, and the propositions to which each respectively belongs are kept separated, the construction is plain and simple; as

The man is coming;
Who brings the letters.

To show that *who* means *the man*, we may, if we please, write

The man is coming.
He brings the letters.

Or

The man is coming.
The (*same*) man brings the letters.

The result is the same. There are two actions and one agent. Instead, however, of naming the agent twice, we use a word that *relates* to him.

All this is clear. Nevertheless, it is well known that although sentences, like the one just given, are easily constructed, they are, by no means, very common in the actual course of language; wherein few persons keep the two propositions separate. On the contrary they blend them together, and say *the man who brings the letters is coming*. This, although it adds a little to the complexity, ought not to create a difficulty. A little consideration tells us that we may say—

1. The man is coming; the man brings the letters; *or*,
2. The man is coming; he brings the letters; *or*,
3. The man is coming; who brings the letters; *or*,
4. The man [who brings the letters] is coming.

The relative here means the same as the antecedent, and is only the antecedent under another form.

252. *Attraction.*—This is a term of the same kind as

ellipsis and *pleonasm*; for it is a name of one of those processes by which the ordinary rules for the concords are disturbed; and a name of sufficient importance to require a special notice. Though attraction plays a part in the explanation of certain irregular constructions in English, the English is not the best language for explaining its nature and operation. A familiar example will best illustrate it. The Greek for *I use* is χρῶμαι; for *book*, βιβλίον; for which—ους is the dative, and α the accusative plural. For *I have* the Greek is ἔχω. But χρῶμαι governs a dative case, ἔχω an accusative. In what case then will the relative pronoun *which* be when we translate *I use the books which I have?* The answer is plain. It will be in the case which is governed by the word corresponding with *have*, and *not* in that which is governed by the word corresponding with use. Hence the translation should be χρῶμαι βιβλίοις ἃ ἔχω. Instead of this, however, it is χρῶμαι βιβλίοις οἷς ἔχω. But the disturbance is readily referred to its cause.

The regimen, or government, of the antecedent extends itself to, or *attracts* the relative. And that very naturally, inasmuch as the relative and the antecedent equally apply to the same object.

253. Along with attraction we should consider two other points in the syntax of the relative pronoun.

The extent to which the relative in some cases, and the antecedent in others, may be omitted; as

1. *Who* steals my purse, steals trash.

Here the construction in full is *he who steals*. In the text, however, the antecedent *he* is omitted.

2. The man I want is come.

Here the construction in full is *the man whom I want.* In the text, however, the relative *whom* is omitted.

254. Between the two influences of attraction and omission we get several well-known instances of very doubtful grammar in some of our best authors: especially in the *obliqua oratio*, and in questions. Thus in

Ques.: Whom do you say that they seek?
Ans.: I say that they seek *him.*

Here *him* is governed by *seek*, and is properly and correctly in the objective case.

Again,

Ques.: Who do you say that John is?
Ans.: I say that John is *he*, &c.

Here *he* is in the same case as *John*, i.e. the nominative; for though *is* be a verb, it is not one that governs a noun in the objective case.

Nevertheless we have as actual texts—

And he axed hem and seide, *whom* seien the people that I am? Thei answereden and seiden, Jon Baptist—and he seide to hem, but whom seien ye that I am?

Wycliffe, *Luke* ix.

Tell me in sadness *whom* she is you love.

Romeo and Juliet, i. 1.

And as John fulfilled his course, he said, *whom* think ye that I am?—Acts xiii. 25.

Again, in sentences like the following, wherein we find both the relative and the antecedent, the construction is strictly correct.

He whom I accused has by this time entered the city gates.
It is better to leave something undone, than to acquire fame when *he whom* we serve is away.

Here both the relative and the antecedent are in full. By ejecting one of them we get

He [*whom*] I accuse has entered, &c.
Better to leave undone when he [*whom*] we serve is away.
[He] *whom* I accuse has by this time, &c.
Better, &c. acquire fame when *whom* we serve is away.

The real texts, however, as they stand in Shakspeare, are—

Him I accuse, by this
The city ports has entered.
Shakspeare, *Coriolanus*, v. 5.

Better to leave undone
Than to acquire when *him* we serve 's away.
Id. *Antony and Cleopatra.*

In

Satan, than *whom*
None higher sat,
Paradise Lost,

strict grammar requires *who:* inasmuch as *who* = *Satan*, and *Satan* sat so high that no one sat above him.

THE AFFIRMATIVE AND NEGATIVE PARTICLES— *YES* AND *NO.*

255. *Yes* and *No* are, perhaps, words sufficiently peculiar to justify us in making them a separate part of speech; for it may be observed that, unlike any word hitherto noticed, they constitute a whole proposition by themselves. *Yes* = *It is*, while *No* = *It is not.* At the same time they depend upon what has preceded; for unless a question has been asked, how is an answer to be given? There is nothing to reply to.

256. When the copula precedes the predicate, the question is *categorical*, and its answer is *Yes* or *No.* Question: *Is John at home?* Answer: *Yes* or *No*, as the case may be.

257. When the predicate precedes the copula, the question is *indefinite*, and the answer may be anything whatever. To *where is John?* we may answer *at home, abroad, in the garden, in London, I do not know*, &c. &c.

258. It is only the categorical answers that can, *by themselves*, constitute a proposition.

Have you done this?—*Yes.*
Have you done this?—*No.*

259. In all sentences containing the statement of a reciprocal or mutual action there are in reality two assertions: one that A. *strikes* (or *loves*) B.; and another that B. *strikes* (or *loves*) A. Hence, if the expression exactly coincided with the fact signified, there would always be two full propositions. This, however, is not the habit of language. Hence arises a more compendious form of expression, giving origin to an ellipsis of a peculiar kind. Phrases like *Eteocles and Polynices killed each other* are elliptic, for *Eteocles and Polynices killed each the other.* Here the second proposition expands and explains the first, whilst the first supplies the verb to the second; so that each clause is elliptic. The first is without the object, the second without the verb. That the verb must be in the plural number, that one of the nouns must be in the nominative case, and the other in the objective, is self-evident from the structure of the sentence.

This is the syntax. As to the power of the words *each* and *one*, I am not prepared to say that in the common practice of the English language there is any distinction between them. A distinction, however, if it

existed, would give precision to our language. Where two persons performed a reciprocal action, the expression might be, *one another*; as *Eteocles and Polynices killed one another*. Where *more than two* persons are engaged on each side of a reciprocal action, the expression might be *each other*; as, *the ten champions praised each other*. This amount of perspicuity is attained, by different processes, in the French, Spanish, and Scandinavian languages.

(1.) French.—*Ils* (*i.e.* A. and B.) *se battaient—l'un l'autre. Ils* (A. B. C.) *se battaient—les uns les autres.*

(2.) In Spanish, *uno otro = l'un l'autre*, and *unos otros = les uns les autres.*

(3.) Danish.—*Hin*ander = the French *l'un l'autre*: whilst *hverandre = les uns les autres.*

SYNTAX—COMPOSITION.

260. *Composition* is the joining together of two different words so as to form a single one.

261. In determining the difference between two separate words and two words united as a compound, the *accent* plays an important part.

Compare such a word as *blúe-bottle* in the combination *blúe-bottle fly*, or such a one as *blúe-stocking = a learned female*, with *blúe bóttle* and *blúe stócking* as separate words. Compare, also, *bláck-bírd*, meaning *a bird that is black*, with *bláckbird* the Latin *merula*; or *blúe béll*, meaning a *bell that is blue*, with *blúebell*, the flower. Expressions like a *shárp, édged instrument*, meaning *an instrument that is sharp and has edges*, as opposed to a *shárp-edged instrument*, meaning *an instrument with sharp edges*, further exemplify this difference. Subject to a

few exceptions, it may be laid down that, in the English language, *there is no composition unless there be either a change of form or a change of accent.*

262. *Differences of meaning.*—In *a red house*, each word preserves its natural and original meaning, and the statement suggested by the term is *that a house is red.* By a parity of reasoning, *a mad house* should mean a *house that is mad;* and provided that each word retain its natural meaning and its natural accent, such is the fact. Let a *house* mean, as it often does, a *family.* Then the phrase, *a mad house*, means that the house or *family is mad*, just as *a red house* means that the *house is red.* Such, however, is not the current meaning of the word. Every one knows that *a mad house* means *a house for mad men;* in this case it is treated as a compound word, and has a decided accent on the first syllable. Compared, then, with such words as *red house*, meaning a house of a *red colour*, and compared with such words as *mad house*, meaning a *deranged family*, the word, in its common sense, expresses a *compound* idea, as opposed to *two* ideas. Such is the commentary upon *treating the combination as a single term;* or, in other words, such is the difference between a *compound* word and *two* words.

263. *Order of elements.*—In compound words it is the *first* term that defines or particularises the *second.* A *tree-rose* is a *rose*, a *rose-tree* is a *tree*, of a particular sort. A *ground-nut* is a *nut* particularised by growing in the ground. A *nut-ground* is a *ground* particularised by producing nuts. A *finger-ring*, as distinguished from *ear-rings* and from *rings* in general, is a *ring* for the *finger.* A *ring-finger*, as distinguished from *fore-fingers* and from *fingers* in general, is a *finger* whereon *rings* are worn.

264. *Third element in compounds.*—It is clear that in every compound there are *two* parts, *i.e.* the whole or part of the original, and the whole or part of the superadded, word. Are there ever *more* than two? Yes. There is, sometimes, a third element, viz. a vowel, consonant, or syllable, that joins the first word with the second. In the older forms of all the German languages the presence of this third element was the rule rather than the exception. In the present English it exists in but few words; and that doubtfully.

(*a*) The *-a-* in *black-a-moor* is possibly such a connecting element.

(*b*) The *-in-* in *night-in-gale* is, perhaps, one also. Compare the German form *nacht-i-gall*, and remember the tendency of vowels to take the sound of *-ng* before *g*.

(*c*) The *-s-* in words like *Thur-s-day*, *hunt-s-man*, may be the same; but it may also be the sign of the possessive case.

265. *Compound radicals.*—Words like *midshipman*, *gentlemanlike*, &c., must be treated as formations from a compound radical, and analysed thus—*mid-ship-man*, *gentleman-like*.

266. The classification of compounds in respect to their *form* begins with the two extremes.

At one end they pass into the ordinary combinations of the rules of concord and government between two separate words in syntax—as *Thursday* = *Thoris dies* = *Thor's day*.

At the other they pass into derivatives; as in the case of *manly*, as opposed to *manlike*. There is no such single word as *-ly*. But we know that it is only *like* in a newer form. This leads us to Etymology; or the grammar of single words.

GRAMMAR OF SINGLE WORDS.

267. In the first division of English compounds, *both* the elements are either nouns or verbs; in other words, they belong to the *inflected* parts of speech. In the second, one of them is either an adverb or a preposition; in other words, they belong to the *un*inflected parts of speech, and are often classed as *Particles.*

268. To the first division belong—

Substantives preceded by substantives; as *day-star, sea-man, moonlight, watch-house, fir-tree,* &c.

Substantives preceded by adjectives; as *blind-worm, free-man, half-penny, black-thorn, quicksilver, holiday,* &c.

Adjectives preceded by substantives; as *sin-ful, blood-red, coal-black, footsore.*

Substantives preceded by verbs; as *turn-spit, spit-fire, sing-song, turn-coat.*

269. This is nearly as much as can be said in a short work like the present, for the place of the verb in composition is often ambiguous. Thus in words like *turning-lathe* and *sawing-mill,* the affix *-ing* is common to both the present participle and the verbal abstract. In *all-seeing, all-ruling, fast-sailing,* where the participial character of the termination *-ing* is less equivocal, the adjective which precedes it, to say the least, is adverbial in import. In *fruit-bearing, music-making,* the association of a true participle with a true substantive is undoubted. In *man-eater, kid-napper, horn-blower, lamp-lighter,* where we have the name of an agent, the combination is that of the *verbal* rather than the *verb.*

270. In fact, true verbs, as distinct from the participle and the verbal, rarely enter into composition. In the foregoing list there are no such words as *man-eat,*

horn-blow, and *lamp-light*; though there is such a verb as *kidnap*. How this exception arises, we need not here inquire: indeed, it is only in its general principles that the rule itself can be noticed.

271. There are no such verbs as *man-eat* and *horn-blower*, though there *are* such substantives as *man-eater* and *horn-blower*. Moreover, there are no such verbs as *mop-head*, *chicken-heart*, and *cold-blood*, though there are such participles, or participial adjectives, as *mop-headed*, *chicken-hearted*, and *cold-blooded*. We see our way to this when we remember that every object in nature to which a *heart*, a *head*, or anything that can bear a name, belongs, is an object which is *endued with* the same. In other words, it is *hearted* or *headed*, and the like. When these *hearts*, *heads*, or whatever they may be, are of an exceptional or peculiar character, they attract attention, and their character is indicated by a prefix. If a man has merely *blood*, *a heart* or *a head*, we take no special notice of it; and there is no need for such forms as *blooded*, *hearted* or *headed*. But if the *blood* be over-hot, or over-cold, or if the *head* and *heart* have anything remarkable about them, combinations like *hot-blooded*, *mop-headed*, and *cold-hearted* are the result.

272. The *simple* substances that can thus be invested with a participial character are but few—so few that it has been doubted whether they are any at all. A well-known instance of these doubtful participials is the word *talented*, which has mainly been condemned on the authority of Coleridge, who contemptuously compared it with such impossible words as *shillinged*, or *guineaed*. He would have dealt more fairly with his hearers had he compared it with such words as *monied* and *landed*, in such combinations as *a monied man* and *the landed interest*.

273. The composition of the uninflected parts of speech, or the class that contains the adverbs, prepositions, and conjunctions, is conveniently called that of the *particles*—these particles being of two kinds: inseparable, like the *a* in *a-bide*, or the *un* in *un-untrue*; and separable, like the *out* in *out-break* and the *over* in *over-throw*. In the second division occur numerous equivocal compositions; it being often doubtful whether we have a compound or merely two separate words in ordinary grammatical contact.

274. Of the inseparable elements the following more especially claim notice: inasmuch as they are abbreviations of words originally fuller in form and more definite in meaning.

275. The single sound *a* represents no less than seven different words. Of these the two that have undergone the greatest amount of abbreviation are the prefixes in (1) *a-long* and (2) *a-bide*.

(1.) The fuller forms of the *a* in *along* were *and* in the Anglo-Saxon; *ent-* in the present German; and *anda* in the Mœsogothic. Word for word it is the Greek *ἀντὶ*, Latin *ante*. Its meaning in the German languages was *back*. It is the *a* in *a-cknowledge* (in Old Saxon *ant-kennian*) and *an-swers* (A.S. *andswarian*).

A, however, is not the only form which this original *anda* assumes. Nor is it the commonest. It is, also, the original of the numerous compounds in *un-*, *un-bind*, *un-lock*, *un-ready*, &c.

(2.) The fuller forms of the *a-* in *a-bide* were *-er* and *-ur* in the German, and the stronger form *-us* in Mœsogothic. Its meaning was *away*, *from*.

(3.) The oldest form of the *a-* in *a-ught* was the *aiv-* in the Mœsogothic.

(4, 5.) Of the *a* in *a-down* and the *a-* in *a-gain*, the respective originals are *of* and *an* (*on*): *of-dune*, *on-gegen*.

(6.) The older form of *twit* = *reproach* was *ed-witan*; the *d* being part of the prefix, and *not* a part of the verb. Of this prefix *ed* or *æt*, the meaning was *back*.

(7.) The *a-* in *a-like*, *a-among*, *a-ware*, is generally considered to represent the Old English and German *ge-* of *g-leich*, *ge-wahr*, *ge-wiss* (in English *iwiss*). The *e-* in *enough* is the same word—German *genug*.

276. Of *be-* as a prefix the *import* is various; as may be seen from such words as *be-smear*, *be-speak*, *be-head*, *be-friend*, &c. As a *word* it is the preposition *by*, of which the older form was *big*.

277. The *fore* in words like *fore-tell*, *fore-father*, &c. explains itself. The *for* in *for-swear*, *for-lorn*, is the *ver-* of *verloren* in German, and *faur* or *fair* in Mœsogothic.

278. The *mis* in *mis-chief* and *mis-chance* is *not* the *mis* in *a-miss* and *mis-deed*. The first is the French *mes-* from the Latin *minus*—*mes-chef*; *mes-chaunce*. The second is the Mœsogothic *missa*.

279. The *with* in *with-hold*, &c. is a shortened form of *wiðer* = *back*, *again*, in German *wieder*.

280. It is easy to see that these two divisions of inseparable and separable particles graduate into one another. The former are words that have undergone much, the latter words that have undergone but little, change. But besides their history, we must also attend to their origin: remembering most especially that whatever applies to the combinations under present notice applies to the whole English language.

281. In *lamb-kin* and *lanc-et*, the syllables *-kin* and *-et* have the same power; both being *diminutive*. Yet

we cannot say either *lamb-et* or *lance-kin*. This is because the affix *-kin* is of German, the affix *-et* of Latin origin; *lamb* and *lance* being also German and Latin respectively. Compounds formed by mixing the two languages together are generally condemned as *hybrid*, or mongrel. Sometimes hybridism is excusable; sometimes indispensable. Still it should be avoided when avoidance is practicable.

282. There are, probably, more instances of hybridism connected with the two particles *in-* and *un-* than with any other dozen words in our language. Any one may see from a dictionary how numerous are the compounds beginning with these two prefixes, to which we may add those that begin with *en-*; which is simply *in-* as it presents itself in French. And this creates fresh criticism, for the spelling itself may be doubtful, and if each ambiguous word were discussed on its own merits, the bulk of our lexicons would be increased to an impracticable extent. Sometimes the same word has to be entered twice; a double entry being less inconvenient than an exposition of the reasons for the preference of the one mode of spelling to the other. But with all legitimate retrenchments the entries, under these two prefixes, are inordinately numerous.

283. Notwithstanding the great numbers of words that begin with the prefix *-in*, the word itself, as an English element in English compounds, is comparatively rare. It presents itself in its most unequivocal form in the word *in-ward*, which we may contrast with *out-ward*. Here its import is manifestly that of the ordinary preposition (or adverb), and nothing else. And so it is in *in-come*, *in-sight*, *in-land*, and others. In the vast majority, however, of the compounds with *in-* the sense

is *not* that of *inwardness*; and the word itself is not English. On the contrary, the language to which the *in* belongs is the Latin, the meaning of it in *most* cases that of the English *un-* (German *ent-*) in *un-true*, *un-safe*, &c.

However, even in Latin, the privative or negative import is not its only one. In words like *in-clude*, from *in-cludo* = *shut-in*, it *has* the English sense; whilst in words like *in-struct*, from *in-struo*, it has no very definite meaning at all, but is what is somewhat loosely called *intensive* or *augmentative*.

284. In compositione multiplicem vim habet, modo enim *intendit augetque*, ut *increpo*, *insono*; modo (idque sæpius) *negat privatque*, ut *insanus*, *ineptus*; modo *contra* significat, ut *insulto*; modo *intra*, ut *ingredior*; modo *intus*, ut *inædifico*, *inambulo*; modo *supra*, ut *immineo*.—*Facciolati*.

Of these six powers of *in-* we may neglect those that give an equivalent to *contra* and *supra*, and combine the two that coincide with *intro* and *intus*.

It is with these two (treated as one), and with these two only, that the English *in-* coincides. The *in-* in *in-ward* is the *in-* in *in-gredior*, *in-ambulo*, and *in-cludo*; but the *in-* in *in-cognitus* is not an '*in*' at all, but the '*un*' in *unknown*.

285. What applies to the Latin *in-* applies also to the French *en-*.

Moreover, though the *inclusive* power of both the English and the Latin *in-*, and the *negative* (or *privative*) power of the English *un-*, are pre-eminently clear, distinct, and intelligible, the so-called *intensive* (or *augmentative*) is more vague than precise. The compounds, however, in which it appears (especially as the French *en-*) are conspicuously numerous, so much so as to en-

gender in the mind of an uncritical writer the notion that it may be used anywhere.

'En, in composition, was used by our old authors more lavishly than now. Skelton appears to have wantoned in such compounds. In the very short space of six pages in Mr. Chalmers's edition of the Poets, the following occur, of which (as they have not been met with elsewhere) the bare enumeration must suffice; viz. *en*craumpish (*i.e. en*cramp), *en*sowk, *en*hack, *en*hard, *en*crisp, *en*galaxy, *en*lozenge, *en*pave, *en*vaut, *en*bullion, *en*glase, *en*crown, *en*tackle, *en*sand, *en*turf, *en*grape, *en*gush, *en*swymm, *en*silure (*en*silver), *en*glister, *en*verdure, *en*brethe, *en*beauty, *en*bud, *en*picture, *en*flore, *en*vive.—*Richardson.*

In this we have the key to its influence, its undue extension, and the confusion which it engendered between the three forms. It came to be used both in place and out of place; and a false precedent in spelling, one which still disfigures our orthography, has been the result; for traces of it still continue.

286. *In-*, then, is an English prefix only so far as it coincides with *in* of the Latin language, with the sense of *intro* and *intus; i.e.* the inclusive *in-*. And it may be added that, upon the whole, the particles of either Latin or French origin are much more numerous in composition than the English ones. Of these last *be-*, *miss-*, and *for-* (in *for-bear*) are the chief of the *inseparables;* of the *separables*, *fore-*, *in-*, *of-*, *over-*, *under-*, *thorough-* or *through-*, and *up-*. On the other hand, *dis-*, *ex-*, *in-*, *en-*, *per-*, *pre-*, *sub-*, *super-*, are equal to all the others put together, and are either directly Latin, or derived from the Latin, through the French.*

287. This leads us to the consideration of the composite character of our language. The mass of our words

* For the details of composition in general, and especially for that in which the participles play a part, see Dr. Morris's *Historical Outlines*, &c. pp. 324 and 327

does the same; but the mixture is more conspicuous, and presses itself more upon us, when we find elements from different languages packed-up together in the same word. Of course it is only in derivatives that we find them. A few instances from each class are sufficient in the way of illustration.

288. In *derivation* the termination *-ess* is one of the best. The sign of the feminine gender in the German family of languages is *-in*; as *G. fuchs = dog-fox*; *füchs-in = bitch-fox*. Word for word, this last is the English *vixen*, which passes for the only remnant of the old affix. It has been replaced by the French *-ess*, the older form of which was *-ice*, and the Latin *-ix*, as in *genitr-ix*, as opposed to *genit-or*. Most of the words to which it is appended are, undoubtedly, of Latin origin—as *duch-ess*, *peer-ess*, *mistr-ess*, and the like: indeed, however freely we call a female *lion* or *tiger* a *lion-ess* or a *tigr-ess*, we shrink from saying a *dog-ess* or a *fox-ess*. Yet, though our instincts save us from this, there are few who hesitate to say *shepherd-ess*. This means, though we avoid hybridism to a great extent, we do not altogether ignore it.

289. The consideration of hybridism brings into prominence the composite character of the English language, the Latin being the most important of its foreign elements; the word *Latin* meaning the *French* of Gaul as well as the Roman of Italy.

290. The oldest source of this is the Latin of the first, second, third, fourth, and fifth centuries, when Britain was a Roman province. *Eagle*, from *aquila* (probably), and *street* from *stratum* or *strata via* (certainly) belong to this period. So do *-chester = castra*, and *-coln = colonia*, as in Dor-*chester* and Lin-*coln*; but these are

proper rather than common names, so that the Latin of this (the *first*) period, consisting of few words of any kind, is not generally recognised as a division.

291. More important is the list of the next period. To this we may assign a long series of words connected with the diffusion of Christianity, such as *monachus* = *monk*, *monasterium* = *minster*, and more than a hundred others. *Church*, from *κυριάκη*, is Greek, but as it is introduced through the Latin, the Latin itself has to be analysed.

292. A Danish, Norse, or Scandinavian element is usually assigned to this period; *i.e.* the ninth, tenth, and eleventh centuries. It is a point, however, upon which a careful writer finds but little that he can assert with any confidence. That words common to the Norse and English are to be found by scores, and even hundreds, is certain; especially in the English of Northumberland or the parts between the Humber and the Forth. Some of these are rare in Germany, and some have not been found there at all. But it is one thing to show that an English word is Norse, and another to show that it is *not* German.

293. The best claim for a Norse element of any notable magnitude is to be found on our maps. Here we may contrast such forms as An-*caster* with Dor-*chester*, Orms-*kirk* with *Dun-church*, *Carl*-ton with *Charl*-ton, and the like. Still more important, especially in respect to their distribution, are the endings in *-by*, as *Spils-by*, *Thurl-by*, and more than five hundred others in Lincolnshire and Yorkshire (East and North Ridings) only.

294. With the Norman conquest began the introduction of the French element, and that on a large scale.

Here the remarks that applied to the analysis of the Latin of the second period apply still more closely. Over and above its Latin basis (itself to some extent decomposable) the French retained some words from the original Gallic, whilst, on the other hand, it adopted some from the intrusive German of the Franks. In both cases it had words which it might *re*-introduce into England. Of reputed Celtic origin are: *bag, barren, barter, barrator, barrel, basin, basket, bassinet, bonnet, bucket, boots, bran, brisket, button, chemise, cur, cart, clapper, dagger, dudgeon, gravel, gown, harness, marl, mitten, motley, osier, pot, posnet, rogue, ribbon, skein, tike.*—(Dr. Morris, *Historical Outlines of English Accidence.* Appendix i. p. 252.)

Of reputed German origin are: *bivouac, champion, carcanet, enamel, eschew, hauberk, marshal, quiver*—(*Ibid.*)

295. Concurrent with this came the numerous Latin and Greek words connected with the Logic and Theology of the schoolmen of the eleventh and twelfth centuries, and along with these not a few from the Arabic.

296. With the sixteenth century began the influence of the revival of classical literature. This brought with it words from *both* the classical languages *direct*, and the call for an enlarged vocabulary for the purposes of science favoured the predominance of the Greek. However, it is the Latin and French languages that have done the most in the development of hybridism; and the bearing of the composite structure of our language upon this point is the only matter upon which it has here been necessary to enlarge. There is mixture in the English language no doubt; but there is nothing like any transmutation of our speech, and no real impairment of its true German character.

297. This is the *historical* analysis of the elements of our language. But it is clear that there may be a *logical* analysis as well. Instead of arranging a group of words according to their *origin*, we may group them according to their *import*. Thus, so many may be the names of abstract ideas, so many may relate to the tenure of land, so many to war, so many to the Church, to chivalry, to agriculture, and what not. When these two classifications coincide (and it is well known that they do so to a great extent), we get not only so many natural classes, but an instrument of criticism in the history of the development of the language under notice.

298. There are few languages in which the coincidence of the meaning of a word with its origin is so conspicuous as it is in the English. In the Latin of the second period, the names are chiefly such words as *mynster*, *munuc*, *preost*, *mæsse*, *pistel* = *minster*, *monk*, *priest*, *mass*, *epistle*, connected with the introduction of Christianity, or the names of plants, esculent or medicinal, e.g. *fynel*, *feferfuge*, *minte*, *balsalm*, &c. = *fennel*, *feverfew*, *mint*, *balsam*, &c. Of French origin are the numerous names relating to the feudal system, to war and chivalry, to the courts of law and legal processes, to the chase, falconry, and the refinements of the table; *baron*, *count*, *chief*, *homage*, *estate*; *battle*, *lance*, *mail*, *challenge*, *lists*; *assize*, *court*, *attorney*, *damage*, *suit*; *chase*, *covert*, *forest*, *venison*; *falcon*, *merlin*; *beef*, *mutton*, *pork*, *veal*.

PREFACE.

THE present work is the '*Outline*' rather than the full exposition of the subject upon which it treats. And it is an outline of the *Method* of investigation rather than a collection of any specific results. Moreover, it is a work on General, or Developmental, rather than upon Comparative, Philology. In the latter branch of study there is no want of valuable works, and a fair amount of well authenticated and generally recognised details. In respect to the growth, development, and *à fortiori*, the origin and general character of Language, there are fewer works, fewer recognised facts, fewer trustworthy principles of criticism, and, not unnaturally, much more speculation.

The two principles which, in the present treatise, have carried the writer farthest are—(1.) That of beginning with the languages of the present time, and arguing from them backwards, *i.e.*, from the more familiar to the unfamiliar, from the more certain to the less uncertain. Theoretically, then, the best languages to begin with are those in the most advanced state of development; inasmuch as they have the longest history, and, as a rule, the greatest amount of material

for its investigation. The language, however, which everyone best understands is his own, whatever it may be: and this is really the starting-point in every philological investigation, either actual or possible. To an Englishman, the difference fortunately is unimportant, because his language is both the one which he knows best, and the one that belongs to the most advanced stage of development. It is, always, it may be said safer to argue in this way, *i.e.*, from the known to the unknown rather than *vice versâ*: and there is no doubt but that such is the case. There are degrees, however, in the danger or difficulty of reversing the process: and if there is one subject of human knowledge which is more dangerous and difficult to investigate *à priori* than another, that subject is the growth and origin of language.

(2.) The second point is the necessity of looking more closely to the idea than to the expression of it. The former is the thought itself, the latter the sounds by which it is communicated to the person spoken to. The thought is the same throughout all languages and in every stage of each. The manner, however, in which it clothes itself in words or syllables differs with the conditions of time and place. In a word like '*γέγραφα*' and a combination like '*I have written*,' the expression is different both in the form and the principle of its formation. But the idea is the same, *viz.*, that of a certain action done in time past, but continued in its actual or possible operation up to the time of speaking, or time present. In like manner the differences be-

tween one and more than one; between male and female; between time past, time present, and time future; between certainty and contingency; between being an agent and being an object in an action, are universal. Of the combinations of sounds that express them the name is Legion. With the idea, then, so far as we have a clear conception of its nature, we have a certainty and a unity; with the guise it may take in language we have any amount of variety.

In the familiar terms *Person*, *Voice*, *Number*, *Case*, *Tense*, *Gender* and *Mood*, we have these mental conceptions not only recognised as such, but classified, named, and defined, converted, so to say, into categories. The signs of them are their Inflections. What those are taken by themselves, is taught as Etymology; how they stand to one another, we learn from Syntax. Of these two divisions it is only the former that deals in single words. In Etymology, moreover, it is the chief questions which are connected with the Inflections. There are other details in this division besides these; but Inflection gives us the most important of them: and to see our way to the origin and structure of this is to get an adequate conception of the most difficult problem in Language, save and except the mysterious one of its earliest infancy and origin—and even this, when the general character of its later history is known, is no illegitimate subject of speculation.

That the vast majority of Inflections originated as separate and independent words, first combined as compounds, and subsequently modified in form, in import,

or in both, may safely be assumed as the dominant opinion; so that the extent to which they are reducible to elements of this kind is the leading question in the present investigation. These elements we are bound to seek, though we may fail to find them. Nor are our *data* wholly inadequate. There are three stages in the development of Language which are generally recognised, and for which we have three (perhaps four) current names—the *Analytic and Synthetic* represented, in different degrees of progress, by the languages of the Indo-European class, the *Agglutinate*, and the *Monosyllabic*. Any pretence to exhaust the *data* thus supplied is out of the question. A short general view of the characters of the three stages, with an exposition of the chief materials that serve for the illustration of each of them, and an occasional instance of an Inflection reduced, or shown to be reducible, to its elements, is as much as the writer, in a short work like the present, can attempt, and he doubts whether he could do much more in a larger one. It is with these limitations that he wishes his book, though it bears a somewhat ambitious title, to be read. It is to the principles of the processes by which languages are changed, rather than to the changes themselves, that he chiefly refers. In the way of detail he limits himself to those that may serve as examples or illustrations. These he selects as he best can; and when they either illustrate a rule, or explain a condition of thought, he makes much of them—sometimes, perhaps, too much. But this is about all that can be done safely.

CONTENTS.

PART I.

SYNTHESIS AND ANALYSIS—MATERIALS FOR THE STUDY OF THE SYNTHETIC AND ANALYTIC STAGES OF LANGUAGE—AGGLUTINATION—SELECTED MATERIALS FOR THE STUDY OF THIS STAGE —MONOSYLLABICISM—MATERIALS.

ADDENDUM.

In p. 34, § 94. The meaning of the Laplandic verb *lånom* is not given. It is in English *loose*, or *loosen*, Danish *lösè*, Greek λύω, Latin *luo* and *solvo*.

ANALYSIS AND SYNTHESIS.

PART I.

SYNTHESIS AND ANALYSIS—MATERIALS FOR THE STUDY OF THE SYNTHETIC AND ANALYTIC STAGES OF LANGUAGE — AGGLUTINATION — SELECTED MATERIALS FOR THE STUDY OF THIS STAGE—MONOSYLLABICISM—MATERIALS.

SECTION I.

ANALYSIS AND SYNTHESIS.—INFLECTION.

§ 1. We know what is meant by the Numbers, Cases, and Genders of the Latin Nouns; we know what is meant by the Voices, Moods, Tenses, and Persons of their Verbs; and, finally, we know that all our examples of these parts of speech, and their like, are *single* words as '*homini*,' '*hominibus*,' '*scripseram*,' and dozens of others. Yet every one of these single words, when we translate it into English, requires more words than one to render it intelligibly; *e.g.* for '*homini*' we must say '*to (a) man*'; for '*hominibus*,' '*to men*'; for '*scripseram*,' '*I had written*'; and so on through a large portion of the grammar. Nevertheless, there is no part of the words '*homini*' and '*hominibus*' that exactly translates the preposition '*to*;' neither is there any syllable in words like '*scripseram*' which translates '*had*.'

§ 2. Yet we know what we are doing; and we understand the import of the difference. We know that, though

in *form* the two modes of expression may be widely different from one another, they are absolutely identical in meaning, and that they both convey the same idea, though the language in which it is clothed may be different. In short, the Latin expresses by single words what the English expresses by the combination of more words than one. In Latin, the Nouns have more Cases than we have in English; and, for those signs of Case which are wanting, the English substitutes a Preposition. In Latin, the Verbs, moreover, have more Tenses than the English; and, for those signs of Tense that are wanting with us, we substitute certain words—'*be*,' '*am*,' '*have*'—and these are called Auxiliars, or Auxiliary Verbs.

§ 3. The system of the Numbers, Genders, and Cases of Nouns, is called *Declension*; and Nouns are said to be *declined*. That of Voices, Moods, Tenses, Numbers, and Persons with Verbs, is called *Conjugation*; and Verbs are said to be *conjugated*. The Conjugation of the Verb and the Declension of the Noun are called *Inflections*; so that both Nouns and Verbs are *inflected*.

§ 4. There is a great deal more inflection in Latin than there is in English, and there are many more combinations like '*I have written*' in English than there are in Latin. In fact, the two forms, or the two modes of expression, are in the inverse ratio to one another. Yet one form, by no means, excludes the other. The Romans said '*scripturus sum*' ='*I am about to write*': we say '*father's*,' just as the Romans said '*patris*.' We also say, concurrently, '*of (a) father*,' and sometimes use one form, sometimes another. It is doubtful, however, whether the meaning is exactly the same in both cases, or rather it is certain that it is not so. Still, roughly speaking, the forms may be said to correspond with one another. But be this as it may, it is certain that single forms like '*patris*' and '*scripseram*' are inflections, and that combinations like '*of a father*' and '*I had written*' are not.

§ 5. Such is the general view. It is probably a loose,

probably, an incomplete one. I believe, however, that the best way of amending it is to give a minute analysis of a single sentence. When Pontius Pilate said ὃ γέγραφα, γέγραφα, he meant something different from what would be conveyed by ὃ ἔγραψα, ἔγραψα. This last combination would have implied simply '*I wrote.*' The reduplicate form, which is Perfect and not Aorist, means a great deal more; viz.. not only a recognition of the fact that he *had* written something, but that what he wrote had a *present* application of some kind or other: possibly to the effect that he would not write again; possibly to the effect that he meant to hold by what he had written. The act of writing was past; the determination was present; the result of it was future. It was all this because, instead of using the Aorist, he used the Perfect (*præteritum perfectum*).

§ 6. So much for the tense. But the sign of it—the reduplicate γε—must also be noticed. The farther we go in the present researches the more clearly we shall see that in the expression of ideas wherein the repetition of an act, the plurality of an object, or the continuance of a state is an element, the repetition of either the whole word or a part of it is one of the first resources to which, in the earlier stages of language, the speaker resorts; indeed, it is so common that it seems as if it were the first contrivance that presented itself. No wonder, then, that in a tense like the Greek Perfect, where an action done in past time crops up (so to say) and reproduces itself in the present, the sign of it should be a reduplication.

§ 7. In Greek it stands in strong contrast to the Aorist, as we have seen. In Latin the line of demarcation becomes fainter; and, in English, the expression of the ideas conveyed by single words in a definite tense, like γέγραφα and others, is simply impossible. There are no such tenses.

§ 8. But there is something equivalent to them; indeed, there is an admirable substitute. But it is a circumlocution. The translation of γέγραφα is *I have written*—three words

for one; an Analytic sentence instead of a Synthetic tense. This is a great change; and we cannot be too methodical or minute in our investigation of its nature. Let us, therefore, begin with ascertaining, in due order, the exact details of (1) the Meaning of the word *have*; (2) its Regimen, or Government; (3) the Concord; and (4) the Collocation of the whole sentence.

(1) *Have* means *hold*, *possess*, *own*, and the like; and where there are *holders*, *possessors*, or *owners*, of anything, there must be something that is *held*, *possessed*, or *owned*.

(2) Such being the case, it is an *Active* or *Transitive* Verb; so that the Noun which it governs must be in the Accusative Case.

(3) With this Noun any word in apposition to it must agree; and, so doing, must also be in the Accusative Case.

(4) In respect to the collocation, the Adjective in English generally precedes its Substantive: as *a good man*. But by a very slight change in the structure and an extension of the clause this order may be reversed; as *a man good and wise*. In all these cases it must be remembered that the syntax of the adjective is that of the passive participle as well.

§ 9. All this is, probably, not only intelligible, but self-evident. Nevertheless, in the combination under notice, every one of the statements must be taken with a qualification.

1. There are certain nouns incapable of being governed; in other words, there are certain nouns which only combine with an *in*-transitive verb. All words expressive of the manner in which a thing is done are of this kind, *e.g. mile*, *hour*, and the like; and, what is more, such expressions as '*I have ridden a mile*,' or '*I have talked an hour*,' are legitimate. We cannot, however, be said to *possess* either *miles* or *hours*. If so, where is the active, transitive, or governing power?

2. Again, the concord between the participle and its noun in the way of *gender*, is not quite so simple as it appears to be.

In English, indeed, its true nature is of no practical importance; inasmuch as the participles, like the adjectives, have dropped their signs of gender altogether. But there was a time when they had them; so that theoretically the question as to the Concord presents itself. What would it be in English, supposing that, in English, we had two, or even three, signs of gender for the Accusative Case? The answer that first suggests itself, of course, that in '*I have ridden a horse*' it is masculine, and in '*I have ridden a mare*' it is feminine.

This *may* be the case: but it is not so necessarily. The commoner concord is that of such sentences as '*Triste lupus stabulis*'=the '*wolf is a bad thing for the folds.*' If so, '*habeo equam equitatum=I have ridden a mare*' is as good as '*habeo equam equitatam*;' and even in '*habeo equum equitatum*,' the '*-um*' is not masculine, but neuter.

3. Thirdly; the adjective, as a general rule, precedes the substantive it agrees with; and the same rule applies to the participle, *I have a black horse, I have a white mare.* Yet this is *not* the collocation in *I have ridden a horse.*

§ 10. But the explanation of these anomalies is easy; especially that of the third and second, which are closely connected with one another. In *habeo equam equitatum* the *-um* is not masculine, but neuter; and the noun it agrees with is not the word *equam*, but some word meaning *thing* or *object*, which is understood. Hence, the translation is *I have a mare* (*as*) *a ridden* (*thing*); and, as this is the concord, the participle is in its proper place.

§ 11. The first anomaly is somewhat more perplexing; and in some languages it is, to a certain extent, avoided. In English we say *I have been*; whilst *J'ai été* is what the French say, and *Jeg har varet* what the Danes say. But the Italians and the Germans, though with other participles they agree with the English, seem to shrink from using such an extreme form as *Io ho stato*, or *Ich habe gewesen* (*I have been*), and say '*Io sono stato*' and '*Ich bin gewesen* (*I am been*). Theoretically, the Germans and Italians are right;

yet, except in the case of the participle of the Verb Substantive, they do just as we do; and just like us follow a natural tendency: the tendency to stretch an analogy beyond its due bounds, and carry the influence of a legitimate precedent too far. We may call this *abusive*, or we may call it *catachrestic*; but, whatever be its name, the fact is both real and common. Out of natural combinations, like '*I have written a letter*,' *non*-natural ones, like '*I have spoken an hour*,' are constantly developed. In some languages the process goes farther than in others. In the English, Danish, and French, where it goes so far as the term for simple *being* or *existence*, it reaches its utmost limit.

§ 12. That the verb *have*, however much its full import may be disguised is, still the verb which translates the Latin *habeo*, *teneo*, or *possideo*, is manifest from the Spanish *tengo*, word for word, the Latin *teneo*, and from the Old German *eigan*, word for word, the English *own*, which are used concurrently with the ordinary '*have*.'

§ 13. Such is the sense or meaning of the combination, and such the principle that makes the relation between the two intelligible. What follows belongs to the *history* of the expression. A change in its application takes place; and it first shows itself in the Latin, in which language there is a confluence in meaning of the forms like *scripsi* and the forms like *momordi*. *Scripsi*, in Latin, means either '*I have written*,' or '*I wrote*;' and *momordi* either '*I have bitten*,' or '*I bit*;' so that the difference of import no longer coincides with a difference of form; as it does in the Greek ἔγραψα and γέγραφα.

§ 14. When this happens one of the two forms becomes superfluous, and, then, sooner or later, drops out of the language. The one that thus dies out is, almost invariably, the one represented by γέγραφα and *momordi*, i.e. the reduplicate perfect. Meanwhile the distinction in import, whether adequately or inadequately expressed, or whether not expressed at all, still exists.

§ 15. It exists in both Latin and English, but with a

difference. In English the forms like *swam*, *spoke*, and others, where the past tense is formed by a change of vowel, mean, in respect to time, exactly the same as those ending in *d* or *t*, as *moved*, *slept*, &c. &c., and there is only one meaning for each or both of them. That is the one of the Greek Aorist, *not* that of the Greek Perfect. In Latin each of the two forms *scripsi* and *momordi* can be used with either meaning; *scripsi* as '*I have written*,' or '*I wrote*,' and *momordi*, as '*I bit*,' or '*I have bitten.*' This being the case, the Analytic form in *have* has a different position in the two languages. In English it is pre-eminently common and conspicuous. In Latin it is exceptional, rare, perhaps rudimentary. '*Compertum habeo, milites, verba viris virtutem non addere*,' may be translated, '*I am in possession of a discovery*,' but it is, really, word for word, '*I have discovered.*' Even in Greek combinations like '*ἔχω γράψας=having written (something) I have it (now)*,' has the same import, and the same elements. There is a participle in the past tense, and a verb in the present. The former places the action and object with which it is connected in time gone by; the latter connects it with the time of the speaker's notification of it. When the participle is passive the past action is connected with the object (*ἔχω γεγραμμένον*), when active with the agent (*ἔχω γράψας*), i.e. '*I have—as a written thing=having written, I have.*'

§ 16. Why is '*have*' the particular verb which takes the place of the reduplication '*γε-*' in '*γέγραφα*,' and the like? We have already seen what it suggests, viz. *continuation represented by repetition.* In '*I have ridden a horse*' what does '*have*' govern? Undoubtedly '*horse.*' And what does '*have*' mean? Undoubtedly it means '*possess*,' or '*own.*' But what if the horse is *not* mine, and I am *not* the possessor, or owner, of it? Again: what is the notion of possession in *I have written a letter*'? I may, perhaps, *have* it in my hand, or *hold* it. If I do I, *pro tanto*, possess or have it. But I may have posted it, and possibly be willing to give

much to get it back. All this seems to be a long way from anything like possession or holdership. But it is connected with *me*, and, to that extent at least, is *mine*; and if at the time of speaking I connect myself with the object spoken about, I am, in some sense, an owner, or possessor, or holder. At any rate, I have an interest in it, and am connected with a part of the transactions appertaining to it. If it were not so, why should I speak about it?

§ 17. The horse was *ridden*, and the letter *written* at a time anterior to the time of speaking about it. Hence the time of the verb *have* is present, the time of participle which implies the action is *past*.

§ 18. Let us now look to the changes which the reduplicate form, like *γέγραφα*, has undergone, as a sign of the Tense. There are some who believe that originally the whole word was doubled, i.e. that the reduplication was really a repetition. There is certainly some ground for this view. But, at present, it is sufficient to take the ordinary Greek Perfect as we find it. This repeats the first consonant of the root, whatever that may be. It expands it into a syllable by suffixing *ε*— no matter what may be the vowel of the root.

If a word begin with *two* consonants it takes the first *only*. But this is not the case in Latin, where from *spondeo* they make *spo-spondi*. Nor is it so in Mœsogothic, where from *hlaipa* they make *hlai-hlaup*.

§ 19. All three languages sometimes change the vowel of the root—*δέρκω*, *δέδορκα*—*parco*, *peperci*, and *hlaipa*, *hlai-hlaup*, as we have seen. But this change of vowel probably arises from secondary causes.

§ 20. Thirdly, in Latin frequently, and still more frequently in Mœsogothic, the reduplication drops off; in which case the sign of the Perfect tense consists only in the change of vowel.

§ 21. As the language becomes more and more Analytic, the abandonment of the reduplication increases; but not that of the changed vowels. There are no reduplications in the

languages derived from the Latin: a mere vestige (the word *did* is the chief instance) remains in the languages of the German family.

§ 22. Concurrent with this change of form is a change of meaning. In Latin, words like *cu-curri* mean either '*I ran*,' or '*I have run*'; and words like *scripsi*, either '*I wrote*,' or '*I have written*'; and it is only from the context that we can tell, in the way of import, which is which.

§ 23. When Cæsar writes '*veni, vidi, vici*,' the reader who looks at the three propositions as they stand by themselves has two meanings to choose between; for so long as the text stands isolated, there is nothing to help him in his choice. Does Cæsar mean '*I have come, I have seen, I have conquered*,' or does he mean '*I came, I saw, I conquered*'? If the letter, or message, which contained these words had contained more; if it had given in extension his intentions in *coming*, *seeing*, or *conquering*, we might decide. If he means '*I have come, and have no intention of going*,' then *veni* has the sense of a Perfect; but if he means '*I came, and then went farther*,' the import is that of an Aorist. More than this—we have no warrant from the mere form that the three words are in the same predicament, inasmuch as one may be Perfect in sense, while the other two are Aorist, or *vice versâ*. The chances are that what applies to one applies to all; but it is by no means certain that such is the case. Compare, or rather contrast, this with the definitude and precision of the forms like γέγραφα and ἔγραψα.

§ 24. In English we go farther than they did in Latin. In Latin, each of the two forms had two meanings. In English, both words like *swam* (originally a Perfect) and words like *moved* (an Aorist) have only one meaning between them; and that is the meaning of the Aorist, or the *non*-reduplicate form.

§ 25. The Latin, as we have seen, lost in the way of definitude and precision by the ambiguity of each of its two Tenses; for though such combinations as '*compertum habeo*'

and '*satis dictum habeo*' existed, they existed only as rudiments of little influence or efficacy. In English, however, the Analytical combinations '*I have found*,' '*I have said*,' and the like, are among the commonest expressions of our language.

Nevertheless, the English sins on the side of redundancy. If forms like '*I moved*,' '*I called*,' are sufficient, what is the function of forms like '*I wrote*,' '*I swam*'? There are, as aforesaid, two forms, originally and really; two Tenses with only one meaning between them.

§ 26. But of this redundancy the language is relieving itself.

(*a*) No new word, or word of foreign origin, when it finds a place in English, forms its past tense by a change of vowel. It is never conjugated like *wrote*, &c., but always like *moved*, &c.

(*b*) When one of the two forms gives way to the other, and becomes obsolete, it is, as a rule, the form constructed by the change of vowel, *i.e.* the old Perfect, shorn of its reduplication. The changes in the other direction are rare; perhaps non-existent. When the last of these has become obsolete, the long line of the reduplicate Perfects, from words like γέγραφα downwards, will have come to its end, and the typical representative of the Synthetic system will have become abolished by the typical representative of Analysis.

§ 27. Such is our exposition of a single example of the difference between Analysis and Synthesis, and it cannot be denied that it has been a long, we may say a lengthy, one. But '*the whole is easier than the part*,' and I believe that the example selected is the best one that can be found. How much is there beyond it? Is it a mere fact in the history of three languages, or is it a part of a systematic whole? How far can we invest it with generality?

§ 28. The principle, in nearly all its details, holds good for all the languages of the *German* family.

The principle, with nearly all its details, holds good for all the languages of the *Latin* family.

The principle, as far as the history of the language goes, holds good for both the ancient and modern Greek.

But the history of the Greek is not so varied as that of the Latin class. There are no separate and independent languages that have grown out of the Greek, as the French, Italian, &c., have grown out of the Latin; and no such languages as those of England and Scandinavia, that are the near congeners of the German. In short, we get fewer *data* in Greek; and besides this, the *rate of change* has been slower.

§ 29. Of the Sanskrit on one side, and of the Lithuanic and Slavonic on the other, we may say that the first ends too soon, and that the last begins too late, to give us more than a single stage—or, at any rate, any series of changes—commensurate with the difference between either the Latin and the French, or the Mœsogothic and the English. There is no doubt upon this point in respect to the Lithuanic and the Slavonic. Respecting the Sanskrit, more will be said in the sequel.

§ 30. The *rate* at which languages change varies with the language; and it is very rarely that it is the same with two together. The languages in which the stability seems to be at its *maximum* are the Greek, the German, and the Icelandic. The literary Romaic seems to be much less altered from the classical Greek than it really is; but this is because it is written as much as possible on the classical models; and it is beyond all doubt that, by this artificial adaptation, the natural tendency to change, even in the spoken language, has been modified. Of the dialects our knowledge has, of late, been greatly increased; and it is certain that there is much to be learnt from them.

§ 31. The German of Germany, and to some extent of the Netherlands, is much in the condition in which it was nine

hundred years ago; *i.e.* its inflexion is almost identical with that of the Old Saxon of Westphalia, and the West-Saxon (Anglo-Saxon) of Wessex: and though less Synthetic than the Mœsogothic, which, itself, is far less so than the Latin, Greek, and Sanskrit, it appears more Synthetic than it is when compared with the present literary English. This is certainly not only the most Analytic language in the world, but the one in which the change has been the quickest.

§ 32. The same applies to the Icelandic as compared with its derivative, the (literary) Danish and Swedish. These, less Analytical than the English, are Analytical as compared with the Icelandic. This last, since the twelfth century, when its prose literature begins, has been but slightly changed; and the Icelandic of the newspapers of to-day is, practically, the Icelandic of the old classics, Snorro Sturleson, and the Saga writers. Between this and the somewhat earlier language of the Edda there is a slight difference; and, again, there are certain archaic forms peculiar to the Runic period; *i.e.* the time of the introduction of Christianity. These have a special value, inasmuch as they help us to connect the Norse with the Mœsogothic—the oldest specimens of the Scandinavian with the oldest specimens of the German proper, or Teutonic, group.

§ 33. Upon the special question as to the *Rate of Change*, and the conditions which seem to regulate it, far too little has been written. But the best contribution to it is Petersen's work upon the relations, as Analytic and Synthetic, between the old Norse language and the new; or the Icelandic and the Scandinavian of the Continent, *i.e.* the Swedish, Norwegian, and Danish.

§ 34. In these three countries a form of speech, which in the tenth century was certainly intelligible over the whole of Scandinavia, and which was always treated as a single language, seems to have preserved its original character in Iceland, the colony, rather than in Denmark and Sweden, the mother countries. With Norway the case was somewhat

different. However, in all three there was change; though in each at a different rate. It went upon the same principle, and affected the same inflections in the same way throughout. But it went on in Denmark quicker than it did in Sweden. Denmark, Petersen observes, seems always to have been a century in advance of (*i.e.* more Analytic) than Sweden; so that the condition of the Danish in (say) 1400 was, there or thereabouts, that of the Swedish in 1500, and so on throughout. Both, however, began to change early, *i.e.* before the date of the first specimens of their respective literatures.

§ 35. With Norway it was different. In Norway the oldest literature is Icelandic; though, in Norway, it is more usual to call it *The Old Norse*; and such it really is. It is in one well-known instance more archaic than the Norse of Iceland. And, as it began, so it continued; little altered until the end of the fifteenth century. Then, concurrently with the Reformation, it changes so rapidly that, in less than a century, it is as Analytic as its sisters of Denmark and Sweden.

§ 36. We now return. Along with the question of rate we must take that of *Continuity*; clearly understanding that this is not so much the actual continuity of the language itself (for this is essentially continuous), but the continuity of our knowledge of it; the continuity of the literature which embodies and fixes it; the continuity which tells us what it was up to such a time, and what it was after that time. If gaps in the evidence present themselves, though the language is as continuous as ever, our knowledge of it, except so far as it is inferential, is interrupted.

§ 37. Now actual continuity of the history of any language in detail from the date of its earliest record to the time of its investigator is rare. Where there is actual continuity the chances are that the history of the language is a short one: and in respect to the two great classes—the Greek and the Latin—it is easy to see that, during one period at least, a break of

some sort must present itself. With a language long recognised as the standard of speech, long known as the only exponent of a literature; a language that has for centuries been colloquial among the men of any intellectual cultivation; a language which from the very fact of it being written had, to a certain extent, fixed and established itself as national—with a language invested with such a prerogative as the concurrence of elements of this kind cannot fail to establish, no subordinate form of speech can well become fit for writing; or, if so fitted, be applied to the composition of any work of importance, any work likely to survive the generation, or even the writer, that composed it. It must itself be established before it is written; and before the time can come when this can take place a long series of unrecorded changes must be in operation, and something like a separate language be acknowledged.

We know not when these changes first made their influence definitely perceptible; still less when the earliest of them began. The germs of some of them—as in *compertum habeo*, &c., belonged to the parent language; possibly in its earlier stages. But for their full development time is needed; and during this period the change goes on silently, and the details of it are unrecorded. With the derivatives from the Latin this is self-evident.

§ 38. With the Greek it is somewhat different. The dialects of the Greek never developed themselves into separate and independent languages like the French, Spanish, Roumanian, and others; and, besides this, they were rarely written without some classical, semi-classical, or would-be-classical model in the mind of the writer. The Byzantine literature was continuous, no doubt; but its vernacular character is more than doubtful; and even to the standard Romaic, as it is written at present, the same objection applies. It is only in the true provincial dialects of Greece, its islands, and parts of Asia Minor, that the real growth of the language can be studied, and that but imperfectly.

§ 39. In the German family this want of continuity is not so great: nor is it so closely connected with the history of the language in general; but, at the very beginning there is a deplorable *hiatus* in the record; for the Mœsogothic stands by itself. The language was reduced to writing long before any other; and it was not upon German ground that the translation of the Gospels was produced. It is due to the influence of the Greek Church, and the alphabet was founded on the Greek. It was not till more than two centuries later that Christianity introduced the alphabet into either Germany or Britain: and the earliest records here are chiefly from Britain and Southern Germany. Neither of these is anything like identical with the other, and neither is what we look for as a lineal descendant of the Mœsogothic. The German resembles it the most in its structure, the British in its phonesis. There is a gap, then, in respect to both time and space—both date and locality.

§ 40. This leads us to another point of view. The history of a language may be continuous; but histories of its dialects may be different. One dialect may represent the language at one time, another at another. In Great Britain, the present literary English is that of the Midland dialects; but for the Midland dialects we have no record earlier than A.D. 1175, if so early. The literary language of King Alfred's time was the West-Saxon, or the English of Wessex. By A.D. 1400 it was all but superseded by the Midland forms of speech. Its history, since then, is that of the provincial dialects south of the Thames, especially those of Dorset, Somerset, Devon, and Wilts, where the old characteristics are best preserved, or rather the least lost. The Lowland Scotch, a cultivated language from the time of the first Stuarts, is a dialect of the great Northumbrian division. But it is only represented by small and doubtful fragments until the 14th century. Hence we find, for the language of England at large, *one* history; for its dialects (all of which, under different political and geographical conditions, might pass for different lan-

guages), *three*. There is continuity here; but it is continuity of an imperfect and *dis*continuous kind.

It may be continuous in respect to a language at large, or in a general way; but not continuous in respect to its several dialects. Nevertheless, even in respect to these, it has a continuity, as we expect *à priori*. But the *records* of it may be discontinuous; and this is the case when one dialect at one time is the literary language, and another at another. There are no *data* for the subsequent enquirer as to the language that has lost its prerogative. This is the case with no language more decidedly than our own. We know the West-Saxon up and down to a certain time; and that well, for it was the literary language of the times of Alfred and Edward the Confessor. Then a change comes over the whole language; we might say an eclipse. About A.D. 1200 the language revives, and it is only up to that time that we can trace the present literary English. But the language of Alfred is, at present, a provincial dialect; while the English of Macaulay is unknown in its exact form beyond (about) 1200, and the Scotch of Burns is but obscurely known till a century later. Yet both existed when the West-Saxon was the sole (or main) representative of the German of Britain; in other words, the English language. The record, then, of the *language*, is uniform; of its representative *dialects*, fragmentary.

§ 41. We now return to our old friend, the typically Synthetic form γέγραφα, and the class it represents. It is destined to be superseded by the Analytic combination *I have written*. A change must come upon it, and upon all words like it. What the change may be is another question. It is only certain that γέγραφα is the word upon which it *falls*, or has its *incidence*. The change itself, which is purely formal, is from one word to more than one, the import being *un*changed. This is the illustration of the term now under notice.

§ 42. How far are the same changes connected with the same forms? How far are the changes that so occur of the

same kind, and leading to the same results? Thirdly, how far, when there are many of them, and different in kind, do they fall upon the words they affect in anything like a regular sequence?

These are, manifestly, questions which would not be asked if they were not meant to be answered, to some extent, at least, in the affirmative. So far as the Latin and the German families are concerned, the synthetic forms that become analytic are, generally, the same in both, and the equivalents for them the same also. If it were not so, the explanation of such combinations of '*I have written*' and '*J'ai écrit*' would have been less conclusive than it is. The same applies to the *order*, or sequence of the changes.

§ 43. The synthetic forms which are first to change in the Latin family are likewise the first to do so in the German, and *vice versâ*; for it is not to be supposed that whole groups of words transform themselves at once, or in companies. This the comparison of Petersen, as to the differences in the changes between the Danish and the Swedish, well exemplifies. They not only change in the same way, but in the same order.

§ 44. It is not held that this rule is general, except we apply it with some latitude. The word '*have*' in Greek, Latin, Slavonic, and Lithuanic, is scarcely used as an auxiliary at all. Still the rule is, to a considerable extent, general.

§ 45. A fourth suggestion is less susceptible of either proof or disproof; viz., the doctrine that those inflections which are the last to be lost are the first to be developed. The presumption in favour of this view is their comparatively necessary or indispensable character. What we need most we are quick to acquire and slow to part with. It is manifestly impossible to prove this historically. All that can be said is that there is nothing against it, and that presumption is in its favour.

§ 46. But even if we are doubtful on this point, there is

something like certainty in regard to the others—so far, at least, as the evidence of a single family enlightens us.

§ 47. But the German is only one family out of five, and of these the Latin alone has, at least, as many derivative forms of speech as the German. It has the Italian, the Spanish, the Portuguese, the Roumanian, the Provençal, and the French, not to mention several dialects that may pass for languages.

§ 48. What do we learn from these? Much what we expect *à priori*; viz., illustrations of the same principle, with varieties in the way of detail.

§ 49. Upon one point, however, we must be on our guard, and remember, most especially, that the term '*old*' is an equivocal one. We may say that the French and Italian are so much Latin in a newer form, or that the Latin is the French or Italian in an older. We may say, instead of *newer* and *older*, *later* or *earlier*, more *modern* or more *ancient*. We generally, however, use the terms *old* and *new*. That there is a show of inaccuracy in the ordinary use of these words we know; for we know that the longer a language, like anything else, lasts, the older it grows; and the English and French were never so old as they are at the present moment. This, however, is not the use or abuse of the terms that we must now be cautioned against.

§ 50. It is beyond all doubt that the present German, in one sense of the word *old*, is not only older than the present English, but older than that of Chaucer and Wickliffe; older, indeed, than the English of the thirteenth century. Of course, in this sense there is but one meaning that can be assigned to the term. It must mean not not *aged* but *archaic*, or *old* in respect to structure rather than according to date. In the languages, moreover, which are at present under notice, *old* means more *Synthetic*, and less *Analytic*, while *new* means the contrary. The reason for this is evident. One language changes more rapidly than another; and the difference is a difference of *rate*.

§ 51. Even the familiar and important terms *Synthetic* and *Analytic* must be used with a certain amount of reservation. In strict language they are *correlative* terms, neither more nor less; one implying the other, and neither existing without its fellow. If so, a synthetic form without an analytical one to correspond, is as impossible as a relative without an antecedent, or *vice versâ*.

§ 52. It is not, then, every combination of *two* (or more) *words* with the import of *one* that gives an instance of Analysis. There must be a synthetic form to correspond. And here the meaning, or import, must correspond also. In this correspondence there are degrees. Tense for tense, and form for form, Latin words, like *mo-mordi* and *cu-curri*, answer to words like *γέγραφα* and *τέτυφα*. Yet *mo-mordi* is not so thoroughly and so completely the synthetic equivalent to *I have bitten*, as *γέγραφα* is to *I have written*. This is because the reduplicate tenses in Latin are not so thoroughly and completely Perfect in sense as they are in Greek. *Momordi* is translated both by '*I have written*' and '*I wrote*.' It cannot be denied, however, that '*I have written*' is synthetic. It has its correlative single-worded equivalent, and the meaning, though sometimes varying, is as often unvaried.

§ 53. Again, the combination, '*I am singing*,' translates '*canto*.' Nevertheless, it is not so thorough a substitution for this word as '*I have written*' is for '*γέγραφα*.' This is because it does not wholly eliminate the single-worded form from the language, for we still say '*I sing*.' The sense, however, is slightly different. '*I sing*' means that *I sing* habitually, rather than that '*I am now in the act of singing*.' In Latin, words like '*canto*' had both meanings. By saying '*sum in cantatione*,' or '*sum cantans*,' they might indicate the same distinction that we do. Combinations, however, like the first were rare, and those like the second rarer—if existent. Here, then, we have Synthesis and Analysis, but without the displacement, or supercession, of the one by the

other. Still '*I am singing*' may pass as an instance of Analysis.

§ 54. But though it be this, it is notorious that it is not very easily analysed. We know that it is made up out of two words; but whether these are to be translated '*sum cantans*' or '*sum in cantatione*' is a point upon which there is no unanimity of opinion.

§ 55. Again—'*I do sing*'—this is a form that no one would translate by '*facio*' (or '*ago*') '*cantare*,' but rather by '*canto*.' Yet, even when it is so translated, the combination is anything but analytic, and *canto* is manifestly synthetic. But '*I do sing*' and '*canto*' are not analytic and synthetic *to one another*, for they by no means coincide in import. In other words, there is no correlation between them. '*Canto*' tells us that the speaker is either singing when he tells you that he is doing so, or that he sings habitually. In *I do sing* the speaker merely states that he *does-not not-sing*. It implies a previous state of denial or doubt as to whether he sings or not, and as such is used emphatically, as if in reply and contradiction to some one who said he did *not*.

§ 56. The full name of the stage of language under notice is either *Synthetico-Analytic* or *Analytico-Synthetic*. However, when spoken of as such, and especially when compared with the terms '*Agglutinate*' and '*Monosyllabic*,' '*Agglutination*' and '*Monosyllabicism*,' it will simply be called '*Synthetic*,' and '*Syntheticism*' or '*Synthesis*.'

§ 57. *Analysis* by no means excludes *Synthesis*. Many forms of speech which, from the general amount of change that they have undergone, and from the undeniably analytical character of the majority of their phrases, may reasonably be called Analytic, preserve remains of their old and more original synthesis. This, however, only means that the change from the predominance of one form to that of another is not sudden, but gradual, a fact of which we only need to be reminded.

§ 58. More important than these are the Postpositive Article of the Norse and Roumanian languages, the so-called Passive Voice of the Norse, and the Futures (*parlero* =*parabolari habeo*=*I have to speak*=*loquar*) of the languages derived from the Latin. These have been actually constructed either within the Analytic period or during the more equivocal period of the transition. On these, more will be said in the sequel.

§ 59. It has manifestly been the *Inflectional* part of language which the foregoing criticism has most especially illustrated; for it is this which the system of Synthesis and Analysis best explains. It, of course, when explanation is needed, can be made to do much more than this; but the languages which have been referred to explain it better than all the other languages of the world put together. Moreover, it is only partially that even Inflection has been explained, inasmuch as next to nothing has been said as to what Inflection really is when considered *by itself*. All that *has* been said has been in respect to its connection with Analysis. What will soon follow will be the relation of the *Inflectional* system to that of the *Formatives*: and just as the *Synthetic* stage has illustrated the former, the *Agglutinative* stage will illustrate the latter.

§ 60. More, then, will be said upon the structure of the *Formatives* in the sequel. At present the difference between them is only indicated by a single instance. The *-mus* in both *voca-mus* and *vocit-amus* is *Inflectional*: the *-it-* in *voc-it-amus* is *Formative.*

Sub-Section II.

MATERIALS FOR THE SYNTHETIC AND ANALYTIC STAGE OF LANGUAGE.

§ 61. The forms of speech that illustrate this period are few, but very important. One and all they represent language in its latest known stage. Hence, they are the mate-

rials with which we begin our investigations; for the right method is that of proceeding from the later to the earlier, from the more certain *data* to the less uncertain, from the known to the unknown.

§ 62. Besides all this, the languages themselves are, upon the whole, those that are not only the best worth understanding, but the best understood, viz. the *Greek*, the *Latin*, the *Sanskrit*, and the *German*; and, in a less degree, the *Lithuanic* and the *Slavonic*.

§ 63. Again, these are not only the languages that have undergone an important amount of change, but those which have an adequate literature wherein the several changes are recorded.

§ 64. Among these the first place must be assigned to the *Greek*. The Greek records begin earlier than the Latin; and, like the Latin, the literature descends to the present time. But, on the other hand, and as a drawback to its otherwise high value, there are no languages that stand in relation to the Greek as the French and Spanish, &c. do to the Latin. As a set-off to this, the Greek *begins* with a greater variety of dialects; some of which, as the Æolic, the Doric, the Ionic, and the Attic, may pass for different languages. Moreover, at the time when the structure of the two languages first becomes open to comparison, the Greek is the more synthetic of the two.

§ 65. The *Latin* begins later than the Greek, and with fewer dialects. On the other hand, it undergoes far more change than the Greek, and that in all the languages derived from it, which are more than one: viz. the Italian, the Spanish, the French, the Provençal, the Romance, and the Roumanian, not to mention numerous dialects and sub-dialects.

§ 66. The *Sanskrit*, both in its antiquity and its synthetic character, stands on the high level of the Greek; but it has not the same undoubtedly continuous history.

§ 67. Again, the Sanskrit, both in its antiquity and its

synthetic character, stands on a higher level than Latin; but here a similar question suggests itself. Has it an equal amount of difference and variety in the way of dialects and derived languages?

§ 68. There is no answer to either of these questions which commands universal assent. There are those who consider that the present languages of Northern India, the *Hindi*, the *Gujerathi*, the *Marathi*, the *Bengali*, the *Uriya* (or *Udiya*), and others are *not* the descendants of the Sanskrit; that they are *not* in their relation to that language what the English and German are to the Mœsogothic, the Italian and French to the Latin, or the Romaic to the Greek. There are those who think that the Hindi, &c., are only Sanskrit in the way that English is Latin, *i.e.* through a strong intermixture of Latin words, whether directly from the language of Rome or indirectly through the French. They deny the grammatical or structural connection; and this connection they take (as do their opponents) as the evidence and test of descent.

§ 69. Those who hold the last view are innovators; for the doctrine in favour of the Sanskrit origin of the languages of Northern India is the older one, and it has also any amount of authority to support it. They are in a minority; and a fair display of argument, whether sufficient or insufficient, has been brought against their views. Still the doctrine thus strongly supported is not (so to say) Catholic. The belief that the Romaic is Greek, the French Latin, and the English German is held *hic, ubique, et ab omnibus.* The same belief is *not* held respecting the Sanskrit and the Hindi. Hence, though at present I pass no opinion on the question, I abstain from putting a disputed fact on the same level as an admitted one; for if the present work have any value at all, it derives it from the admitted certainty of the facts upon which its results are founded. Hence the most convenient way in which I find it necessary to treat the term '*Sanskrit*,' as a class-name, is to speak of it as the '*Sanskrit and its*

congeners whatever they may be.' That the *Pali* and *Zend* are such congeners no one doubts.

§ 70. The *German*, though far inferior to the three above-named languages in both its synthetical structure and its date, gives us a more varied, as well as a more continuous, history than any of them.

Its high value in this respect is absolute and intrinsic; but to those who speak it, whether Germans proper, Englishmen, or Scandinavians, it is the *mother-tongue*, and as such the form of speech of which they know more than they know of all the other languages of the world put together. It is the language with which they compare, and by which they measure, all others. It is not only the best language to begin with, but it is the one with which we, as German, *must* begin.

§ 71. Of the *German* family of languages the history, which is scarcely half so long as that of the Greek, and full five hundred years shorter than that of the Latin, begins with what is known as the German of Mœsia, or the *Mœsogothic* of the Ulphiline Translation of the Gospels, of which the date is, within a few years, A.D. 375. As compared with the present English, the Mœsogothic is undoubtedly synthetic. But it is not synthetic after the manner of the two great classical, and the one great Indian, languages, viz. the Greek, the Latin, and the Sanskrit.

§ 72. The history of the German family of languages is both varied and continuous. It cannot, however, be added that its continuity presents itself in the first instance, inasmuch as the Mœsogothic, for more than three hundred years, stands entirely alone. Neither was the Mœsogothic, as we know it, adequately known in its historical or its geographical relations to Germany. It was for German emigrants rather than for the Germans of the mother-country that the Ulphiline Translation was made. Their settlement was in the Roman province of Mœsia, not far from Philippopolis. But

before they settled here they had occupied a part of Dacia; and, before they crossed the Danube, had probably been soldiers in the Roman service on some part of the Marcomanic March.

§ 73. As to the part of Germany in which they originated there is no unanimity of opinion. Michaelis referred the language to Thuringia; and suggested that the present dialect of that district was the best existing representative of the Mœsogothic. I am not aware that anything has been adduced that invalidates this opinion; and I am satisfied that there is much which tends to confirm it. But, be this as it may, there is a gap of more than three hundred years between the Mœsogothic and the next representative of the German family.

§ 74. It is the parts south of the Danube, and on ground which made no part of the *Germany* of Tacitus, that we find the Old High German, which is mainly that of Suabia (*Decumates agri*), Alsace, Bavaria, and Switzerland. The earliest specimens of this are older than anything on the undoubted soil of Germany. These date from about the eighth century.

§ 75. It is in Britain that the German, now known as the *English*, first presents itself: a few years earlier than the oldest High German. And this is, for the third time, German, on ground other than that of the Germany of Tacitus. The German of Britain is represented by three literatures: (1) the *West-Saxon*, for the part south of Thames, from about A.D. 750 to 1400; (2) the *Midland*, or *Mercian*, which is the present literary English; and (3) the *Northumbrian*, of the parts between the Humber and the Forth.

Of German, on the undoubted soil of German, the Old Saxon of Westphalia gives us the earliest specimens; about A.D. 900. The *Frisian* is specially akin to this, as well as to the West-Saxon of Britain, and, moreover, is considered to be transitional between the Teutonic and the Norse, or

Scandinavian groups. Of this last, which is most especially illustrative of the change from Synthesis to Analysis, enough has been said in §§ 32–35.

§ 76. It is manifest that in this family we have a most valuable store of materials: a fair amount of continuous history; a fair amount of separate and independent languages; a very considerable number of dialects and sub-dialects; and other elements of value besides. But with all this, the main element of its importance is relative rather than positive. It is the family to which our own language belongs, and, consequently, the family which we best understand.

§ 77. *The Lithuanic Family.*—In this there is nothing earlier than the sixteenth century, and this is in the language of the *western* parts of East Prussia, in which nothing is now spoken but German and Polish. This is called *Prussian*, as opposed to the *Lithuanian* of Lithuania proper, and *Old Prussian*, which, so far as it means anything, means the old language of Prussia; for of anything that can be called Middle, or New Prussia, we have no vestige. In this Prussian the demonstrative pronoun is used as the definite article, whereas the allied dialects are without one.

On the east and north-east of Lithuania proper lie the *Lett* districts of Courland, Livonia, Esthonia, Vitepsk, and Polotsk; and a division of some kind between the *Lett* and the Lithuanian, as dialects or languages, is rightly recognised. But what it amounts to is another question. The statement that Lithuanian is notably more synthetic than the Lett, and the two tongues are as widely separated from one another as Latin and Italian, is a gross exaggeration. What light the Lithuanic family throws upon the field of the philologue is practically that of a single language in a single stage. But, thus limited, the Lithuanic is a language of inordinate interest. In the declension of its nouns it is more synthetic than the Latin.

§ 78. *The Slavonic Family.*—The first point to notice in this is the number of its divisions and sub-divisions. Its

extreme forms, or the languages most unlike one another, are the Polish, or the Bohemian, on one side, and the Russian, or Moscovite of *Great* Russia, on the other.

1. The *Polish*, with the *Kassubic*; a fragment still spoken in Pomerania; and the *Linonian*, of which a fragment remained in Lünenburg in the latter half of the last century.

2. The *Sorabian*, still spoken in Lusatia and Brandenburg. Intermediate to the Polish and

3. The *Bohemian*, *Czech*, or *Tshekh*. This is the name that the Slavonians of Bohemia give themselves. In Moravia the language is called *Moravian*, and in Upper Hungary, *Slovack*.

These are more closely allied to each other than to the languages of the second branch.

4. The *Slovenian*, spoken by the Slavonians of Austria, who called themselves *Sloventzi*. It is a political, rather than a philological, division, inasmuch as it graduates into the *Servian*.

§ 79. All these nations use an alphabet of Roman origin, and, except when Protestant, are Roman Catholics. The Slavonians, however, originally used an alphabet founded on the Greek, and called *Glagolitic*, or *Glagolite*.

5. The *Servian*, spoken in Bosnia, Servia, and Montenegro. Alphabet of Greek origin; and creed, the Christianity of the Eastern Church.

6. *Russian*. This falls into the *Ruthenian*, *Rusniak*, or *Red Russian*, of Eastern Gallicia (originally Lodomeria); the *Little Russian* (*Malo-russ*) of Kiev and the surrounding Governments; the *Black Russian* of Grodno and Minsk; the *White Russian* of Smolensko; and finally, the *Moscovite*, or *Great Russian*, of the rest of the Empire.

7. The *Bulgarian*; which probably differs from all the others as much, or more, than they differ from one another. Alphabet and creed of both Russia and Bulgaria. The same in Servia.

For so large an area, and so many divisions, the general uniformity of the whole Slavonic class is remarkable.

SECTION II.

AGGLUTINATION, FORMATIVES.

§ 80. The *-o* in *voc-o* is an *Inflection*; so also are the *-amus*, *-atis*, *-avi*, *-avissem*, &c., in *voc-amus*, *voc-atis*, *voc-avi*, *voc-avissem*, and the like.

The *-it-* in *voc-it-o* is a *Formative*; and so are *voc-it-amus*, *voc-it-atis*, *voc-it-avi*, and *voc-it-avissem*. A *Formative* is different from, and opposed to, an *Inflection*.

§ 81. The outward and visible difference between the two is that the *-it-* keeps its form throughout the whole conjugation of the verb to which it belongs; whereas the termination *-o-* changes with the Person, Number, Tense, Mood, and Voice, becoming *-amus*, *-atis*, and the like, according to circumstances. Changing the expression, the *-it-* is a *part* of the theme, and, as such, is permanent; whereas the inflection is *adjunct* to the theme, and mutable.

§ 82. The *-it-* in *voc-it-o* belongs to the *theme*, but not to the *root*, and it is to the root that it is attached. So attached, it precedes the inflection in the way of order. The inflection attaches itself directly to the root only when there is no such intervening syllable as the one under notice. This is the view of the two adjuncts simply and solely in respect to their place and permanence.

§ 83. The *logical* difference between them, or the nature of their respective meanings and functions, is another question. The *-it-* in *voc-it-o* expresses a difference in the nature of the act (that of calling) itself. The inflection denotes certain circumstances that attend the act; viz., the agency, the time, and the conditions under which it takes, or may take, place. In this way the first of them indicates that the speaker, the object spoken to, or some object spoken about, is the agent, or, if there be more than one, the agents. In

the way of time it indicates whether it is Past, Present, or Future; in the way of conditions, whether it be Indicative, Imperative, or Conditional. In other words, they give signs of Person and Number, Tense and Mood. With the character of the act (or state) itself these have nothing to do. On the other hand, the difference between *voc-* (the root) and *voc-it-* (the theme) relates to the act itself, which is, of course, so far as the *voc-* goes, one of the same kind as that denoted by *voc-it-*. The *-it-*, however, indicates a difference. *Voc-o* is translated *I call*; *voc-it-o*, *I call often*: and as there are many words thus differentiated, there is a class of forms which are called *Frequentative*. What *-it-* is in Latin, *-εθ-* is in Greek, as *φλέγ-ω*, *φλεγ-έθ-ω*. In *vire-sco=I begin to grow green*, and *γερά-σκω=I begin to grow old*, the *-σκω* and *-sco* are called Inchoative; and of names and classes of this kind they are many. For all such names the general name is *Formative*.

§ 84. Now it is the languages in the *Synthetic* stage that best illustrate the character of *Inflections*. In like manner it is the languages of the *Agglutinative* stage that best illustrate *Formatives*; and this is the reason why so much has been said about them. They must be clearly distinguished from Inflections; and, more than this, the difference between them must be shown to be both *formal* and *logical*.

§ 85. But it was only partially that, in our first group, even Inflection was dealt with. Very little, if anything, was said as to what Inflections were in themselves. The great deal that was said about them applied almost wholly to their relations to the Analytical forms by which they were so largely superseded. Yet they were never supposed to exclude Formatives. Neither will Formatives, in the consideration of the Agglutinate forms of speech, exclude Inflections. On the contrary, both forms will be considered together as we proceed.

§ 86. Hitherto the point of the chief importance is the difference between these two classes of words. It must

however, now be added that it is only in the extreme forms that this difference exists. This is because it will be seen in the sequel that *some* Formatives, at least, can become Inflectional.

§ 87. As a preliminary, it is necessary to classify the chief *Formatives* upon the principle that we classify the Inflections. Doing this, we get, for the Nouns, Gender, Number, and Case; for the Verbs, Mood, Tense, Person, and Voice.

§ 88. Nouns.

The Formatives for Nouns are (*a*) Substantival, (*b*) Pronominal, (*c*) Adjectival. To the first of these classes belong the forms like the *-en* in *vix-en=female fox*, the German *-in* as in *Freund-inn=female friend*, the *-esse* in the French *duch-esse*, and the *-ix* in the Latin *genetr-ix*, as opposed to *genit-or*, the *so-called* Signs of Gender. To the second belong the adjuncts in *-d* and *-th*, which characterise the Ordinals (*thir-d*, *four-th*, &c.) as opposed to the Cardinal Numerals. To the third belong the Degrees of Comparison. These are mentioned because, in many of the ordinary Grammars, under the old name of *Accidents*, they are taught along with the Inflections. There is no harm in this. There *is* harm, however, in confounding them with the true Inflections; and it cannot be denied that this is done sometimes—perhaps more than once too often.

Substantives.

Here we have Formatives for Natural Sex as opposed to Artificial or Conventional Sex, which is *Gender*, as has just been indicated; also Collectives, Diminutives, Augmentatives, Patronymics, Gentiles, and (more important than any) Abstract forms.

Pronouns.

Ordinal Formatives, as above mentioned.

Adjectives.

Degrees of Comparison, as above.

§ 89. Verbs.

Verbals.

The name for the agent as *hunt-er*, and for the action as hunt-*ing*. These are universally recognised as Nouns, rather than Verbs, and are declined like *Substantives*.

Verbs.

Inchoative, as *viresco*, γεράσκω.
Frequentative, as *vocito*, φλεγέθω.
Desiderative, as *parturio*, δρασείω.

§ 90. Now with some of these there is a decided suggestion of something akin to some of the Inflections. *Gender* is manifestly involved in the Formatives for *Sex*; *Number*, in those for *Collectives*. With Mood and Tense the connection is not quite so clear.

§ 91. On the other hand, there is nothing that suggests Person, nor can there be.

§ 92. We may now change the subject, and notice some other characters of the Agglutinate class.

In this Agglutinate class the first languages that present themselves are those of the *Fin* or *Ugrian* family; and, on the first view, the difference between Agglutination and Synthesis is by no means decided. So far as the mere number of Cases goes, very many of the Agglutinate tongues are more inflectional than the Latin, the Greek, or the Sanskrit; for the most we can get out of these and their congeners is a small matter of seven or eight cases; whereas the Fin of Finland, or Finlandish proper, gives us fifteen, the Lap, eight, or, counting the Vocative, nine. With others, six or seven present themselves, as a matter of course. Thus—

Finlandic or Fin Proper.

Maa = land. *Maat* = lands.

	Singular.	*Plural.*
Nominative	maa	ma-a-t
Infinitive	maa-ta	ma-i-ta
Genitive	maa-n	ma-i-tten
Inessive	maa-ssa	ma-i-ssa
Elative	maa-sta	ma-i-sta
Illative	maa-han	ma-i-hin
Adessive	maa-la	ma-i-lla
Ablative	maa-lta	ma-i-lta
Allative	maa-ille	ma-i-lle
Abessive	maa-tta	ma-i-tta
Prolative	maa-tse	ma-i-tse
Translative	maa-ksi	ma-i-ksi
Essive	maa-na	ma-i-na
Comitive	maa-ne	ma-i-ne
Instrumental	maa-n	ma-i-in

§ 93. Laplandic.

Close Declension—Ending Consonantal.

Singular.

Nominative	måraś (*sorrow*)	bavćas (*pain*)	hævoś (*horse*)
Genitive	mårraś	bafćas	heppuś
Infinitive	mårraś	bafćas	heppuś
Allative	mårraśi	bafćasi	heppuśi
Factive	mårraśen	bafćasen	heppuśen
Locative	mårraśest	bafćasist	heppuśist
Comitive	mårraśin	bafćasin	heppuśin
Caritive	mårraśtaga	bafćastaga	heppuśtaga

Plural.

Nominative	mårraśak	bafćasak	heppuśak
Genitive	mårraśi	bafćasi	heppuśi
Infinitive	mårraśid	bafćasid	heppuśid
Allative	mårraśidi	bafćasidi	heppuśidi
Factive	mårraśen	bavćasen	hævośen
Locative	mårraśin	bafćasin	heppuśin
Comitive	mårraśiguim	bafćasiguim	heppuśiguim
Caritive	mårraśitaga	bafćasitaga	heppuśitaga

Open Declension—Ending Vocalic.

Singular.

Nominative	jåkka (*river*)	gietta (*hand*)	oabba (*sister*)
Genitive	jåga	gieða	oaba
Infinitive	jåga	gieða	oaba
Allative	jokki	gitti	oabbai
Factive	jåkkan	giettan	oabban
Locative	jågast	gieðast	oabast
Comitive	jågain	gieðain	oabain
Caritive	jåga-taga	gieða-taga	oaba-taga

Plural.

Nominative	jågak	gieðak	oabak
Genitive	jågai	gieðai	oabai
Infinitive	jågaid	gieðaid	oabaid
Allative	jågaidi	gieðaidi	oabaidi
Factive	jåkkan	gieðan	oabban
Locative	jågain	gieðain	oabain
Comitive	jågai-guim	gieðai-guim	oabai-guim
Caritive	jågai-taga	gieðai-taga	oabai-taga

PERSONS.

Singular Number.

	First.	*Second.*	*Third.*
Nominative	mån (*I*)	dån (*thou*)	sån (*he, &c.*)
Genitive	muo	du	su
Infinitive	muo	du	su
Allative	munji	dunji	sunji
Locative	must	dust	sust
Comitative	muin	duin	suin
Caritive	muotaga	dutaga	sutaga

Dual.

	First.	*Second.*	*Third.*
Nominative	måi	dåi	såi
Genitive	måno	dåno	såno
Infinitive	måno	dåno	såno
Allative	måndoidi	dåndoidi	såndoidi
Locative	måndoin	dåndoin	såndoin
Comitative	måndoguim	dåndoguim	såndoguim
Caritive	måndotaga	dåndotaga	såndotaga

Plural.

	First.	*Second.*	*Third.*
Nominative	mi	si	di
Genitive	min	sin	din
Infinitive	min	sin	din
Allative	migjidi	digjidi	sigjidi
Locative	mist	dist	sist
Comitative	minguim	dinguim	singuim
Caritive	mintaga	dintaga	sintaga

§ 94. ACTIVE.

INDICATIVE.

Present.

Singular	låånom	låånok	lâdno
Dual	lodnu	lonobætte	lådnoba
Plural	ladnop	ladnobættet	lodnuk

Preterit.

Singular	lodnum	lodnuk	lånoi
Dual	lånoime	lånoide	lånoiga
Plural	lånoimek	lånoidek	lodnu

CONJUNCTIVE.

Present.

Singular	lonućam	lonućak	lonuća
Dual	lonućædne	lonućæppe	lonućæva
Plural	lonućæp	lonućæppet	lonućek

Preterit.

Singular	lonušim	lonušik	lonuši
Dual	lonušeime	lonušeide	lonušeiga
Plural	lonušeimek	lonušeidek	lonušeigje

IMPERATIVE

Singular	. . .	låno	lodnus
Dual	lodnu	lâdno	lodnusga
Plural	lådnop	lådnot	lodnusek

Passive.

Indicative.

Present.

Nomen Adject. Verbale	*Pres. Part.*	lâdnome	lodnujuvvume
	Pret. Part.	lâdnom	lodjuvvum; lodnum

§ 96. This apparent Synthesis is only superficial; for the doctrine that underlies the whole system of the growth, development, or evolution of language, presupposes that all Inflections, if we can only reduce them, are reducible to words originally independent. The mere amount of these is a secondary matter; the question is the evidence in favour of their reducibility, and it is certain that in languages like the Fin, the Turk, and their congeners, this is notably improved.

§ 97. Roughly, and for the sake of illustration, we may compare the union of two or more words in Synthesis to a *graft*, in which the union is so close as to be indecomposable. The union in the way of Agglutination is a *splice*, whereof the separation is comparatively easy. We cannot always—perhaps we cannot often—say what the incorporated element was when it stood alone; but we can generally convince ourselves that, of some sort or other, it is a superaddition.

§ 98. Again, when we have two inflectional elements in combination, one of which suggests the notion of (say) *number*, and the other of (say) *case*, we can, in Agglutination, separate the two signs with far greater certainty than we can in Synthesis. The Turkish grammar throws a strong light on these points.

Adem = man.

Nominative	ādem	ādemler	*man, men*
Genitive	ādemun	ādemler-un	*of* „
Dative	ādemeh	ādemler-eh	*to* „
Accusative	ādemi	ādemler-i	*man, men*
Ablative	ādemden	ādemler-den	*from* „

Compare this with the declension of *homo*, or any Synthetic substantive, and see whether the separation of the signs of number and case are anything like so distinct.

§ 99. The Conjugation of the Verb is still more suggestive of differences. How easily are the several significant affixes separated from each other.

Ṣumeḳ = *love* (*Present Imperative*).

Active.

Negative	ṣumemeḳ	*not to love*
Impossible	ṣuehmemeḳ	*not to be able to love*

Passive.

	ṣuilmeḳ	*to be loved*
Negative	ṣuilmemeḳ	*not to be loved*
Impossible	ṣuilehmemeḳ	*not to be able to be loved*

Causal Active.

	ṣudermeḳ	*to cause to love*
Negative	ṣudermemeḳ	*not to cause to love*
Impossible	ṣuderehmemeḳ	*not to be able to cause to love*
Passive	ṣuderilmeḳ	*to be made to love*
Neg. Passive	ṣuderilmemeḳ	*not to be made to love*
Imp. Passive	ṣuderilememeḳ	*not to be able to be made to love*

Passive Causal.

	ṣuildermeḳ	*to cause to be loved*
Negative	ṣuildermemeḳ	*not to cause to be loved*
Impossible	ṣuilderehmemeḳ	*not to be able to cause to be loved*

Reciprocal.

	ṣuishmeḳ	*to love one another mutually*
Negative	ṣuishmemeḳ	*not to love &c.*
Impossible	ṣuishehmemeḳ	*not to be able &c.*
Passive	ṣuishilmeḳ	*to be loved mutually*
Neg. Passive	ṣuishilmemeḳ	*not to be loved mutually*
Imp. Passive	ṣuishilehmemeḳ	*not to be able to be loved mutually*
Causal	ṣuishdermeḳ	*not to be able to be caused to love mutually*

Personal.

	ṣuinmeḳ	*to love himself*
Negative	ṣuinmemeḳ	*not to love &c.*
Impossible	ṣuinehmemeḳ	*not to be able &c.*
Passive	ṣuinilmemeḳ	*to be loved*
Causal	ṣuindermeḳ	*to cause to love himself*

§ 100. And last, not least, as an element in the more manageable character of the Agglutinate languages, most of them are without the distinction of Gender. That this facilitates the separation of case-endings into their elements is manifest. *Three* distinctions are involved in the Synthetic, *two* in the Agglutinate, inflections. By the final syllables in such words as *bon-um* and *bon-as*, three differences are indicated, that of Case, of Gender, of Number; and the work is done by a single combination of two letters.

§ 101. The following is an equally illustrative instance, from a language now nearly extinct, but probably intermediate to the Turk and the Mongol.

YENISEIAN.

Bieng = *hand.* Bieng-en = *hands.*

	Singular.	*Plural.*
Nominative	bieng	bieng-en
Genitive	bieng-da	bieng-en-da
Dative	bieng-deng	bieng-eng-den
Locative	bieng-gei	bieng-eng-ei
Ablative	bieng-denger	bieng-en-denger
Instrumental	bieng-sâs	bieng-en-sâs
Prosecutive	bieng-bes	bieng-en-bes
Comitive	bieng-san	bieng-en-san

SUB-SECTION II.

MATERIALS FOR THE AGGLUTINATE STAGE OF THE LANGUAGE.

§ 102. In the amount of the material, or *data*, which it supplies the Agglutinate class shows to disadvantage. The languages are numerous, no doubt; but there is scarcely one Agglutinate language of which we have enough. Some begin early, but then they become extinct prematurely. Some (indeed, the majority) are in full life at the present moment; but, on the other hand, we know nothing of them in any earlier stage. We have, in the Agglutinate class, languages

which are in many respects semi-Synthetic, and others which are well-nigh Monosyllabic; but we have no *single* language which, in one of its stages, is Monosyllabic, and, in the other Agglutinate. In many cases there is a fair amount of both duration and continuity; but, even when this is the case, the amount of change is inconsiderable.

§ 103. The Fin of Finland, the Finlandic, the Finlandish, or the Fin proper of the Duchy of Finland, is a single language of a class: a class sometimes called *Fin*, sometimes *Ugrian*; and it is the number and character of the different divisions and sub-divisions of the classes which invest it with its recognised importance. *Tavastrian*, *Karelian*, *Vod*, *Tshúd*, *Vesp* (or *Ludin*), *Krivonian*, *Lief*, *Esthonian*, *Permian*, *Zirianian*, *Votiak*, *Lap* (or *Laplandish*) of (*a*) *Norway*, (*b*) *Sweden*, (*c*) *Russia*, *Tsheremiss*, *Mordvin*, *Vogul*, *Ostiak*, *Samoyed*, and (?) *Tshuvash*, are all denominations which, either as separate languages or dialects, supply illustrations of some kind of the difference and likeness between the several members of this very important class.

§ 104. Next in geographical order come the *Turk*, *Yeniseian*, *Mongol*, and *Mantshu* families, the last two of which are in contact with the Monosyllabic area. The *Yeniseian* is still unplaced; but it is probable that it belongs to the same division as the languages with which it is here associated. Of the remaining languages of Northern Asia, of which the affinities run either in the direction of Japan and the Kurile Islands, or that of Kamtskatka, the Aleutian Chain, and America, it is not necessary to take cognisance.

§ 105. The *Dravirian* or *Dravidian Family*.—Spoken in *Southern* India, and opposed to the languages represented by the Hindi. This means that, ever since attention has been paid to it, it has been recognised as other than Indian of the Hindi, Gujerathi, and Bengali type; *i.e.* has never, either rightly or wrongly, been considered a derivative of or from the Sanskrit. The four best known members of this group, each with a literature, are—

1. The *Telinga*, or *Telugu*, spoken by about 14,000,000 occupants of the Northern Circars, and parts of Hyderabad, Nagpúr, and Gondwana; bounded on the North by the Oriya of Orissa, and on the side of the Pacific by Chicacole, North, and Pulicat, South.

2. The *Tamul*, spoken by about 10,000,000 natives from the parts about Pulicat to Cape Comorin, and on the West as far as Trevandrum. In the interior it extends to the Ghauts and Nilgherris.

3. The *Canarese*, spoken by about 5,000,000. Mysore is its centre; bounded by the Telinga N.E., and the Tamul S.E.; on the North by the Marathi, other than Dravirian.

4. The *Malayalim*, spoken by about 2,000,000 along the Malabar coast.

§ 106. These are the four old, or long recognised, members of the Dravirian family; but a fifth has recently been added, and that as an independent language. This is—

5. The *Tulu*, spoken by about 150,000 about N.L. 13° 30′ along the coast, and, like the Canarese, bounded by the Marathi.

The *Cúrgi*, of *Cúrg*, has scarcely been raised to the level of a language. As dialect it has been claimed for the Tulu, the Malayalim, and the Tamul.

To these add not fewer than five barbarous dialects, or sub-dialects, of the Canarese, and spoken in the Nilgherris by the *Tudas* or *Todavas*, the *Budugars*, the *Kohatars*, the *Irular*, and the *Kurumbas*.

§ 107. Later researches have brought no less than four more groups within the range of the Dravirian family, though the position of one of them is equivocal.

§ 108. On the western frontier of the Uriya (Hindi) and the northern frontier of the Telinga (Dravirian), in the Circar of Gúmsúr, the *Khond* in several dialects is spoken: *Gadaba*, *Yerukale*, *Savara*; and in Gondwana the *Ghond*, or *Gundi*. This is not so manifestly Dravirian as the Khond; but still

it is more Dravirian than aught else. Little is said about it in Caldwell's standard Dravirian Grammar; but he does not exclude it.

§ 109. But with the next group he hesitates. It is the most Northern (North-Eastern) of any; and is fairly represented by vocabularies—*Sontal*, *Singbhum*, *Mundala*, and *Bhumij*. *Ho*, meaning *man*, is the name which the *Kolehan* apply to themselves. Ramguhr, Monghir, Chuta Nagpúr, Gangpúr, Sirgujah, Sumbulphur, Palamaw, and the Rajmahal Hills, where the Sontals are stated to be intrusive, are, in the ordinary maps, the most conspicuous names for the *Kol* districts, and *Kol* is the usual name for the group.

§ 110. The *Kol* has recognised affinities with the *Monosyllabic* family, and how closely the two groups approach one another geograpically may be seen in § 135.

§ 111. The BRAHUI.—This is the last language that has been connected with the Dravirian; and, in respect to its geography, it is other than Indian. It is Persian; and, what is more, is separated from the most northern frontier of the Dravirian proper by the *Non*-Dravirian Gujerathi and Marathi, not to mention the Persian and Indian dialects of the Lower Indus. It is in the mountain districts of Beluchistan that the *Brahui*, *Brahooe*, or *Brahuiki* is spoken, unwritten, and its Dravirian structure disguised by the inordinate amount of Persian with which it is overlaid. Those, however, who have paid most attention to the subject, have pronounced in favour of the Dravirian affinity.

§ 112. With this ends the list of those Agglutinate languages of *Eastern* Europe and Asia which come under the conditions and limitations of the present treatise; viz., (1) that they should be spoken in something like geographical contact with the languages of the Synthetic and Monosyllabic division, and (2) that the recognition of them as Agglutinate should be universal.

§ 113. Far apart from those, however, and on the farther side of the Synthetic area, on the extreme south-west of

Europe, still stands over the *Iberian*, *Euskarian*, or *Basque*, which may reasonably be considered to represent, at least, the original language of the whole of the Spanish Peninsula. It is now limited to the provinces of Biscaya, Guipuscoa, Alava, and Navarre, in Spain, and parts about St. Jean de Luz and Labourdin, in France. Bounded on three sides by the sea, the Iberian Peninsula is isolated, whilst of the Peninsula itself the Basque area is but a fraction ; and, fraction as it is, it is bounded on both sides by intrusive languages —the French and Spanish—both of Latin origin. After these, there is nothing nearer than the Celtic of Brittany, and the German of Switzerland, and the Slavonic of Bohemia. No wonder that its affinities are a mystery.

§ 114. Such are the chief Agglutinate languages of Europe and Asia in respect to their geographical areas. We see, at once, that they are in contact with one another, and that some of them, the Ugrian and Turk most especially, are in contact with the North and North-Eastern members of the Synthetic class ; and we shall see, in the sequel, that as we move southward, others will touch the Monosyllabic frontiers of China, Tibet, and Northern India. This invests them with a special value, inasmuch as, over and above the intermediate or transitional character of the Agglutinate stage of growth or development, their geographical position has a like intermediate character, suggestive of elements of affinity of a more specific character.

§ 115. And such is the case. There are many more Agglutinate languages than these—languages that are to be counted by the score and hundred. Indeed, we may anticipate and add that, with a few possible exceptions, all the world over, whether in Africa, America, Australia, or Polynesia, whatever in the way of speech is neither Synthetic, nor Monosyllabic, is Agglutinate. Nevertheless, it is only the few under notice that will be specially dwelt upon.

§ 116. So far, then, as mere material goes, the Agglutinate class is abundant to excess. But the material is nearly

all of one kind; viz., a multitude of different languages, and an average amount of dialects and sub-dialects for each. To set against this, we must state that, as a rule, the material is of the later, or latest, date.

§ 117. The great exception to this statement, the oldest language of the class, and, perhaps, of the world at large, is the Hebrew, the only language in the Agglutinate division that can be compared, in respect of its antiquity, to either the Greek and Latin of Europe, or the Sanskrit and its congeners of Asia. This, or the Jews' language, is that of the *Old* Testament.

But the language of the *New* Testament is Greek; and it is in the earliest translations of the New Testament that we get the earliest monument of the languages that are now about to present themselves.

§ 118. To the time between the Birth of our Saviour and the Flight of Mahomet (*i.e.* the Christian and the Mahometan epochs), the New Testament (wholly or partly) is translated into *Syriac*, *Coptic*, *Ethiopic*, and *Armenian*. Then follows the *Amharic* and *Georgian* versions; the former suggested by the Ethiopic, or Gheez, the latter by the Armenian.

The earliest *Irish* belongs to the same class. It is safe to say that before the Flight of Mahomet it was a written language, and it is possible that some of the existing specimens of it may be of that age. This is the period represented in the Synthetic stage by the Mœsogothic translation of Ulphilas.

Out of the Syriac alphabet grew the Arabic; and with this, the Arabic itself, before the time of Mahomet, became a written language.

§ 119. The date of the oldest compositions in the Georgian is uncertain. Probably, they date from the introduction of Christianity; but are not so old as the oldest Armenian.

§ 120. Lastly comes the *Tamul*, the representative language of *Southern* India. It is not pretended that this, in either its cultivation or antiquity, rivals the Sanskrit. Nor has it been so carefully studied. The old, or classical Tamul

—the *Shen* Tamul as it is called—is considered to have flourished as the language of a rich and varied literature as early as the ninth century, and to present itself in inscriptions earlier. Caldwell specially states that it was comparatively free from the influence of the Sanskrit, and that it was richer in forms than the present language. I have not, however, met with any definite exposition of these differences; nor has any considerable proportion of the literature itself been printed.

§ 121. With the discovery of America came a great flood of light upon what we may call the *unwritten* languages, or the languages which having no literature of their own had to be made known to us through the investigations of missionaries, travellers, traders, slavers, and, finally, professed philologists. This means the languages of the New World, as a matter of course; all Africa, with the exception of Egypt and part of Abyssinia; Siberia, Caucasus, North-Eastern Asia, and all the islands, whether of the Atlantic or Pacific, with the exception of Sumatra, Java, Bali, Celebes, and the Philippine Islands. Some of the grammars of this period were composed before A.D. 1600, for in Mexico, Guatemala, and Yucatan the zeal of the missionary had already found its vocation. Elsewhere, the accumulation of material was somewhat later. Enough, however, has been said to show that the languages of the Agglutinate division of which we have any precise knowledge are nearly all, in respect to their *data*, less than four hundred years old; and all, with the great exception of the Hebrew, later than the Christian era, or, compared with the classical languages and the Sanskrit, later than the Augustan age.

§ 122. Later than these, in respect to their oldest records, come the *Turkish*, the *Mongol*, and the *Mantshu*. Of these the alphabets are of Syrian origin, and, in all probability, some centuries older than the earliest specimens of the literature to which they gave origin. The Turkish is the oldest, the Mantshu the latest; and it was by the Christian mis-

sionaries of the Nestorian heresy that the Turkish, the earliest of them, was introduced. It was to the *Uighur* dialect that it was first applied; and, though manuscripts in it still exist, and represent the oldest form of the Turkish language, it has long been superseded by the Arabic, the alphabet of Mahometanism.

§ 123. It is in Eastern Europe and Western Asia that the languages which most especially lie *between* the Synthetic and the Monosyllablic areas present themselves. These, when we take the whole of them, are the languages of Caucasus and Transcaucasia, all of them falling into dialects, and many of them forming small groups of distinct languages: the *Circassian* (and *Abkazian*); the *Midzhdzhedzhi* or *Tshentsh*; the *Lesgian* (of many denominations); the *Georgian* (with well-marked dialects for Guriel, Mingrelia, Swaneti, and Lazestan); the *Iron* and *Armenian* (of which the ethnological affinities are not universally admitted), and an outlying obscure form of speech, called the *Ude*.

SECTION III.

MONOSYLLABICISM. ACCENT. MATERIALS.

§ 124. *The Bhot, Bhotiya, or Tibetan.*—Beginning in the West, and on the confines of the Persian of the North-East, and the Turkish of Chinese, and Russian Turkestan, we find the first *Tibetan* in Bultistan, or Little Tibet; then in Ladakh, Tibet Proper, the Sub-Himalyan ranges of India between Cashmir and Kumaon, Butan, the obscure tract of country between the Eastern frontier of Tibet (or Butan) and China, and, more or less, along the whole Himalayan range, (North) from Cashmere to Assam.

§ 125. The age of the oldest literary records of the Tibetan is uncertain; but we know that the spoken Tibetan of the present time is notably more modern than the written language. This is because the older orthography is still kept

up, and in (I believe) the great majority of words there is a considerable difference between the two; indeed, it is a common practice of writers on the language to draw special attention to the difference between the '*spoken*' and the '*written*' Tibetan, and to give each word in both forms. I cannot state the precise nature of the difference between the two extreme forms. It is probably as great as any that is to be found in any of the *Non*-Semitic languages of the Agglutinate class; but, nevertheless, wholly incommensurable with differences that present themselves in the Synthetic and Analytic forms of speech, where the rate of change has been quicker, and the material to act upon greater.

§ 126. 1. In respect to its dialects little is known; the central parts being unexplored by Europeans. On the East and South it is difficult to say what is a dialect of the Tibetan and what a separate language; especially along the Southern slope of the Himalayas.

§ 127. 2. The *Burmese* of Burma Proper, Arakan, and Manipur; falling into the Khen, Karyen, and other undoubted dialects. On the frontier of Assam and India it is difficult to say when the forms of speech cease to be dialects of some superior language, or when they constitute separate and independent languages. The denomination *Naga*, applied to a long list of tongues spoken along the mountain-range on the south side of the Assam valley is a notable example of this. Some of the forms of speech have one, some another, set of affinities.

§ 128. 3. The *Singpho*. Spoken to the East of the Burmese, and to the North and East of the Siamese. That the Singpho, Burmese, and Tibetan are members of one and the same group, family, or class, is, pretty generally, admitted. What the value of the group may be is another question.

§ 129. 4. The *Thay* or *Siamese*, with the *Ahom*, *Khamti*, *Laos* or *Lau*, and the Shan dialects of the Burmese Empire.

§ 130. The *Môn*, or language of Pegu.

§ 131. The *Kha*, or Ka, of Cambojia.

§ 132. The *Anamese*, or Anamitic, of Cochin China.

§ 133. The *Chinese*.—This has long been considered to be the typical language of the Monosyllabic class; and that, probably, on good grounds. Of its paramount importance in both politics and literature there is no doubt. The Mandarin, or classical language, is uniform throughout the empire; though its history shows that it has undergone several changes—artificial rather than natural. The opposite to this, as a form that has been modified by the influence of commerce, and contact with other languages, is the Chinese of Canton. Of independent dialects, the best known is that of the Province of Fokien.

§ 134. On the antiquity of the Chinese literature little need be said; and as little about the method of writing it. It is not one which favours the exact representation of old and obsolete forms. Nor is there any warrant for any composition of any very great antiquity being exactly in the form it took under the hands of the original author. The matter may be as old as the time of Confucius or older; but the antiquity of the form—*ipsissima verba ipsissimis literis*—is another question. We are sure of nothing in this way older than the oldest manuscript, and who knows the date of this? Of the changes in the Mandarin dialect we know something; but this refers more to the *tones* than to the literal and syllabic structure of words and their combinations. In the opinion of the present writer—for which he claims very little—it is probable that more knowledge of the changes that any monosyllabic language has undergone is to be got from a comparison of *written* Tibetan in its older forms than from anything attainable from the older compositions in Chinese. It is not likely, however, that the comparison will be made for some time to come.

Of independent languages spoken within the area of China Proper the *Miaoutsé* of the Province of Yunnan has the best claim to be considered other than Chinese.

From a single short vocabulary which the present writer has seen in manuscript it seems to be equally unlike the Chinese, and the languages of its western frontier.

Of the languages of the Andaman and Nicobar Islands it is only necessary to state that they are not Malay.

In the Malayan Peninsula, the Siamese, which runs farther south than any member of the Monosyllabic family, but which appears to be of more northern origin, is succeeded by the Malay—other than Monosyllabic.

§ 135. 9. 10. *The Sub-Himalayan and Naga groups.*—Kunaweri, where the Sutlej, the most eastern of the Five Rivers of the Punjab, flows from the higher to the lower levels of the Sub-Himalayan slope, and first becomes an Indian river, is the point where, in the details of this large and mixed division, it is the most convenient to begin. Here it is where monosyllabic forms of speech, and those of Northern India which are other than monosyllabic, come in contact.

1. 2. For the *Kanet* of Kunawur we have, at least, two varieties, the *Sumchú* and the *Theburskud*, with sub-dialects: unwritten. Then Eastward, and in Nepaul rather than in Hindostan,—

3. 4. The *Magar* and *Bramhú*.

5. 6. The *Gurung* and *Murmi*.

7. 8. 9. The *Vayu* (or *Hayu*), *Kusunda*, and *Chepang*.

10. 11. 12. 13. 14. The *Denwar*, *Kuswar*, *Paksya*, *Thaksya*, and *Tharu*.

15. The *Nepalese* (*Pahari*).

16. 17. The *Kiranti*, or *Kirata*, with which we may associate the *Limbu*, which, until lately, was treated as a separate language. Of the Kiranti dialects Mr. Hodgson gives us vocabularies for no less than *nineteen*, of which the Limbre is the only one that has an alphabet.

18. The *Lepcha*—spoken in Sikkim, and the most eastern member of this range; inasmuch as, east of Sikkim, we find,

in Butan, the Butani, or Lhopa, form of speech, which is Tibetan. The Lepcha, also, has an alphabet.

19. 20. 21. *Bodo* (*Borro*) and *Dhimal*. In Hindostan; spoken in Kooch Bahar, and Mymansing.

22. 23. 24. 25. *Garo*, *Mikir*, *Kuki* (or *Luncta*), and *Casia*.

26. 27. 28. 29. 30. 31. *Abor* (*Aka*), *Dofla*, *Miri*, *Mishimi* (*Tablung*), *Mithan*, *Deoria Chutia*, and *Jili* (?).

It is in the southern members of this last division that the chief materials for the transition from Monosyllabicism to Agglutination are the best studied; and of the raw material no one has given us so much as Mr. Hodgson, and that both in the shape of vocabularies, and of grammar, or, at least, of valuable grammatical outlines. The number of dialects and sub-dialects is one element of their value. Another is the fact that lying, as many of them do, well within the frontier of India, they come into actual contact with languages other than Monosyllabic; the Hindi and Bengali on the West, and, on the East, in approximation to the Dravirian forms of speech of the Khond class. In the parts about the Rajmahal Hills members of this last class are spoken up to the banks of the Ganges, which the most southern congeners of the Dhimal, Bodo, and Garo *approach*; though it is doubtful whether there is ever any absolute contact.

§ 136. 10. The *Naga* group, to which allusion has been made, under the head of '*Burmese*,' must be taken along with another; and both connected with the Valley of Assam. In this the Bengali is rapidly encroaching; but the original speech of the whole district was Monosyllabic.

§ 137. Of these languages and dialects less is known in the central valley than in the mountain-ranges on each side of it. On the North they are the *Abor* (and *Aka*), the *Dofla*, and the *Mishimi* (*Tablung*), and *Mithan*. These take us up, or near, to the Eastern extremity of the valley. For the line on the South we find, first, a series of dialects akin to the Burmese and Singpho, and also certain Northern offsets of the Siamese; and, running from East to West, a list

of not less than twenty languages, dialects, or sub-dialects, known under the general name of '*Naga*.' These, of course, lie nearly parallel to the Abor and Dofla line from Tibet; the affinities being with the Northern and Southern Tibetan and Burmese respectively. Dr. Brown, however, to whom we owe the valuable series of illustrative vocabularies, has pronounced that, between the two we are justified in throwing the Burmese and Tibetan into a single class. Of the other groups, the Siamese is the most isolated.

§ 138. In respect to Accent and Tone more will be said in the sequel; for it is with the Monosyllabic languages that we may *begin*, and argue upwards, i.e. from the earlier to the later stage. We may now ask not only whether we can go farther back (which will be seen in the sequel), but whether we can go farther forward? We can certainly speculate on the tendencies of the more advanced languages, and point to the portions of them in which change is going on at present, and also seems likely to proceed. But there are points which are of a more practical character; points which are less connected with either of the two extremities of our chain than with the relation of these extremities to one another. Let us remind ourselves that, in way of growth, or development, the two most opposite languages are the English and the Chinese. The English is the most Analytic language in the world; the Chinese the most typically Monosyllabic. If we compare the two, we shall find something like the old adage—'*Extremes meet*.' Nor is it difficult to see how this may be the case; indeed, how, to some extent, it *must* be so.

§ 139. The chief and most conspicuous process in the Analytic stages of language is to divest the words it affects of all such additions, affixes, or appendages as constitute Inflection: indeed, if we compare the present English with the Greek, Latin, or Sanskrit, we may say that the function of Analysis in Britain has been to denude all English words of their inflections; and, if they leave any standing, to make

them as little distinctive as possible. We have, notoriously, very few real inflections of any kind, and it will be shown that of the majority the action, or influence, is incomplete. At present, it is enough to suggest the similar uninflectional character of the Chinese, and, at the same time, the very opposite reason for it. In Chinese the inflections have not been developed. In English they have been developed and dropped.

It is, probably, more important to understand this than to trouble ourselves about giving it a name. It is more like a *Circle* than anything else; and we may, if we choose, call it a *Cycle—ob differentiam*. This is what we do with '*Noun*' and '*Name*,' and, to some extent, with '*Mode*' and '*Mood*'; though the only difference is, that the words (identical in meaning) are taken from different languages. It would be somewhat technical to call it a *Cycloid*. It is, probably, more of a *Spiral* than aught else. But, be this as it may, there is certainly a tendency in the more advanced stages of Analysis for the non-inflectional character to return upon itself.

§ 140. It may now be shown that the English system of inflection, limited as it is at its best, is even more limited than at first it appears to be. This is because it is less distinctive; and '*distinctive*' means as follows:—If two or more parts of speech have inflections of the same form, and, *totidem literis*, identical; however they may differ in import, their inflection is only distinctive in reference to words with *different* endings, and not distinctive in respect to one another. Thus the *-s* in *fathers* is distinctive as opposed to *father*; but whether it represent the Latin *patris* or *patres* is doubtful. In writing we can indicate the difference by the apostrophe: *father's=patris, fathers=patres*. But writing is Language, and something more. In Speech the *-s*, as between the Genitive Case and the Plural Number, is *not* distinctive, and, so far, is deficient in the function of an inflection. Again, from *love*, which is a verb as well as a noun, we have *love's =amoris*, *loves=amores*, and *loves=amat*; words which, in

meaning, are three, but in form, one. The context, no doubt, tells us what is meant. But, if so, what is the function of the inflection? Again, we know that, originally, such inflections were different; *i.e.* that the Genitive Singular ended in *-es*, the Plural in *-as*, and the Verb in *-eth*. But, now, we must take them as they stand; so that out of the few inflections which we have in English, the three in *-s* are imperfect. So are the two in *-ed* (*-d* or *-t*), as *loved*=*amavit*, and *loved*=*amatus*. So is the termination *-ing* in words like *speaking*, *moving*, and the like. Do they translate words like *motio*, or words like *movens*? Originally, the forms were different; for the Participle ended in *-nd*, the Verbal in *-ung*. So were, originally, the two forms in *-d*. Later on, they became confluent: and of the Analytic stage the tendency to confluence is a character; and, in proportion as inflections become confluent, their operation as distinctive signs is impaired.

When these imperfect inflections are duly considered, what, in the way of distinctive inflection, remains in our language? The *-t* in the words *wha-t*, *tha-t*, and *i-t* (*hi-t* from *he*). The form in *-en* for the Participle Passive is no inflection, but a formative.

Hence, it is, manifestly, of primary importance to know whether a language is on its way from Agglutination, or some lower stage, to Synthesis, or from Synthesis to Analysis: and between extreme forms, like the English and Chinese, it is not difficult to do so; with the intermediate ones it is otherwise. There are some combinations, however, such as '*I have been*,' that scarcely can be other than Analytic.

§ 141. Such are the stages and such the materials. The stages are recognised, and the names have an adequate amount of currency. They are not unexceptionable; but it is better to take them as they are, than to try to improve upon them. Nevertheless, both the names and their distribution must be taken with a certain amount of reservation.

It is probable that, in their two extreme forms the

Analytic and Synthetic constitute *two* distinct stages. But they are languages for which we have a long series of records; languages which belong to the same great Indo-European class; and, above all, languages which, to a degree not found elsewhere, can be studied continuously. Hence, independent of other reasons, the two classes may be taken as one; and the stage which they constitute is here treated as such, not so much because it is a stage, but because it is a stage specially and pre-eminently susceptible of illustration.

§ 142. The Synthetic, or Analytico-Synthetic, stage stands first in order, because it is the one which, in Great Britain at least, is the best understood. It is the last of the series; and it is from the newer to the older, from the more developed to the less developed, from the more certain to the less uncertain, that we must reason. The special elements of language that the above-named languages illustrate are the *Inflections*. They are fairly illustrated; but when we, also, see how they transmute themselves into Analytical equivalents, the combined illustration of the two classes is very valuable; and it is only from the languages of this period that we can arrive at it. But the difference between Syntheticism and Agglutination is not absolute; nor are all the Agglutinate languages equally in contrast to the Synthetic. In the mere number of cases the Fin surpasses the Latin and Sanskrit. Neither is there much difference in the reducibility of the signs. In the Turkish, however, which is probably the nearest congener of the Fin, the signs both of Case and Number (Gender there is none) are easily divisible into separate syllables, independent of one another, and, in short, more like reducible compound words than irreducible signs of Inflection. On the frontier of the Monosyllabic area, *i.e.* on the parts between the Himalayas and the Ganges, the Agglutinate class is nearer in structure to the Monosyllabic than it is to the Synthetic. Nor should this surprise us. Between the spread of the Russian eastward and the Turkish westward, the displacement of (probably) intermediate forms

is inordinate. It is probable that nine-tenths of the area which is now Turk, Mongol, or Russ was originally other than Turkish, Mongolian, or Russian. Of one of these hypothetical languages—the Yeniseian, between the Turkish and Mongolian—a fragment still remains.

§ 143. In the Agglutinate stage there is, undoubtedly, Inflection, and that to a notable extent; just as in the Synthetic stage there was Agglutination. Neither of the two forms excludes the other. On the other hand, however, it is certain that the proportion which the two processes bear towards one another varies. By this, (like the other two stages) *i.e.* by its general character it must be judged, and by this general character each of the remaining stages will be tested. *Agglutination* will mainly coincide with the predominance of *Formatives*; *Monosyllabicism* by the importance which it gives to *Accent*.

§ 144. The characteristic elements which the Agglutinate stage most specially illustrates are the *Formatives*; and, even if it were not so, the system of Inflections is more adequately illustrated in the section on Synthesis. That they should characterize the Monosyllabic series, is a contradiction in terms. But it is not merely because the Formatives, if not assigned as characteristics to the Agglutinate class, have no other place of allotment, that they are thus associated. Fair reasons will be given in the sequel for enabling us to refer the origin of some Inflections, at least, to a corresponding Formative.

§ 145. The Inflection, the Theme, and the Root, are, until we come to Phonesis, the three parts of a word in its latest stage of development; or, if we begin from the beginning, the Root, the Themative Affix, and the Inflection. Thus *voc-* is the root of both *voc-o* and *voc-it-o*; it is in the latter the thematic element; and *-amus* in both *voc-amus* and *voc-it-amus* the inflection. The *-amus* may become *-atis*, *-ant*, *-avi*, and the like. The *-it-*, and *voc-* remain unchanged. Words without any superadded elements, and

that in their shortest form, are the elements of our ideal of a Monosyllabic form of speech; which we safely believe to be older in its structure than any wherein we find additions, sounds, or syllables. But words are not used singly. It must be an exceptionally short sentence in which there are not two or more than two in contact; and certain words may not only come in contact with others, but coalesce with them. This gives us *Composition*; which brings us to ask where and when Composition begins, *i.e.* when out of two separate words we get a compound.

§ 146. The Monosyllabic stage precedes the Agglutinate, and, *à fortiori*, it precedes the Synthetic. In its extreme—perhaps we may say ideal—form it gives neither inflectional nor thematic elements; but simply and solely the root. That this root should be monosyllabic is what we believe *à priori*, and, on the whole, rightly. But it does exclude dissyllables. A third syllable, however, would, in general, imply an addition of some kind.

§ 147. The paramount question in the languages of the Monosyllabic type is, the point at which two separate and independent words so coalesce as to become one. This means, when does *Composition* begin? There is no better example of which the difference actually is than the familiar instance of '*All blácк birds are not blácкbirds.*' It is the difference of the *Accent* that indicates the change. But Accent underlies the Monosyllabic system, and belongs to Phonesis; under which head it will be considered.

§ 148. And now the treatment of the subject is changed; and, from the *data* supplied by the materials which we have indicated and classified, an attempt will be made to explain some of the chief details in the way of Inflection and its antecedents. It must be premised, however, that the whole mass of available material has not been treated exhaustively. For the Synthetic and Monosyllabic classes all the materials have been noticed. In the Agglutinate class there has been a selection. This is because, though there is no language,

dialect, or sub-dialect on the face of the earth which may not illustrate some other, there is a great difference in the extent to which they may illustrate the questions under consideration. The languages and classes which have been enumerated are (so to say) *on the line*. Europe, except so far as the Sanskrit is other than European, is exclusively the domain of the Synthetico-Analytical class. In like manner the South-Eastern parts of Asia are Monosyllablic; and that, not here and there, with a mixture of monosyllabicism and agglutination, but in contact with one another, *en bloc*, and to the exclusion of anything polysyllabic. But the Agglutinate languages are ubiquitous; indeed, we may say, that whatever is neither Monosyllabic nor Synthetic is Agglutinate. It is manifest, then, that there must be a wide difference between some of these languages and others in respect to their value as *data*: and that those languages which, like the Mantshu, the Turk, the Yeniseian, the Fin, and the Dravirian, lie between the Monosyllabic and Synthetic areas, must have a special value of their own.

PART II.

PARTS OF SPEECH—MIGRATION—THE INFINITIVE—VERB OR NOUN—PERSON, VOICE, NUMBER, CASE, AND TENSE—GENDER AND MOOD—ORIGIN OF, AND GROWTH OF INFLECTION.

(1.) Migration.

§ 149. '*Omne verbum, quum desinit esse quod est, migrat in Adverbium.*' This is from Servius; and Horne Tooke remarks upon it that, when a man has a word of which he can make nothing, he makes an Adverb of it. It is doubtful whether he meant this to be complimentary to the grammarians. On the contrary, it looks like a grim sneer on either the word '*Migration*,' or the goal towards which the grammarians directed it. Be this as it may; if one fact in language is more real than another, it is that of *Migration*. And equally real is the fact, that a large proportion of the *migrants* become Adverbs. Nor do they always stop at the Adverbial stage; but, on the contrary, go onwards and become *Prepositions*, and subsequently *Conjunctions*: indeed, we may fairly say, that until we have got a word as a Conjunction we have not got to the end of it.

§ 150. But migrations are of many kinds. Some carry the emigrant to a distance; some over a mere strip of country. And so it is with the Parts of Speech. Cases and Tenses may migrate. The Second Personal Pronoun Singular has long been migrating; so long that, in some cases, it has not only abandoned the domicil which it had in such a phrase as '*thou speakest*,' to the Plural form '*you*' but has, itself, gone no one knows where. But '*you*,' itself an Accusative form, has replaced *ye*, which was the Nominative

so that in the sequence *thou speakest*, *ye speak*, *you speak*, we have a double change. But, along with itself the Pronoun takes its Verb; for *speak*, like '*ye*' or '*you*,' is a plural form. The result of all this is, that the Second Personal Pronoun Singular and the Second Person Singular of the Verb are simply eliminated from the current language.

§ 151. In German, they say *Sie=they*; so that, in German, the migration is that of the *Third* Personal Pronoun. But it is possible that this is not a true migration; or rather that it is not the migration of a *word*. It may be that it is a change of the subject-matter, and that, as a point of courtesy, a simple person spoken to may, by a fiction, be considered as *more than one*. Of fictions of this kind the Oriental languages supply numerous instances; instances of ceremonious, reverential, or, at any rate, of an artificial, language.

§ 152. There is another kind of approximate migration. *Two* words may be used to express what is sometimes expressed by one. We get an instance of this in the combinations '*I have spoken*,' and the like. But let '*have*' be omitted. In that case, the *Participle* alone expresses the same idea. If so, it then becomes a Tense; in which the difference, as in Latin, is either '*I have spoken*,' or '*I spoke*.' Now this formation of a Tense out of a Participle is neither a hypothesis nor a fiction. It exists in the Slavonic languages; and that throughout each of them, and through all the divisions and sub-divisions of the Family. And, as if to show that the so-called Tense is merely a Participle with an omission of its Verb, the Genders of the Participial form are retained in the Tense.

§ 153. The same is the case with the Second Person Plural in the Latin Passive. Words like '*amamini*,' '*regimini*,' and the like are merely participles; as truly participial as such forms as '*τετυμμένοι εἴσι*' are in Greek —the Verb Substantive being dropped.

§ 154. Again; were it not so, Speech would be un-

changeable. In fact, *Migration* is little more than another word for *Change*.

§ 155. Again, how do we translate into *thought* such sentences as '*Either John or Thomas is in the wrong*.' If the thought run '*One of the two is in the wrong*,' the word '*either*' is a *Pronoun*. If it run '*In the way of an alternative*,' &c., it is an *Adverb*. But, in Grammar, it is generally treated as a *Conjunction*. Yet this it is not. The real Conjunction is *or*; and the word '*either*' only strengthens, or expands, its Conjunctive (or *Dis*junctive) force. Still the word takes the disguise of a Conjunction, though it is rather an adjunct to one. But, at any rate, it shows the instability of the word as a Part of Speech; and it is probable that most words, when they migrate, begin with being, more or less, equivocal.

§ 156. Finally, what is the whole system of Synthesis and Analysis? It is *Migration* reversed. In the foregoing illustrations we began with a form, or word, and traced the different, but allied, meanings to which it lent itself. In Synthesis and Analysis we begin with the thought, or idea, and follow it through the different combination of words by which it expresses itself. In Migration, a word changes its place as a Part of Speech. In Synthesis and Analysis, a thought, or idea, changes its garb, or clothing. But they both change, and that on the same principle. We can prove this in the change from Synthesis to Analysis historically. In the change from Agglutination to Synthesis, or from Monosyllabicism to Agglutination, we can only infer it. But it is reasonable to believe that the difference lies only in our want of *data*.

§ 157. In these illustrations it is almost needless to mention that by '*Parts of Speech*' we mean not only the recognised classes of Noun, Pronoun, Verb, Participle, &c., but the parts of those parts, such as Case, Person, and the like. There is one migration from (say) the Noun to the Adverb, and another within the domain of the Noun itself, or from one

form of it to another. Of changes of each sort there is no better illustration than the words *then* and *there*. Let the substantive denoting *locality*, or *direction*, be understood. The form '*there*,' which is simply a Dative Feminine Singular, means '*at that place*,' '*on that spot*,' or '*in that direction*;' while '*then*,' the Accusative Masculine of the same number of the same pronoun, means '*at that time*.' In the present English these two words which, as Pronouns, have parted with their Substantives and lost their place in the Paradigm of a Declension, are preserved in the language as Adverbs—*migraverunt in Adverbia*.

Closely akin to this are the changes of the same Part of Speech in another direction. The Demonstrative Pronoun, in most languages where there is an Article at all, furnishes it. It becomes Definite; for between *pointing-out* and *defining*, as ideas, the connection is the closest. Then, for the Indefinite Article, the usual term is the Numeral for 1. Between the two we get a new Part of Speech. But this, from its close attachment to its noun, is almost a part of it, and, being this, is all but an Inflectional affix. In the Roumanian and Norse languages it is actually incorporated with it, affixed, and recognised as the Postpositive Article. It is this, no doubt; but, on the other hand, it is more of an Inflection than aught else. At the beginning it was a Personal or Demonstrative Pronoun. This is as much as can be said on this point.

(2.) The Infinitive (Verb or Noun) as a Part of Speech.

§ 158. The heading of this chapter is more than what the mere words imply. It is a text; a text upon the Infinitive Mood and other matters besides. And we can easily see why it is thus comprehensive. The Infinitive Mood stands on the border-land between the Noun and the Verb. In languages like the Greek, upon which the principles of the Grammars for, at least, the rest of Europe were founded, there was a

well-marked distinction between them. Both were inflected; but Nouns were inflected in the way of Declension, Verbs in that of Conjugation. Nouns had Gender and Case; Verbs had Person, Voice, Number, Tense, and Mood; and for every one of these groups the characteristic signs were clear and definite. But what when we come to languages where the Inflections are obsolete, obsolescent, or extinct? And what with languages where they have never been developed? There must be cases where the Greek system is, more or less, inapplicable; the more so as it was by logicians, rather than by philologists, that the system of Nouns, Verbs, and the like, was devised. The only wonder is that such a system carries so far as it does: a tribute to the genius of the great philosophers of antiquity.

§ 159. '*The Infinitive Mood stands on the border-land between the Noun and the Verb*;' and when we investigate its relations, we must determine not only what are the characters of the Mood itself, but the characters of the Noun and Verb besides. It is probable that most of us do one of two things: we either (1) make too much of the distinction between the two Parts of Speech, or (2) carry the Infinitive too far into the domain of the Verb.

I am convinced that it is best, when we treat of the *Verb*, to begin with the *Verbals*, and when we treat of the *Noun*, to carry it on to the *Finite Verb*. This last, perhaps, is what we generally do. But it is not enough. We must be prepared, when we reach the *Finite Verb*, to consider the difference between it and the Noun as one of kind rather than of degree. When we see how thoroughly the Participle appears to connect the two, we are likely to underrate the difference. But (to anticipate) we must be prepared to realise the fact, that as words, terms, parts of speech, or whatever we call them, the *Finite Verb* and *Noun* are incommensurable; and that any difference of classification less than incommensurable is insufficient. The Noun is a *Word*: the Finite Verb is a *Sentence*.

§ 160. It is better to begin with the Verbals (*hunter* and *hunting*) than with the Infinitive; and, when we do this, we must go back farther still: we must rise into the region of the *Abstract* and the *Concrete*.

§ 161. What, as a part of speech, is a word like *hunting*? A Noun. And what are words like *hunter*? Nouns also. The first is the name of an action independent of its agent; the other the name of an agent independent of any action. There is nothing concrete about either of them. They are abstract terms, just like *redness*, *heaviness*, and the like, and they are formed with the same regularity and to the same extent. Every Adjective in our language can be made into a Substantive by adding *-ness*, and, by adding *-er* or *-ing* (originally *-ung*), every Verb can be made into a Noun.

§ 162. What applies to the Verbal abstracts like *hunt-ing*, *leap-ing*, and the like, applies also to the simpler forms, *hunt* and *leap*. There is a difference, no doubt, between such sentences as '*he is good at leaping*,' and '*he is good at a leap*.' There is, also, a difference (somewhat less perceptible) between such a line as

To err is human; *to forgive*, divine,

and

Error is human; *forgiveness*, divine;

but, in both cases, the import of the words under notice is that of a Noun. In both cases we get the name of an action without the name of the agent; just as in '*redness*,' '*goodness*,' &c., we get the name of a quality, but no name for substance, with which it is connected.

§ 163. The difference between the words like *leap* and those like *leap-ing*, as in '*he took a leap*' and '*leaping is a certain action of the lower extremities*,' is much the same as that between words like *red* and *redness*. We can say '*this is redness*,' and, as *redness* is the name of a general attribute of all red objects, it is a Noun. But '*red*' is not so much a name as a word that suggests a name; i.e. *redness*. The logicians get over this by saying that in expressions like '*this*

is red,' some such word as *thing* or *object* is understood. And such is doubtless the case. But, when this is the case, the Adjective is not so much a term *per se* as an element in a compound term. Now though the parallel scarcely runs on all-fours, this is essentially the difference between *leap* and *leap-ing*. The first points to a particular act, the latter to the character of the action in general.

Of the two words thus brought into comparison it is self-evident that the more general and indefinite, which is also the derivative form, is the newer; and that the less general, the one that most readily suggests (though it does not name) a second factor, is the older one. This secondary element in the case of the Adjective is the substance of which *redness* is the attribute, and in that of the Verb the agent in the action. But attributes and actions are equally abstractions, and though not equally *Substantives* are equally *Nouns*. This is not written for nothing. When we come to the names of the agents in actions (or states), and when these names are represented by the *Persons of Verbs*, the details of the present comparison are important.

§ 164. Now Verbs as well as Nouns are *names*; and so far as '*name*' and '*Noun*' coincide in import, they are Nouns. But the *Nouns* or *names* are of a peculiar kind. In the first place, they are Abstract as opposed to *Concrete*; but they are not Abstract in the way that the Adjective and their derivatives—*red* and *redness*—are Abstract. They do not represent Qualities. What the Verb represents is either an *Action* or a *State*. When, over and above this, it tells us who or what is in such or such a state, or who or what is the agent in such or such an act, it (then) becomes 'invested with circumstances,' or Concrete. But the name of an action, purely and simply, without the name of the agent, is as much of Noun as any other ordinary Abstract. Such a name is '*hunt*'='*venari*' as opposed to '*hunter*' and '*venator*.' But words like '*hunter*' are incomplete in their import. What is a *hunter*, unless we know what is meant by *hunting*?

Unless this be known, he is agent without individuality, and without any definite action.

§ 165. In words like '*I hunt*,' &c., we get something more; *i.e.* we get the name of both action and the agent. But this is a name and something more; in fact, it is *two* names. *Per contra*, the Latin for '*I hunt*' is '*venor*,' and this is a single word. Nevertheless, it translates *two*; and, what is more, it contains the element, or representative, of a second term. What, then, are we to say? We may safely say thus much—that a Verb, whether in what is called the Infinitive Mood or in its simple radical form, is very like a Noun; and that a Verb with its Person is very like *two* Nouns.

§ 166. To which, then, are the Infinitives most like—the Nouns or the Verbs? They are wholly without the Persons of the Finite Verb; for if they had them, they would cease to be Infinitives. Have they the Declension of the Noun? and, if they have, to what extent? This is a point to be considered. Outward appearances are against their having it. It is certain that, *totidem litteris* and *totidem syllabis*, such inflections are wanting. But their absence is not due to anything in the nature of the Infinitive itself; but rather to another cause. Every Infinitive has its corresponding Substantive; the difference between the two forms being but slight. Thus φθόνος corresponds to φθονεῖν, μῖσος to μισεῖν: and these are declined. But even in Greek, at least, there is a concurrent system of Cases; though of an indirect kind—τὸ φθονεῖν=*invidia*; τοῦ φθονεῖν=*invidiæ*; τῷ φθονεῖν=*invidiâ*. In Latin, this indirect inflection is wanted. But in Latin there is no Article.

§ 167. I do not know that this particular construction is found in the Plural *number*, or that we can readily produce such words as τὰ or τῶν τυπτεῖν. But there is no logical reason why we should not; and, if we could, there would be no difficulty in translating them. They would simply give us equivalents to such words as *beatings*, *risings*, *findings*, and the like. There would be a shade of difference in their

import, just as there is one between *to err* and *error*—but that would be all.

§ 168. Can Infinitives have Gender? Are such combinations as *ὁ φθονεῖν*, and *ἡ φιλοσοφεῖν* possible? All that need be said on this point is, that words like *ὁ φθόνος* and *ἡ φιλοσοφία* are common, and that, as Substantives, they correspond with the Infinitives in sense.

The accidents of the Verbal Substantives are, also, the accidents of the Infinitive Mood *in import*. But there is one exception. However, in this there is nothing, either in form or import, which brings the Infinitive and the Noun within the same class. This one exception is that of *Person*. The Infinitives have no *Persons*. If they had, they would thereby cease to be Infinitives, and become Finite Verbs. This, at first, seems but a trifling distinction. In reality it is a very wide one. It is just the distinction between *two* words and *one*; just the difference between a single word and a sentence; just the difference between (in Logic) a *Proposition* and a *Single Term*. It is a distinction of no small import; indeed, it is the difference which justifies us in saying that the relations between the Infinitive and the Finite Verb are incommensurable.

§ 169. The Person of a Finite Verb is either a separate word, as '*I*' in '*I swim*,' or its equivalent the *-o* in '*no*:' both of which are, in Grammar, *Sentences*, in Logic *Propositions*; short ones, no doubt, but still *propositions* and *sentences*. No Infinitive has a Person. No Finite Verb without one.

§ 170. The exceptions to this last statement are only formal; inasmuch as the Personal element may be implicit in the sense, though not explicit in the expression. This happens when the Subject is either so manifest that it needs no sign, or too indefinite to be represented by any particular name.

Instances of the first alternative are words like *dic* and

fac, Imperative Moods, where the personality of the individual addressed is self-evident.

Of the second we find examples in the so-called Impersonal Verbs, *tædet*, *pœnitet*, and the like. In some cases the context supplies what is missing. But in short sentences the case is different. In combinations like '*it rains*,' it is hard to say who, or what, is the agent; yet this is not because there is no agency, but because its nature is indefinite. In the Infinitive, however, there is no name for an agent anywhere, or of any kind, no name whether explicit or implicit, no name either *citra dictionem* or *extra dictionem*.

§ 171. It is only then in the Imperative Mood, where there is no possibility of doubt as to the agent, and in some few Impersonals, where the Nominative Case is too indefinite to be expressed, that the Finite Verb thus loses its characteristic. Whether it take this name in the shape of a separate Noun, as '*I think*,' '*John speaks*,' or by the way of inflection, as '*puto*,' or by both processes, '*Ego puto*,' and '*I think*,' is immaterial.

§ 172. The Finite Verb then is a Verb, and something more. It is a Verb *plus* a Pronoun, or the equivalent to one. It is the name of an action *plus* the name of an agent. It is not one word, but two. It is not a single Part of Speech, but two Parts of Speech united as one.

§ 173. I know no better exposition of these details than the following, from Stockfleth's Laplandic Grammar, §§ 231–233.

A. There are two capital forms of the Verb: 1. the Subjective form, with the conception of Personality and Time; 2. the Objective form, without any other conception, especially of Personality.

B. The Subjective form has three Moods (*modi*):

1. The Indicative.
2. The Conjunctive.

This last has two divisions: *a.* Subjunctive (*præsens subjunctivus*); *b.* Optative (*præteritum conjunctivum*).

3. The Imperative.

C. The Objective form, independent of Person, and to some extent of Time, has two divisions: 1. *Verbum Nominale*; 2. *Nomen Verbale.*

To the *Verbum Nominale* belong—

1. *Infinitivus*, which answers to the ordinary Infinitive.
2. *Factivus*, which answers to the Latin Supine.
3. *Comitativus*, which answers to the Gerund.

To the *Nomen Verbale* belongs—

a. Nomen Substantivum Verbale.
b. Nomen Adjectivum Verbale.

Each falls into two subdivisions:

1. *Nomen Substantivum Verbale Abstractum*, which corresponds with the two [Danish] forms in *ing* and *-n*, *Læsning* (i.e. *lectio*) and *Læsen* (i.e. *legere*). It is inflected in both numbers.

b. Nomen Adjectivum Verbale Concretum, which answers to the Latin Participle.

1. *Præsens Participium*, without the conception of any definite time, and therefore, in conjunction with the auxiliary verb, it applies to any time.

2. *Præteritum Participium*, with the conception of past time; uninflected.

§ 174. This last word, '*uninflected*,' applies to the Lapландic language, not to the Past Participle of the Indo-European class.

The name *Præteritum Conjunctivum* assigned to the Optative indicates its mixed character, and its relations to the Tense on one side, the Mood on the other.

Of a Negative Gerund, which is called '*Caritivus*,' no notice has here been taken.

It is necessary, too, to draw attention to Stockfleth's notice of the negative form of the English Infinitive. In the present language there is no sign for the Infinitive Mood, so that in English the Infinitive is *equivocal*, *i.e.* a form like *ride* and *hunt*, in which the Substantives *a ride* and *a hunt* are absolutely identical in form with the verbs *to ride* and *to hunt*.

(3.) Inflection.

§ 175. The *Inflections* are a natural class; and their import is the expression of what, in Logic, is called the Accidents of a Substance, Action, or State. As such, they are signs of Person, Voice, Number, Case, Tense, Gender, and ood. Of these, Person, Voice, and Tense are the most reducible, *i.e.* the most readily analysed, and the most manifestly derived from separate and independent words. Those of Gender and Mood are, perhaps, the last to develope themselves and the first to become obsolete. Number and Tense seem to be both the earliest in origin and the most permanent in duration.

§ 176. The two principal methods of forming these Inflections are *Addition* and *Differentiation.* By Addition we get a wholly new sound, vowel or consonant as the case may be. By Differentiation we get either the substitution of one sound (vowel or consonant) for another, or the same vowel in a modified form. Sometimes, indeed, we have nothing more than a change of either tone or of accent; as, *I beát you if you do that=I shall beat* &c.

§ 177. Upon the difference between the results of Addition and Differentiation some important inferences depend. The termination *-as* in words like *bon-as* differentiates the Feminine form from the Masculine *bonos*; but between the *two* we get *three* distinctions—those of Gender, Number, and Case. It is not necessary to go into the explanation of the mechanism of this, and to show how it can be; but it is clear that when such forms present themselves, there must be one of the three inflections for which we have no extrinsic, audible, or definite sign. It is convenient to call these inflections either '*modified*,' or '*differentiated*;' and it is evident that such abbreviated or modified forms are much more difficult to reduce than inflections *in extenso.* Now, the Inflection of Gender is generally expressed by either differentiation of this kind, or by the omission or non-existence

of some increment which is present in one gender, but absent in one of the others. In the Synthetic class of language, where Gender prevails, reduction is difficult. In the Agglutinate languages, on the other hand, where there is no Gender, it is comparatively easy; and we can, in many cases, lay our finger on the respective signs of Number and Case, and determine their sequence. Moreover, they often amount to syllables of notable length. Nevertheless, even here it is not easy to ascertain what they were as separate and independent words. It is enough, however, if they improve the presumption that such is what they were originally.

§ 178. The signs of the *Conjunctive* Mood are also, as a rule, *differentiations* or *modifications*; and the Conjunctive Mood, like Gender, is late in its development and early in its disappearance. This means that both look very like secondary formations, or formations from some earlier inflection—*with a difference.*

§ 179. It is submitted, then, that the distinction is natural; and that inflections formed by change rather than by the addition of some special separate element will be found to correspond with other characters, and with certain classes that such characters determine. When this is the case, we may presume that the arrangement is natural; though, of course, its value must be measured by the extent of the correspondence. How far this is the case will be seen in the sequel, especially under '*Gender*' and '*Mood*.'

(4.) Declension and Conjugation.

§ 180. Each of these terms is used in two senses. When we say that the Genitive Case is a part of the Declension of a Noun, and that the First Person Singular is a part of the Conjugation of a Verb, we mean that each belongs to the class for which *Inflection* is the generic name. This is a mere matter of classification, and requires no further notice.

But when we say that *musæ*, *domini*, *lapidis*, *gradûs*, and *faciei*, all of which are Genitive Cases, belong to five different Declensions; and that *amo*, *moneo*, *rego*, and *audio* belong to four different Conjugations, we mean something which, when we come to understand what is involved in the difference, is perplexing.

§ 181. *Declension* and *Conjugation*, in this sense, mean classes under which, when we find *more forms than one* for the *same* Case or Tense, the different paradigms of the inflections are arranged. Sometimes words are placed in different declensions on the strength of very slight differences; sometimes a considerable amount of them is required before a second class is recognised. But this varies with the grammar and the language; and, in many cases, there may be different systems within the same language. This depends on the grammarian. The old number of the Greek Declensions was Five. They were subsequently reduced to Three. On the other hand, by giving the Simple and the Contracted Nouns a Declension each, they are raised to Ten. Again—the Conjugations of the Verbs in the Eton Grammar are (or were) thirteen—'*sex Barytonorum, tres Contractorum, et quatuor Verborum in* -μι.' But these are manifestly reducible to three higher classes. Are we then to apply the same term to the Genus and Species? Or are we to have names for each class? These are questions which are not asked for the purpose of being answered. They are rather asked for the purpose of showing that the number of Declensions and Conjugations is, to some extent, a question of names rather than one of realities.

§ 182. The real question is—Why should there be any difference of Declension and Conjugation at all? If a given meaning is adequately represented by one form, what is the use of another? Either rightly or wrongly, we believe that Nature is not tolerant of superfluities. Still, if there are not a great many ideas which have more forms of expression than one, there must be something exceptionable in many of

our common modes of speech. Two such are the words before us; and '*synonym*,' or '*synonymous word*,' is a term of the same kind. Are there such things in *Rerum Natura* as two words with *exactly* the same meaning?

§ 183. There are not. Neither is there any method of forming a second inflection absolutely identical with one already existing, and along with which it can be used concurrently. There is, doubtless, something like it. There are differences of structure in the fundamental parts of the word, which may produce small changes; there are differences in the effect which two, or more, inflectional elements in combination may have upon each other; there are differences in the permanence of certain elements, (*i.e.* an archaic form may become obsolete in one class of words earlier than in another); and there may may be confluence in meaning between two forms originally distinct. All this we may expect, and all this we actually find; but they fail to give us a single instance of Language being, in the strictest sense of the word, tautological. Wherever it appears to be so, we must suspect the rule, or formula, which embodies it. We need not condemn it. Grammars are written less for comparative philologists than for learners of foreign languages. We therefore must frame the rules in the way that is most convenient. We cannot make them so stringent as to be followed by a long list of exceptions; nor yet so guarded by qualifications and conditions as to include all possible variations. We must do the best we can for the purpose in hand. But the philologue must not mistake this for anything more than a special exposition of a special form of speech. From the Grammar of Language as it exists in nature he must exclude tautology. There are no such things as *absolute* synonyms; no such things as declensions and conjugations that give us double forms for *exactly* the same cases and tenses; and no such things as exceptions to a rule, provided the rule be expressed in terms sufficiently general.

It is not, however, meant by this that, for the ordi-

nary purposes of teaching, rules of less general character are inadmissible. Neither is a certain amount of exceptions. But we must be very cautious in admitting tautology as a real element in Speech.

(5.) Person. Noun and Verb.

§ 184. The Persons are the Inflections with which it is the most convenient to begin. No other inflection plays so important a part in classification; and in no other inflection is the structure so readily analysed. It is the Pronoun, moreover, which constitutes the broad and primary distinction between the Noun and the Finite Verb.

In the Infinitive, whether Verb or Noun, we deal with a single word. In the Finite Verb we deal with *two* words; one a Verbal name or the Abstract name of an action without the name of the Agent, the other a Pronoun, Personal or Demonstrative as the case may be. The Finite Verb, then, consists of two Nouns, and constitutes a sentence, or (in Logic) a Proposition. Hence it is a Term, and something more.

§ 185. The Noun as well as the Verb has Persons, though not in English and its Synthetic congeners. The Magyar, which is Fin and Agglutinate, is only one of the numerous languages which supply us with examples of this.

Verb.

1. Olvas-*om* = *I read* = *reading-my.*
2. Olvas-*od* = *thou readest* = *reading-thy.*
3. Olvas-*uk* = *we read* = *reading-our.*
4. Olvas-*atok* = *ye read* = *reading-your.*

Substantive.

1. Almá-*m* = *my apple* = *apple-my.*
2. Alm(a)-*d* = *thy apple* = *apple-thy.*
3. Alm(a)-*nk* = *our apple* = *apple-our.*
4. Alm(a)-*tok* = *your apple* = *apple-your.*

The Celtic does the same; and, in both the construction or parsing, is the same. It is not that of the Government of the Verb by a Nominative Case, but that of the Concord of a Noun with either a Possessive Case or a Pronominal Adjective. It is upon this difference that the little which need here be said about the Person of the Verb depends.

§ 186. The basis of everything connected with the Pronoun is the all-comprehensive dualism of the logicians—*Ego*, with its counterpart *Non-ego*. Everything in the Universe is either *Ego* or *Non-ego*. Everything, too, is either *A* or *Not-A*, and whatever is *not Not-A* must be *A*. In Philology this dual becomes a triple partition. Every Name in Language is that of (1) the Speaker; (2) the Object spoken *to*; and (3) the Object spoken *about*. Out of this Triad we get the Three Persons of the Verb.

§ 187. The very term '*Person*' suggests such an origin; and with such terminations as the -*μι* of *τίθημι*, and the *σ* and *τ* of the Second and Third Persons, nothing suggests itself so readily as a connection between them and the Pronoun; due allowance being made for wear and tear. There are difficulties in detail, but not more than we expect. The Persons are old inflections, and have undergone very many changes. Transitional forms, however, that we miss in one language often present themselves in another; so that the doctrine that the Persons of the Verb are Pronouns in disguise has grown up spontaneously, and in the main is correct.

§ 188. In what *Case* are there incorporated Pronouns? This is a question which until lately has scarcely been thought worth the asking. Does not '*I love*' translate '*amo*,' and is not *I* the Nominative Case to its Verb—its own special verb which it governs? It is all this, no doubt. On the other hand, however, the -*μ*- in the Verbs in -*μι* manifestly points to the *m*- in *me* rather than to the -*g*- in *ego*.

It was the famous Welsh lexicographer, Lhuyd, who

indicated the likelihood of the signs of Person having been *oblique* cases; and it is due to Garnett that its full importance has been recognised, and the details of the change been investigated. Garnett, who, with his usual justice to his predecessors, makes special reference to Lhuyd, maintained that the Verb to which the signs of Person were attached was not so much a Finite Verb as a Verbal, that the Pronoun which invests it with personality was not a Nominative in concord with that Verb, but one in the Possessive Case, the Verb being in a state of regimen or government; in other words, we held that *scribo* was not *write-I*, but *writing-my*. He proceeds:

> The second person plural does not end with the nominative *chwi*, but with *ech*, *wch*, *och*, *ych*, which last three forms are also found coalescing with various prepositions—*iwch*, 'to you;' *ynoch*, 'in you;' *wrthych*, 'through you.'
>
> Now the roots of Welsh words are confessedly nouns with an abstract signification; as, for instance, *dysg* is both '*doctrina*' and the second person imperative '*doce*.' *Dysg-och*, or *wch*, is not, therefore, *docetis* or *docibitis vos*; but *doctrina vestrum*, 'teaching *of*' or '*by* you.' . . . *Doctrina ego* is a logical absurdity; but *doctrina mei*, 'teaching of me,' necessarily includes in it the proposition *ego doceo* in a strictly logical and unequivocal form.

§ 189. For some years no one found this doctrine harder to believe than the present writer. There was no denying the oblique character of *m-*, and *-och*, or *-ych*.

(1) But the identity of form between the verbal *dysg*, and *dysg* as the second person imperative, and (as such) an undoubted verb, is not the same in English as in Welsh. In English *teach*, which translates *dysg*, only translates it as the equivalent to *doce*. The English equivalent to *doctrina* is not *teach*, but *teach-ing*. Now this so manifestly invests the Verb with a radical character that, to an Englishman, the abstract noun is reduced to a derivation or secondary idea. There are many words, no doubt, in English where the two forms have the same meaning. Thus we say, I took

a swim, *a walk*, *a dip*, or *a rest*, &c. &c. ; but we do not say, '*I got a teach.*' *Per contra*, however, there was a time when there was no such sign as *-ing* for the verbal abstract, and when the affixes *my*, *thy*, &c. might be affixed to every verb or verbal in the language. The more we think upon this, the more we feel that this *must* have been the case. As the exposition of the doctrine is not my own, I may say that it is thoroughly convincing. There *must* have been a time when words like *swim* and *move* existed, and when words like *swimming* and *moving* did not. Perhaps the difference between terms like *nare* and *natatio* was not recognised ; but even in that case it must have been implicit in the root, and destined in due time to take a special and distinctive form. It may do this in some languages, in others not. When it fails to be developed, there is not much tendency to demur to such a doctrine as Garnett's. When it presents itself, it is a stumbling-block. There is visible evidence of the formative being of secondary origin ; and we in England have to divest it of this, and to treat it as equally primitive with the simpler one. In the Welsh this is unnecessary. Still the doctrine is pre-eminently intelligible, and we, with no great difficulty, understand it. But when the existing Abstract forms, with these unmistakeable marks of a secondary origin and derivation, are presenting themselves in almost every sentence, we are slow to become familiar with it. We are like beginners in arithmetic. We can understand the principles of computation, but are slow and dubious when we do a sum. So it is with those whose languages abound with the signs under notice. It takes a long time to get rid of their influence, and a long time to shake off its effects. It may be different with others, but this is what it has been with the present writer. Again. Most of us are in the habit of thinking that nothing but a Nominative Case can be the Subject to a Verb. Upon this more will be said in the notice of the Nominative Case. Hence, then, the real difficulty is the confirmed habit of thinking

otherwise. Some minor points lie in the details of the construction. Is the affix a Personal Pronoun in its radical form (*me*, *te*, &c.), or is it the *mei*, or the *tuus*, which is Possessive? Something depends on the difference. The forms like *mei* and *tuus* suggest a later, those like *me* and *te* an earlier, period for the language in which the change took place, and when the Infinitive Verb first became Finite. The Personal element in any form is less evident, and the elements of the inflection are less easily distinguishable in the Dual than in the Plural, and in the Plural than the Singular. But this lies more in the complex character of those two Numbers than in the principle itself. If it only held good for the Singular Number, it would be sufficient to separate the Finite Verb from the Infinitive, and make them incommensurable.

(6.) Voice. Noun and Verb.

§ 190. Nouns as well as Verbs have Voice, though it is not recognised in the ordinary Grammars. Nor, for the purposes of special teaching, need it be. Indeed, in many languages it belongs wholly to Syntax. In some we have different sorts of expression in different stages. In some cases there is no sign at all, no formative, no inflection, nothing whatever *in esse*. Nevertheless, whether adequately or inadequately represented by signs, there is in the Noun a far more elaborate system of conceptions in the way of Voice than there is in the Verb.

These, from the very nature of the language, may, with a certain amount of data, be determined and arranged *à priori*. This is because in the notion of Voice there are always an antithesis and a correlation. Hence, if we have only one form *in esse*, we are sure of another *in posse*, and, without saying exactly what it will be in language, can construct it for ourselves in thought. Thus, given such a word as *hunter*, *i.e.* the Verbal Agent from a *transitive* Verb, we know that there must be something that he is supposed to *hunt*; in other words, an object. There may or may not be a name

for this; and in *in*transitive verbals, such as *sleep-er*, it is not wanted, though it is sometimes used, almost tautologically, to strengthen or specify the character of the state, *e.g. he sleeps the sleep of the righteous.* If the verbal element, however, of the name of the Agent be transitive, there must be an object, and the name of this object is the correlative (signified or not) to the Verbal of the Active Voice. Thus far there is absolute certainty. On the other hand, however, it is well known that in English, at least, no such correlative exists. In a foxhunt both the horsemen and horses are *hunters*, though with a difference. The *huntsman*, too, is a *hunter*; but, as opposed to the *whipper-in*, he is a *hunter* of a special kind. For these then we have, either by composition or derivation, two forms deduced from the verb *hunt*, with certain distinctions between them. The horses, then, and the men are *hunters*, and take their class-name from the verb involved in their agency. But the fox has surely something like a similar connection. He is the object, or the *thing hunted.* Yet he has no single name as such. The *thing hunted*, the *hunted animal*, or the *object of the hunter* has to be expressed by a combination of different words. There is no necessity for this. One syllable is as easily attached to words like *hunt* as another. Nevertheless, we have no such word as the one suggested in English.

§ 191. Yet there is no scruple as to other modifications of the *-er*, (the *-er agentis*) under notice. One female takes to the hunting-field and becomes a *hunt-r-ess*, another to the hotel and becomes a *waitress.* We have got, then, one form; but the one that we most especially expect we have not got. We have not got a correlative to the Verbal Agent. Such is the case; but it is necessary to add, that the affix *-ess* is other than English in origin. And this implies more than it states. We did not in English often apply the affix till it was specially wanted for the expression of a practical distinction; and when we had to apply it, we took it from the French.

Again, notwithstanding what has just been said, the formative that gives us a correlative to the *-er* in *hunt-er* is not wholly and absolutely un-English. *Mortgag-or* and *mortgag-ee*, *grant-or* and *grant-ee*, *trust-or* and *trust-ee*, are correlative to one another. But, again, they are words of a particular class; and again, they are words of un-English origin.

They are French, as we all know. But even in French they are not exactly what we want, not exactly the counterparts to the verbals like *hunter*. They are rather Passive Participles with a special application; and, as such, of secondary origin. But in a context they correspond exactly. They can stand as Nominative Cases to the Verb without either an expressed or an understood Substantive with which they have to agree; and they (in English) can take the sign of the Plural Number, which the Passive Participle can not.

§ 192. Two points are now transparently clear: (1) that the ordinary Passive Participle is not exactly the correlative of the Verbal in *-er*; and (2) that, at the same time, it is something very like it. And with this likeness the history of the Inflection begins.

The words of which *hunter* is the type have always had their opposites or counterparts, but not their exact ones. They never seem to have stood quite alone in import; this meaning that they seem always to have had certain approximate parallels, *i.e.* words of different form, but of like meaning. It was a difference, however, which did not amount to much. It might require a special and separate sign to express it, or it might not. But it was by no means indispensable. One language might adopt it, another not. One language might have it in one stage, but not in another. At any rate there has generally been for the two *Active* Verbals the Participle proper, like *amans*, *-antis* (=*qui amat*), and the Verbal proper, like *amator* (also=*qui amat*); but only one form in Passive sense. It was more Participial than Substantival, and its Greek sign is the *-θ-* in *τυφ-θ-εῖς*. Whether

it was always thus participial, and never substantival, in other words, whether it prevailed to the exclusion of the more substantival counterpart, will soon be seen.

§ 193. But what if both *amans* and *amator* can be translated by *qui amat*, and are yet expressed by words as distinct as *amans* and *amator*? what is the difference between this *pair of words* that in the Active Voice is recognised and in the Passive is ignored? There are three ways of discovering it.

a. In the first we must *think* it out. We must clearly see what we mean by correlation, and also that each of the forms under notice, no matter whether it exist or not, is correlative. They may exist in the shape of formatives, or they may not. This is the *à priori*, or theoretical method; and by it we get what we may call the ideal correlative to such words, as *hunter* and its congeners, *i.e.* the class of Active Verbal Abstracts.

b. We may *work* it out. We may write a sufficient amount of Latin prose, and see when and what distinctions we make ourselves; or we may read so much classical Latin, and see what distinction the writers make.

c. We may get what we can from such grammars as touch upon the subject. From which we learn that words like *amator* are concrete, substantial, and substantival rather than adjectival, and that they imply the actor rather than the act; whereas words like *amans* (*amantis*) apply to the act rather than to the agent, and are more general. By substituting for the single term a combination of the relative pronoun with the verb, we get farther into the nature of the difference. *Amator* and *amans* are equally *qui amat*. But what does *qui* mean? Does it equal *ille*, or *iste*, *qui*, denoting some particular individual whose name is implied by the context, or does it equal *quisquis*, or any *qui* whatever? If it mean the latter, it makes something like a class of *lovers*. A *hunter* is a certain one of a class which *hunts*; one of more than one, perhaps one of many. Now this brings out the

element of Plurality; and we shall see, as we proceed, that *Plurality* combined with the *Substantival* nature of the Verbal under notice implies a great deal.

But why not have a pair of Verbals on both sides, or why should there be any difference at all? The explanation of this lies in the history of the form more especially under notice. At present it is enough to say that it exists. There is no doubt about it. It exists; and the only question that stands over for consideration is that of its extent and influence. Does it absolutely and entirely exclude any second form? Does it make any second form impossible? It certainly does not do this.

In the Lap language we have a recognised *Nomen Substantivum Verbale*:

ACTIVE.

Abstract lā̆dnom = λύειν.
Concrete lā̆dno = λυήτηρ.

PASSIVE.

Abstract lodnojubme = τὸ λύεσθαι.
Concrete lodnojuvve = τὸ λύηθεν.

All these are declined as Substantives. Each has its full complement of Numbers and Cases. The Preterite *Participle* is *lodjuvvum*; but between this and *lodnojuvve* the difference is slight, and, scarcely a real one.

The Latin Supines carry us somewhat farther. That in *-u* is both Passive and Substantival. But, on the other hand, the Supine in *-um* is Adjectival. This perplexes us. Still more do words like *rec-t-or*, *duc-t-or*, *pis-t-or*, and the like; for, in these, the formative affix contains the sound of *-t-*, which is that of the *Passive* form. But still it is not necessarly the *-t-* in *ama-t-us*. It may be this, or it may not; but with the *-at-* in words like *luct-at-or*, *amator*, and a host of others, there is no doubt. It is admittedly the *-at-* in *amatus*. But its sense is *Active*.

§ 194. Here we get a second complication. Of the two

Supines, one was Active and the other Passive in import; both Passive in form. Of the substantives like *luctator* the form is also Passive, but the import wholly Active. Now both these difficulties are recognised, and both will be explained, as we best can, in the sequel.

§ 195. Next come such words as *trustee*, *mortgagee*, *grantee*, and others. They are Passive, Substantival, and Correlative to so many actual, obsolete, or probable *Active* Verbals. It may be said that they are Participles; and in one sense they are so. But they fail to comport themselves in a context as such. *Trust-ee* is, up to a point, the same as *trust-ed*; but we can speak of *trust-ee-s* and we cannot speak of *trust-ed-s*. It may be objected that *trustee* is not wholly an English word. Granted. But it is a word, nevertheless; and what is more, it exists in concurrency with, and as parallel to, *trusted*; and, so doing, indicates not only the recognition of the double form, and a notable difference between the import of the two, but comports itself, in its form for the *plural*, as a Substantive.

§ 196. At present, this is enough to say about it. It is not denied that two objections may be made to the view taken here; but these will be treated in a more appropriate place, for the question is a complex one, and involves other considerations. Meanwhile, the words *trustee* and others may pass for Passive Verbal Abstracts; and, so doing, serve as the basis of a more special argument, viz. the development of the rule, that this or that formative, when absent where, *à priori*, we may expect it, is absent not so much from anything inherent to it, or *per se*, but that it is developed or undeveloped according to the conditions or state of the language, in which it occurs. As it is, words like *trustee* seem to show themselves only in the eleventh hour. They do something very like this, but they do not do it quite.

VOICE OF VERBS.

§ 197. *The Scandinavian (or Norse) Reflective, Middle, Passive, Reciprocal, and Deponent.*—Upon the principle of working backwards, or from the later to the earlier, and the more certain to the less uncertain, it will be well to begin with a Voice which in many respects stands alone; in one respect, most fortunately. It is a Voice of which we know the history. We know what it is now, and we know the time when it was not. This is the Passive of the Scandinavian languages. It is, there or thereabouts, a thousand years old. Before A.D. 900 it was a palpable compound, of which we knew the elements; and of which the import was eminently intelligible. There are at least three names which are applicable to it. It began as a *Reflective* combination; a combination of a Verb and the Pronoun *sik* or *sig*, *self*; the Verb, of course, being generally and normally Transitive. But the additament extends occasionally to Intransitives. What is called Reflective may also be called *Middle*, because Middles imply Passives. But at present it is chiefly *Passive*; and so it is called in the Grammars. Many, however, of its applications are to *Active* Verbs; and in this case it is *Deponent*.

§ 198. In the simple structure of this Scandinavian Voice, as at present represented by the literary Danish and Swedish, the addition is that of *-s*, as an affix to the Active form with which it corresponds. *Kalle=vocare, kalles=vocari; jeg, du, han,* &c. *kaller=ego, tu, ille, voco, vocas, vocat; jeg, du, han, kalles=ego, tu, ille=vocor, vocaris, vocatur.* So *kallade = vocavi, kallades = vocabar.* Now in the Icelandic this *-s* appears as *st*, a fuller form, but not the one we expect. The true form is *sik*, the reflective pronoun, and this is what we find in the shape of *-sc* in the older Norse of *Iceland* mixed up with a form in *-st*; but in the Norse of *Norway* used exclusively, or nearly so.

The word *sik*, meanwhile, is the ordinary reflective pronoun as a separate word, sometimes preceding, sometimes following,

the verb. When it precedes, it keeps its full form. Here, then, we see the whole process of the change.

§ 199. The extension of *sik*, which is the pronoun of the third person to the other two, is perhaps mysterious. So long as the three pronouns *precede* the verb and keep their full form, they are used as regularly as they are in the Italian. But *sik* is a simpler form of *self*, and *self*, in our own language, to go no farther, may denote any of the three Persons. In the Slavonic and the Lithuanic its extension goes farther; and the possessive form, that naturally means *suus* or *sui*, is used in the place of *meus* or *mei*, and *tuus* or *tui*.

§ 200. Here, then, we have a Voice beginning, proceeding in its development, notably altered in its final character, and perhaps transformed; every change being, if not under our very eyes, within the range of our reading. Every change of its structure and of its import can be verified. It begins as a combination of a Verb and the Reflective Pronoun: proceeds as a compound, with its latter element modified, yet still referrible to its original form; is Reflective in the first instance, then Middle, then Reciprocal, then Passive, and then besides this, also, to a great extent Deponent. I doubt whether any second instance of the like kind can be found. It is now in the Swedish and Danish Grammars classed as *Passive*; and practically it is one. In General Philology the Reciprocal and the Deponent phases are the ones which most claim consideration. It is Passive, as has been stated, and that, structurally, to the exclusion of many so-called Passives. But even in the way of structure, it is by no means a true Passive—a Passive both in import and in origin.

§ 201. *The Passive Voice as represented by the Greek Aorist.*—The typically *Passive* Voice is best represented by the Greek Aorist—ἐ-τύφ-θ-ην, τύφ-θ-ητι, τυφ-θ-είην, τυφ-θ-ῶ, τυφ-θ-ῆναι, τυφ̀-θ-εὶς=*I was beaten, be beaten, might be beaten, may be beaten, to be beaten,* or *being beaten, beaten.* In this

we have the Verb Substantive as manifestly as in the Reflective Voice we had the Reflective Pronoun; and the parsing this combination is, in one respect, easier than that of the Reflective, inasmuch as the affix *sik* has to serve for all the three Persons.

a. Of the Passive *Future* the most obscure point is the question how a Substantive Verb like εἰμὶ could have any Voice but the Active. I am constrained to consider it Deponent.

b. The peculiar forms like κεκλήσομαι may safely be considered more Middle than Passive.

§ 202. In these two instances two constructions are very clearly explained. There is one Middle Voice that we understand thoroughly, and there is one Passive that we understand as well. The Greek Aorist is wholly and absolutely, in origin, in form, and in import truly Passive, and we know how it comes to be so. It is the Passive Verbal Abstract *plus* the Substantive Verb. Now Passives of this kind differ *toto cœlo* from the majority of the Passives of the ordinary Greek Grammars; the structure of which is less Passive than Middle. In English, on the other hand, there is no Passive Voice at all, except for the Participle. This combined with the Verb Substantive gives the English language and others their Analytical equivalents to such tenses as τύπτομαι, *amor*; ἐτυπτόμην, *amabar*; τέτυμμαι, τύψομαι, and the like. Hence, whatever is left unconsidered here will be considered under the head of *Participle*. What the *non*-participial portion of the dominant inflection in Greek—*i.e.* that of the forms like τύπτομαι, τέτυμμαι, &c.—may be is no easy question. They are certainly not Passives, like ἐτύφθην.

§ 203. *The Deponent.*—Of Deponents there are two kinds: (1) those like *vapulo*, and others where there is a Passive, import but an Active form; (2) those where the form is Passive, but the sense is Active. The explanation

of the first of these generally lies on the surface, and is involved in the meaning of the Verb itself. Being this, it requires no sign, whether inflectional or formative. *Vapulo* may as easily be interpreted '*I take*,' or '*suffer a beating*,' as '*I am beaten*.' Still better are the instances of *audio*, and *cluo*='*Jupiter audit*'='*answers to the name of Jupiter*;' '*κακῶς κλύει*'='*bears a bad name*.' Here the sense is reflective, and often means *hears (him)self called*. . A name which a person gives himself, or even takes to himself as permanent, is of this kind; *e.g.* *κληθήσομαι*=*I shall be called, or named*; *κεκλήσομαι*=*I shall take to myself the name, and keep it*.

§ 204. The other change is also to a very considerable extent explicable; and in this the element of the chief importance is, no doubt, the connection between reflectiveness and reciprocity; indeed, reciprocity is simply a double reflection: '*I strike myself*'='*myself strikes me*.' This however is only a change of form. But '*A. strikes B.*, and *B. strikes A.*,' gives a real reciprocation of blows. Closely akin to such combinations as this is the meaning of a great number of words which, in their proper import, involve the idea of action and reaction—such as *fight*, *wrestle*, *speak*, *exhort*, and others. In the Greek and Latin these run *μάχομαι*, *luctor*, *loquor*, *hortor*, &c. In the Greek nothing much is said about them; in Latin they may almost be said to be recognised as a Voice; while in Scandinavian, where they are at least as numerous as in Latin, the evidence that they are derived from the Reflective is as clear as is that of the Reflective sign itself. *Sik* from the very beginning means *one other* or *each other*, as regularly as it means *self*. The Swedish Grammar of the late Professor of History in Christiania, L. C. Daae, specially draws attention to this; indeed, the doctrine that the Reciprocals are the main sources of the Deponents may be considered to be admitted in the languages where the structure of the Middle Voice is best understood; *i.e.* the Norse forms of speech.

§ 205. From words such as *loquor*, *luctor*, *hortor*, and the like, the next step is to the Verbal Abstracts derived from them—*locutor*, *luctator*, *hortator*, &c. These have hitherto perplexed us, inasmuch as the formative *-t*, *-at*, or *-it* is *passive*. But the Verbal may be what the Verb is; and the Verb, as we have seen, is Deponent. Even if the doctrine of Deponency carry us no farther than this, it carries us far; and here for the present we may leave it.

(7.) Number.—Noun and Verb.

§ 206. Simple repetition seems to have been the earliest way of expressing plurality. It is so natural, that we can imagine nothing that is likely to have preceded it. It is one, however, which is destined to be superseded by more refined, but somewhat less intelligible, methods. The Malay languages, and after these the American and African, give this process in its fullest development. In a single short vocabulary of the language of the island of Enganho (off Sumatra), one of the most primitive of the Malay languages, are found, almost in succession: fire, *howi howi*; water, *lewo lewo*; stone, *vakeo vakeo*; sand, *hawo hawo*; bird, *weo weo*; and that these are plural, or if not collectives, we infer from their import, and often find them expressly recognised as such by grammarians.

Next to this comes Reduplication, or the doubling of the first syllable of the word.

From the Sahaptin (*British Columbia*).

Substantives.—*Woroit*, *woworoit*=man, men; *tokon*, *totokon*=woman, women; *kitsh*, *kikitsh*=house, houses; *pailkukar*, *papailkukar*=bow, bows; *haikh*, *hahaikh*=mountain, mountains; *wasi*, *wawasi*=dog, dogs; *ishot*, *isishot*=wolf, wolves. Adjectives.—*Mohai*, *momohai*=bad; *tshinui*, *tshitshinui*=small.

§ 207. Than this no more convenient method could be devised; indeed, it seems to have devised itself. To plurality in its simplest form, or to the *plurity* consisting in the repetition of a certain number of actions, or a certain number of objects, of the *same* kind, what sound is a better '*echo to the sense*' than a reduplication? Nor could it be better placed than at the beginning of the word, for so it left ample room for the signs of Gender (if wanted), or of Case, or aught else, at the end.

§ 208. But there are many other combinations under which the notion of plurity may suggest itself. There is the plurity arising out of a mixture of objects in which the same idea is *not* repeated. There is the plurity which constitutes a collection; in which case a form may be *collective* rather than truly *plural*. In some, as in the case of the stars, the equality between the two ideas of individual difference and collective unity is so great, that it is difficult to say whether the original conception is plural or singular, collective or disjunctive. Again, a family is as much a real unity as each individual member of it; and when the unity of the whole becomes more impressive than the singleness of its parts, we have such a fact as a Singular form may derive from a (*collective*) Plural.

§ 209. *Partition* is the very opposite to Collection. But when we take parts from a whole, we have a plurity. This is the notion that a word like '*some*' expresses; *i.e. more than one, less than one, less than all.*

§ 210. These and others are the ideas which create conflicting forms of expression for what, when put in its more general sense, is the representation of '*more than one*,' as opposed to '*one*.' Which of them at the end of centuries will be the typical representative, or prerogative, form which survives and subordinates the other? Which will give the most general expression of the idea? Which will be *the* sign

of the Plural? The fittest, no doubt. It will unconsciously become adopted. But the unconscious choice is divided among many languages, and spread over hundreds and thousands of years. There is always a Plural Number; though the original sign of it may have been superseded by others, suggested from different points of view. There is no more natural, and, inferentially, no more primitive form of the expression of *plurity* by the repetition of like objects than the reduplication already noticed. But we have to go to the Pacific and the New World before we can find it in anything like current use.

§ 211. Yet we find it elsewhere. We find it in the Greek reduplication, and that conspicuously. But it has another import, a different application. It implies, indeed, repetition, but repetition of another kind. It is a sign of Tense, past in one respect but present in another. But upon this much has been written already. In some of the American languages it serves as a sign of the Superlative degree; in which we again have the idea of repetition. It is the third degree in the way of Magnitude or Quantity. Historically, however, it seems to have fallen away as language advanced. There was pressure upon it in two directions. There were new expressions needed for the increasing varieties of Plurity; and there were conceptions akin to, but different from that of simple Plurity, which it was called upon to express. In the older stages of language it had three important applications. In the English it has practically ceased to exist—*fuit Ilium.*

Such, then, has been the fate of what we may safely call the earliest and most natural sign not only of Plural Number, but probably of anything in the way of either Declension or Conjugation; and of the inflectional forms in the Synthetic languages it is the only one which is at one and the same time a definite separable syllable, and one which we may call self-developed, *i.e.* made out of the ele-

ments of the root to which it belongs, without any additions *ab extra*.

§ 212. From all this it is manifest that the elements of the present signs of Number must be sought elsewhere What were they? They were certainly not deducible from any single source, or limited to any single sort of plurity. We may arrange them in at least four classes:—

1. The Dual.
2. The Non-Singular (*i.e.* Dual and Plural taken together) of the Personal Pronouns—*In*clusive and *Ex*clusive Plurals.
3. The Plural of the Noun.
4. The Plural of the Verb.

§ 213. In the Dual, if anywhere, the Inflectional element ought to be pre-eminently reducible. It ought to be the Singular *plus* the name for 2. It is this sometimes, but only sometimes. It is this in Lithuanic; but then it is only a grammarian's inflection, *i.e.* no inflection at all, but simply two words—just as *hi duo*, *hæ duo*, *horum duorum*, are two. This is the dilemma which is always presenting itself. When we can reduce any inflection to its elements it ceases to be an inflection. But this is really no discouragement. On the contrary, it shows the reducibility of certain inflections, and this is all we need attempt.

§ 214. In the German languages we get such forms as *wi-t* and *gi-t*=*we two*, *ye two*. This is somewhat more to our purpose. *Bo-th*—through its derivation from *bâ-twâ*= Danish *begge to*, German *beide*, has been objected to—is probably the same combination.

Our-two, or *of us-two*, and *your-two*, or *of you-two*, are also respectively *incer* and *ungker*; the first of which, and perhaps the second, are in use in provincial Westphalian at the present time. *Incit* and *ungkit* are the Accusatives.

This, however, goes for very little. They all seem second-

ary formations; though it is only the first which is, like the Lithuanic, a simple compound.

§ 215. It is highly probable that there was in some language or other a Dual Number before there was the Numeral 2.

§ 216. But this is not conclusive. There may possibly have been some natural *dyad*; which suggested not only the inflections subservient to the expression of Duality, but possibly the Numeral=2 itself; some word like '*pair*,' '*brace*,' '*couple*,' and the like. The words quoted are of foreign origin, and probably artificial. Hence they throw no light on the special details of our enquiry. But they illustrate the character of it. It is suggested, then, that in natural *dyads* of this kind the elements of the Dual Number are the likeliest to be found. But these are numerous; and who can say, *à priori*, which was the one originally pitched upon for the purpose of being made up into a combination expressing *more than one and less than three*, for this is what the Dual representation comes to? This is likely. But it does not carry us far.

§ 217. The Greek and Latin ἄμφω and *ambo* look as if they meant *one on each side*, and so applied to a part of a triad. Again, there is in the West-Saxon a strange form, *wit Skilling=we-two Skilling=I and Skilling* or *Skilling and I*. This looks like something that carries us farther, and leads to the consideration of—

The Exclusive and Inclusive Pronouns.

§ 218. It is patent from mere inspection that in our own language, as well as in its congeners of the Synthetic Stage, there is a difference in the Pronouns of the First and Second Persons, between the Singular and the Plural Numbers, wholly opposite to that which presents itself in the ordinary Nouns. The Plural of '*I*' is '*we*,' and the Plural of '*thou*'

is '*ye*.' Now there is a process in the less advanced languages of the Agglutinate and Monosyllabic stages which is beginning to be duly recognised as an important element in the explanation of this anomaly, viz. the system of the *Inclusive and Exclusive Pronouns*. Thus—

From the Australian.

Ngaia = I; *ngulle* = we two = thou and I; *ngullina* = we two = he and I.

From the Melanesian.

Ainyak = I; *akaijan* = you two + I; *ajumrai* = you two − I; *akataji* = you three + I; *ajeimtai* = you three − I; *akaija* = you + I; *aijama* = you − I.

§ 219. These two examples may suffice to give a general idea as to the import of the two terms. But much more than this must be said about them. The Double Plural, though not equally prominent in all languages, is present in most of them; sometimes in its rudiments, sometimes in its fragments. Even in its fullest form the system is widely spread. We have it conspicuously in the languages of the Sub-Himalayan range; and this, as we have seen, is the district in which the Monosyllabic class comes in contact with the Agglutinate. Within the Agglutinate area Melanesia, Polynesia, and America abound in Persons of this kind; so that these give us the chief materials for our criticism. But there is both Exclusiveness and Inclusiveness elsewhere, as will soon be seen.

§ 220. In some languages they play a very notable part, in others, they are almost latent; and between the two extremes there are differences and degrees of all sorts. When at its maximum the proportion of these two Plurals to the Accidents of the other Parts of Speech is inordinate. Of its development in a single dialect, the following paradigm speaks for itself:

DECLENSION OF BÁHING PRONOUNS AND OF NOUNS.

I.—Of Pronouns.

1*st Personal Pronoun.*

1. *Nom.* I, Go.
2. *Gen.* Of me, { *Conjunct.* Wa = *my.* / *Disjunct.* Wake = *mine.*
3. { *Dat.* To me, / *Ac.* Me, } Go. No sign.
4. *Loc.* { In me, / Within me, } Wake gwáre (interior).
5. „ { Into me, / In me, } Wake di (entering, resting in).
6. *Abl.* From me, Wake ding (removal).
7. *All.* Towards me, Wake la (nearing).
8. „ From towards me, Wake lang (departing).
9. „ Towards me, Wake taure (behaving).
10. *Soc.* With me, { Wakenung / Gonung } (society).
11. *Priv.* Without me, { Wake manthi / Gomanthi } (privation).
12. *Inst.* By me, Go mi.
13. *Loc.* At, by me, Wa pumdi (proximity. Hind. pás).

Dual.

1. Gósi, inclusive. Gósúkú, exclusive.
2. { *Conjunct.* I'si, incl. Wási, excl. / *Disjunct.* I'sike, incl. Wásike, excl.
3. Gósi, incl. Gósúkú, excl.
4. I'sikegwáre, incl. Wásikegwáre, excl.
5. I'sike di, incl. Wásike di, excl.
6. I'sike ding, incl. Wásike ding, excl.
7. I'sike la, incl. Wásike la, excl.
8. I'sike lang, incl. Wásike lang, excl.
9. Gosi taure, incl. Gosuku taure, excl.
10. Gosi nung, incl. Gosuku nung, excl.
11. Gosi manthi, incl. Gosuku manthi, excl.
12. Gosi mi, incl. Gosuku mi, excl.
13. { Isi- / Wasi- } pumdi, { incl. / excl.

Plural.

1. Gó-i, incl. Góku, excl.
2. { *Conjunct.* Ike, incl. Wake, excl.
   { *Disjunct.* Ikke, incl. Wakke, excl.
3. Gó-i, incl. Góku, excl.
4. I'kegwáre, incl. Wakegwáre, excl.
5. I'ke di, incl. Wake di, excl.
6. I'ke ding, incl. Wake ding, excl.
7. I'ke lá, incl. Wake lá, excl.
8. I'ke lang, incl. Wáke lang, excl.
9. I'ke taure, incl. Wake taure, excl.
10. Góï nung, incl. Goku nung, excl.
11. Góï manthi, incl. Goku manthi, excl.
12. Góï mi, incl. Goku mi, excl.
13. { Ike- / Wake- } pumdi, { incl. / excl.

§ 221. How these Plurals combine with the Verb we may see in the following :—

CONJUGATION OF BÁHING VERBS.

I.—Paradigm of Verbs Transitive in 'wo.'

Root, Já, *to eat*. Imperative, já-wo, *eat*.

Active Voice.

Imperative Mood.

1. SINGULAR OF AGENT.	1. DUAL OF AGENT.	1. PLURAL OF AGENT.
Já-wo, *eat it.*	Já-se, *ye two eat it.*	Já-ne, *ye all eat it.*
	2. DUAL OF OBJECT.	
Já-wosi, *eat them two.*	Já-sesi, *ye two eat them two.*	Já-nési, *ye all eat them two.*
	3. PLURAL OF OBJECT.	
Já-womi, *eat them all.*	Já-semi, *ye two eat them all.*	Já-némi, *ye all eat them all.*

Negative Form.

By má prefixed Má já wo, &c., and so in all the subsequent Moods.

INDICATIVE MOOD.

Present and Future Tenses.

SINGULAR OF AGENT.	DUAL OF AGENT.	PLURAL OF AGENT.
First Person.		
1. Já-gna, *I eat* or *will eat it.*	1. Já-sa, incl. Já-suku, excl. *we two eat it.*	1. Já-ya, incl. Já-ka, excl. *we all eat it.*
DUAL OF OBJECT.		
2. Já-gna-si, *I eat them two.*	2. Ja-sa-si, incl. Ja-suku-si, excl. *we two eat them two.*	2. Já-ya-si, incl. Já-ka-si, excl. *we all eat them two.*
PLURAL OF OBJECT.		
3. Já-gna-mi, *I eat them all.*	3. Ja-sa-mi, incl. Ja-suku-mi, excl. *we two eat them all.*	3. Ja-yami, incl. Ja-ka-mi, excl. *we all eat them all.*
Preterite Tense.		
1. Já-tong	1. Já-tá-sá, incl. Já-tá-súku, excl.	1. Ján-tá-yo, incl. Ják-tá-ko, excl.
2. Já-t-óng-si	2. Já-tá-sá-si, incl. Já-tá-súkú-si, excl.	2. Ján-tá-yo-si, incl. Ják-tá-kó-si, excl.
3. Já-t-óng-mi	3. Já-tá-sá-mi, incl. Já-tá-súkú-mi, excl.	3. Ján-tá-yó-mi, incl. Ják-tá-kó-mi, excl.

§ 222. This forms but a small part of the space devoted to these remarkable Plurals in Mr. B. Hodgson's Grammar of the Báhing Language; itself one out of the nineteen dialects of the Kiranti, one of the ten, or more, languages of Nepaul. It belongs to the Monosyllabic class, and this is indicated by he hyphen between the several syllables. But this must not lead us to suppose that each syllable is a separate word,

inasmuch as at the very point where our extracts end the author writes, that he has thus far separated the syllables 'merely to facilitate the student's comprehension, and that I shall do so no further, for the genius of the language is averse to any such treatment of its finely blended elements.' It is certain then that we are on or within the boundaries of the Agglutinate class of languages.

§ 223. Beyond all doubt there is a very great deal of this inclusion and exclusion expressed in the later and more advanced languages, and that in more ways than one. *Wit Skilling=we-two Skilling=Skilling and I*, has been already noticed. Let us now take a text from a different quarter:

Tecum Philippos et celerem fugam
Sensi; relicta non bene parmula,
Cum fracta virtus et minaces
Turpe solum *tetigere* mento.

Here the Inclusive Plural is as clearly expressed as is possible, the person addressed being in the ablative case, governed by a preposition denoting association, and the verb being in the singular number. It *might* be Plural, as might also the Pronoun; and this would give *sensimus* and *vobiscum*. We know, here, that this is the parsing of the expression; but in an uninflected language, or one of which the inflections were known only by bits and fragments, *tecum* might pass for a nominative plural. As for such combinations as *tu-cum*, it is probable that they are common; the *-cum* being translated adverbially, or as ἁμα; and so giving *those simultaneously*, *at the same time*, or *accompanying*.

§ 224. For *tecum sensi* write *mecum sensisti*. The result is the same. Two persons are indicated, and to some extent two persons are named; *i.e.* one by the pronoun as a separate word, and the other by the person of the verb. Which of these two is the Included, which the Including, term? Perhaps there is no actual inclusion at all, but only something akin to it. Which is the original, primary pronoun?

Is it *I and you*, or *You and I*? It is hard to say; and, at present, there is no need to enquire. But in the languages where the system is at its full development no distinction is more difficult. Perhaps it is one of the same kind as that which perplexes us in the case of *shall* and *will*; but this amounts to an explanation.

In the extract just given the change of Person in *tetigere* suggests the excluded agents.

§ 225. This indefinite number of individuals involved in the affair or action spoken of, and therefore in some degree connected with the speakers, is what we have in the Spanish *nos otros*, the Italian *noi altrui*, and the French *nous autres*. Let A. ask B. what C. thinks of D., and let the answers be, '*Comme nous autres*,' or, conversely, '*Comme vous autres*.' The first means '*As I and you and others like us*;' the second, '*As you and others like you, but not as I*' (or '*like of me*').

§ 226. It is not easy to get an insight into the details of this system; and less easy for an Englishman than for a native of many other countries. Beyond those who, as Frenchmen, Italians, and Spaniards, are familiar with the European use of *otros*, *altrui*, and *autres*, the only Europeans and Americans who know much about the system of ruder languages are the missionaries; and these, as a rule, admit that the right use of the form is difficult. So good a general philologist as Norris observed, that in all the explanations he had met with the so-called *In*clusive was really *Ex*clusive, and the so-called *Ex*clusive *In*clusive; and that most men had confounded the two, and that he himself was only in the process of learning which was which. The point from which the line is drawn has, in my mind, something to do with it. Is it *I* with or without *you*, or *you* with or without *me*? Is it *I* + or − *you*, or *you* + or − *I*? For the exclusion of a third object, the methods are numerous; and some of them, such as the French &c., require an additional word—*autres* &c.

§ 227. Then comes the question of *Case*. We have seen that what is generally called the government of the Verb by its Nominative Case was, in the earlier stages of language, either a combination like *speaking-my*, or *speaking-from-me*. If so, these Persons, notwithstanding their correspondence with the Casus Rectus in import, may really be *Oblique* cases—perhaps Possessives. At any rate, there is no great difference between the Possessive and the Personal expression of the Pronoun, especially in Greek, where τὸ ἐμὸν=ἐγὼ, τὸ σὸν=σύ. Let then (τὸ) ἡμέτερον=ἡμεῖς; and then compare form for form, and meaning for meaning, and place for place, the Greek ἑτερ- with the French *autre*. Mark, too, that the *spiritus* of ἡμέτερος and ἡμεῖς is not the *spiritus lenis* of ἐμὸς, but the aspirate of ἕτερος.

§ 228. Again: from the Melanesian group of the New Hebrides we get such sequences as the following: *Inau*=I; *kha-im*=you; *naïi*=he; *namuhl*=we two exclusive, or I + some one not the person spoken; *arivan*=we two inclusive, or I + the person spoken to; *kha-müih*=ye two; *natarvi*=you three; *dra-tin*=we three; *dra-tavats*=we four; *na-tavatz*=you four.

These look like *trinal* and *quaternal* Numbers, and it has been suggested that such they are in reality. They are rather so many Numerals, the numerical value of which varies. Of the speaker or the person spoken to, one or both may be included.

§ 229. It is little, then, that the Dual Number does in the way of explaining the Plural. It rather complicates the question. Even when we have got an intelligible Dual, we are by no means sure of keeping it. What if it encroach upon the higher denomination, and so doing *pluralise*? What, if having done this, it eliminate the original plural? Now if word for word the Greek νῷι and σφῷι are the Slavonic *nos* and *jus*, and the Slavonic *nos* and *jus* be the Latin *nos* and *vos*? It *has* done this. If so, we are taught that definite and precise as the structure and the formation

of the Dual seem to be, they help us but little in our enquiries. The Duals here adduced are those of the Pronouns. But the whole subject of the Pronominal Numbers is peculiar.

§ 230. *Plural of the Finite Verb.*—The Verb here means the Finite Verb; for the Infinitive and, *à fortiori*, the theme and root are *Nouns*. The ordinary Grammars, however, recognise the Number of the Verb, though they ignore it in the Infinitive. They can scarcely do otherwise. The most that a grammar for teaching purposes could tell us would be that in the Finite Verb the verbal portion of it has no sign of Number *of its own*, and that what it has it takes from the inflection of its pronouns. Practically this would be enough. But in general grammars it is necessary to add, that the Finite Verb, when divested of these adjuncts, is a Noun; and that though the Infinitives have no outward sign of Number, the Verbal Abstracts, which are almost identical with them in meaning, and sometimes identical in form, *have* one: *hunting*, *huntings*; *fast*, *fastings*, and the like.

§ 231. We can speak of twenty acts of *dining*, *i.e.* of twenty *dinings*, as readily as we can of twenty *dinners*; those who partake of them being the *diners*. But twenty *dinings* may be made by twenty different partakers of a single *dinner*; and twenty different *diners* (agents) may dine off a single *dinner*. Of the Seven Captains against Thebes every one may have fought in seven, or seventy-times seven, *fightings* or *fights*. But it was no part of any inflection to express any number beyond that of the agents.

Plural of the Verb and Noun.

§ 232. Is there then no such thing in *verborum naturâ* as a Plural Finite Verb? As a definite sign of Plurality there is nothing. Is there anything like it? There is something not unlike it. There is the -εθ- in φλεγ-έθ-ω, or the *-it-* in *voc-it-o*. There is the Frequentative *Formative*. It

is not exactly a Plural, but it is sufficiently akin to one to enable us to perceive that when we say *tu voc-it-as* there is more than one act of *calling*; and that, even though the *caller* may be a single individual. In *vos voc-it-amus* we get a plural import for *both* numbers; the *-it-* in the Verbal part of the combination, or the theme, and the *-amus* in the Pronominal part, or the Inflection. But it is only the *-amus* that is an Inflection. The *-it-* is Formative.

All this is written partly to illustrate the statement that the verbal part of the Finite Verb has no sign of Number; but partly with a far more important object. It is submitted that these Frequentative formatives are virtually the Verbal Plurals, *i.e.* the signs which denote the plurity of the *callings*, the *dinings*, the *fightings*, and the '*omne quod exit in*-ing.'

§ 233. It is now submitted that, *mutatis mutandis*, what applies to the Frequentative Verb applies also to the *Collective* of the Noun. There is no question of any double Plurity in the Nouns, so that the Collective Formative has nothing to prevent its becoming an actual sign of Plurality; and that, as an *Inflection*, *i.e.* a changeable affix, rather than a permanent part of the theme. The plurals, too, that are required for such words as *eye*, *ear*, *nose*, *tongue*, *hand*, and the multitudinous concrete, individual, separable, and numerable substantives of the same kind, are far more numerous than those required for such abstractions as *seeing*, *hearing*, *smelling*, *touching*, and the like. Nouns, then, have more Plurals than Verbs, and keep them longer. Probably, too, they took signs for them earlier. But for all this, the Noun must take its place in its typical form, *i.e.* the Concrete, and the visible, audible, or palpable *Substantive*. With Abstract Nouns and Adjectives the case is somewhat different; and the Personal Pronouns have, as we have seen, a system of their own.

§ 234. If this be the origin of the Plural, the Collective formatives of the Noun, now existing in language, should be

less numerous and less definite than the Frequentative formatives of the Verbs—φλεγ-έθ-ω, *voc-it-o*. This is because they are all by hypothesis converted into plurals. And such is the case. There are but a few collectives, just as there are but few successful traitors. When the usurper becomes a king he is no longer traitorous, and when collectives become plurals, they are no longer formative.

§ 235. But this does not carry us far. Nine-tenths of the details concerning formatives and inflections in the present work have been applied to the illustration of the *difference* between them, and not to the likeness. Again and again the *-it-* in *voc-it-amus* has been opposed to *-amus*, as a part of the theme, and not as a part of the inflection; as a permanent part of the word, and not as a changeable or moveable one. There is no doubt upon this point. But behind this lies the leading doctrine of the work at large, viz. the hypothesis that the inflections are, as a rule, deducible from, and reducible to, formatives; which themselves were originally separate and independent words. If so, it is only in these extreme or typical forms that they can be definitely separated. When we come to the boundaries, it must be by Type rather than by Definition that we classify.

§ 236. But we need not at present do this. Definition by type, though valid, necessary, and in some cases indispensable, is deficient in validity and precision. The following is from the Hindostani, in which *mard*=man; as it also does in the Persian.

1. Hindostani.

	Singular.	*Plural.*
Nominative	mard	mard
Genitive	mard-ká	mard-on-ká
,,	mard-ke	mard-on-ke
,,	mard-ki	mard-on-ki
Dative	mard-ko	mard-on-ko
Ablative	mard-se	mard-on-se
Inessive	mard-men	mard-on-men
Adessive	mard-ne	mard-on-ne

2. PERSIAN.

	Singular.	*Plural.*
Nominative	mard	mard-ān
Genitive	i-mard-i	i-mard-ān
Dative	mard-rā	mard-ān-ra
Accusative	mard	mard-ān
Ablative	az mard	az mard-ān

The *-on-* here is universally treated as a sign of plurality. Yet in place and stability it is more of a formative than a plural. Are we then to deny that it is a plural of any kind? Are we to say that it is a plural, but not an inflection? Are we to say that the distinction between the permanent and the changeable parts of a word is unimportant, or that *Plurality* is only a modified form, or Variant, of *Collectiveness*? We may certainly say all this, and more, and not be very far from the truth.

§ 237. I submit, then, that Plurals are not naturally changeable or movable, and that naturally they are parts of the theme—just like the *-it-* in *voc-it-o*, &c.; and that it is not till we get to a certain stage of development that they are other than formative, or thematic. It is only in the Synthetic languages that they become generally and manifestly movable, and not only this, but indistinct—indeed, it is because they are indistinct that they are movable. They are this because, in the Synthetic languages, there is a great development of a new element—*Gender*; and with Gender Number becomes fused, combined, or amalgamated. Hence, in the main, the Formative Inflections, or the Collective Plurals, are movable, non-radical, or non-thematic only when these signs are complicated by those of Gender. I do not then say forms like the *-on-* in *mard-on-ká* and the like, are not Plural, for we must take the term *Plural* as we find it. I only say that under certain circumstances the word *Plural* may become ambiguous.

§ 238. *Collectiveness*, however, seems to be an older idea,

and as such it prevails as language advances. There are, and must be, in the domain of Thought more plurals than collectives: just as there are, and must be, more units than pairs, more twos than threes, more parts than wholes. Every collection is what it is because, as a unity, it contains more than one individual. In the earlier stages of language it may not be very necessary to separate such unities into their elements; and, moreover, it may not be very easy to do so, for it must be remembered that the art of counting is of comparatively recent origin. It seems, then, that before the series of Numerals became adequately developed (and how low it is in some countries even now will be seen in the sequel), the notion of Collectiveness prevailed over that of Plurality. As definite Numeration became easier, Plurality would prevail over Collectiveness. How closely they are allied, and how naturally we mix them together in thought, and how difficult it is to say which, in certain cases, should determine our choice of an expression we well know; for we know how naturally with a Collective Substantive we connect a Plural Verb; and how the majority of grammarians warn us not to do it, and how, nevertheless, we continue to do it.

§ 239. The sign of Number follows that of Person, and precedes that of Case; and from this it is readily separated. With Gender (or Conventional Sex) it takes the same place; but, whether it be that one of the signs is omitted or that the two coalesce, there is often but a single syllable; sometimes only a single sound or letter serves for the expression of both—*e.g.* *bon-us*, *bon-æ*, *bon-os*, *bon-is*.

(8.) Case (of Nouns).—Tense (of Verbs).

§ 240. Signs of Case, or Case-endings, fall into two classes: (1) those of the Greek, Latin, and Sanskrit type; (2) those of the Fin and Turk type.

In the first the signs of Case, Gender, and Number

become confluent; or, perhaps, two drop out. There is nothing to be done with these without a great deal of preliminary analysis, which is by no means easy. In the second we get an independent and separable syllable. But this goes for little until it can be shown what it is as an independent word. We cannot often do this; and when we succeed in doing it, the result may be that the combination is one of simple composition rather than a true inflection.

Short of this, however, we get a fair amount of information so far as it goes; for it is something to know in a word like the Turkish *adem-ler-un*=the Latin *hom-in-um*, that the *-ler-* denotes Number only. But this depends upon a fortunate coincidence; viz. the fact that where we get what we may call *syllabic* signs of Number, we also fail to find the signs of *Gender* wanting. It is certain that in the Synthetic languages it is a very difficult matter in many cases to say what represents Gender, what Number, and what Case. It is not so difficult to do this in the Agglutinate forms of speech, and it is often very easy. The inflections are fewer, and the signs of them are more distinct.

We get thus much, no doubt. But, until we get more, Case-endings look like mere arbitrary signs; being what they are solely through their relation to the main words. What they are of themselves we have to discover, if we can. The earliest doctrine was (and *is* to a great extent) that they were *pre*positional in origin and in character; modified in form; and *af*fixes rather than *pre*fixes to the words with which they were connected. It is not worth our while to incriminate the compound *Post*-positive *Pre*-position as a contradiction in terms. We must take it as we find it; just as we must recognise *Dis*-junctive *Con*-junctions and the like.

They are this, doubtless, to some extent, and in a certain way; but it is probable that the extent to which the doctrine presented itself to the philological world (we might almost say *obtruded* itself) has depended on an accident. Nine philologists out of ten are familiar with some synthetic

and with some analytic forms of speech; and as words like *lapid-is*, *lapid-i*, *lapid-e*, &c. are translated *of a stone*, *to a stone*, *from a stone*, the notion that words like *of*, *to*, *from*, &c. correspond to the terminations like *-is*, *-i*, *-e*, &c. forces itself upon them; or, at least, presents itself spontaneously. But this is little more than a reproduction of the translation of γέγραφα, or τέτυφα by *I have written*, or *I have beaten*; wherein no one thinks that, word for word, or rather syllable for syllable, the formal elements of the two combinations are identical in origin. The words *vobis-cum*, *nobis-cum* give us true *post*-positive prepositions; but in these it is the syllable *-bis-*, and not *-cum*, which is the sign of Case. The real fact is that, as a rule, the actual Prepositions of a language do *not* coincide with the Case-endings in form, whatever they may do in import.

§ 241. There is no better instance of this than the history of the so-called Genitive Case in English and French. What the *Case* which, both in French and English, comes next to the Nominative may be in import, is equivocal. The English has a sign for *it-'s*. But the French has nothing of the kind. Taken by itself, the French Genitive (*tête=head*) is no more Genitive (or Possessive) than it is Nominative, Dative, Vocative, Accusative, or Ablative. But it has its special pronoun, *de=of*; at least, so far as '*de tête*' corresponds with '*of head*.' With *head's* and the like the French has nothing correspondent. But, in both languages, the Preposition represents the *-is* in *capit-is*. So far, then, as they do this, each is an Analytic equivalent to the Latin inflection. But so is '*I have written*' to '*γέγραφα*;' only, however, so far as the import goes. Word for word, *de* and *of* no more stand for the *-is* of *capitis* than the *have* in *I have written* stands for the γε- in γέγραφα. But, at any rate, we may say, the import is the same. Not so in all cases. In English a *picture of John* is a very different thing from *John's picture*. At least, however, *de* and *of* govern a Genitive Case. This is just what they do *not*. The Case that both *de* and *of*

govern is the Ablative. To come to the worst, the Prepositions are Genitival in sense. This depends on circumstances; and it does this occasionally because what we now call *Genitive* is partly Genitive and partly Ablative; Genitive when it is possessive in import, Ablative when it is partitive. Now it is with the notion of partitivity only that both *of* and *de* are naturally connected. The real history of the two particles and the inflections with which they become connected, is that the meanings of the two Cases are sufficiently akin to become confluent. In like manner, the Greek Ablative is the Latin Genitive. But this is a question connected with the Affinity of Cases, which is here only alluded to. The reason, however, for alluding to it is much to the present point—viz. the inaccuracy of identifying the inflections of the Synthetic parts of the Noun, with the Prepositions which represent it (more or less approximately) in sense. There is confusion when we call the French *de* a sign of the Genitive Case; and when we say that the Genitive is the Case that it governs, there is '*confusion worse confounded*.' A combination of separate words with the same meaning as a single word with which it corresponds, and has superseded, is one thing; the identity of the respective elements of the two combinations, is another. Between '*I have written*' and '*γέγραφα*' we see it clearly; between *capitis* and *de tête* we see it indistinctly.

§ 242. Notwithstanding all this, it cannot be denied that, in some instances, we have what to all intents and purposes are Cases formed from actual Prepositions. Such a word is *whilom=at* or *about some time* (*while*); *some time ago*. The Preposition is obsolete; the Substantive obsolescent. Such, however, is the structure. Here the Preposition is a *post*-positive. On the other hand, in Italian, such combinations as *pello=per illum*; *collo=cum illo*; *nello=in illo* and the like; where it is truly *pre*-positional. These are manifestly secondary formations. The Gaelic, which gives us the language of an earlier stage, has also words like it, which are,

in like manner, *pre*-positional. But in Gaelic and Italian we have the several Prepositions as separate words. These are, also, secondary. Are they inflections, or are they mere compounds? They are certainly the latter; perhaps the former. But in no case are they the inflections of which we have to analyse the structure. We see this at once. The inflections that we have here to examine are those of which the origin is problematic. And here comes the difficulty which always besets us. When the case is plain, there is no problem at all.

§ 243. Between the combinations like *whilom* and those like *collo* we get both *pre*-positions and *post*-positions. The real Preposition is neither one nor the other. Wherever there is a Preposition there are *two* Nouns, and its place is generally *between* them; thus being *inter-positional*, *i.e.* *pre*-positional to one, *post*-positional to the other.

§ 244. Such is the criticism that applies to the doctrine of the connection between the Prepositions and the Cases of Nouns. There is a connection of some kind, but the one that has just been noticed is too much of a sectional, or partial, character. Reasons will be given in the sequel for believing that the signs of Case are of earlier origin than the Prepositions; and that, where case-endings can now be replaced by Prepositions, they were not Prepositional in origin, though akin to the Prepositions in import. And this is as much as need be said at present.

And even less than this will be said about *Tense*. All that is, at present, said about the two is, that Case and Tense belong to the same system of Inflection, and are analogous to one another; *i.e.* that, *mutatis mutandis*, Case is Tense in respect to Time, and Tense is Case in respect to Space; and that words like '*behind*,' '*here*,' and '*before*' correspond with words like '*past*,' '*present*,' and '*future*.' It is, however, from Space that the principle of direction is deduced. This is because the relations in Space are the most *definite*, *i.e.* those that most specially present themselves to senses. Such, at least, is the presumption.

(9.) Gender (of Nouns).—Mood (of Verbs).

§ 245. *Gender* is one thing; *Sex* is another. So is the import of the word *Masculine* and *Feminine* as opposed to *Male* and *Female*. Sex with its Males and Females is a natural division of objects: Gender, with its Masculines and Feminines, is an artificial, a conventional, or a grammatical one. Artificial, however, as it is in the nature of external objects, it is real in Language. This reality we must recognise and explain as best we can.

Of forms like *θεός, λέαινα*; *genitor, genetrix*; *duke, duchess*; *freund, freundin*; *fox, vixen*, and others, where there is no change in the inflection, and where the *gender* corresponds with the sex, nothing will be said. The forms and combinations that specially illustrate *gender* are those like *bonus clypeus, bona parma*, and *bonum scutum*, where we get well exemplified the two chief difficulties connected with this part of grammar. These are: (1) the little agreement there is between *sex* as we find it in nature and *gender* as we find it in language; and (2) the incomplete and indirect way in which the gender, thus characterised, is expressed. *Clypeus, parma*, and *scutum* have very nearly the same meaning, viz. that of a *shield* of some kind: a shield which is not only invested with a *sex*, but which, as *clypeus*, is Masculine, as *parma*, Feminine; and, as *scutum*, Neuter, *i.e.* neither one nor the other, or else both.

§ 246. There, certainly, is something in this which is widely different from what is meant by *Sex, Male*, and *Female*; or, in other words, there is a variance between the Genders of Thought and Language and the Sexes of external Nature. And it is this that perplexes us. What is this Gender which has no counterpart in Sex? What is it in Thought? What is it in Form? How far does it extend? What is the history of its development?

§ 247. *What is it in thought?* The principle that has commanded the most attention is that of *Personification.*

In the earliest stages of language and in the newest we can always find some inanimate or some immaterial object which is invested with Sex of some kind. It may be as material and common-place as the *scythe* or *spade* of a day-labourer, or as high and abstract as the Seven Cardinal Virtues of the philosopher. It need not be indicated by an inflection, nor by any such formative as the *-ess* in *duchess*, &c. &c. It may show no sign of its existence in the substantive to which it refers, any more than it does in such words as *ship* and *scythe*. Nevertheless, if, when these are represented by their Pronouns, the sailor calls his ship '*she*' or '*her*,' while the mower calls his scythe '*he*' or '*him*,' the principle of personification asserts itself; and with it comes the notion of Gender, or conventional Sex. There are other subordinate and partial explanations of this contrast; and these, so far as they go, may be valid. But Personification carries us the farthest.

§ 248. Yet it does not carry us far. It is the most conspicuous in the domain of Mythology, with its Gods and Goddesses. Here the Personification does not so much personify individual objects already existing, as it creates, or makes for itself, imaginary persons. For the more indefinite objects of thought it makes Abstractions; which, in general, are Feminine. Sometimes there is a physical element manifestly suggested; as when in certain American languages the Sun is the Man in the Sky, the Moon the Woman in the Sky. Here the difference of bulk and power originates the image. But in the German languages there is a *Man in the Moon*, and the Moon is Masculine whereas the Sun is Feminine. Here the Sex is determined on different principles; but, in both there is purely physical element. In respect to the habit of unlettered Englishmen calling one implement a '*he*' and the other a '*she*,' it may be merely a remnant of the older system of Genders preserved; though of Gender in the Noun itself all conspicuous traces are lost. It may in some cases be what

is suggested by Cobbett, viz. because certain objects are more specially connected with himself—like a wife. It *may* be this. It *may* be that in some cases a number of individual objects may have only the value of one of a higher denomination; so that if many females are required to make up the value of a single male, the question is as much one of Number as of Sex. There are some forms in Tutshek's Grammar of the Galla Language that favour this view, and in a very low state of language something of the kind is not unlikely. Then there is the whole of the Vegetable Kingdom, which so far as it is productive of seed and fruit is Feminine rather than Masculine. Nevertheless, we may take all that has been thus suggested, and making the most of it, ask how far it carries us. The answer is, '*Not very far*;' farther in some languages than in others, especially in those where it connects itself with Mythology. But it nowhere gives us a general principle. We have only one foundation for our argument, and this we must get from the actual nature of the objects themselves with the nature of the words, or formatives which symbolise them in Language. With these we can consider the two essential questions. How did the idea of Sex first present itself? and how far did it extend itself beyond the domain of *Natural Sex*?

§ 249. The fundamental fact in this is the undeniable existence of such a difference as that of *Sex*, not only in external Nature, but in Thought, and in the Language that expresses it. All that we have to do with this is to recognise it. In words like *boy* and *girl* its expression is clear enough. In words like *man-servant* and *maid-servant* it is equally so. In words like *genit-or* and *genet-r-ix* we can, also, understand it, though not so readily. But all this is intelligible. We may wish to know more; to know, for instance, the exact origin of the formative syllable like *-ix*; but why they are used, and what they imply, we know. There is a difference in Nature with which, as forms, they correspond. It is in the *Substantive* that we comprehend it best.

§ 250. In the Adjectives and Pronouns, especially the Demonstrative and Relative, we do not see our way quite so clearly. A male or a female '*good*,' a male or a female '*this*,' a male or female '*which*,' we can only understand when we know what they mean as Substantives. But this we can discover from the context. In a language where there are neither formatives nor inflections all this is mysterious. But when we get these, and, along with them, *Concords*, we can realise the character of the change. They adapt themselves in form to the Substantives with which they agree. This agreement is of two kinds. The Adjective gives us a *Quality*, *i.e.* when attached to its Substantive, tells us that a *good man* is a *man* and something else. The Pronoun gives us the actual Substantive with which they correspond *under another name.* In fact, it gives us a Synonym. There is the element of a Concord in all this.

§ 251. If neither the Adjective nor the Pronoun have any sign of Gender whatever, there is no *positive* Concord; *i.e.* there is no sign whatever by which we get either agreement in form or disagreement. But there is no *Dis*cord; nothing by which the notion of *Con*cord can be violated. There is nothing of this kind in the present English. We cannot, in English, violate the rule of Concord (which is a natural one), because the Adjective has no sign of Gender. We could do so when it had one. We *can* do so, even now, with the Pronouns of the Third Person and the Relative, because they have one. If speaking of a female we cannot say '*he did this.*' The Concord, then, when there is a sign to express it, is a matter of common sense rather than aught else. We must avoid a *Dis*cord.

§ 252. Given, then, a language which has arrived at a state in which we get Parts of Speech, Substantives, Adjectives, Participles, Demonstrative, Relative, and Personal Pronouns with signs denoting difference of Sex, there must be a Concerd in form when any two words applying to the same object come together. We may dispense with such

Concords altogether; but, if we have them, we must use them in their proper places; and just as we have Concords of Person, Number, and Case, we may have one of Sex. In short, we have it; and we '*know the reason why.*' If we have words like *genitor* and *genetrix*, and *bonus* and *bona*, we must not say *bona genitor*, or *bonus genetrix*. There is no reason why we should have such forms; but if we have, we must not combine them *dis*cordantly.

§ 253. But *Gender* is not exactly co-extensive with *Sex*; and the perplexing fact now confronts us, that we have signs of a difference of Sex extended to Substantives where there is no Sex at all. In other words, we have *Masculines* and *Feminines* in Gender and Language where we have no corresponding *Males* and *Females*. This is our fundamental difficulty.

§ 254. *What is the sign of Gender in Form?* An *Inflection* rather than a *Formative*. The *-ix* in *genet-r-ix* is a formative; for its inflections are exactly those of *genitor*. The Plural of both is *-es*; their Cases *-is*, *-i*, *-em*, *-e*, and so on, the Plural. The *-or* and *-ix* are parts of the theme—unchanged throughout the Declension. In words like *bonam*, *bonas*, *bonarum* the Vowel changes with the Case and Number. In combining these we must avoid a Discord; and the sign which makes this Discord possible is an Inflection rather than a part of the theme.

§ 255. *How far does this system extend?* It does *not* extend to the Neuter. We may call Nominatives like *regnum* or *bonum* Neuters. But they are not Neuter as opposed to *Masculine* and *Feminine*, or to *Male* and *Female*. They are not Neuter as to anything in the way of either Grammatical Gender or of Natural Sex. They are the Negatives or Opposites to something of a very different kind; and they represent a contrast which originated in an earlier stage of language. At present, the Neuter may, conveniently, be treated as a third *Gender*; but, in origin, so far as Gender is equivalent to Sex, it is no Gender at all.

It was *not* in the difference between Male and Female that the Neuter originated, but in the difference between *Animate* and *Inanimate*, for that is the difference which was the first to be recognised. There is no doubt about this. The Dual division of *Animate* and *Inanimate* preceded the Triple distinction of Masculine, Feminine, and Neuter.

§ 256. More than this. As this Dual division was the first to be recognised, it will probably be the last to be abandoned. In the Old Norse (or Icelandic), the Genders are the *three* ordinary ones—Masculine, Feminine, and Neuter. But in the Danish and Swedish they are reduced to two; the one that is abandoned being the Feminine, the one that is retained the Neuter. Of something akin to this we have an example nearer home. In the inflection of an Interrogative and Relative Pronoun the division is, also, Dual: (1) *Masculine* or *Feminine*, *i.e. Common*, and (2) *Neuter*—(1) *who*, (2) *wha-t*; (1) *who*, (2) *whi-ch*; though the *-ch* in the last example is not exactly an inflection, but the *-lk* of the Scottish *whi-lk*, which is the Adjective *like*.

§ 257. In some grammars, instead of *Animate* and *Inanimate*, we find such words as *Rational* and *Irrational*. And we see our way to this when we consider how readily the lower animals may be looked on as *things*. But this is not all. There is a great deal which makes the division a natural one. Whatever may be the exact difference between States and Actions, and, however clearly we may make out a case for every state being, to some extent, an action, there is a great practical difference between the agent or subject on one side and the patient or object on the other, especially when we consider the proportion in which names are likely to be allotted to them. The more conspicuous the agent the greater will be the likelihood that he will take a name; especially when he belongs to a class that gives names; and this is the class which the Animate beings of the world best represent; and of the Animate beings the Rational most exclusively.

§ 258. The relegation of the lower animals to the class of Things rather than Persons, is diametrically opposite to the later system of Gender. In Gender we invest objects which have no natural with a non-natural Sex. The older process, which limited the Animate world to the Rational, divested of Sex such animals as had it.

§ 259. This leads us farther. It is probable it was neither Sex, nor Life, that determined the original division. It is more probable that it was the difference between the class of Agents and the class of Objects.

§ 260. So much for a limitation of one kind; a limitation which reduces the number of Genders. But there is another, and one of another kind, that we must, also, take under consideration. To what Parts of Speech does the system, as we have it, extend? Does it extend to the *Substantives*? If it do so, does it manifest itself by the same clear, and definite signs that present themselves elsewhere? Supposing it to do so, does it do so to the same degree throughout the class? To all this we must answer, that the Substantive is *not* the Part of Speech wherein the system of Gender is most typically represented. In the typical Substantives there is no inflection to express it; no sign or mark whatever. The words, nevertheless, are Masculine, Feminine, or Neuter, as the case may be. They are supposed to be this always; and, when the difference of Sex is real, they are so; but Sex is not Gender, neither is Gender Sex. When the Gender, then, neither coincides with Sex, nor has any distinctive sign of its own, how far is it Gender at all? How far are words like *lapis* Masculine, and words like *nubes* Feminine, when they stand alone? The sense tells us that, in the way of Sex, they are neither the one nor the other; while in their declension they are identical. In fact, the terms in question have neither real Sex nor any sign of grammatical Sex or Gender when we take them as single words; and, when we have to do this, we find them

somewhat troublesome. In our language they are not so, because in English there are practically no signs of Gender; but in French and German there are scores and hundreds of words which when found for the first time have to be looked out in a dictionary before we know their Gender. In short, except for the fact that an Adjective or Pronoun, which *has* a sign of Gender, agrees with them, and they with it, they have none.

§ 261. The Substantives to which this most specially applies are those of the Third Declension in Greek and Latin; and these it is which are most typically Substantival. The inflection of words like *dominus* and *domina* is that of the Adjective.

§ 262. Gender, then, is the result of a *Concord* rather than of aught else; and it is in the Adjective rather than in the Substantive that we find it.

§ 263. It is in the Adjective rather than in the Substantive that we find the Gender as opposed to Sex. It is in the Substantive, however, that we find Sex as opposed to Gender (*genitor*, *genetrix*). The Concord, too, is a strange one; with Nouns of the Third Declension it is the Substantive that agrees with its Adjective or Pronoun rather than the Adjective or Pronoun that agrees with its Substantive. Are we, then, free to say that the signs like the *-or* and *-ix* in *genitor*, &c., the formatives expressive of Natural Sex, originated in the Substantive? and that those like *-us*, *-a*, *-um*, the signs of Gender or conventional Sex, are adjectival in origin? The first statement we may safely make; the second is not so clear. We can only say something like it. It by no means follows that because the Substantive may have taken its Gender from the Adjective, it is the Adjective in which we are to seek its origin; for this is by no means the case. I submit that the Adjective took it from the *Pronoun*. If so, it was in the class of Demonstratives and their nearest congeners that Gender took birth. By '*nearest congeners*' I mean the Relatives, the Interrogatives, the

Definite Articles, and, above all, the Pronouns of the Third Person.

§ 264. It is in the *Demonstrative Pronoun* that Gender seems to have originated. Demonstratives are Pronouns, and Sex is a *Quality*. Pronouns, however, have no Qualities. They have only *Relations*. But every Pronoun has its duplicate; *i.e.* a Noun which corresponds with it. And this Noun *has* Qualities; and when the Pronoun is, so to say, *translated*, *interpreted*, or *specified*, by its correspondent Noun, it, in its adopted form, takes to itself Qualities; and amongst them that of Sex. It has *not* these in itself; inasmuch as words like '*this*' and '*that*' imply nothing but a greater or less distance between the objects they apply to and the speaker. If a *man*, a *woman*, and a *tree* present themselves at different distances, the man being the nearest and the tree the most distant, nothing but the difference of the intervening space is suggested by such terms as '*this*,' '*that*,' and '*you*.' Nevertheless, '*this*' is the name of the Masculine man; '*that*' the name of the Feminine woman; and '*you*' the name of the Neuter tree. But change their places, and the Sex of the object changes also; and each name may have any one of the three imports. Relations are changeable; and so is the power of their signs in Speech; but so long as words like '*this*,' '*that*,' or '*you*' mean man, woman, or tree respectively, so long are they Male or Masculine, Female or Feminine; or neither one nor the other, which is Neuter. It is only, then, for the time being that these Pronouns have Sex. But this time is always changing.

§ 265. The Demonstrative Pronouns, then, *have* Sex just as much as the Nouns. But only *for the time being*. They have the sex (for the time being) of the Noun with which they correspond. This depends upon the Attribute of Relations; but Relations are always changing. It is impossible under these conditions that such Pronouns can have any permanent sign of them; for any integral part of their natural

structure; anything that would not be every instant liable to be converted into something else; anything essential to, and inherent in, their structure; anything like an Attribute that might be attached to them as *Pronouns*. Such an Attribute must be a *Quality*—an *inherent* Quality, if we like; but it is just because a Pronoun has the Attribute of *Relation*, to the exclusion of that of *Quality*, that it is what it is. On the other hand, the counterpart Nouns had the Attribute of Quality, to the exclusion of that Relation; and, because they had it, they were Nouns as opposed to Pronouns; and, because the Attribute of Quality is permanent, they were permanent names. Some change must now take place in respect to the Pronoun. There must either be more of them, *i.e.* new words, like *he*, *she*, or *the*, or else existing words modified, as *heo*, *heo*, *hit*, *is*, *ea*, *id*, and the like. Or both processes may be adopted. In the Synthetic language we have both forms, but with differences. In our own language we get the Neuter of both *he* and *the*; or *it* (*hit*), and *that*. Still, the first is used in a Personal, the latter in a Demonstrative sense. But the West-Saxon Personal form is *se*, and its Feminine *seo*; of this the only Gender or Number is, extant in the present English, *she*. In the Lithuanian, and I believe in that language only, it is declined throughout—in six Cases and three Numbers; for it has its Dual forms, though they are only compounds formed by the addition of the term for Quantity, or rather, Quotity.

§ 266. But it is not this that we need enlarge on. The point to which we must most specially attend is the fact, that in the passage from the Demonstrative to the Personal Pronoun, we get not only Gender in a Pronoun, to which, as an Attribute of Quality rather than Relation, it is naturally and essentially foreign, but a reason for its being adopted, and an argument in favour of its being the Pronoun in which it originated; or rather the Pronoun in its transition from Demonstrative to Personal.

§ 267. It is in this transition that we find the germ of the triple division into Masculine, Feminine, and Neuter. The dichotomy of everything in the Universe into, '*Everything is either I (Ego)* or *Not-I (Non-ego)*, is that of the logicians; and it is exhaustive. In Language it becomes, for the Pronouns of the Third Person, a trichotomy; viz. *I (the Speaker)*; *Thou (the object spoken to*—generally Rational, and always Animate); and '*This*,' '*That*,' or '*The other*.' For the first two no sign of either Animation or Sex is needed. For the third, something of the sort is required. The special name of each of the three objects in a narration cannot be continually repeated. Neither can we ring an indefinite number of changes on '*This*,' '*That*,' and '*The other*.' A change of form takes place.

§ 268. When this is completed, the Inanimate, or Irrational division of the older stage of language, and the Neuter of the newer, become, in a way, confluent. But only partially; and so as to meet the classification of the grammarians of the Synthetic languages. The older division *includes* the Neuter, *and something more*. Hence it is only to a certain extent that they coincide. There is a partial confluence, but there is no co-extension.

§ 269. Traces of the older division still survive. The Danish and Swedish Genders have already been noticed. So have the Interrogatives and Relatives of our own language. In the Slavonic, the Masculine Gender falls into two divisions: the Masculine Animate, and Masculine *In*animate. With the Masculine *In*animates it is the Nominative (as elsewhere) with which the Accusative agrees in form. With the Animate, it is the Genitive.

§ 270. We now see something to which such an apparent anomaly as Gender, or *non*-natural Sex, can be traced.

(*a*) There is *real* Sex in Nature, and in Language there is a Formative to *sign*-ify it. It is in the Substantive that this originates.

(*b*) In another direction there is, also, a concurrent process. The Demonstrative and (or) Personal Pronouns take to themselves a sign of Gender, and, this being done, agree—or stand in Concord—with the Noun to which, as names, they correspond.

(*c*) This tendency to *sign*-ify the Concord extends itself. When a Substantive has an Adjective in combination with it, there is, whether *sign*-ified or not, a Concord—at least, so far as a *Dis*cord would involve a contradiction. There need not be any formal, external, or positive sign of it; in other words, it is not necessary, nor is it always the case, that there is any sign of Gender for the Adjective. If, however, there *be* signs, they must not be discordant. In some cases, the Substantive being understood, a single word such as *bonus=good man*, *bona=good woman*, stands by itself. When this is the case, the Adjective is, *pro tanto*, Substantival.

§ 271. Then comes the extension of such signs of Concordance *beyond* the bounds of Natural Sex. '*Gender*' now becomes a convenient term; and, when once the change has begun, there is much to promote it. The Demonstrative Pronoun itself is something more than a Demonstrative. It is also Interrogative and Relative; also the Definite Article. This being the foundation of the Third Person, it presents itself in the Verbs more often than the other two Persons put together. Then there is older division of Animate and Inanimate; and, still more important, that of Rational and Irrational. This would make the whole of the lower animals Neuter; and, so doing, contribute greatly to the confusion of Sex and Gender. Then there are the minor elements which, in detail, would promote the same intermixture—Personification, especially when connected with Mythology, being the chief of them. But, with all this, it must be remembered that the extension is by no means very wide; or, at least, that, except with the Pronoun and the Adjective, it is of an equivocal and imperfect character. In words like *dominus*

and *domina*, the distinction is real. In words like *mensa* and *sylva*, it is conventional; but in both cases the declension is Adjectival. With the typical Substantives of the Third Declension there is no sign of Gender at all. There are words like *genitor* and *genetrix*; but, in these. the difference is real, and the formative signs are in their proper place. In Neuters like *opus* the Nominatives and the Accusatives are alike; and, in the Plural number, they end in *-a* (*oper-a*), rather than in *-es* (*lapid-es*). But this is not a difference of Masculine and Feminine, it is the older difference of Animate and Inanimate.

§ 272. Of the extent to which the present class of *Neuters* is something more than a mere collection of the names which are neither Masculine nor Feminine, we have already had evidence. We have seen that the present triple division of Gender is of secondary origin. The lower languages tell us that the older division was a *Dyad*, or *Dualism*; and that this was the first in origin. The later languages—the Danish and the Swedish—tell us that the double division survives the triple, and that throughout the whole domain of Gender. The present English tells us that in the Interrogative and Relative Pronouns there is no Feminine; whereas, there is a Masculine and a Neuter. The Slavonic tells us that, concurrently with the ordinary triple division into three Genders, the *Masculine* draws a distinction between *Animate* and *In*animate.

§ 273. From another point of view, however, the whole gist of the present observations on *Gender* have been to the effect that, over and above its tendency to present itself late and to disappear soon, its signs are of an indefinite character. To the Neuter, however, *neither* of these criteria appertain. This is because the Neuter is not an instance of *Gender*. The Neuter shows itself early; and has yet to become either obsolete or obsolescent. And it is just the same with its Inflection. Its signs are definite; no mere differentiations of some vowel or diphthong, but con-

sonantal in form and permanent in duration. The difference between ὁ and ἡ, *eum* and *eam*, *the* and *theo*, *se* and *seo*, is indicated by an evanescent vowel. The signs of the Neuter are Consonantal; and, if not exactly everlasting, permanent. The Neuter sign, in short, is always the most positive of the three.

It is, certainly, in the Pronouns that this comparatively definite, permanent, and undoubtedly consonantal sign presents itself. I do not use this as a reason in favour of its having originated in the Pronoun. I merely indicate it as a presumption in favour of its having done so. Against this view I know nothing. In the German Family of Languages, however, the Adjectives follow, in its signs, the Gender of the Pronoun. *Pro tanto*, this is in favour of the view. Of course, practically, the Neuter is a Gender; but, historically, it is connected with a system in which Sex was only a secondary and accidental element.

§ 274. Of the extent to which the earliest Inflections are the most persistent there is no better evidence than that of the Interrogative Pronoun. The Greeks said ὅς, ἥ, ὅ,; the Latins *qui*, *quæ*, *quod*; the English *who* and *what*, having nothing that corresponds to ἥ and *quæ*. We may, or may not, call this *Gender*. It is certain that it is not Gender founded on *Sex*. We may, or may not, call this Gender *Neuter*; but it is certainly not the Neuter of a *triple* division, or *tri*chotomy. It represents one of *two* classes, not one of three; and it is not expressive of a mere residue, consisting of something that is neither '*this*' nor '*that*.' It is a term like '*The other*' when it applies to one object out of two; but it is not '*The other*' in such a phrase as '*This, That, and Tother.*' It is '*The other*' as opposed to either '*This*' or '*That*' singly; but not '*The other*' as opposed to '*This*' and '*That*' collectively. The difference, for the purposes of practical grammar, is of no great importance; but the fact of being retained, to the exclusion of the Feminine, in the Interrogatives, is not without its import.

§ 275. We may now add, that the sign of *Gender* is one of a peculiarly faint and indistinct character; being formed by modifying some sign previously existing, rather than by the introduction of any new element. Few, if any, of these signs contain a consonant, neither can they always be separated from the sign of the Number and Case; indeed, as a rule, the three become confluent, and one syllable may stand for all. When inflections are of this indefinite character, they are rarely either old or permanent. They come into language late, and they fall out of it early. This is mentioned—not for the first time—to show that the two characters may be taken together; and that so they give a natural character to any class founded upon them.

§ 276. It was not, then, for nothing that the §§ 172, 195 were written upon the difference between Inflections formed by the separate and definite addition of what, by hypothesis, was originally a distinct and independent word, and Inflections formed by *Differentiation*; and that, at the first opportunity, it was laid before the reader; nor is it without a purpose that the term *Variant* has elsewhere been suggested. More in the special notice of the *Mood* will be said about this. At present it is sufficient to state that in Inflection the differentiated form is common to both Mood and Gender.

Mood.

§ 277. The remarks with which the notice of '*Gender*' concluded are those with which it is convenient to begin the notice of '*Mood*.' This is because, in the present treatise, some pains are taken to establish a comparison between them. In both divisions there is a *minimum* of Inflection in the way of *addition*; the chief changes being from one vowel or diphthong to another, *i.e.* by *differentiation*. In both divisions the result is short-lived. The distinction of both Gender and Mood come into language late and drop out early.

§ 278. Of the way in which a Mood like the Conjunctive dies off, we have a good instance in our own language. In very correct English we are supposed to say 'If this *be* the case, you are right,' rather than 'If this *is* the case,' &c. But '*be*' and '*is*,' it may be objected, are two different verbs, and not the same verb in two different Moods. Hence, 'if I *were* you' as opposed to 'if I *was* you' is nearer to the point. Now this is the only instance in English of a *positive* distinction in the way of *Mood*. In sentences like 'if he *choose*, he will comply with your request,' the form '*choose*' is preferred to '*chooses*'; but we know that the distinction is often neglected. What, however, when we get it, is the sign of the Conjunctive? Simply the *omission* of that of the Indicative. With the exception of the word *were* as opposed to *was*, all the English Conjunctives are of this *negative* character. The signs, then, of Mood, in English, are obsolescent, those of Gender obsolete.

§ 279. It is easier to say what Mood is *not*, than what it is. Etymologically, it is a *Mode* of some kind or other; but it is certain that, in the divisions and subdivisions of the class to which the term applies, there is very little regularity of relation. In words like *Vocito = I call often*, *γηράσκω = I begin to grow old*, we express the *kind* of action, but none of the circumstances, conditions, or accidents under which it presents itself to the person spoken to.

In words like *τύπτειν*, *τύπτω*, *τύπτε*, or *τύπτοιμι* there is no change whatever in the character of the action, which is neither frequentative, nor inchoative, nor anything else ending in *-ive*, but purely and simply *beat*. In words like *vocamus* and *vocitamus* we have two different verbs; in words like *vocamus* and *vocemus*, *vocitamus* and *vocitemus*, we have identical verbs in different moods.

§ 280. In Greek and Latin, Frequentatives like *vocito* and *φλεγέθω*, and Inchoatives like *viresco* and *γηράσκω*—in contrast to such forms are *amarem* or *τύπτοιμι*—are not likely to be mistaken for anything but what they are. But

in many languages all these formations are considered to constitute *Mood*; so that the Moods of this may amount to more than a dozen. These, however, we may wholly exclude; and the Infinitive Verb we have excluded already. This last may, of course, be called a *Mood*, if a definition of that term be framed so as to allow the Mood to Nouns. But this is another question. The Moods now under notice are those of the Finite Verb exclusively.

§ 281. How many of them are they? This is a question which partly belongs to Logic, and partly to Grammar; and when this is the case, each illustrates the other. It is the *Finite* structure of the Verb that makes that Part of Speech what it is in the eyes of the logician. The *Infinitive* portion of the compound supplies the Predicate, the Personal part the Subject. Between the two we get a Proposition; sometimes a very short and compact one—as *eo*=*I go*, *no*=*I swim*, and others. But it is not with *all* these forms that the logician has to deal. It is only when the verb delivers a statement, an assertion, or a predication to the effect that some one does, or does not do, something, or that some one is or is not, something, that the logician recognises the Verb. The simple union of the name of an agent, or being, with that of an action or state, is not enough for him. He may or may not allow that such combinations constitute sentences —perhaps even propositions; but such propositions and such sentences are excluded from the province of Logic. One class of this kind is that of *Commands*; another, that of *Questions*. We can found no argument on either. The Command must be either obeyed or disobeyed, and the Question must be answered in some way before the first *datum* in any inference can be recognised.

§ 282. The logicians, then, ignore *Commands*, and that rightly. They also ignore *Questions*, but not so rightly. This is because in such sentences as '*What is this?*' there are two terms; viz., '*what*' and '*this*;' and between the two the result is, '*this is something concerning which infor-*

mation is required.' But this is incommensurably between two propositions, and one is what we have already seen in the case of the Finite Verb and the Infinitive; nor need it detain us now. What we more especially need notice is the extent to which the element of uncertainty and conditionality is common to the Verbs of the Conjunctive Mood and the class of *Questions.*

§ 283. Hence, between what the logician admits, and what he excludes, we get something like a rule, by which we may ascertain the number and nature of the Moods; for the triple division is, undoubtedly, meant to be exhaustive of the different forms under which a Subject and a Predicate in combination can present themselves. Hence, also, the more we bring these divisions of the logician into harmony with those of the grammarian, the more do we give precision and definitude to our conception of the function and number of the Moods. In respect to the last point, we may safely say that, for the *Finite* Verb, they are not more than *four*—not more; possibly not so many.

§ 284. *Four* in Greek, and *Three* in Latin, are the numbers with which we are the most familiar. The names are (1), Indicative; (2), Imperative; (3), Conjunctive, for both languages; (4), Optative, peculiar to the Greek. The *Indicative* is the one which the logician adopts. The *Imperative* he has recognised; but only to exclude it. With the *Conjunctive* and *Optative* the case is different. These are, by no means, so evidently the counterparts to the class of Questions as the Imperative is the counterpart to the class of Commands.

§ 285. As a Mood (for nothing need be said about the Indicative), the Imperative is, on the first view, a very simple one; and if its character depended on the purely imperative part of it, there would be little to be said about it. The object addressed must, of necessity, be in the Second Person, and his name may be dispensed with; for its presence and its relation to the speaker are self-evident. Hence, we may

have such words as *dic*, and *fac*, and others, where the verb presents itself in its simplest form. As more individuals than one may receive a Command, the Imperative may have more *Numbers* than one; but as a Tense, it is essentially *Future.* The time when a command is delivered is Present; that of its contemplated fulfilment, Future. An Imperative Mood in a *Past* Tense is a contradiction in terms.

§ 286. These are the characters of the Infinitive which give us as formulas. But if a formula is one thing, the practice of language is another. *Eamus=let us go*, and *eant=let them go*, are in form Conjunctive. But it is in sense wholly unconditional; so that by the double test of form and import it is neither Imperative nor Conjunctive. But its sense is Precative, and as such, implies permission, which is akin to an order. Again, in

Moriamur et in media arma ruamus,

the sense is Hortative. With a secondary verb, like *let* or *may*, we may find these differences expressed. But then the combinations are analytic.

§ 287. *Wishes* are of the same class with orders, supplications, and exhortations; but in wishing, a man need not go beyond himself. When he says, '*I wish you well*,' he does not so much give vent to the wish, as he tells us that *he wishes*, or that he is a *wisher.* The purely Optative expression partakes of the nature of an Interjection. Between the Interjection and the Verb, as Parts of Speech, there is a wide interval; but in combinations like *utinam*, εἴθ' ὄφελε, '*would I could*,' we have, between the elliptical forms of the expression and the suggestive, rather than indicative, character of the sentence, something that is truly Interjectional. In English, when we use '*may*,' we get the difference between the Conjunctive and Optative sense by a transposition —'*you may be happy*'—'*may you be happy.*' And so it is in the Latin *sis*—

Sis licet felix, ubicunque mavis,
Et memor nostri, Galatea, *vivas.*

In the Greek—

Ὦ παῖ, γένοιο πατρὸς εὐτυχέστερος,
Τἀδ' ἀλλ' ὅμοιος καὶ γένοι' ἂν οὐ κακὸς,

the same word is both Optative and Future; in the latter case with *ἂν* superadded.

§ 288. Then, in the way of Tense, we have such abnormal forms as the Imperatives of the Greek, and extravagant forms as the Imperatives of the Greek Aorist. In the Active Voice, the form may as easily be considered Future as Aorist: *τύψον*, *δράσον*, *ποίησον*, &c.; but in the Passive there is no doubt as to the tense of *τύφθητι*, *τύφθητον*, *τύφθητον*, *τυφθήτων*, *τύφθητε*, *τυφθήτωσαν*. This is telling a man on Saturday to take a beating on the *preceding* Friday. We cannot do this; though, in saying, '*consider yourself beaten*,' we can get at something like it; and that loose likeness of the kind may pass for real ones, is a fact that we must recognise in language, and take it as it presents itself. There is a great deal of it, and that in several languages. Thus, in the Fin paradigm of § 92, we may notice the entry of a '*Factive*' case; the ordinary explanation of which term is, not so much that something is actually *made*, *converted*, or *transformed* into something else, as that it is *made*, or *becoming*. *like*, or *as* something else. In languages where there either is or has been the recognition of the system of *Ex*clusive and *In*clusive Plurals, the paradoxes connected with the *Person* of the Imperative can scarcely be said to exist; for it is often hard to say how far the designation of the object addressed is that of any particular person at all. It certainly applies, in the first instance, to a second person; but if, when either excludes or includes the speaker and the objects spoken about, its import becomes equivocal. That the ideas, notions, or conceptions, connected with that of *Command* are numerous, we have already seen. They have, also, a tendency to graduate and run into one another.

§ 289. The Indicative and Imperative Moods are commensurable. In each there is but one term, and only one proposi-

tion. Neither of them, however, is commensurable with the Conjunctive; because in the Conjunctive there are *two* propositions. The difference here is the difference between the Finite Verb and the Infinitive repeated; except that, in the question between the Finite and Infinitive it was one of *terms*, whereas, here it is one of *propositions*.

§ 290. There are no two propositions which may not stand in juxtaposition to one another. They need not be connected; inasmuch as, to use a familiar simile, they may touch one another like marbles in a bag; nor even, when connected, need they have any sign of the connection. But, given some such sign, the possible series of them must be co-extensive with the possible ways in which connection of any kind can be expressed. It is not impossible that the number and nature of these may be calculated *à priori*; and that each of them may have a class-name; even though the class be limited to a single conjunction.

This is what is possible. Actually, however, we have a limited series of classes, each with its distinctive term, which is amply adequate to illustrate the meaning of the term *Conjunctive*. They fall into two classes: those which exercise no influence upon the *Verb* in the secondary proposition; and those which influence, or modify, it. All of these, however, except the first two, have some effect or other upon it; in respect to either its form, or the interpretation of the connecting link. It is this influence which makes the difference between two propositions in mere juxtaposition (the marbles in the bag) and propositions with a sign of connection, or Conjunctives. There is, however, only one form of the conjunction that affects the Mood, *exclusively*. There is another that affects *either* the Mood or the Tense; but which of the two be the one that is so affected depends upon the language rather than the power of the conjunction taken by itself. This, of course, anticipates the contrast between the Greek and the Latin; in which, between the two, we find a *Tense* in one language where a *Mood* presents itself in

the other; a point of no small importance in showing how unstable is the character of the Mood, and how readily it is converted into something else.

§ 291. The principal conjunctions, each with its own recognised class-name, are as follows:—

(*a*)

CAUSAL.

The day is fine;

because

The sun is bright.

(*b*)

ILLATIVE.

The sun is bright;

therefore

The day is fine.

(*c*)

COPULATIVE.

The sun rises in the east;

and

The sun sets in the west;

or

The sun rises in the east *and* sets in the west.

Here the single word *sun* serves as the *Subject* for two Propositions:

The sun shines;

and

The moon shines;

or

The sun *and* moon shine.

Here the word *shine* serves as the *Predicate* for two Propositions.

In like manner :

(*d*)

DISJUNCTIVE.

John will do it;

or

Thomas will do it.

This may take the more compendious form :

John, *or* Thomas, will do it.

(*e*)

ADVERSATIVE.

All fled *but* Hector.

Here the import of *but* is equivocal. This is because we can understand the Proposition either as—

All fled *except* Hector;

In which case *but* is a Preposition;

Or,

All fled *but* Hector (did not fly);

where *but* is a Conjunction.

(*f*)

COMPARATIVE.

You are fairer *than* she.

This we must parse as if it were written :

You are fairer *than* she (is fair);

or

You are fairer *than* her.

Here *than* is a Preposition, and governs *her* in the Objective Case.

Thou art a girl as much fairer than her
As he is a poet sublimer than *me*.

Here we may write *she* instead of *her*, and *I* instead of *me*; but the lines are by Prior, and this is how he wrote them. Which gives the better grammar of the two is another question. Both are current in the average English.

It is clear that, with the exception of the first two, all these conjunctions affect either the form or the parsing of the second proposition, supposing that they are two, or, as in the case of the Adversatives and Comparatives, raise the question as to whether there are two propositions, or one. On the other hand, it is equally clear that none of them affect either the Moods or the Tense of the Verb.

§ 292. With two other conjunctions, however, the case is different—these being '*if*' and '*that*.' The first of these affects the *Mood*, the second the *Tense*, in *English*. In Greek and Latin it is different; as will be seen in the sequel. At present, it is enough to say that the difference is an important one. For this a single illustration of each is sufficient.

(*a*) IF, and IF—NOT. Here it is considered better to say:

If he *do* this he will repent;

than

If he *does* this he will repent.

Whether every one who speaks English does, in ordinary conversation, so speak, is another question. Such, however, is the rule; and the older the stage of the language the more valid it is; but, as language advances, it becomes obsolescent. Still the difference is, fundamentally, a real one. We may call the import of this '*if*' *Conditional*.

(*b*) THAT and THAT—NOT, or LEST. Here we say:

I *do* this that I *may* succeed,

rather than

I *do* this that I *might* succeed;

also

I *did* this that I *might* succeed,

rather than

I *did* this that I *may* succeed.

We may call this '*that*' (or *lest*) *Intentional*, or, perhaps, more conveniently, *Potential*.

§ 293. In each of these instances we get a new structure. In the first we get what we may fairly term a Mood with its special sign. It is a negative one in the present English; nevertheless, between the two there is a differentiation. So there is in the second; but it is a differentiation of *Tense* rather than of Mood; and its element is a Concord—a Concord of *Tense*. But it is one of *Mood* as well. If the two propositions did not depend upon one another, and were merely unconnected sentences, there would be no call for a concord. Both, however, are Conjunctive; inasmuch as they involve not only propositions, but imply a link between them. In this way, however, all the other conjunctive pairs of propositions were in the same predicament. With '*if*' and '*that*' we have something more; viz. a special structure for the subordinate one.

§ 294. '*Conjunctive*,' then, and '*Mood*,' are passable names; but neither is unexceptionable. There are Conjunctive sentences in which the verb undergoes no change; and in the case of '*that*' the Concord was one of *Tense*. Still, the terms may pass; and now we may take the two foregoing cases separately.

§ 295. The construction that depends upon '*if*,' and words of a similar import, is the one that we must first investigate. This is because it is pre-eminently a construction in the way of *Mood*; for the other, or the one indicated by '*that*,' &c.,. is partly one of Mood, partly one of Tense. Words like '*if*' are *conditional*. The propositions which they give us in Logic are called *hypothetical*; but both terms point to the same relation between the two sentences or clauses. Something will *be*, *take place*, or *be done*, provided that something be *done*, or *take* place in reference to, and in connection with, it; in other words, one of the two propositions depends upon the other; and the conditional Conjunc-

tion connects them. In the mind of the Speaker there is a manifest difference between the two propositions in respect to the certainty or reality of the action or state indicated by them. It need not be absolutely certain in both, inasmuch as we can say '*If I do this* I may *succeed*,' as readily as we can say, '*If I do this* I shall *succeed*.' But *one* of them must be more or less *un*certain. This difference is a difference *per se*; or, at any rate, it is not one of Person, Voice, Number, or Case. Nor is it one of Frequentativeness, Inchoativeness, or anything indicated by the Formatives. There is a Negative suggested by it; but to express this *in extenso* would be to do away with the element of uncertainty upon which the conditional character of the clause or proposition depends. It does not, however, so much matter what it is, as how it suggests itself to the speaker. Nor is the exact form of the suggestion important. The real question is whether the difference between them be sufficiently striking to suggest a different form for the less certain term as opposed to that of the certain one.

§ 296. It is submitted, then, that it is the perception of this difference that suggests the process of differentiation—when it takes place, which it may or may not do. The contrast, however, in the speaker's mind between the less certain and the more certain is the *primum mobile* in the change. It is by no means necessary that there should be one at all; but if there be, this is its origin. It is rarely, if ever, of a very decided or conspicuous character, and it rarely, if ever, suggests the notion that it was once an independent word, or even a biliteral syllable. It is something more than an ordinary accent, but to the class of Accents, Tones, and Modified Vowels, it belongs, rather than to that of substantial and definite increments. It effects such changes as those from *τύπτω* to *τύπτῃ*, from *τέτυφα* to *τέτυφω*, or from *sum* to *sim*, and not much more. There is a little more than this, in the difference in Greek between the Conjunctive and Optative, and this will be noticed in the sequel.

§ 297. In the Agglutinate languages there is also something more, as may be seen in the Lap, § 94. But, so far as the present writer can form an opinion, these are not *Inflectional*. The sign, which in the Lap is consonantal, and, as such, formed by *Addition* rather than by *Differentiation*, probably belongs, like the *-it* in *voc-it-o*, to the original verb. This we must suppose to be defective in the other moods, and, in the Conjunctive, suggestive of some kind of action or state which is less positive or definite than that suggested by the Indicative. A *Consuetudinal* import would meet this condition; for in sentences where the Verb implies merely that such or such an act or state is habitual, would make its connection with the associated proposition more or less doubtful. In other words, it would give us the elements of a *condition*. There might be a habit, but there might also be exceptions to it.

§ 298. This is how we get the Conjunctive Mood as governed by the Conditional Pronoun; *i.e.* by some word like '*if*.' But '*if*,' and its equivalents, are words of a very wide import, and they are this because, in all kinds of doubt or uncertainty, there are degrees. In many cases we can measure these, and hence calculate the probabilities. Sometimes an '*if*' gives us little more than a mild form of denial, and is all but negative. Sometimes it is the '*if dubitantis*' ='*as may or may not be*.' Sometimes it is the '*if concedentis*,' or the '*if*' of one convinced (perhaps against his will), by what he has learned, in favour of a more affirmative view. In this case we often say '*since*,' a word referring to past time, and indicating a change of opinion. When we do this, the Verb that follows is properly Indicative; *i.e.* the word '*if*' means '*since*,' and the doubt is dispelled.

But on the doubtful ground of admission or denial, '*if* itself may be used as *since*. If so, it may be followed by a verb in the Indicative.

The Optative.

§ 299. In strong contrast to words like '*if*,' stand words like '*that*.' In sentences like—

I *do* this that I *may* succeed,

and

I *did* this that I *might* succeed,

we have *Tense*, where before we had *Mood*. This leads us to the consideration of the *Optative* forms in Mood or Tense, as the case may be.

There are two sorts of Optativeness; and, between them, the Greek makes a special Mood of many Tenses, whereas the Latin gives many Tenses to a single Mood.

1. The Optative element of the first is simply that of a vague wish, vaguely expressed. The wish is one in which the element of intention, or the will to do anything to forward it, is at its *minimum*. The accomplishment depends upon uncertain circumstances, rather than on any action of the wisher. It may, perhaps, partake of the nature of a prayer, or, when mixed up with past time, of a regret. *May something occur favourably! Would that something had happened*, or (what is commoner) *that something had not happened!* If we translate '*opto*' by '*wish*,' rather than by '*choose*,' the first gives a purely *Optative* expression. The second may be called *Desiderative*. In the first the time involved is *Future*; in the second, *Past*—past and irremediable. In Thought this is, perhaps, as much akin to the *Interjection* as it is to the Verb; indeed, expressions like '*would I could*' are verbal only in form, especially when compared with such interjections as *lo*, *ecce*, *proh* (vocative or deprecative), and the like. When phrases like '*would I were*' are changed for phrases like '*O, that I were*,' the mixture of the two elements, as connected in thought, is conspicuously clear.

§ 300. In this no second proposition is involved, except so far as the word expressive of a wish may be verbal. In '*would I were*,' the word '*would*' is, doubtless, a verb; but

it can, with a very slight difference of meaning, be replaced by the Interjection. We may not, however, say that this kind of meaning *excludes* a second preposition. We may only say that it can dispense with one.

§ 301. The more we look into the import of the Optative, the more clearly do we see that it is not to the Conjunctive Mood that it is more especially akin. It is far more so to the Precative variety of the Imperative; and the more it resembles this the more it partakes of the nature of an Interjection. We, doubtless, have it in Conjunctive form, as in—

Sis licet felix, ubicunque mavis,
Et memor nostri, Galatea, *vivas*, &c.;

and

Serus in cœlum *redeas*, diuque
Lætus *intersis* populo Quirini;

and in innumerable other cases. But the Imperative has a similar connection. On the other hand, both in Greek and Latin, we have particles of an Interjectional character in such elliptical expressions as—

Εἴθ' ὤφελ' Ἀργοὺς μὴ διαπτάσθαι σκάφος
Κολχῶν ἐς αἶαν κυανέας Συμπλήγαδας, &c.,

when the Optative sign is εἰ, whereas ὤφελε represents something that the ship Argo *ought not to have done.*

In—

O utinam subitæ *raperent* mea poma procellæ,
Vel possem fructus excutere ipsa meos,

the force of *utinam* is Present, while that of *raperent* is Past; a construction impossible if there were any element of *intention* in the exclamation. The past import, then, lies less in the wish that the winds would do something that they will not do on the strength of the prayer, than in the feeling of regret that both, for the time subsequent to it, and the time anterior to it, the winds did not do such things at all. The wish, by implication, had been made before, and that in vain.

§ 302. We may now look to certain Latin forms. The forms like *amarem*, *amavissem*, *amaverim*, are *Tenses* of the Conjunctive Mood. In Greek, forms like *τύπτοιμι*, *τετύφοιμι*, *τύψοιμι*, &c., are Tenses, and something more; *i.e.* they are Tenses of a Mood which, in Latin, is wanting, viz. the *Optative.* Hence, to a certain extent, what is Tense in Latin is Mood in Greek, and the Latin Conjunctive Tenses represent a great deal of what, in Greek, is represented by the Optative as a *Mood.* To some extent, too, these Tenses and Moods are complementary to one another.

§ 303. It matters little whether we take the Greek Optative, as a Mood, or the Latin combinations as Tenses, separately; or whether we take the two systems as a whole. Little, too, does it matter what we call them. In any case, the purely optative element is at a *minimum.* In such exclamations as—

> Ὦ παῖ, γενοῖο πατρὸς εὐτυχέστερος,
> Τὰ δ' ἄλλ' ὁμοῖος, καὶ γενοῖ' ἂν οὐ κακὸς,

it is only one of the forms that expresses a wish. The remaining forms are for the greater part other than optative—*i.e.* they are (with the affix ἂν) Future; with ἵνα and the like intentional; and, with the Latin *an*, if not actually Interrogative, a near approach to an interrogation.

§ 304. This brings us back to the triple division of the Logicians; which, by what it *in*cludes and by what it *ex*cludes, is held to be exhaustive of the three primary forms in which the combination of a Subject and a Predicate may be conveyed. We may call this a Proposition in reasoning, which, considering that Logic is merely a part of Language, specially applied, we are free to do. Or we may call a Command, or a Question, by some other name; though I submit that this limitation of the term *Proposition* as determined by the logicians is in no way valid in Language. In either case, however, the division of the Logicians into Statements, Commands, and Questions is sufficiently near to that

of the grammarian, to limit the number of his Moods; and it must be admitted that, as a Mood, the Optative is one of a very mixed character.

§ 305. The bearings of this approximate relation, and partial correspondence, between the division of the Logicians and that of the Philologists now explains itself. Between what the logician admits, and what he excludes, we get *three* different ways in which a Subject and a Predicate in combination may present themselves to the speaker. Definite statements correspond with the *Indicative* Mood; Mandative or *Imperative* with *Commands*; questionable cases, or cases which involve a question, with *Questions*. What this way of presentation may be, is not so easy to say. But it is easy to say what it is *not*. The relation of *voca* or *vocato* is *not* the relation of *voc-o*, and *voc-it-o*, inasmuch as *vocito* forms as good a Proposition as *voco*; whereas neither *voca* (*vocato*) or *vocita* (*vocitato*) forms any proposition at all. And the same is the case with the other *Formatives*. *Viresco* and *γηράσκω* comport themselves, in a logical proposition, exactly as *vireo* and *γεράω* do. The difference, then, between the Imperative, or Conjunctive, on the one hand, and the Indicative on the other, is not one connected with any difference in the character of the verb itself. We may call differences of the last kind *Modes*. We may even call them *Moods*; but they are not the Moods represented by the *Indicative*, *Imperative*, and *Conjunctive* denominations. As little are the differences of Voice, Tense, or Number; because all these are present in the Moods which correspond with *Commands* and *Questions* (*Questionables*). With *Person* there is an apparent difference; but it is only partial. The *Imperative* is, formally, limited to the Second Person. But the Second Person is common to it and to the Indicative. It is no difference, then, of this kind that constitutes a difference of Mood. Besides this, we have seen that the Imperative Mood, in Thought, has more Persons than one. *Eamus*, in Latin=*let us go*, which is Imperative. This is, in *Thought*,

'*may we go*,' a *Precative* Imperative, if we choose to call it so. In like manner, '*moramur et in media arma ruamus*' is what we may call *Hortative*='*do as I do*.' We may call these *Mandatives*; but, whatever we call them, they are Variants of the Imperative.

§ 306. What, then, is the difference which the *Non*-Indicate moods signify? It is certainly a peculiar one; one *per se*. It is the difference between '*Yes*' and '*No*.' But it is not the exact and absolute difference. Combinations like '*This is not good*,' are as truly Indicative as '*This is good*.' But the Negative when definitely expressed is as positive as the Affirmative; *i.e.* as free from any uncertainty. It is not, then, to this extent, a difference of '*Yes*' or '*No*.' An absolute denial is only a contradiction; and as such simply the affirmative of an opposite. In the Command, however, of the logician, and the Imperative Mood of the grammarian, we get something that is neither one nor the other, but a mixture of the two; viz. an explicit affirmative with the suggestion, or recognition (either consciously or unconsciously), of a possible, or probable, denial. And this is something wholly different from anything like any other Formative or Inflection. It is, also, one of a more subtle and less definite character than any of them. It is also one which is not very necessary to language. It is long before it is recognised by any sign; so that language does, for a long time, without it. It is also, early in its disappearance; so that language, hereafter, is likely to dispense with it altogether. Its sign, like that of Gender, with which it agrees in the last respect, is either differential or negative—at any rate, it is indefinite and indistinct. It coincides but loosely and indifferently with its distribution; for we have seen Imperatives replaced by Conjunctives, and Optative Moods by Conjunctive Tenses, in the Synthetic languages; while, in the Analytic we have such purely Imperative combinations as '*let us go*' superseding forms like the Latin '*eamus*.' Finally, we have no separate syllable, no con-

sonantal sound, nothing in short beyond the modification of a vowel to which we can assign its inflection. The *-m* in *ame-m* as appended to *am-o* is no instance to the contrary; inasmuch as the most that we can get from it is the fact, that the original sign of the Person was retained in one Mood after it had become obsolete in another.

§ 307. We can go farther in this direction. We not only get no definite sign, or additament *aliunde*, as we do in the signs of Person, Voice, Number, Case, and Tense, but we cannot very readily find a probable one; in other words, we not only fail to discover an additamental sign, but fail to see our way to the making of one. The two quarters in which we are most inclined to look for it, are the Particles that indicate either a denial or an interrogation—the Negatives and the Interrogatives. But this is just where we fail to find them. Of the Particles themselves there are plenty; but even though they may partially coalesce with their verbs, they never help us to the origin of the differences that separate forms like *τύπτ-ε*, *τύπ-τω*, and *τύπτοιμι* from *τύπτ-ω*. The likeliest word to enter into an inflection is the Greek *εἰ*; but we have seen how it comports itself. In

Εἶθ' ὤφελ' Ἀργοὺς μὴ διαπτάσθαι σκάφος,

the word suggests a wish, much as the Interjection 'O' may do so; whilst *ὤφελε* is governed by *σκάφος*. To look for such possible elements in their analytic equivalents, such as *may*, *can*, *would*, and *let*, is like looking for the roots of such words as *will* and *shall* in such Futures as *γράψω*, and *amabo*.

§ 308. That the signs of the Moods are real is beyond doubt. There is a difference, of some kind, between the three, four, or whatever the number may be of them. But it is not a sign of the ordinary kind. It is one of two things: (*a*) a mere Negation, as we find it in the Imperative, where the sign of Person may be dispensed with; or (*b*) a mere modification of a certain element, rather than an

element superadded to the theme or root in a definite and separable form. It is not suggested that this rule is invariable; it is only stated that such is usually the case. Except in the instances of Gender and Mood, the general sign is made by an addition of something *ab extra*. If, in Gender and Mood, there is no such material to apply, it is useless to try to reduce the signs of them to any originally independent and separate word. But their forms can scarcely be said to stand alone; even though they be ever so alien to the class of Persons, Number, Cases, and Tenses. There is a system towards which it (so to say) the formation of Mood gravitates. The difference between an Indicative and a Conjunctive is not exactly one of Accent, or Tone, or Emphasis. But it belongs to the same order of mutations, neither is it, in Thought, independent of the rules of Collocation. In the present English, we may get three different imports from the same combination, word for word:

(1) '*You may be happy*'=*You may*, (*or not*) *be*, *happy*—*may*, *possibly or probably*, *be happy*.

(2) '*You may*' &c.=*You are free to be happy*, or '*I let you be happy*.'

(3) '*May you be happy?*'—This conveys a question—*Are you free, or able, to be happy?*

(4) '*May you be happy!* This expresses a wish—*I wish you may* &c.

Here we have four Moods; in the *sign*-ification of which the only two elements are Accent and Collocation; and in Collocation we get a new element, and one of a different kind.

§ 309. Of the two, or three, *Non*-indicative Moods (for this is the safest general term for them) four characteristics have been notified:

(1) The differential and (as such) indistinct nature of their signs.

(2) The lateness of their appearance, and the earliness of their disappearance, in language.

(3) The difficulty of seeing our way to any elements out

of which any sign in the way of an additament can be made.

(4) The comparative closeness of their affinity with the system of *Tones* and *Accents* (though they are not exactly either one or the other), as opposed to the more distant connection with the system that gives us the signs of Person, Voice, Number, Case, and Tense, as to *Inflections*, or that of the *Formatives* of any kind.

The first two of these characteristics are, probably, related to one another as cause and effect; because what is faintly *sign*-ified may easily be neglected.

Of the third it may be said, that we have, at the present time, a conspicuous series of equivalents in such familiar verbs as *may*, *can*, *might*, *would*, *should*, *ought*, and (to some extent) *will* and *shall*. It is by these that, in the Analytic stage, they are superseded. That such is the case is a very good reason for considering that, in Thought, the two systems have the same import. On the other hand, the very fact of the system of Analytic combinations of Auxiliaries being later than that of synthetic Inflections (and originating in its decay) is conclusive against its being the origin of it.

§ 310. The system that gives us the three *Non*-indicative Moods is a system *per se*. And it is not this by accident. Its typical illustration presents itself in the Conjunctive as governed by '*if*.' Its basis, in Thought (we may almost say Feeling) is the contrast between a statement conveying a certainty (or what passes for one) and a statement conveying an *un*certainty; the two being connected with one another—if not exactly as Cause and Effect—as a result and a condition. We know how important little like '*if*' are in matters of this kind. We know that when one word assumes a '*Yes*,' the other suggests a '*No*.' We know that, though in some cases, the contrast may fail to impress itself on the mind of a speaker, there are others wherein it makes itself painfully apparent. We know this from our own experience; and we know, from the history of language, that there is a special

way of indicating it. And now we may remind ourselves that it is only the Moods under notice, only in those equivocal sentences which involve an uncertainty, and recognise in its expression, that we have anything of the same kind—anything that has its foundation in the intention, hope, fear, wish, or curiosity of the speaker who utters them. The nearest approach to it is in the Future; and it is with the Future and the Consuetudinal Present that the Conjunctive is most closely allied.

In the Conditional Conjunctive we have this influence of uncertainty in its typical form, and the conjunction *governs* the Verb; *i.e.* determines a change in its form. In this change it has the difference of *Mood.*

In the use of words like '*that*,' words implying an intention, it is not so much a case of *Government* as one of *Concord.* In the Greek it is one of Tense and Mood; in the Latin it is one of Tense and Tense. In Stockfleth's Lap Grammar it seems to be the same. At least, he writes—

1. *Modus Indicativus* (experience).
2. *Modus Conjunctivus* (feeling).

This falls into two divisions:

(*a*) *Modus Subjunctivus* (*præsens conjunctivus*).
(*b*) *Modus Optativus* (*præteritum conjunctivum*).

3. *Modus Imperativus* (will).

Here, as in Latin, the Optative is the Past Tense of the Conjunctive.

§ 311. In the Imperative no second clause is needed. Yet it is implied. The command may be obeyed or disobeyed. The same secondary sentence, in the form of an answer, is implicit in the delivery of a Question. In the simple Optative there may or may not be a second verb, the difference between a simple *wish* and an intention being the fact that, in the latter, something is done with a view to a result. But in all, the secondary element is a question of '*Yes*' or '*No*,' or the

equivocal '*Perhaps*,' in which the original uncertainty presents itself.

§ 312. The faint and negative nature of the inflection of the Optative *Mood*, as we find it in Greek, is by no means characteristic of the *Tenses* by which it is replaced in Latin. In—

am-arem	*am-ares*	*am-aret*
am-aremus	*am-aretis*	*am-arent*
am-avissem	*am-avisses*	*am-avisset*
am-avissemus	*am-avissetis*	*am-avissent*
am-avero	*am-averis*	*am-averit*
am-averimus	*am-averitis*	*am-averint*

we have an inflection of a more than ordinary character; *i.e.* one wherein the additaments are of more than the average length.

§ 313. The structure of these forms is doubtful, inasmuch as it may be got by two processes.

a. One of these gives us the doctrinal fact that the will appended simply the same as those of *vell-em* and *noll-em*, &c., *volu-isse* and *nolu-isse*, &c., and that these are the same as those of the Verb Substantive, *si-m* and *ess-em*, the question as to which is oldest being beyond the range of our criticism.

b. The other would make them the tenses of the Verb Substantive, bodily attached to the tense-signs of the ordinary Verb, in which case the system of expression must be held to have originated in the Verb Substantive. Against this lies the difficulty of seeing how such a combination of tense-signs as *voc-av-* or *scrip-s-*, and *-essem* or *ero* (*erim*), can be made to give any sense; in other words, how they can be *parsed*. It cannot be done in any instance but *one*. But with one it can be done, viz. with *pos-sum*. If the *pos-* stands for *potus* or *pote sum*, we can parse the compound throughout, allowing only for the difference between an Adverb and Adjective. By identifying the *pos-* with the *-pos* in *com-pos* we can parse it without any abatement whatever.

If so, the process of formation which is here intelligible may have become extended to combinations which are not so; and how far this extension of a false analogy (*catachrestic*) may affect a language we know from the existence of such combinations as '*I have been*,' and other less extreme instances of the same kind. But *pos-sum* is only one word, and a single word is a very insignificant precedent for a system of catachresis to be established on. This is true. But, when we consider that the '*pos-*' represents the auxiliar '*can*,' with its special *Potential* import, and that the '*-sum*' is the Verb Substantive—a verb more in use than any hundred words put together—this latter view becomes less improbable than it is at first sight. It is not one, however, that is pressed upon the reader very decidedly. In any case, however, the Latin equivalents to the Greek Optative *Mood* are *Tenses*; and that, not only because they are classed as such in the Latin Grammar, but on the internal evidence of their structure.

§ 314. In §§ 176–179, attention was drawn to the difference between Inflection by *Addition* and Inflection by *Differentiation*. It is in '*Gender*' and '*Mood*' that the latter principle most especially displays itself.

Both Gender and Mood have an inflection of a less definite, decided, and reducible character than that of Person, Voice, Number, Case, and Tense.

§ 315. Both are more or less exceptional in language, and disappear early.

It is now added, that in the case of *Mood* the signs seem to be more closely connected with the system of Tone, Accent, and similar forms of emphasization, in which there is a change of *existing* elements, rather than the introduction of *new* ones, than with the system of the other recognised Inflections, which, by hypothesis, are either actually or possibly reducible to words originally separate and independent.

§ 316. *Non*-Indicative was the general but negative term

which best seemed applicable to the Imperative, Conjunctive, and Optative denominations; and, upon the same principle, it is convenient to call the Infinitives *Non*-finite. As such, they must be considered as *Verbs*, inasmuch as the Finite forms are treated as Verbs, so that the term *Non*-finite invests the words to which it applies with a Verbal element.

§ 317. In import, however, the Infinitives are *Nouns*; nouns giving the name of either a state or an action. They are nouns, then, but *not* substantives. But neither are the Abstract Nouns substantival in sense, whatever they may be in their declension. At any rate, they are not *substantial*. The Abstracts, however, are substantival in their declensions, which the Infinitives are not. But neither are they Verbal in this respect. Between the two, the Non-Finite Verbs are a class *per se*; but a class on the borderland between Noun and Verb. That, so far as Voice and Tense, they have an undoubted and actual inflection, which is best seen in the Greek forms like τετυφέναι, τύψεσθαι, and the like, is evident. In Greek, too, they can be invested with an approximation to *Case*; *i.e.*, by considering that in combinations like τὸ φθονεῖν and τοῦ φθόνεῖν, the infinitive is, virtually, in the same case as its article. And what we can say about such combinations as τὸ φθονεῖν and τοῦ φθονεῖν, can be said about τὰ φθονεῖν and τῶν φθονεῖν, in case we find them. But such combinations are either rare or non-existent. Nevertheless, they are as actual in Thought as words like *invidiæ* and *invidiarum*. *These*, however, are rare; but this is simply because they are *Abstract* Nouns, not because they are *Non*-Nominal. In respect to Gender, we can only say that, if in '*invidia*' we can think of *envy* as Feminine, we could do the same with ἡ φθονεῖν, if it chanced to exist. The Greek Article is *Neuter*; but this does not preclude both Masculine and Feminine Infinitives. Without over-refining, we may say of the τὸ, in combination with the Greek infinitive, that its function is less to express Gender than to *sign*-ify the

Nominal (as opposed to the Verbal) character of the name with which it is connected.

§ 318. There is no class of inflections in which the difference between the Greek and the Latin is more conspicuous than it is in the case of the *Non-finite* Verbs (or Verbals); for, in the Latin, their Nominal character is conspicuously prominent. Of these, the most remarkable character (and that all through the class) is that in the Gerund, the Supine, and even in the proper Infinitive Mood, there is an intermixture (we can scarcely call it a confusion) between the Voices. The nature of this, in Thought, is fairly indicated by such combinations in our language as, '*you are to blame*,' where the form is Active, the import Passive='*you are to be blamed*.' Here '*to blame*'='*ad culpandum*,' rather than either '*culpare*' or '*culpari*!' In the *Gerunds* the same inflection is sometimes Active, sometimes Passive, in sense. Again, the Supine in *-um* is Active; the *Supine* in *-u* is Passive. In—

Spectatum veniunt, veniunt spectentur ut ipsæ,

the second clause might be expressed by *spectatu*. This is the declension of a noun like *gradus*. In English, '*they come for a spectacle*' or '*sight*,' may mean either come '*to see a sight*,' or '*to be seen as a sight*.' In the Fin, the *Factive* case applies to the second of these senses; and '*sight*' means '*a thing to be seen*,' or '*as a sight*.' In '*you are to blame*,' we have the Analytic equivalent to a Dative case with both meanings, or either. Here we have *Case* taking the import of *Voice*. But in Thought, it is neither Case nor Voice so much as it is *Mood*, which gives us the division, to which the forms must be referred. In Thought, the relation of the object, action, or state is akin to the relation between the words '*if he succeed*,' and '*he succeeds*,' or '*he will succeed*;' *i.e.* it is determined by the view which the speaker takes of the object, rather than the view suggested by the conditions of Time, of Place, of Number, or of any

other *external* circumstance. On the other hand, it is by *external* circumstances, that every one of the conceptions connected with Person, Voice, Number, Case, and Tense are suggested; and the farther we proceed in our classification the more important will this difference, or contrast, be seen to be.

§ 319. Returning to the consideration of the Latin Infinitives, I have no hesitation in stating that as '*spectatum*' and '*spectatu*' are to one another, so are '*amare*' and '*amari*'; the Declension of the two Supines being that of *gradus*, the Declension of the two Infinitives being that of '*mare*.' If so, we have a second process for the formation of the Passive Voice; *i.e.* the Voice which, in its elements, structure, and origin, is other than Middle, Reflective, or Reciprocal; for from this it must be distinguished. On the first view this looks as if there were another principle for the formation of a Passive Voice; or one over and above that which gives us such forms as *ἐτύφθην*, &c. But so exceptional a fact as absolute Tautology is one which we must be slow to receive without scrutiny. It is more than probable that, in the strict sense of the term, the Latin may be said to have no pure infinitive at all, but only an approximative one; one such as *running* as opposed to *run*, or (closer still, for the Latin has no Article), as *τὸ φθονεῖν* is opposed to *φθόνει ν*. This difference may be imperceptible in practice; but in our method of investigation it must be recognised. We must be slow to acknowledge any second sign for *exactly* the same conception; though the converse, or the extension of one sign to two allied conceptions is one of the commonest phenomena in Language.

§ 320. Upon this view the Roumanian throws some light. In the Roumanian, even in the *Active* Voice (for the Passive is formed analytically), the simple Infinitive is founded, *not* on the forms in *-are*, *-ēre*, *-ĕre*, and *-ire*, though they are ready at hand, but from the Gerund in *-dum*, preceded by *ad*; as *ad laudandum*. Yet not to the exclusion

of the old familiar forms in *-re*. The functions of these, however, is to express the Abstract Verbal; and the two are used concurrently. The following examples are from a German grammar of the Roumanian; and, as the German uses the Article in the same way as the Greek, they give us the exact parallels to *τὸ φθονεῖν*, &c.

(1)

THE TRUE INFINITIVE.

A lyudá = *loben*, or *zu loben*.
A tyaçé = *schweigen*, or *zu schweigen*.
A vinde = *verkaufen*, or *zu verkaufen*.
A auzi = *hören*, or *zu hören*.

(2)

THE VERBAL ABSTRACT.

Lyudare = *das loben*.
Tyacere = *das schweigen*.
Vindere = *das verkaufen*.
Auzire = *das hören*.

§ 321. We may now revert to the approximate correspondence between the Commands and Questions of the logician, and the *Non*-indicative Moods of the grammarian, premising that, in both classifications, we have an element of uncertainty; an element which implies, in different degrees of directness or indirectness, a *Negative* of some kind—actual, probable, or possible. For what is the whole relation of *Affirmative* and *Negative* but *Modal*? And, as everything either '*is*' or '*is not*,' we have in the Dual division of the different aspects under which an action or state can present itself, the exhaustive alternative betwen '*Yes*' and '*No*,' the *Summum Genus* in the way of logical predication. They are both equally positive; and both, as such, Indicative. We know, too, that the Negative, in Logic, may be made Affirmative by a mere manipulation of the Copula—as '*this is-not black*,' or '*this is not-black*.' In Logic, we measure

the amount of Affirmation or Negation by Quantity in respect to the proportion which the members of a class are, or are not, in correspondence with the Predication—*one*, *more than one* (*some*), and *all*. In Grammar we measure the relation of one proposition to another by the actuality, the probability, or the possibility of its *being* what is ordered, required, wished, hoped, or intended to be. In Grammar we consider what a certain object of thought is as real or unreal. In Logic we ask how many objects of thought constituting a class have such or such an attribute in common with the rest. But in both the question of Negative or Affirmative is involved.

§ 322. In the logical formula *All* A = B, the correspondence between the Subject and the Predicate, for the intents and purposes of the argument, is amply adequate and complete. So it is in *No* A = B. But in *Some* A = B, which implies that *Some* A *is not* B, we have the Negation and Affirmation mixed and indeterminate. In Logic there are two distinct and definite Copulas. But in Language, except in the case of the Verb Substantive, there is only one *expressed* Copula, *i.e.* one *with a sign*. This is because the connection between two Verbs is always and naturally Affirmative unless it be specially shown that it is not. Its place in the Collocation of the words of a Proposition shows the connection; which, until it is shown by a special sign to be otherwise, is always *con*-junctive. In combinations like *fire burn-s* the *-s*, which stands for a repetition of the idea conveyed by *fire*, the fact of the two words belonging to the proposition being connected is beyond doubt. On the other hand, in *fires burn* there is no such sign at all.

§ 323. Is there, then, since Negation is, in Thought, so thoroughly *Modal*, no such thing as a Negative *Mood* in Language? That there are Moods in which a Negation is, more or less directly, involved we have seen. But a Mood for the absolute Negative is a different thing. There is something like one. But it is only imperfectly *inflectional*.

It is only inflectional in the way the Greek Aorist Passive, or the Norse Reflectives (Middle, Passive, Reciprocal, or Deponent as the case may be) are inflectional—inflectional so far as it is compound, reducible, and made up of elements, separable and intelligible. Words like ἐ-τύφθ-ην are as truly combinations of the Passive Participle and the Auxiliary Verb as are words like *I was beaten;* and *Jeg calles* is equally identical with *I call* (*my*) *self.* This is, we may say, just what all inflections are; *i.e.* by hypothesis, reducible to separate words. But, in these, the two elements are distinguishable. Now, in this way, we certainly have Negative Moods. So far as the coalition of two words into one goes, such combinations as *won't* and *can't*, *winna* and *canna*, are just as much one word as *am* and *amat.* Yet they are scarcely inflections in the ordinary sense of the term. In the older English we have words like *nam*, and *nis=not am* (*am not*) and *not is* (*is not*); and that with the negative element *either* as a prefix or an affix. In Roumanian we have:

1. Eu n'am, *or* nu am = *I have not.*
2. Tu n'aí, *or* nu aí = *Thou hast not.*
3. El nare, *or* nu are = *He has not.*

In the Fin Family the Negative inflection is common. In Lap it is classed with the Substantive Verb as *Auxiliary*—not, of course, as an Auxiliary *Verb*, but as a recognised member of the class to which the Auxiliaries are considered to belong. Of this the Negative forms are the most conspicuous; and form three-fourths of the whole class. The other is the verb *læt=to be*, or *have*, *i.e.* '*have*' in its sense as an Auxiliary.

PRESENT INDICATIVE.

	1	2	3	
Singular	Im	ik	i	} *lek.*
Dual	Æm	æppe	æva	
Plural	Æp	æppet	ei	

§ 324. For *lek* substitute *læm*, in the Preterite Indicative; *læʒá* in the Conjunctive Present, and *lifći* in the Conjunctive Preterite, or Optative. The combination here is with the Pronoun rather than the Verb; and so it is in—

	1	2	3	
Singular	Amam	amad	amas	=*that not I, thou, he, she,* or *it*
Dual	Amame	amade	amasga	=*that not we two*
Plural	Amamek	amadek	amasek	=*that not we* &c.

In the Imperative the inflection, of which the import is Vetative, is—

	1	2	3
Singular	—	ale	ellus
Dual	allo	allo	ellusga
Plural	allop	allet	ellusek

In Gaelic we have—

PRETERITE TENSE.

Negative.

1. Ni raibh me.	Ni raibh sinn.
2. Ni raibh tu.	Ni raibh sibh.
3. Ni raibh se.	Ni raibh siad.

Interrogative.

1. Raibh me?	Raibh sinn?
2. Raibh tu?	Raibh sibh?
3. Raibh se?	Raibh siad?

This means *Am, verily, I not?* &c. and *Am, verily, I?* &c. There are two words, but only one syllable; so that, so far as the incorporation of two words into one goes, it is inflectional. But it is, also, a reducible compound; inasmuch as the *bh-* is the Substantive Verb, and *rai* the Adverb *ro=very* (*verily*). It serves not so much to convey either an Affirmation or a Negation; for it belongs to both. It merely strengthens or emphasises each.

§ 325. In *Questions* we have the same mixture of Affirmation and Negative—so long, at least, as they are

Categorical, *i.e.* answered by *Yes* or *No*. Even when they are not so, as in '*What is this?*' there is an element of uncertainty, and the collocation is peculiar. The places of the Subject and Predicate are reversed; inasmuch as *This* is the Subject. It implies—'*something concerning which I want information.*' Such is the nature of the Question, whether Categorical or not; and between the two the whole class is exhaustively divided. In combinations like '*It is not so. Is it?*' '*This is not so. Is it?*' to which the answer is categorical, we get in words like *anne* and *nonne*, the Negative and the Affirmative combined. Here the answer is anticipated in the expectation of the speaker; and the combination of the two signs is the result.

§ 326. In the Gaelic Negative and Interrogative we had in the prefix *ro-* (*rai*) a strengthening or emphasising of the form in which the Question was put—*Is it verily so? Is it verily not so?* This emphasising process is common, especially in Negations. Both *Yes* and *No*, as compared with *Yea* and *Ne*, are compounds. The affix indicates not so much either the Affirmation or the Negation as the extent, or reality, of it. *Aye*, or *No*, *certainly*, *verily*. In French this is conspicuous; *e.g.* *ne—pas*, *ne—rien*, with the Verb between. We may call this, if we choose, *Tmesis*. But the name is less important than some of its results. Let the *ne* be omitted, and we get such negations as *pas de parolles*, *rien de tout*, *point d'argent*; where the only sign of negation is a word of a very positive sort—in Latin *passus*, *res*, *punctum*. Let words of this kind be further abbreviated, then coalesce with their verb so closely that the two shall be represented by a single syllable, and finally, let them, as single separate words, either change their meaning or form, or else drop out of the language. The result is a pre-eminently irreducible inflection; and of inflections of this kind there is a large per-centage—a very large one, but not one that should discourage us in our attempts to reduce it to a *minimum*.

§ 327. But beyond the range of even Negation, Affirmation, and the uncertainty between the two, this mental, internal, or subjective view is found in what are called the *Figures of Speech*; in all of which there is some deviation from the strictly normal rules of construction and parsing What is an expression like '*Rundle and Bridges*,' '*St. Paul's*,' '*Ubi ad Dianæ veneris*' &c.? What are those like '*The more serener spirit*,' '*The most straightest sect*,' and others? What those like '*The cities who aspired to liberty*'? What are such anomalies as 'χρῶμαι βιβλίοις οἷς ἔχω;' '*Whom say they I am?*' These are familiar examples, the result of well-known processes, or, at least, of processes that are recognised under the well-known names—*Ellipsis*, *Pleonasm*, *Personification*, *Attraction*, *πρὸς τὸ σημαινόμενον*, and others of less importance. All these express conception, and indicate differences widely foreign to the character of the differences expressed by Person, Voice, Case, and Tense; for in these last the accidents of the conceptions belong to the *external* world, and not to the world of Mind. In this respect even *Gender*—*i.e.* conventional as opposed to natural Sex—is in the same great dichotomous class of Mood and its numerous congeners. Finally, we may note the connection between the Conjunctive Mood and the Relative; the consideration of the place that Mood takes in Language being a more complex question, and one involving a general classification of the other denominations—viz. Person, Voice, Number, Case, and Tense.

(10.) Retrospect.

§ 328. The order in which the different denominations of Person, Voice, Number, Case, and Tense, along with Gender and Mood have been examined, will now be repeated in a general and retrospective view of these relations in the way of classification.

Person.

§ 329. In every *Finite* Verb there are *two* names; either separate, or combined into a single word; as, *I love*, *am-o*.

The result is a statement, Negative or Affirmative, as the case may be. This means that in the *Finite* Verb we have a Verb and something more. It is a Verb *plus* its Noun; and when we have this we have not so much á single word as a sentence.

Voice.

§ 330. In Voice, as in Person, we have more words than one. But though there are two names, there is but one individual to which they apply; inasmuch as the Agent and the Object are identical—*I strike me* (*myself*). Here the second pronoun by no means constitutes the whole Predicate. It is only a part of it. This is what we find in the Middle Voice; as considered only in respect to its structure. In import it, having been purely Reflective, becomes Passive, Reciprocal, Deponent, and, occasionally, Active. Still the structural characteristic is the incorporation of the Personal Pronoun as the name of the Subject, and the Reflective Pronoun as that of the Object, with a Transitive Verb. The elements then of the Middle Voice are *three* in number; so that combinations like *amatur* and τύπτεται are even more compound, or composite, than words like *amat* and τύπτει.

§ 331. The structure of the true Passive is, also, one that gives us two words rather than one, the second element being the Verb Substantive—as ἐ-τύφθ-ην. The -ην here is Finite; and it is from this that the sign of Person is derived.

Number.

§ 332. Whatever may be the minor differences between *Person* and *Voice*, as denominations, they belong to the same Class, Order, Section, or whatever we choose to call it.

§ 333. So far as Verbs are Personal, or Finite, they are, in respect to Number, in the same class as their Pronoun; so that words like *amamus*, &c., give us *two* words. The *Non*-finite portion of it, or the Infinitive element—except in a few possible exceptions—has no

signs of Number. Yet in every Finite Verb there are two elements: (1) the Number of Agents, or Subjects; and (2) the Number of the Actions, or States. Of these, as a rule, the Finite Verb gives us the first only. It tells us that more captains than one fought against Thebes, but it does not tell us how often each captain fought against either Thebes or any other place or person. Logic, in questions of Language, is a good servant but a bad master; and some of its obsolete terms are useful. Of the *Quotity*, then, of the agents, it tells us in the Plural Number that they were more than one. Of the *Quotity* of their fightings it tells us nothing. It could not well do so; though in forms like *voc-it-amus*, φλέγομεν, and (possibly γεγράφαμεν), it gives us something like it. Again; the Infinite, or *Non*-Finite, Verb has no signs of Plurality. But it might have them, as has been indicated elsewhere. It is not difficult to see our way to this. It is not in the nature of language to express too much in a single word and at once. The recognised Plural, then, of the Verb is the Plural of the *Person*; that is, the Plural of a term which is other than Verbal. The Plural of Infinitives exists in reality, and if need be could be expressed by a special sign. But the Verbal Abstract, in such words as '*erring*,' or '*error*,' is sufficiently akin to the Infinitive in Thought to make a Plural for the Infinitive superfluous.

§ 334. Having thus put the Plural of the Finite Verb in its proper place, and having accounted for its absence in the Infinitive, we get the question of Number in its proper form. This means the Number of Agents, irrespective of their States or Actions; but not the number of States or Actions, irrespective of the Agent, or the object in such or such a state. In this we get but *one* name, or term; *i.e.* a single word rather than either a sentence or a proposition. It is this exclusion of any second noun which separates Number, as a denomination, from Person and Voice. We need not be very careful to measure the exact difference between the

groups, or to ask whether it be one of Class or Order. It is certainly not one of Section or Subsection. It is one of a broader—a much broader—description. But just as it is removed from Person and Voice, it approaches Case and Tense. We have now done with the Inflections that convey, in a single word, both a Subject and a Predicate, or those which give us sentences rather than single words.

Between the ideas of *Repetition*, expressed by Reduplication; of *Collectiveness*, or Number with Totality; and *Plurity*, or the conception of more than one irrespective of the extent to which they constitute a whole, we see our way clearly to the development of the signs of Number.

Case and Tense.

§ 335. *Case* and *Tense* are more closely connected with one another than either of them is with Number. Nevertheless, as opposed to Person and Voice, they are allied. Person and Voice belong to the division in which there is *either* a Subject or a Predicate, or both. The undoubted Noun has Case, but not Tense. The *Finite* Verb has Tense, but not Case. The Infinitive Verb has both Tense and Voice. But its Cases, as has been shown in § 166, are of an equivocal, indirect, or constructive, character.

In respect to their connection and relation with one another, Case and Tense are *analogous*. What Case refers to in Place, Tense refers to in Time; though, with Time, Tense is more exclusively connected than Case is with Place. As inflections, Case and Tense are the most important and typical of the class; and in the way of criticism there is more to be said about them than all the others put together.

§ 336. Number; though different in many respects from Case and Tense, has been shown to be more akin to them than it is to Person and Voice. We cannot exactly measure the value of the classificational divisions thus suggested. We need only insist on the wideness of the difference involved in

the primary Classes, Orders, or whatever we choose to call them. Between combinations which, in a single word, give us *both* a Subject and a Predicate, and those that, in a single word, give us but *one* of the two, the distinction is a very broad one. It is now submitted that just as these two higher classes stand apart from one another, so do Gender and Mood, subordinate members of a third Class or Order, stand apart from both.

§ 337. It is, also, submitted that, so far as the changes of form in individual words are concerned, these three classes exhaust the different ways in which Inflection presents itself; whether its character be determined by the structure of a word or by its import; out of the elements by which it is made up, or through the idea upon which it is founded. If so, all the forms that belong to neither of the preceding classes belong to this. And such seems to be the case; the links by which they are connected being the internal, mental, or subjective character of the conception that determines the expression. In the other division, *i.e.* in those where it is founded upon the name of the Agent or the Object in a state or action, this is often an individual of the most material sort, while, even when it it abstract, it is founded on something pre-eminently cognisable by the senses. In Number, names of this kind are implied, and the only question is as to the nature of them. In Case and Tense we have, in each, the notion of direction, and that in its three most general forms: *to, from, at; hither, hence, here; thither, thence, there; this, that, yon,* and the like; and in time, *now, then, hereafter; at the present time, in past time, in time to come.* These, especially the latter, which deal with the States or Actions and (as such) Abstractions, though not material, or substantial, belong to, and originate in, the external world; and they are what they are because they do so. In Mood the question is not so much what the object of any conception actually is, but whether it is or is not; whether it exist at all, and, if it do, under what conditions.

(11.) Tense. The Greek Aorist.

§ 338. We may now notice one or two instances of a more special kind than those which have already presented hemselves. These, as a rule, have been introduced for the sake of illustrating some general principle. The present criticism is submitted to the reader for a different reason. It applies to a particular Tense, and to a very important one; one, too, in a very important language.. In the mind of the present writer, the current doctrine concerning it is founded on a misconception. Up to about 1830 this doctrine was generally admitted; mainly, or perhaps exclusively, because the reasons against it were unknown. Since that time they have been recognised; and, by no lower an authority than Bopp, have been authoritatively rejected. That the question to which the criticism applies is a wide one may be seen on the surface.

The special Tense in question is the Greek Aorist (*Aoristus primus*). What it is generally held to be is well known. What the present writer believes it to be is as follows. The doctrine he defends is laid down somewhat dogmatically; but this is because the question is easily presented under its different divisions, and because it is thus that the issue is most clearly stated. Hence, the true sign of the Perfect is the reduplication; with or without a change of vowel. The true signs of the Aorist are the augment and the affix -κα. The true sign of the Future is -σ-; and between the Future and the Aorist there is no connection; though σ is common to the two. The -σ- of the Aorist is the -κ- of words like ἔθηκα and ἔδωκα *assibilated*; in the first instance through the influence of the *small* vowel (ἔγραψε); from which it affects the other persons by *extension*. That ἔθηκα and ἔδωκα are Aorists which do not assume the characteristic of the Future is true; but it is by no means true that the -σ- in the other and ordinary Aorists is the -σ- of τύψω and γράψω. On the contrary, it is the -σ- of the

Aorist itself, developed out of the -κ- by Assibilation. The -σ- of the Future is, probably, the -σ- of the Aoristus Æolicus, τυψεῖα; but this is no true Aorist; the -σ- being the -σ- of the inchoative, or desiderative Verbs in -σειω; in which, signifying something desired, or something about to be begun, it involves a Future element.

§ 339. The -κ-, in forms like κέκληκα, δέδορκα and others is not the true, original, and normal sign of the Perfect; but the -κ- of the Aorist with the reduplication of the Perfect, and generally (but by no means always) its import. It has *extended* itself from the Aorist to the Perfect; and there is reason for its having done so.

§ 340. This must, in the first instance, be investigated with a view to the Verbs of which the fundamental form ends in a vowel—*ι* or *ῠ* (not contracted), and *α*, *ε*, and *ο* (contracted). All these are in the same predicament. These have no consonant wherewith to close the syllable to which the sign of Person is affixed; and, as this sign is vocalic, two vowels would be brought into contact with one another. It is suggested that, in this, there is an element of instability, and that words like τέ-τι-α from τίω, would be likely to change their own termination for a stronger one. To a change of this kind the -κ- of the Aorist would readily lend itself.

§ 341. With the Contract verbs the same condition presents itself; with the exception, that the vowels *α*, *ε*, and *ο* have less of a radical character than the *ι* in τίω. They come, however, at the end of the word to which the personal affix is to be attached.

§ 342. With the Barytone Verbs ending in λ, μ, ν, or ρ (a liquid) the contact is, at the first view, identical with that of the -α in τέ-τυφ-α, γέ-γραφ-α, πέ-πηγ-α, and πέ-πωιθ-α. But this is not the case. Liquids, more especially λ and ν, have in most languages a tendency to take after them a semivowel; in which case they stand much in the same position as the true vowels. Except in these two divisions the rule that the sign of the Perfect (with or without a change of vowel) is

nearly absolute; the chief exceptions being the preterites of the comparatively few words which end in τ, δ, or θ, *i.e.* the dentals.

The *primum mobile* for this hypothesis lies in the Slavonic; which gives us two points of support.

1. In the Slavonic the sign of the Past Tense is *h* (*k*), just as it is in ἔθηκα, and ἔδωκα. And this Bopp allows to be the σ in ἔγραψα. Omit the Augment and the sign of the First Person, and the two forms are identical; Greek, -θηκ- and -δωκ-; Slavonic, *bih=fui*, *tshitah=I read*. The Persons run thus:

(*a*) *I was, &c.*

1. bih	bismo
2. bi	biste
3. be	bisheh

(*β*) *I was, &c.*

1. biyah	biyasmo
2. biyashe	biyaste
3. biyashe	biya*shu*

(*a*) *I read, &c.*

1. tshitah	tshitasmo
2. tshita	tshitaste
3. tshita	tshitashe

(*β*) *I read, &c.*

1. tshitah	tshitasmo
2. tshitashe	tshitaste
3. tshitashe	tshita*h*u

It is submitted then that it is from the -*h*- (*k*) that the -*s*- has been deduced; and that, in accordance with one of the most general rules of Philology; viz. that, when the palatals *g*, *k*, change their sound, their tendency is to become sibilants. The change is one of the commonest in language, and it almost invariably takes the same direction. The Palatal becomes Sibilant; the Sibilant rarely, if ever, becomes Palatal. Indeed, the process is known as that of the *Assibilation of the Palatals*.

In this Assibilation, then, lies the hypothesis as to the origin of the -σ- of ἔγραψ(σ)α and the Aorists in general; and thus far it looks as if the authoritative sanction of Bopp recommends it. But such is not the case. He stops at the identification of the Greek -σ- with the Slavonic -*k*; but with the belief that, of the two, -σ- is the older form. Yet no one knew better than Bopp how decidedly the change between the Gutturals and the Palatals ran exclusively in one way; and how thoroughly his explanation was exceptional. He seems, however, to have ignored the objection. Few, too, know better than the same illustrious scholar the difference between the antiquity of the structure of language and the antiquity of its early records. But this he seems also to have ignored, or at least to have made the Sanskrit an exception. Be this as it may, he certainly takes no notice of the change from *k* to *s* under the influence of the small vowel that succeeded.

If this view be considered correct, it explains something more than the mere structure of the Aorist; for it enables us to account for something that is, otherwise, almost unaccountable, viz. the suggested affinities between the Aorist and the Future. The -σ- is the characteristic of each; and, the artificial rule which deduces the Aorist from the Future 'mutando ω in α et præponendum augmentum,' is so convenient that it almost looks natural. But Tense for Tense, the Aorist and the Future, except on the assumption that '*Extremes meet*,' are antipodes to one another; one a Tense of Past, the other of Future time. The true history of the Aorist gets rid of this anomaly. Whether the -σ- of the Future be the -σ- of the Desiderative Verbs and the Aoristus Æolicus, is a question that must be investigated on its own merits. At any rate, however, the investigation is simplified by the riddance of the Aorist connection.

(12.) The Postpositive Article.

§ 343. The Postpositive Article means the Article that not only follows its noun, but is absolutely incorporated with

it; so that the two words become one, and the Article takes the form of an inflection. In some cases this second element in the declension of nouns (for it is by no means uncommon) may be overlooked; but in three languages, at least, of Europe they are conspicuous.

§ 344. *Roumanian—Latin Family.*—The *Roumanian* of Wallachia and Moldavia, or the ancient Dacia, is a derivative from the Latin. In the Latin there was no Article. In its later stages the Pronoun of the Third Person became its substitute; *i.e.*, *il* in Italian, *el* in Spanish, *le* in French. In Roumanian it is as follows :—

LATIN, *homo ille*; ROUMANIAN, *óm-ul.*

Nominative	óm-ul	oameni-i
Genitive	óm-ului	oameni-lor
Dative	óma-ului	oameni-lor
Accusative	óm-ul	oameni-i
Vocative	óm-ul	oameni-lor
Ablative	óm-ul	oameni-i

LATIN, *parens ille*; ROUMANIAN, *perint-ele.*

Nominative	perinte-le	perinzi-i
Genitive	perinte-lui	perinzi-lor
Dative	perinte-lui	perinzi-lor
Accusative	perinte-le	perinzi-i
Vocative	perinte	perinzi-lor
Ablative	perinte-le	perinzi-i

LATIN, *casa illa*; ROUMANIAN, *kas-a.*

Nominative	kas-a	kase-le
Genitive	kas-ei	kase-lor
Dative	kas-ei	kase-lor
Accusative	kas-a	kase-le
Vocative	kas-e	kase-lor
Ablative	kas-a	kase-le

LATIN, *mulier illa*; ROUMANIAN, *muer-ea*.

Nominative	muere-a	muer-ile
Genitive	muere-i	muer-ilor
Dative	muere-i	muer-ilor
Accusative	muer-a	muer-ile
Vocative	muer-a	muer-ilor (?)
Ablative	muere-a	muer-ile (?)

LATIN, *sacerdos* (*papa*) *ille*; ROUMANIAN, *pop-a*.

Nominative	pop-a	popi-i
Genitive	pop-i	popi-lor
Dative	pop-i	popi-lor
Accusative	pop-a	popi-i
Vocative	pop-a	popi-lor
Ablative	pop-a	popi

§ 345. *Lithuanic Family.*—Here the Demonstrative Pronoun is *jis*=Latin *is* (*ea*, *id*).

	Masculine.	*Feminine.*
Nominative	jis	jì
Accusative	jį	jẹ
Locative	jamè	jei
Dative	jam	jojè
Instrumental	jůme	jẹ̀
Genitive	jo	jós

In combination with the Adjective it runs thus—

	Masculine.	*Feminine.*
Nominative	geràsis	gerójі
Accusative	gerą̄jį	gerąje
Locative	geramjame	geroroje
Dative	geramjām	géraijee
Instrumental	geräju	geraje
Genitive	gerojò	gerósés

And so on through the Dual and Plural.

§ 346. In the late Slavonic there is no Article *eo nomine*. But there *is* a Demonstrative Pronoun—*Vruć=warm*.

INDEFINITE.

	Masculine.	*Feminine.*	*Neuter.*
Nominative	vruć	vruća	vruće
Genitive	vruća	vruće	vruća
Dative	vruku (-ćem, -mu)	vrućoi	vruću
Accusative	vruća (vruć)	vruću	vruće
Locative	o vruću (-ćem, -mu)	vrućoi	vruću
Sociative	vrućim (iyem)	vrućom	vrućim (iyem)

DEFINITE.

	Masculine.	*Feminine.*	*Neuter.*
Nominative	vrući	vrućá	vruće
Genitive	vrućega	vruće	vrućege
Dative	vrućemu	vrućoi	vrućemu
Accusative	vrućega	vruću	vruće
Locative	o vrućemu	vrućoy	vrućemu
Sociative	vrućim	vrućom	vrućím

§ 347. *The Scandinavian, or Norse, Family.*—In the Danish *sol-en=the sun, bord-et=the table*; the first form being Masculine (or Feminine), the second Neuter; the Genitive Case is *sol-en-s, bord-et-s*, the Plural *sol-ene, bord-ene*. With a slight change of the vowel, the same is the case in the Swedish. In the Icelandic, however, we get with an older form a fuller inflection; and *en* becomes *hin*; *et, hitt*. In Danish there are only two Genders. But the older Icelandic had the ordinary three—*Masculine, Feminine*, and *Neuter*. All the signs of the Definitude, Number, Case, and Gender were, *totidem literis*, the Numbers, Cases, and Genders of the Demonstrative Pronoun *he, heo, hit*; save and except the omission of the Aspirate in the compound Article, along with a few minor points of euphonic accommodation.

NEUTER.

Nominative	-it
Accusative	-it
Dative	-nu
Ablative	-ins

MASCULINE.

Nominative	-inn	-ina
Accusative	-inn	-ina (-na)
Dative	-num	-inni (nni)
Ablative	-in	-innar(-nnar)

And so on in the Plural. The order of the Cases and Genders here given is Rask's; for Rask was the philologue who of all others strove to combine, so far as was practicable, the natural order, in the way of affinity, of the Cases and Genders, with the ordinary paradigms of the Grammars written for the purposes of teaching.

§ 348. To show how the extreme forms of Declension may meet, the newer Norse, as compared, or contrasted, with the old, supplies a curious example. For the purpose of practical teaching, a grammar-writer for the Danish might write thus:—'The Definite Article is the same as the Indefinite, except that its place is transposed. The Indefinite Article *precedes*, the Definite *follows*, its Noun.' For teaching purposes this rule is both short and true, and, as such, safe as a recipe for the formation of the two, one being known. But the correspondence is a pure accident, and, in the way of representing either the agreement or the difference between them, as wrong as wrong can be. It is good as a formula. The Masculine of the Demonstrative Pronoun is *han*, the Neuter *hit=he* and *it* (*h-it*). The Masculine of the Numeral *s* is *-en*, the Neuter *-ett*. Between the very definite *he*, *the*, and the very indefinite *one=some one*, τις, the difference, in *thought*, is a wide one. However, between the two *forms* the original distinction, small at first, becomes as language advances obliterated.

§ 349. So much for the incorporation of the Definite Article, and the extent to which it takes the guise of an Inflection. It is the languages of the *Synthetico-Analytical* stage which best exhibit it. The incorporation of the *Indefinite* Article is commoner in those of the Agglutinate class.

CINGALESE. *Balla* = dog.

Nominative	balla	ballek
Genitive	ballage	ballekuge
Dative	ballata	ballekuta
Accusative	balla	balleku
Ablative	ballagen	ballekugen

Here the '*ek*' is the numeral *one* just as '*un*' is in French; and, as we expect *à priori*, it is not extended to the Plural number. This, however, is only because the sign of it is a Numeral. In Thought, there is no such limitation. A collection of objects can be just as indefinite as a single one, and, analytically, it has the word '*some*' to express it. In Speech, however, it is chiefly in the Singular that its inflection occurs; though in Coptic and some other languages we have such combinations as *ou-moui=lion*, *ha-moui=lions*; where, by the way, the Article, or Numeral, is *prepositive*. In French this would be *des lions*, *i.e.* a combination denoting *indefinite* plurality; although, as an abbreviated form of *de les*, an Oblique Case, it takes, in Syntax, the place and import of a Nominative. This is because, 'as '*some*'= '*more than one*,' it is plural, and because it also='*less than all*,' it is partitive.

(13.) THE AUXILIARY VERBS. HAVE AND AM.

§ 350. The remarks upon what we may call the *non-natural* sense of the word *have* in such expressions as '*I have written a letter*' (which has gone out of my possession), '*I have ridden a horse*' (which is not mine), and the extreme

anomaly involved in such a phrase as '*I have been*' (when the notion of *possession* is wholly out of the question), which were made in the analysis of the parsing, and general character of such and suchlike substitutes for the Greek Perfect, were only made so far as they illustrated the identity of the word '*have*' in these cases with the ordinary verb denoting *possession*. They showed that the word *eigan* (=*own*) and *tengo* (*teneo*) were used in the same sense. But they connected the use of the word '*have*' itself somewhat too closely, or rather, too exclusively, with the special notion of *possession*. A more comprehensive term, or rather series of terms, might have been used. But they would have been unfamiliar ones. The better words would have been such coinages as *my-ness*, *thy-ness*, *his-ness*, *her-ness*, or *their-ness*; inasmuch as these would have given a wider and more general connection between the object on one side and the speaker, the person spoken to, and the object, or objects, spoken about on the other. Such coinages, however, are useful at times; for there are instances in which they actually suggest themselves in the expression. The single phrase, in Latin, *est mihi pater=habeo patrem*, tells us this. And what we find in Latin we find, also, in the Gaelic: *ta caraid agam*, *ta sgain agam*. This is, syllable for syllable, '*est amicus me +ad*,' '*est culter me+ad*'; and so on throughout the Possessive Pronouns. This use of the Substantive Verb with the Personal Pronoun is carried to a great length in Gaelic; at least, as compared with the extent to which it is carried in Latin; indeed, in Gaelic it seems to exclude the word '*have*' or its equivalent.

§ 351. In words like '*own*' and '*possess*,' then, it is possible that the term for '*my-ness*' and the like occurs only in its more special and definite sense, so that the more indefinite form represented by '*have*' may have been the older one, and an outgrowth from the circumlocution '*there is to me*,' or something like it.

This would be a somewhat unnecessary refinement, if it

were not for the fact of '*have*' being so closely allied to '*am*' in its history; and that, in respect to its prevalence as an Auxiliary Verb, in connection with, or rather in contrast to, the Verb Substantive. This latter is essentially Intransitive. The former is essentially Transitive; and this is the distinction involved in the difference between the Active and the Passive Voices; and it is also probable, considering the functions of the two verbs in the Analytic stage, that, as Auxiliaries, they nearly represent what is represented by the two Voices.

§ 352. At any rate, the Irish use of the Substantive Verb with the Possessive Pronoun is eminently conspicuous.

Mhaith liom go raibh me	= *I wish I were* &c.
Bfear liom go raib me	= *I wish I were* &c.
Is eigin daimh a bheit	= *I must be*
Is feidir liom a beit	= *I may be*
Ba choir damh a bheit	= *I should be*
Ni tig liom a bheit	= *I cannot be*
Caitfid me a bheit	= *I must be*
Is truach liom nhach raibh me	= *I am sorry I am not*

Here *mhait*=desire; *bfear*=advantage; *eigin*=necessity; *feidir*=possible; *coir*=right; *tigim*=I come (*tig*=impersonal); *caitfid*=constraint, obligation; *truach*=sorrow; *le*=with; *da*=to; *m* and *me*=me and I; *beit*=be; *go*=that; and *raib*, a compound of *ro* (=very or verily) and the Verb Substantive. Finally, *nhach* is a Negative.

§ 353. This is how the two ideas ('*est mihi*' and '*habeo*') are connected in Thought. How the two are intermixed in their history may be seen from the Roumanian.

FI = *be* (*esse*). FOST = *been*.

1. Sint	= *sum*	sintem = *sumus*
2. Eshti	= *es*	sintetsi = *eis*
3. Er	= *est*	sint = *sunt*

AVE = (*habere*). AVUTO = *habitus.*

1. Am	= *habeo*	avem	= *habemus*
2. Ai	= *habes*	avets	= *habesis*
3. Are	= *habet*	an	= *habent*

I have been &c.

1. Eu am fost	noi am fost (also *ash*)
2. Tu ai fost	voi atsi fost (also *au* and *a*)
3. El au fost	ei au fost

Als (eale).

1. Am fi fost laudat	am fi fost laudat
2. Ai fi fost laudat	atsi fi fost laudat
3. Av fi fost laudat	av fi fost laudat

The Infinitive here is that of '*fuo*'; of which the Passive Participle would be '*futus*,' but is, here, '*fost*.' '*Sint*,' the Latin '*sunt*'='sum.' '*Eshte*' is a variant of the Plural '*estis*'; '*sint etsi*,' is '*sunt*+*estis*.' '*Am*'='*habeo*,' is, as a word, as like to '*sum*' or εἰμ-ὶ as it is to '*habeo*'; whilst '*are*' is much more like the Substantive '*er*' than any probable form of '*habet*.'

In '*Eu am fost*' we have '*I have been*'; but '*voi atsi fost*' is '*vos estis fut-i*'='*ye are been*.' '*Am fi fost laudat*' ='*habeo* (possibly *sum*) *fore futus laudatus*'; while '*atsi fi fost laudat*'='*estis fore futi laudati*.'

This certainly suggests that as auxiliars the two verbs are mixed up into one another. But, auxiliar for auxiliar, this is a mixture of the signs of two Voices; and the corollary from this is that, in Analytic combinations, the Verb Substantive (*am* &c.) may combine with an Active Participle, and the Verb Possessive (for such *habeo*, or its equivalents in other languages, may conveniently be called) with a Passive one.

§ 354. But what if the Auxiliary Verb thus combined be omitted, and the Participle alone stand for a Tense (in Past Time)? In such a case a combination like '(εἰμὶ) τετυφὼς ='*I am one who has beaten*,' may bear the import of (εἰμὶ) τετυμμένος, and *vice versâ*. Then let this Participle

have signs of Gender, and retain them after it has been used as a Finite Verb. The result is, a Finite *Tense* with *Gender*; and in the Slavonic languages, and in more than one of the Agglutinate stage, this is what we actually find, and recognise; *i.e.* a Verb with Gender. Such, at least, is what we find it in the Slavonic paradigms. But the interchange of the two Auxiliaries is all that we are now considering.

§ 355. The more general way of stating this is to say that when the Verb Substantive (*am* &c.) and the Verb Possessive (*habeo* &c.) become auxiliars, they, to a very considerable extent, lose the power they have as *Non*-auxiliars, or mere ordinary verbs, and become to some extent fused into a single or equivocal auxiliar with a variable import.

§ 356. We have seen, then, that in one language, at least, the Auxiliary Verb answering to '*have*,' as it presents itself in the ordinary grammars, is made up out of *two* verbs. Is there anything unusual in this? Nothing. In the German Family it is made up out of *three*—*is*, *be*, *was*; the last, I believe, being peculiarly German. In Latin it is made up out of *two*—*sum* and *fui*. In Greek, each of these verbs has something like a complete Conjugation. But elsewhere it is defective in respect to one of them. What, however, is wanting in the one is made good by what presents itself in the other. This gives us a whole, on the principle of *Defect* and *Complement*. In the Greek we get an inkling, and something more, of the difference, in sense, too, between εἰμὶ and φύω (φῦμι); inasmuch as we translate the former by *be*, the latter by *become*. That the latter involves a Future sense we infer *à priori*, and we also know that in the German Family *be* had the sense of a Future. But in Futurity there is Contingency; and *be*, rather than *is*, in strict grammatical English, follows, or is supposed to follow, the Conditional Conjunction '*if*.' What the import of *was*, as an independent Verb, may be is not so evident. It is only certain that three Verbs may pass for one in the Conjugation of the Auxiliary Verb Substantive. We know,

too, that '*is*' is the one which is the most purely and especially auxiliar, because when we use it as an ordinary Verb, we identify it with '*exist*.' This gives us *Existence* as a state and *Entities* as beings. Of these we think simply and solely as to whether they *are* or *are-not*. *What* they are, or may be, we do not consider at all. In this we have the *Summum Genus* of things thinkable. In '*Deus est*' the Verb has a double import. As an ordinary one, it implies the existence of *Deus*. As an Auxiliary it denies its *non*-existence.

§ 357. We now revert to the difference between the pure and proper Infinitive Mood and the Verbal Abstract, which is illustrated in § 320 from the double forms '*laudé*' and '*laudare*' of the Roumanian. Of these, that in *-re* is not so much the Infinitive Verb as the Abstract Noun. If this be true, and there be no second form, the Latin must be considered to have no true Infinitive at all; but, instead of one, the closely allied Verbal Abstract. There is nothing improbable in this; notwithstanding the universal and reasonable use of the term '*Infinitive Mood*' in all our Latin Grammars. A difference of the same kind is not only conspicuous in the Gaelic, but is recognised by the grammarians, who have long considered that, in origin, it is a Participle, though, for the purposes of ordinary grammar, an Infinitive. Here, then, the substitute for the Infinitive is not the Verbal Abstract, but the Participle.

ACTIVE.

Imperative	bi = *be* (*thou*)
Infinitive	do (*or* a) bheith = *to be* = *at*, or *to being*
Participle	ag (*or* a) bheith = *being*
	iarm beith = *having been*
	ar ti bheith = *about to be*
Imperative	buail = *strike thou*
Infinitive	do (*or* a) buladdh = *to strike*.
Participle	a buladh = *striking*
	iar mbualadh = *having struck*
	le (*or* ar) ti bualadh = *about to strike*

PASSIVE.

Infinitive	a bheit buailte = *to be struck*
Participle	buailte = *struck*
	iar mbeith buailte = *having been struck*
	le na bualadh, *or* ar ti bualadh = *about to be struck*

Upon this series of examples Nielson writes thus:

Some writers on Irish Grammar deny the existence of an infinitive, and say that the place of it is supplied by a verbal noun; but this is only quibbling about names; the infinitive and participle imply the force of nouns in Irish, as in all other languages.

Again, in giving the paradigm of the recognised Participle, he writes:

These, and the like, may more properly be considered as participial phrases, composed of the infinitive and a preposition, than as simple participles.—*Irish Grammar*, *Notes* 28, 29, p. 148, published 1808.

§ 358. Between the Participle and the Verbal Noun, the least we get from the two is that the recognised Infinitive is more akin to either one or the other than it is to the normal Infinitives of the grammars.

This, perhaps, may be condemned as a refinement. But it is a necessary one. We must think twice before we assume, for *exactly* the same conception, two different signs. If we fail to do this, as is often the case, we are generally misled by the ambiguous use of the terms *Declension* and *Conjugation*. Twice, too, must we think before we assign to a single form two meanings. When we fail to do this, we are misled by such statements as '*The Present and Imperfect Middle are the same as the Present and Imperfect Passive.*' What is really the fact in the first case is that two closely allied forms may, in a certain stage of the language, come to have but one sensible import; and, in the second, that one form under the same conditions may come to have two allied senses. They may, and do, at some time or other, come to this. But

they do not originate in it; and, in the philology which treats of growth and development, the difference or identity of origin is of more importance than the difference or identity of either form or meaning at any subsequent period.

(14.) Retrospect. Person—Voice—Number—Case and Tense—Gender and Mood.

§ 359. Person.—This, in the main, means the Person of the Finite Verb; though it has been shown that the Noun as well as the Verb may have the sign of Person. In the first Person, especially in the Verbs in -μι, the -*m* of the Personal Pronoun is easily and has long been recognised. In the later forms, such as *am-o*=*I love* &c. its structure is, to say the least, obscure. But, to a certain extent, we see that the second element is a Personal Pronoun. How either this or the Verb with which it is connected came to be what they are, is another question. What we can see clearly is the structure of the combination. We may or not see this *à priori*; but between what we get from the presumptions and from what we get from the history of the compound we see our way to the nature of its elements. All this, however, is the analysis of a sentence, and not that of a single word.

§ 360. Voice.—The *Reflective* (*Middle*) Voice is the combination of the name of the object with that of the Verb, sometimes with that of the Agent as a part of the compound, sometimes as a separate word—*am-o, I love.* We see our way also to this.

In the *Passive* we may do the same; the elements here being the Verb in its Passive form, either as a Participle or as the Passive Abstract, and the Verb Substantive.

In forms like *amare* and *amari* we get the same difference of sense by means of a difference of *Case*; but, as has been suggested, these formations may belong to the declension of

the Passive Verbal Abstract rather than to that pu. Infinitive Verb.

§ 361. NUMBER.—(1) *Of the Verb.*—This is that of the Person, or Pronoun; not that of the Verb itself.

(2) *Of the Pronoun.*—This is peculiar; viz. that of the *Exclusive* and *Inclusive* Personals; and, until we know more about these, our speculations are unprofitable.

(3) *Of the Noun.*—Of the nature of this, in Thought, we have an inkling *à priori*; at least, we can, *à priori*, get a presumption in favour of what it is likely to be; in other words, we know where to look for it. We may, however, fail to do this; for it does not suggest itself quite so readily as the signs of Person. The least, however, that can be said about it is that, when we get an example of what it actually *is*, we can understand the process that gives it to us. When we learn that, in the earlier stages of Language, we find it to consist in the reduplication of either the whole or a part of the word to which it belongs, we see that this is a natural —perhaps *the* natural—sign of *Plurity*. It is this, as an element in the sign of *Plurality* for the Noun, as truly as the *Personal* Pronoun is of *Personality* in the Finite Verb. Still, the evidence of its being this is less patent. In the Finite Verb we have the actual Pronoun attached to the main word; so that there is no mistake as to what it means. It means the Speaker, the Person spoken to, or the Object spoken about. The Reduplication, however, even though it means this, does not express its meaning so definitely. It means what it does only so far as Plurity is a form of Repetition and Repetition a sign of Plurity. On the other hand, however, it has a remarkable prerogative. It is not an addition, or increment *ab extra*. It is a part of the word to which it is prefixed; and, being this, it is permanent so long as it is recognised as a sign; and is wholly independent of any difference of language. It is just the same whatever the form of speech may be; and in being this, is either wholly or almost wholly alone.

§ 362. For all this, however, it is only in the earlier stages of Language that it occurs. But this is not so much because the Reduplication was a sign that could be improved, but because there were other forms of Thought to which it was equally applicable. We get it in the less developed languages (not to mention other more indirect associations), as a sign of the Superlative Degree; in the Greek as the sign of an action that is Past continued, by a *Quasi*-repetition, up to the Present, viz. in the Greek Perfect as opposed to the Aorist. Again: we get it, in the Turkish, as a sign of what passes for Mood. The simple negative gives us a *Negative* form. Double it, and it represents an *Impossible*—something which has no very definite denomination.

§ 363. This is not exactly Plurity, nor is it exactly Plurality. Nevertheless, in all the cases, it is something that implies repetition. *Plurity*, then, in Nature is not necessarily *Plurality* in Grammar; for of Plurity, as of Repetition, there are many forms, and a sign that suits one, and which, so doing, is an adequate one when it stands alone, is something very different when it applies to more conceptions than one. And when it does this, it is likely to become obsolete. It *sign*-ifies too many ideas to be distinctive.

§ 364. By adding one, or more than one, to a unit we get Plurity; and the sum of the additaments is an Aggregate, or Collection. But this is, itself, a Unity. By resolving it, however, into its parts we get, by a reversal of the process of Thought, a Plurity. In the Welsh, not to mention other languages, we get certain Singular Numbers derived from the Plural; as if the Plural (Collective) was the fundamental or radical form. We can understand this when we look either at the stars or the inside of a peashell. We take cognisance of the Aggregate before we distinguish the Individual. It is not, then, too much to say that, for certain objects, the Plural form may not be older than, or as old as, the Singular. Here, then, there is a conflict; not, however, between the actual idea of '*one or more than one*,' but in regard to the aspect in which we see it.

§ 365. That out of the signs of Collectiveness, the later signs of Plurity have been developed, has already been suggested; but between the extent to which we see our way to the nature of the two inflections, there is a notable difference. The reduplicate form explains itself; and, also, contains, within itself, the elements of its structure. The sign of Collectiveness, like the signs of Case and Tense, which are now coming under notice, belongs to a different class.

§ 366. We can see, then, our way, partially, to the origin of the signs of Number; though not so clearly as we see our way to the structure of Person and Voice. But both Person and Voice are scarcely Inflections. They are certainly not the inflections of single words. They give us not so much a single word with an additament as a sentence with two terms. In Gender and Mood we may also neglect the inflective element; at least in the words where the differences are signified by Differentiation rather than by Addition. This is because they are not made out of any combination of separate words; so that there is nothing to which we can reduce them; and this reduction is one of the main objects of the present treatise. Such being the case, there is now no other outstanding division of the system of Declension and Conjugation but that of *Case* and *Tense*.

§ 367. CASE AND TENSE.—These we may take together, since they are analogous; *Case* being to Place what *Tense* is to Time. Tense, however, is more exclusively connected with Time than Case is with Place; a fact of no small importance, because it tells us that the analogy is only partial, and, what is more, it suggests the division of the class into, at least, a dichotomy; viz., (*a*) Cases based upon the conceptions of Space, and (*b*) Cases not so based.

§ 368. It is certain that several inflections are, reasonably, called Cases, in which the notion of either fixation or direction in Space is, to say the least, obscure and indirect. The *Nominative*, *Vocative*, and *Accusative* in the Synthetic, the *Factive*, *Comitative*, *Instrumental*, and *Caritive* in the

Agglutinate languages, are of this kind. Between such a Case as the *Caritive* and the *Dative* or *Ablative* we have, probably, the *maximum* amount of difference in the import of any two inflections which come under the same Class; and it is not too much to say that in neither Person nor Voice, in Number nor Tense, any difference of the same amount can be found. In other words, Inflections bearing the name of Cases may be found which are more widely separated from one another in import than they are from Inflections belonging to another class, denomination, category, or whatever we like to call the heads under which the Parts of Speech, and the elements of the system of Declension and Conjugation, are arranged. Nor should this surprise us. In Person, Voice, Number, and Tense, the amount of possible inflections is limited by the nature of the idea. In Gender there is a like limitation—Male, Female, and Neuter. In the older divisions of Animate and Inanimate, the range of difference was even less. Gender, no doubt, is a more difficult class to explain than Case; but this is not because it embraces more numerous and heterogeneous conceptions, but because it deals with and creates a fictitious, conventional, and *non*-natural distinction.

§ 369. *Mood*, on the other hand, agrees with Case. It mainly deals with the difference between the Positive and the Conditional; but when we find that this involves all the possible questions of Affirmation, Negation, and Doubt, its range of application becomes indefinite.

§ 370. It is not difficult to see what this leads to. *Case* and *Mood*, as categories, or something akin to them, are, as much as anything like a category can be said to be so, *Negative*, and, as such, indefinite in their extent. They take —in Case more especially—besides the expression of certain conceptions more characteristically their own, such others as, either expressed or capable of being expressed by inflection, are not included under the heads of Person, Voice, Number,

Tense, or Gender; and this is why they are only partially and imperfectly commensurate with them. Take away their accessory and extraneous details, and Case and Mood have their own proper series of conceptions which it is the function of the truly *Casual* and *Modal* signs to indicate. Limited to these they are like the Classes with which, both in the ordinary grammars and in the present work, they are associated; and, accordingly, Case, with its primary equivalents, '*to*,' '*from*,' and '*at*,' agrees in the limitations of its import in thought, not only with Tense ('*Past*,' '*Present*,' '*Future*'), but with Person ('*the Speaker*,' '*the Object spoken to*,' '*the Object spoken about*'); with Number ('*one*,' '*more than one*,' or in some cases '*two*'); and with Gender ('*Male*,' '*Female*,' '*neither Male nor Female*' in Nature, or '*Masculine*,' '*Feminine*' and '*Neuter*' in Grammar).

§ 371. *Voice*, when it is Reflective or Middle, is simply an extension of Person, of which it involves two signs—two signs applying to the same individual, who is, at once, the Agent and the Object of his own act. When *Passive*, it is made by the combination of either the Passive Participle, or the Passive Abstract Verbal *plus* the Substantive Verb. In neither instance, however, is it anything more than two separate words. But neither are the combinations which signify Person. There is a difference, however, between the two in the extent to which the compound character is perceptible, and the ease or difficulty with which the two compounds are reducible to their elements. But, whether we call such combinations '*Person*' or '*Voice*,' they constitute sentences or propositions rather than single terms.

§ 372. '*Cases*,' however, in no instance give us more than a single term; neither do '*Numbers*;' so that both in this respect differ from *Voice* and *Person*.

§ 373. But *Cases* are not all alike, and some are, so to say, more *Cas(e)-ual* than others. Those that keep their places in language the longest and are the last to be super-

seded by analytical combinations, being, presumptively, among the first to be developed, have a fair claim to this distinction. Such are the *Ablative* and the *Dative*, represented, analytically, by the prepositions '*to*' and '*from.*' In these we have, in space, both motion and direction. In the Slavonic *Locative*, and in the *Adessive* and *Inessive* cases of the Fin, we only get simple position (*in*, *at*) without any idea of movement or direction. Further modifications of this conception are the combinations formed by the prepositions *by*, *without* (or *external* to), and *within*, or the affixes by which they may be represented inflectionally.

§ 374. Thus far *Case* as a denomination is commensurable with *Tense* especially; and in some degree with *Person* and *Number*. There are certain conditions of Thought, and certain combinations of idea, with which they each, respectively, correspond; and for each there is a limited number of aspects. In Time and Space, as we have seen, in the triple but exhaustive classification of all the objects of a real or imaginary universe which gives us the Persons of the Verb, with *none*, *some*, and *all* in the way of Number, and even with the logician's triad of *Propositions Indicative*, *Commands*, and *Questions*, we find that, as a rule, there is something more than the mere additament of a movable sign to a Noun or Verb to make an inflection of any definite and peculiar class. It cannot be said that a denomination such as Case, under which we find a *Nominative*, a *Vocative*, and an *Accusative*, in the same division with an *Ablative*, or a *Dative*, is anything of the kind. It is rather a mixture of orders, or no order at all.

§ 375. It is now submitted that all the remaining Cases of our grammars, in which we have, over and above those which, like the Locative, the Adessive, the Inessive, the Dative, and the Ablative and, here and there, others having a similar connection with the conceptions of Place and Time, and which have no definite limitation in respect to the ideas

to which they apply, are considered Cases not so much because they are combinations of the same type as that of the Ablative, the Dative, and their congeners, or because they have any such connection with them as the Three Persons, the Three, or Two Numbers, and the Three fundamental Numbers with one another, as because there is no recognised denomination to which they can be referred; and that, *mutatis mutandis*, the same reasoning applies to such other combinations as, with the exception of the Indicative, the Imperative, and the Conjunctive, are known among the Verbs as *Moods*. Between the two—one for the Noun and the other for the Verb—they constitute a considerable group of inflections (or formatives), which have yet to be brought not only into order, but into *co-ordination*.

§ 376. The following paradigms are from a Grammar of the *Sahaptin* language, spoken in the American, or southern, part of what before the partition was known as the great, but indefinite, district of Oregon. It is a language of the Agglutinate stage, or period, and has, for the Adjective at least, a Plural Number :—

SUBSTANTIVES.

Nom. init, *house*
Gen. ininm, *of a house*
Acc. inina, *house*
1*st Dat.* initph, *to* or *for a house*
2*nd Dat.* initpa, *in*, *on*, or *upon a house*
1*st Abl.* initki, *with a house* (instrument)
2*nd Abl.* initpkinih, *from a house*
3*rd Abl.* initain, *for the purpose of a house*

initash, *the place of a house*
initpama, *belonging to a house*
ininot, *without* (or *destitute of*) *a house*
initin, *having a house*
initiih, *like a house*
initsim, *only a house*

ADJECTIVE.

Tahs, *good*

	SINGULAR	PLURAL
Nom.	tahs	titahs
Gen.	tahsnim	titahsnim
Acc.	tahsna	titahsna
1*st Dat.*	tahsph	titahpsh
2*nd Dat.*	tahspa	titahspa
1*st Abl.*	tahski	titahski
2*nd Abl.*	tahspkinih	titahspkinih
3*rd Abl.*	tahsain	titahsain

DEGREES OF COMPARISON.

Positive, tahs = *good*
Comparative, tahs kanmakanm = *better*
Superlative, tahsni or tahstamaunn = *best*

This is the best illustration that the present writer can adduce, rather than the best which can be given. The best would be one from the Monosyllabic period. But this is sufficient to illustrate the principle suggested. Here we have a fundamental root, and a series of additaments which we can scarcely call inflections; and unless we know that they are constant, and apply to something like classes of words, they hardly amount to formatives. But they are manifestly compounds, rather than separate and independent words. In the monosyllabic stage, they or their like would be the latter; in other terms, each would be two separate words in contact with one another rather than two words combined into one. Their import would be, in most cases, some word connected in sense with the relation which they, respectively, express as affixes; but of a less abstract character.

§ 377. The first paradigm the grammarian, not unnaturally, calls a *Declension*; and it is mainly Prepositional. The suffixes of the other he calls *Adjectival* or *Adverbial*, and the distinction is real. But the form is the same for

both; and except in the rare instances where the additament can be found elsewhere as a separate word, they are Compounds rather than pairs of words; and they have imports of various kind—in some of which we have classes or subclasses; i.e. variations in the expression of a single fundamental and general notion, or conception; e.g. in the numerous forms of the Ablative. Some of them are compound; i.e. additaments to an additament.

§ 378. This is what we get from the single grammar of a single language. But there are dozens of languages which would give us paradigms of the same kind. In most of these we may find some new combination, or some form which has not presented itself elsewhere. The sum total of these combinations would exceed that of all the recognised inflections, and all the classified formatives, in any single known language. It would certainly give us, by dozens and scores, combinations of one sort or another for which we have no uniform grammatical names, and no definite classification. Each, however, has its own particular history, and each when it originated had its special import. Perhaps we are not bound to find a name for them, inasmuch as they have dropped out of the languages to which they belonged; or the languages themselves have become extinct; or, if not exactly this, so altered in character as to have become partially transmuted. What are these additaments, and what do they *sign*-ify? Do they give us *Cases*? They do this, to some extent, in *Nouns*. Do they give us *Tenses*? They do this to some extent in *Verbs*. Do they give us *Moods*? They are beyond doubt Modal in Adjectives. But there are many which have no class to which they can be unanimously referred; whereas, on the other hand, there are some from which they must manifestly be excluded. The classes known under the denominations of '*Person*,' '*Number*,' and '*Tense*' have a very narrow range of comprehension, and unless there is something specially *Personal*, *Numerical*, or *Temporal* about a combination. it would hardly be asso-

ciated with our First, Second, and Third Persons; our Singular, Dual, and Plural Numbers, or our *Past*, Present, and Future Tenses.

§ 379. It is submitted, then, that *Case* and *Mood* are the names of two classes—Case for Nouns and Mood for Verbs—which only partially coincide with those that are known under the names of Person (Voice), Number, and Tense; and that, practically, they contain all those combinations recognised as inflections which are *not* contained in the other groups. And this, of course, implies that, out of each, certain minor divisions of equal value with the other three (or four) could be constructed if necessary. Even within the Indo-European languages we may see, by mere inspection, the elements of three groups which are, at least, as different from one another as Voice is from Person—these three being (1) the Nominative, Vocative, and Accusative: (2) the Possessive; and (3) the Dative and Ablative. The first of these, or the first group, gives us something that, allowing for the difference between the Noun and the Verb, is very like *Mood*, the Nominative answering to the Indicative, the Vocative to the Imperative, and the Accusative (Objective), somewhat less evidently, to the Conjunctive. The Possessive (Genitive) is so much akin to the Adjective in its import, that Wallis for one has treated such combinations as '*man's hat*,' '*father's son*,' as Adjectival; while the Factive in the Fin language gives a sense which, in many cases, has the import of the *-ly* in *lovely*, *softly*, and the like; the Caritive in the same class giving us the equivalents to the negative adjectives in -less—*loveless*, *harmless*, &c. As for the third class, in which the idea is that of position or direction in place, and of which the analogy with the Tense of the Verb is undoubted, it is manifestly a group by itself, and also the group that in its dimensions and limitations best harmonizes with those of the other three (or four) denominations. Whether this be the division to which the term '*Case*' most conveniently applies, and how far, for the pur-

poses of ordinary teaching, it may be necessary to excogitate any new class-names, is another question. It is certainly the one in which we best see our way to the idea upon which the combinations are founded—viz. those relations in Place which are indicated by the Demonstrative Pronoun; a Pronoun which, in the word '*then*,' at least, serves to indicate Time.

§ 380. We may now revert to the double process by which we get Inflection—(1) that of *Addition*; (2) that of *Differentiation*; and, having done this, eliminate from the present treatise the question of both *Gender* and *Mood*, so far as they are *sign*-ified by mere modifications in the form of a syllable, rather than by the addition of a new and extraneous element. This we must do because, by hypothesis, all the inflections which we are now investigating are held to have been, originally, separate and independent words. This doctrine may or may not be correct; but it is the one which is most generally received, and, certainly, the one which presents itself in the most definite and manageable form. But, in doing this, we must remember that there is a third kind of inflection; one that partakes of the nature of Addition on one side, and that of Differentiation on the other. This is *Reduplication*—*γέ-γραφα*, &c. It is something more than differentiation, because it adds a syllable to the main word. Yet it is something less than addition, because the elements of the additament are not taken *aliunde*, but supplied from the original word itself.

§ 381. Upon the signs of Person, Voice, and Tense, in respect to their origin, little has been said, because little has been needed—at least, in the present investigation. But in respect to *Number* and *Case*, two doctrines had to be alluded to. The connection between the *Numeration* of the arithmetician and the *Number* of the grammarian could not but suggest itself. Such being the case, it was necessary to allude to it, and to recognise the criticism that it might suggest; or rather, to some extent had already suggested. Besides this, there was the connection in

sense between such pronouns as *to* and *from*, along with others, and the signs of certain cases, especially the Dative and Ablative. Now, these were noticed; not, however, to be recommended, though not, on the other hand, to be wholly ignored. There are a few individual cases that they may illustrate; just as, in the cognate question of *Gender*, there are a few (perhaps many) that may be explained by the doctrine of *Personification*. But for all the three questions we must take a wider and a more general view; and, in doing this, go back to a stage of language not impossibly anterior to the ideas of Numeration, Prepositions, and even Personification—early as this last may have been.

(15.) General View of the Origin of Inflections and Formatives.

§ 382. Here our method must be as follows—(1) Treat every combination—real or hypothetical—simply as such; *i.e.* as a single word made up out of more words than one. This means that the question, whether it results in a sign of Person, Voice, Number, Case, or Tense, is reserved for future investigation. All that interests us at present is the simple fact of the fusion of more words than one into one.

§ 383. (2) Give special attention to those recognised inflections which, like the Norse Reflective Verb, the French and Italian Futures (*parlerò*, &c.), and the Postpositive Article, have been developed out of two separate words within the historical period.

§ 384. (3) Analyse carefully the numerous compounds, of every kind, which present themselves in the languages of the present time, or, at least, those of our own, with special attention to the extent to which they differ from the separate and uncombined words by which they are constituted in (1) import, (2) form. In this respect few languages teach us more than the English; not only as to the extent to which inflections have been superseded by combinations of an analytical character, but also by the instructive exposition

of the numerous processes either in action at the present time, or else adequately illustrated by the long history of our literature, and the variety of our dialects. How far more words than one take the guise of even a single syllable is shown in compounds like '*such*,' and '*which*,' from '*so+like*,' and '*hwe+like*,' and, better still, in the word '*not*'; of which the elements are no fewer than three, viz. the negative '*ne*,' the '*ev*'- in '*ev-er*,' and the half-obsolescent word '*whit*,' meaning *jot*, *tittle*, or small part of any thing. In a language with a short history and an inadequate literature words like these and scores of others might easily be mistaken for simple roots. Indeed, the whole history of the word '*like*' is suggestive. Had it dropped out of the language as a separate word with its proper adjectival import, such combinations as '*soft-ly*,' '*gent-ly*,' and all such others as have an adjective for their first element would be obscure; while combinations like '*man-ly*' &c., where the basis is substantival, might pass, in grammars like those of the Fin family, for a Case, viz. the Factive. From the same point of view all the words ending in *-less*, as '*blood-less*,' &c., would be called *Caritives*. Again, the whole series of the participial forms in *-and*, *-end*, and *-ind*, concurrent with that of the Abstract Nouns in *-ung* and *-ing*, from forms like '*burn-and*' to those like '*glintin*,' and '*darklins*' (*Scoticè*), is full of instruction; and that both in the way of form and import. Again, a combination like '*oak-tree*'=a '*tree which is an oak*'; whereas in those like '*dust-hole*' or '*wine-bin*' we get not so much a '*hole that is dust*,' or a '*bin that is wine*' as a '*hole*' or '*bin*' for '*dust*' or for '*wine*.' The difference here lies in the difference of the elements as taken by themselves rather than in any difference of sign, accent, or collocation. This is noted because it is necessary to see how much, even in the clearest and most manifest compounds in their most unaltered form, has to be supplied, or (to use a commoner term) *understood*.

§ 385. In words like *nam* (*am not*), *canna* (*can not*),

catch'em archaic, provincial, or vulgar as they may be considered, we find in even a language so analytic as the English the tendency to composition, or the fusion of more words than one into one with a loss of integrity on the side of the additament, reasserting itself. It may be objected that, in combinations of this kind, we have nothing more than a pair of words taken out of a sentence and pronounced with abbreviations, and that in true composition the elements are brought together from different quarters, and, as such, are the result of something more than the mere slovenly pronunciation of a short sentence, or a part of one. It is doubtful, however, whether juxtaposition of this latter kind may not be quite as common a cause of combination and fusion as any other.

§ 386. This and much more of the same kind is what we get from the study of the languages of our own time—that of the student's his own country, whatever it may be, being the one which will teach him the most. In this, or upon the principle of arguing backwards from the later to the earlier, from the more certain to the less uncertain, or from the known to the unknown, lies the basis of our criticism.

§ 387. The process, however, should be reversed; though the reversal can, at best, be but partial and approximate. We can never arrive at the actual origin of language, nor can we ever say how far we are from it. Indeed, anything like dates in the way of Time is out of the question. What we *can* determine is the stage of growth, evolution, or development in which we find any particular language; and, between the two extremes of the Analytic and the Monosyllabic classes, we have an ample amount of material, and, to some extent, a continuity. The greatest break is that which separates the Agglutinate class from the Synthetico-Analytic (*Indo-European*). Between the Monosyllabic and the Agglutinate the transition is much more gradual. How far it has been studied, or whether it will ever be studied in the way that we study the Indo-European forms of speech, is another question.

§ 388. In the Monosyllabic languages the words, so far as they are spelt by any ordinary alphabet, are few, the Tones and (or) Accents numerous and refined, the rules for Collocation stringent, the general character of the roots monosyllabic, and the import of the great majority of them of a concrete or sensible character, belonging to no *Part of Speech* in particular. In this, as in other points, they agree with the English element of our own language, when, as is the case in its present highly Analytical condition, it is denuded of inflections, inflections which it once had but has now lost—their absence in the Monosyllabic languages being due to the fact of their never having been developed. Many of these words are naturally brought into contact with one another in ordinary speech; and then fusion begins, and, after this, change in the form of the additamental word. When this happens two words take the guise of one. Some of these keep their place as permanent parts of the theme. Others are changeable, and vary with the Person, Number, or Sex, with the relations of the Subject as agent or object, and the time of the Action or State. But these, as language advances, drop off, and are replaced by separate words. The rate at which changes proceed is not to be measured by years, or centuries, or milleniums, but by the rate at which the language developes itself; and we know how great, at the present time, is the difference between those of the highest degrees of development and those of the lowest.

§ 389. At some period between the development of the Alphabet and the completion of the Greek system of Logic the nature of these additaments commanded attention; less, however, with a view to the history of Language than to the Rules of Reasoning. Then the place of the main words as Parts of Speech, and of the additaments as signs of Person, Voice, Number, Case, Tense, Gender, and Mood gave the basis of Grammar. They gave us, *inter alia*, the class-names that have just been alluded to; and it has been submitted that, in the matter of Case and Mood further subdivisions

are required. But all these denominations refer to Inflection only; and it is only the recognised inflections of which the present treatise takes cognizance. Of these in the way of the *Cases of Nouns* alone the Fin Grammars give us *fifteen*, the Chinese at one extremity and the French at the other give us *none*. But enough upon the general principle of development in the line from Monosyllabicism to Synthesis-and-Analysis has been said in the body of the work. The general character of the growth and evolution of the additaments under notice is manifest.

§ 390. What, then, are we to say of the Inflections, whether English, French, Latin, Greek, Sanskrit, or Fin; between which we have for Case, at least, the *minimum* and the *maximum*?

That they are the remains of a system beginning with certain pairs (or more) of words in juxtaposition, in contact, and, finally, in a state of fusion, amalgamation, or apparent unity; yet at the same time, as either affixes or prefixes, liable to fall off from the body of the word, when they ceased to be necessary, or were liable to be superseded by a substitute. As a rule, they *have* been dropped; generally superseded by something else—something else on a different principle, i.e. the combination of different words. It is probable that the fittest, or those for which no preferable substitute has presented itself, are those that still survive.
